Adjustment—None (no shims). Replace bearings. Do not file rods or caps.

Crankshaft:—Four bearing. Integral counterweights.

Journal Diameters—2¾" all bearings.

Bearing Type—Removable steel-backed, babbitt-lined type. No shims.

Clearance—.001" minimum.

Adjustment—None (no shims). Replace bearings. Do not file bearing caps.

End Thrust—Taken by front bearing. Endplay .003" minimum.

Camshaft:—Four bearing. Mounted between cylinder banks directly above crankshaft. Non-adjustable chain drive.

Timing Chain—Morse #1866. Width 1½". Pitch .500". Length 28" or 56 links.

Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that '00' marks are adjacent and centered on straightedge across the shaft centers.

Valves:—

	Head Diameter	Stem Diameter	Length
Intake	1 21/32"	.3405"	6 35/64"
Exhaust	1 21/32"	.338"	6 35/64"

	Seat Angle	Lift	Stem Clearance
Intake	45°	5/16"	.0025"
Exhaust	45°	5/16"	.005"

Tappet Clearance—None in service (automatic take-up).

See article in Mechanical Equipment Section for data.

Automatic Tappet Takeup (Valve Silencer)—See Mechanical Equipment Section for data on bleeding the automatic takeup (necessary in order to grind valves) and initial clearance when installing valves (new or after grinding). Automatic takeup should not require attention at other times.

Valve Springs:—

	Spring Pressure	Length
Valve Closed	70 lbs.	2 7/32"

Valve Timing—See Camshaft Setting above.

Intake Valves—Open at TDC. Close 45° ALDC.

Exhaust Valves—Open 35° BLDC. Close 10° ATDC.

To Check Valve Timing—Intake valve in #1 cylinder of right hand bank (1R) should begin to open with piston 6R on top dead center entering power stroke when mark '1R-UDC' on vibration dampener at front of engine lines up with pointer on chain case cover.

Motor Gauge—Weidenhoff Adapter #114, Rod #2.

Lubrication:—Pressure. Gear type oil pump located in crankcase.

Normal Oil Pressure—35 lbs. minimum at 1000 R.P.M.

Oil Pressure Relief Valve—Under plug on left hand side of crankcase below oil filler. Adjustable by turning adjustment screw.

Capacity and Oil—10 qts. Use SAE. #30 (normal temperatures of 30° to 100°F), #40 (above 100°F), #20-W (0° to 60°F), #10-W (—15° to 40°F).

CLUTCH:—**Long, Model 12CB.** Single plate, dry disc type. No adjustment required for wear. See article in Clutch Section for relining and assembling directions.

Clutch Pedal Adjustment—Clearance between pedal and toeboard should be ½-1". Free movement of pedal should be 1½". To adjust, turn turnbuckle on connecting rod at lower end of clutch pedal.

Clutch Facings—Moulded type, 2 required, 7" I.D., 12" O.D., .137" thick.

STEERING:—**Front Suspension**—Conventional 'I' beam section front axle with Reverse-Elliott ends and semi-elliptic springs.

Kingpin Inclination—9° crosswise.

Caster—1°. Adjustable by installing wedge shims between spring and spring pad on axle.

Camber—1°.

Toe In—0-1/16". Adjustable by changing length of tie rod in usual manner.

Steering Gear:—Gemmer Worm-and-Roller type.

See article in Mechanical Equipment Section for data.

BRAKES:—**Service**—Bendix, Duo-Servo, Single anchor, mechanically operated, vacuum power brakes. Hand lever applies all four service brakes. See article in Brake Section for complete adjustment procedure.

Drum Diameter—15".

Lining—Primary (Raybestos), Secondary (Hyco). Width 2½" (except left front brake which is 1⅞"). Thickness ¼". Length 32¼" per wheel.

Clearance—Free—at heel and toe of each shoe.

Hand Brake Adjustment:—See Packard 8 Model 1200 (previous article) for complete data.

Power Unit:—Bendix plain type vacuum cylinder mounted on frame and linked to cross shaft lever. Controlled by valve in brake rod between brake pedal and cross shaft.

See article in Mechanical Equipment Section for data.

ENGINE NUMBER:—First number—X-27900. Stamped on boss on upper left hand corner of cylinder block (obscured by oil filter when filter installed).

ENGINE SPECIFICATIONS:—8 cylinder, 'L' head.

Bore—3¼". Stroke—4¼".

Displacement—282.04 cubic inches.

Rated Horsepower—33.8 (AMA).

Developed Horsepower—120 at 3800 R.P.M.

Compression Ratio and Pressure—6.5-1 Aluminum head, 110 lbs. at cranking speed (125 R.P.M.).

Vacuum Reading—Gauge should show steady reading of 18-19" with engine idling at 300 R.P.M. or 6 M.P.H.

PISTONS:—Nelson Bohnalite, aluminum alloy, Invar Strut, split skirt type. Recondition cylinders to take finished replacement pistons.

Weight—17.5 ozs. (stripped), 23 ozs. (with rings and pin).

Removal—Pistons and rods removed from above.

Clearance—Skirt .0015". See Fitting New Pistons.

Replacement Pistons—*See Packard Shop Notes.*

Fitting New Pistons:—Use feeler gauge .0015" thick ½" wide to check clearance. Pull required to withdraw feeler from between piston and cylinder wall on side opposite slot must be within 5-7 lbs.

Installing Pistons:—Slot toward left or away from valves.

PISTON RINGS:—Two compression, one oil ring per piston above pin. Lower ring groove drilled with twelve 5/32" oil drain holes.

Ring	Width	End Gap	Side Clearance
Comp. (top)	⅛"	.007-.012"	.002"
Comp. (2nd)	⅛"	.007-.012"	.0015"
Oil	3/16"	.007-.015"	.0015"

NOTE—Ring tension when compressed to cylinder size with .007" minimum gap must be 6¼ lbs. (compression), 4½-7½ lbs. (oil ring).

PISTON PIN:—Diameter—⅞". Length—2 51/64". Pin floats in piston and rod. Held by retaining ring at each end. Pin hole in connecting rod is bronze-bushed. Pins furnished .003", .006" oversize.

Pin Fit in Piston—Palm push fit with piston at 160°

Pin Fit in Rod Bushing—.00025" clearance or thumb push fit with both parts at room temperature (70° F.). See Connecting Rod Upper Bearing.
NOTE—Finish ream bushings to .87515-.87485".

CONNECTING ROD:—Weight 32½ ozs. Length 7 11/16".

Upper Bearing (Piston Pin Bushing)—Formed by two bushings pressed in rod from opposite sides so as to form oil groove in center. Rifle-drilled oil passage in rod must open into this groove.
See Packard Shop Notes for Bushing Installation.

Crankpin Journal Diameter—2 3/32".

Lower Bearing—Interchangeable steel-backed, babbitt-lined type. No shims.

Clearance—.0005-.0025". Sideplay .003-.006".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps.

Installing Rods:—Identification mark on side of rod should be toward front of engine with oil bleed hole in lower bearing toward camshaft side.

CRANKSHAFT:—Five bearing Integral counterweights.
Journal Diameter—2.746" all bearings.
Bearing Type—Interchangeable steel-backed, babbitt-lined type. No shims.
Clearance—.001-.003".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps.

End Thrust—Taken by center (#3) bearing. Endplay .003-.008". Adjusted by replacing or building up bearing.

CAMSHAFT:—5 bearing. Non-adjustable chain drive.

Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1 29/32"; #5, 1⅞".
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.001-.003".

End Thrust:—Taken by thrust plate in back of camshaft sprocket. Endplay .002-.004".

Timing Chain:—Morse #1866 RX. Width 1¼". Pitch .375". Length 58 links.

Camshaft Setting:—With #1 piston on top dead center (when center line above mark '#1 UP D.C.' lines up with indicator in inspection hole in left front face of flywheel housing under starter) and #1 exhaust valve just closing, mesh chain with sprockets turned so that 'O' marks are adjacent and in line with a straightedge across the shaft centers.
NOTE—Radiator and front assembly must be removed as a unit when work is done on front of engine and engine must be supported at front end and front engine support removed for work on timing chain, camshaft or sprockets. To remove front assembly, take out bolts to body (3 each side), bolts to running board (3 each side), fender brace bolts (1 each side), radiator tie rod nuts, center bolt in front cross-member, and running board moulding clips (4 each side).

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 17/32"	11/32"	5⅝"
Exhaust	1 13/32"	11/32"	5⅝"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.300"	.0005-.00175"
Exhaust	45°	.300"	.0005-.00175"

NOTE—Stem clear'ce in guides measured at bottom.
Tappet Clearance—.007" Int., .010 Exh. Engine hot.
NOTE—Splasher in right front fender should be removed when valve adjustments are made.

Valve Guides:—Cast-iron, one piece, removable with exhaust longer than intake. New guides are finish reamed with a taper reamer after installation with .0035" greater clearance at top. Exhaust valve guides are counterbored ⅜" deep at top to provide .015" greater clearance.

Valve Springs:—Intake and exhaust springs are interchangeable.

	Spring Pressure	Length
Valve Closed	40 lbs.	1⅝"
Valve Open	110 lbs.	1 5/16" approx.

Valve Lifters—Single piece barrel-type with openings in side walls.

Valve Timing:—See Camshaft Setting above.

Intake Valves—Open 5° BTDC. Close 39° ALDC.

Exhaust Valves—Open 45° BLDC. Close 5° ATDC.

To Check Valve Timing—Set tappet clearance #1 exhaust valve at .013". This valve should close with piston 5° or .0103" past top dead center when point on flywheel 2½ graduations past #1 UP.DC. mark (top dead center mark) lines up with pointer in inspection hole in left front face of flywheel housing under starter. Reset tappet clearance at .010" with engine warm.

LUBRICATION:—Pressure. Gear type oil pump mounted on right side of crankcase.
NOTE—Whenever oil pump is to be removed turn engine over until distributor rotor in #1 position (#1 piston 7° BTDC.). When installing pump turn oil pump shaft so that tongue-and-groove connection to distributor shaft meshes. Recheck ignition timing.

Normal Oil Pressure:—35 lbs. at 1000 R.P.M.

Oil Pressure Relief Valve:—Located on pump cover. Not adjustable. Replace relief valve spring if defective. Tension 6 lbs. compressed to 2".

Crankcase Capacity:—7 qts. (full).

CLUTCH:—Long Mod. 10CF-CI. Semi-centrifugal, single plate, dry disc type. See article in Clutch Section for relining and assembling directions.

Facings—Woven type, 2 required. Inside Diam. 6". Outside Diam. 10". Thickness .140".

Adjustment—Clearance between clutch pedal and toeboard must be ½" with clutch engaged. Free movement of clutch pedal must be 1½". To adjust, loosen locknut and turn adjusting nut on clutch pedal-to-lever connecting rod.

Removal—Remove floor boards and front seat, disconnect front universal joint, support engine at rear and remove rear engine mountings, remove transmission, remove clutch housing bottom cover, and clutch pedal linkage. Loosen capscrews mounting clutch cover on flywheel turning all screws out evenly to release springs. Remove clutch from below without removing housing.

STEERING:—Steering Gear—Gemmer Model Worm-and-Roller type. See article in Steering Section for adjustments.

Front Suspension:—Independent 'Safe-T-Flex' type with Coil springs. All specifications below apply with car weight on wheels. See article in Steering Section for adjustments.

King Pin Inclination—1°30' crosswise.

Camber—1° plus or minus ¼°. Adjustable.

Caster—2° plus or minus ½°. Adjustable.

Toe In—1/16-⅛". Adjustable by turning tie rods equally (check for equal lengths after adjustment).

Steering Geometry—Inner wheel turned 23°, outer wheel turned 20°. Check tie rod ends and kingpin for looseness.

BRAKES:—Service—Bendix Hydr'lic, Duo-Servo, Single anchor type. Hand lever applies rear wheel brakes. *See article in Mechanical Equipment Section for data.*

Wheel Cylinders—1 1/16" (front—painted white), 15/16" (rear—painted brown).

Drum Diameter—12".

Lining—Primary U.S. Asbestos 714, Secondary U.S. Asbestos 589. Width 1¾". Thickness 3/16". Length per wheel 26".

Clearance—.010" at heel and toe of each shoe.

Spring Pressure—63 lbs. on primary return spring (No. 303837-red), 70 lbs. on secondary return spring (No. 303836-yellow).

Hand Brake Adjustment:—See Service Brakes.

ENGINE NUMBER:—First number 390000 (1400, 1, 2), 757000 (1403, 4, 5). Stamped on left side of block at front of engine near oil filler.

ENGINE SPECIFICATIONS:—**Type**—8 cylinder In Line, 'L' head type.

Bore—3 3/16" (1400, 1, 2), 3½" (1403, 4, 5).

Stroke—5" (all models).

Displacement—320 cubic inches (1400, 1, 2), 384.4 cubic inches (1403, 4, 5).

Rated Horsepower—32.5 (1400, 1, 2), 39.2 (1403, 4, 5).

Developed Horsepower—130 at 3200 (1400,1,2), 150 at 3200 (1403, 4, 5).

Compression Ratio—6.5-1 Std. head (1400, 1, 2), 6.3-1 Std. head (1403,4, 5), 6.0-1 Optl. low comp. head, 7.0-1 Optl. high comp. head (both models).

Compression pressure—110 lbs. at cranking speed of 125 R.P.M. (std. head—both models).

Vacuum Readng—Gauge should show steady reading of 18-19" with engine idling at 350 R.P.M. or 7 M.P.H.

PISTONS:—Nelson Bohnalite, aluminaum alloy, Invar Strut, split skirt type. Recondition cylinders to take finished replacement pistons.

Weight—18.7 ozs. (1400, 1, 2), 21.9 ozs. (1403, 4, 5).

Removal—Pistons removed from top, rods from bottom on Model 1400, 1, 2 (push piston up until piston pin is exposed, remove locking ring and push out pin, remove piston, lower rod and remove from below. Use new locking rings when replacing pistons). Pistons and rods removed from above on Model 1403, 4, 5.

Clearance—Skirt .0015". See Fitting New Pistons.

Replacement Pistons:—Finished replacement pistons furnished in standard size and .003", .005", .010", .015", .020", .025", .030", .035", .045" oversize

Fitting New Pistons:—Use .0015" feeler stock ½" wide to check clearance. Pull required to withdraw feeler from between piston and cylinder wall on side opposite slot should be 3-5 lbs.

Installing Pistons:—Slot should be on valve side of engine.

PISTON RINGS:—Three compression, one oil control ring per piston, all above pin. Lower ring groove drilled with twelve ⅛" oil drain holes.

Ring	Width	End Gap	Side Clearance
Comp (Top)	⅛"	.007-.012"	.002"
Comp (2nd)	⅛"	.007-.012"	.0015"
Oil	5/32"	.007-.015"	.0015"

NOTE—Ring tension when compressed to cylinder size with .007" minimum gap should be 6¼ lbs. (1400, 1, 2 comp. ring), 6¾ lbs. (1403, 4 5 comp. ring), 4½-7½ lbs. (oil ring—all models).

PISTON PIN:—**Diameter ⅞". Length 2 47/64"** (1400, 1, 2) 3 3/64" (1403, 4, 5). Pin floats in piston and rod. Held by locking ring at each end. Pin hole in rod is bronze-bushed. Pins furnished for service .003", .006" oversize.

Pin Fit in Piston—Palm push fit with piston heated to 160° F. Pin holes in piston finished to inside diameter of .87515-.87485".

Pin Fit in Rod Bushing—.0002" clearance or thumb push fit with both parts at room temperature (70°F)

CONNECTING ROD:—**Weight** 40 1/16 ozs. (1400, 1, 2), 47¾ ozs. (1403, 4, 5). **Length 10⅞".**

Crankpin Journal Diameter—2.1875".

Lower Bearing—Removable steel-backed, babbitt-lined type. No shims. Bearings furnished for service .001", .002", .003", .015" undersize.

Clearance—.0005-.002". Sideplay .003-.006".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or bearing caps.

Installing Rods:—Install with oil hole toward camshaft.

CRANKSHAFT:—9 bearing. Integral counterweights.

Journal Diameter—2.625".

Bearing Type—Removable steel-backed, babbitt-lined type. No shims.

Clearance—.001-.002".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps.

End Thrust:—Taken by #7 bearing. Endplay .003-.005"

CAMSHAFT:—8 bearing. Adjustable chain drive.

Bearing Type—Steel-backed, babbitt-lined.

Clearance—.001-.003".

Endplay—.001-.004".

Timing Chain:—Morse #1866. Width 1½". Pitch .500". Length 32" or 64 links.

Chain Adjustment—Loosen generator flange mounting screws, pull generator out or away from engine until sideplay as measured at chain inspection plug hole in top face of chain case is ¼", tighten mounting screws. Adjust chain whenever sideplay exceeds ½".

Camshaft Setting:—Sprockets are marked Mesh chain with sprockets turned so that 'OO' marks are adjacent and are centered on a straitedge across the shaft centers.

VALVES:—

	Head Diam.	Stem. Diam.	Length
Intake (1400, 1, 2)	1 21/32"	.3405"	7 13/32"
Exhaust " "	1 15/32"	.3405"	7 13/32"
Intake (1403, 4, 5)	1 13/16"	.3405"	7 13/32"
Exhaust " "	1 11/16"	.3405"	7 13/32"

	Seat Angle	Lift	Stem Clear.
Intake	45°	.358"	.0025" min.
Exhaust	45°	.358"	.004" min.

Tappet Clearance—.004" Int., .006" Exh., eng. warm.

Valve Guides:—Pressed in block. Reamed to size for correct stem clearance (see table above).

Valve Rocker Arms:—Consist of pivoted arms mounted on bracket on crankcase which transmit motion from cam to valve pushrod (valve lifter).

Removal—Remove screws in bracket on right side of crankcase, withdraw bracket and pushrod assembly.

Valve Springs:—Double springs used on all valves.

	Spring Pressure	Spring Length
Valve Closed	73 lbs.	3 1/16"

Valve Timing:—See Camshaft Setting above.

Intake Valves—Open 30° BTDC. Close 65° ALDC.

Exhaust Valves—Open 65° BLDC. Close 30° ATDC.

To Check Valve Timing—Check tappet clearance #1 intake valve. This valve should open with piston 30° or .4070" before top dead center when flywheel mark 'INT' (visible through starter mounting hole in flywheel housing with starter removed) lines up with indicator on housing within case.

Motor Gauge—Weidenhoff #114 Adapter, #5 Rod.

LUBRICATION:—Pressure type. Gear type oil pump mounted in crankcase. Oil temperature regulator mounted on left side of engine.

Normal Oil Pressure—35 lbs. at 1000 R.P.M.

Oil Pressure Regulator—Located under plug on left side of crankcase. Operates at 35 lbs. Adjustable by turning adjusting screw.

Crankcase Capacity—8 qts. (1400, 1, 2), 9½ qts. (1403, 4, 5).

CLUTCH:—**Long Model 12 CB-CL.** Single plate, dry disc type. See article in Clutch Section for relining and assembling directions. No adjustment for wear required.

Facings—Moulded type, 2 required. Inside Diam 7". Outside Diam. 12". Thickness .140".

Adjustment—Clearance between pedal and toeboard should be ½-1". Free movement of pedal should be 1½". Adjust by turning turnbuckle on connecting rod at lower end of pedal.

Removal—Disconnect drive shaft at front universal, remove transmission and bell housing, take out screws mounting clutch on flywheel turning all screws out evenly to release clutch spring pressure.

STEERING:—**Steering Gear**—Gemmer Worm-and-Roller type. See article in Steering Section for adjustments.

Front Suspension:—Conventional 'I' beam section front axle with Reverse-Elliott ends and semi-elliptic springs.

King Pin Inclination—9° crosswise.

Camber—1°.

Caster—2½°. Adjustable by installing wedge shims between spring and spring pad on axle.

Toe In—1/16-⅛" at rim. Adjustable in usual manner by changing length of tie rod.

Tread—60".

Steering Geometry—Inner wheel turned 22½°-23°, outer wheel turned 20°. Check tie rod ends and king pins for looseness.

BRAKES:—Bendix Duo-Servo, Single Anchor, mechanically operated, vacuum power brakes. Hand lever applies all four brakes. See article in Brake Section for complete adjustment procedure.

Drum Diameter—14".

Lining—Primary (Raybestos 451), Secondary (Hyco DV 1391). Width 2¼" (except left front which is 1¾"). Thickness ¼". Length 30¼".

Clearance—Free—at heel and toe of each shoe.

Hand Brake Adjustment:—With hand brake lever fully released and cross shaft against stop, remove all slack in cable by adjusting clevis position at cross shaft end of cable until clevis pin can just be inserted in cross lever. Check brakes making sure they are fully released with hand brake in off position. Adjustment for wheel equalization should be made after drum lining has been worn in.

NOTE—By removing glove compartment and changing brake latch piece (#228705) operating position of hand brake lever may be moved 2" to the rear.

Power Unit:—Bendix plain type vacuum cylinder mounted on frame and linked to cross shaft lever. Controlled by valve built in brake pedal mechanism. *See article in Mechanical Equipment Section for data.*

ENGINE NUMBER:—First number—904000. Stamped on front of left cylinder block below head.

ENGINE SPECIFICATIONS:—**Type**—12 cyl. 67° Vee, modified 'L' head. Both blocks and upper crankcase cast enbloc.

Bore—3 7/16". **Stroke**—4¼".

Displacement—473 cubic inches.

Rated Horsepower—56.7 (AMA).

Developed Horsepower—175 at 3200 R.P.M. Std. 6.4-1 head.

Compression Ratio & Pressure—6.4-1 Std. head, 6.0-1 Optl. low comp. head, 7.0-1 Optl. high comp. head. Pressure 110 lbs. at cranking speed of 125 R.P.M. Std. 6.4-1 head.

Vacuum Reading—Gauge should show steady reading of 18-19" with engine idling at 375 R.P.M. or 8 M.P.H.

PISTONS:—Nelson Bohnalite, aluminum alloy, Invar Strut, split skirt type. Recondition cylinders to take finished replacement pistons.

Weight—21.7 ounces.

Removal—Pistons removed through top, rods thru bottom of engine (push pistons up until piston pin is exposed, take out locking rings, push out pin, lift out piston, lower rod and remove from below). Use new locking rings when installing pistons.

Clearance—Skirt .0015". See Fitting New Pistons.

Replacement Pistons:—Furnished in standard size and .003", .005", .010", .015", .020", .030", .045" oversize.

Fitting New Pistons:—Use .0015" feeler stock ½" wide to check clearance. Pull required to withdraw feeler from between piston and cylinder wall on side opposite slot should be 3-5 lbs.

Installing Pistons:—Slot should be toward camshaft on all pistons.

PISTON RINGS:—Three compression, one oil control ring per piston, all above pin. Lower ring groove drilled radially with twelve ⅛ oil drain holes.

Ring	Width	End Gap	Side Clear.
Comp. (Top)	⅛"	.007-.012"	.002"
Comp. (2nd)	⅛"	.007-.012"	.0015"
Oil	5/32"	.007-.015"	.0015"

NOTE—Ring tension when compressed to cylinder size with .007" minimum gap should be 6½ lbs. (compression), 4½-7½ lbs. (oil ring).

PISTON PIN:—**Diameter ⅞". Length 2 63/64".** Pin floats in piston and rod. Held by locking ring at each end. Pin hole in rod is bronze-bushed. Pins furnished for service .003", .006" oversize.

Pin Fit in Piston—Palm bush fit with piston heated to 160° F. Pin holes in piston finished to inside diameter of .87515-.87485".

Pin Fit in Rod Bushing—.0002" clearance or thumb push fit with both parts at room temp. (70° F.).

CONNECTING ROD:—**Weight 40⅝ ozs. Length 9".**

Crankpin Journal Diameter—2½".

Lower Bearing—Removable, steel-backed, babbitt-lined type. Bearings furnished for service .001", .002", .003", .015" undersize.

Clearance—.0005-.002". **Sideplay .005-.013".**

Bearing Adjustment:—None (no shims). Replace bearings. Do not file rod or caps.

Installing Rods:—Install all rods with oil bleed hole in lower bearing toward right or starter side of engine.

CRANKSHAFT: 4 bearing. Integral counterweights.

Journal Diameters—2¾" all bearings.

Bearing Type—Removable, steel-backed babbitt-lined. No shims.

Clearance—.001-.002".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps.

End Thrust:—Taken by #1 front bearing. Endplay .003-.005".

CAMSHAFT:—Four bearing. Mounted between cylinder banks directly above crankshaft. Non-adjustable chain drive.

Bearing Type—Steel-backed, babbitt-lined.

Clearance—.001-.003".

Endplay—.002-.006".

Timing Chain:—Morse #1866. Width 1¾". Pitch .500". Length 28" or 56 links.

NOTE—Engine must be supported at front end and engine front casting (engine support, timing chain cover, generator and water pump mounting) removed for work on timing chain, sprockets, or camshaft.

Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that '00' marks are adjacent and in line with a straightedge across the shaft centers (vertical).

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 21/32"	.3405"	6 35/64"
Exhaust	1 21/32"	.338"	6 35/64"

	Seat Angle	Lift	Stem Clearance
Intake	45°	5/16"	.0025"
Exhaust	45°	5/16"	.005"

Tappet Clearance—None (automatic take up).

Automatic Tappet Take-up (Valve Silencer):—Consists of eccentric take-up on rocker arm shaft. Rocker arms contact valve stem ends and cams directly and are mounted on roller bearings.
See article in Mechanical Equipment Section for data.
NOTE—Initial clearance of take-up mechanism must be checked when valves are installed and take-up must be bled when valves are ground.
See article in Mechanical Equipment Section for data.

Valve Springs:—Install springs with japanned end down and close-spaced first coil up.

	Spring Pressure	Length
Valve Closed	70 lbs.	2 7/32"

Valve Timing:—See Camshaft Setting above.

Intake Valves—Open at TDC. Close 45° ALDC.

Exhaust Valves—Open 35° BLDC. Close 10° ATDC.

To Check Valve Timing—Intake valve in #1 cylinder of right hand bank (1R) should begin to open with piston No. 6R on top dead center entering power stroke when mark '1R-UDC' on vibration dampener at front of engine lines up with pointer on chain case cover.

Motor Gauge—Weidenhoff #114 Adapter, #2 Rod.

LUBRICATION:—Pressure system. Gear type oil pump located in crankcase. Oil temperature regulator mounted on right side of crankcase.

Normal Oil Pressure—35 lbs. at 1000 R.P.M.

Oil Pressure Regulator—Under plug on right hand side of crankcase. Adjustable by turning adjusting screw.

Crankcase Capacity—10 qts.

CLUTCH:—**Long Model 12 CB-CL.** Single plate, dry disc type. See article in Clutch Section for relining and assembling directions. No adjustment for wear required.

Facings—Moulded type, 2 required. Inside Diam. 7". Outside Diam. 12". Thickness .137".

Adjustment—Clearance between pedal and toeboard should be ½-1". Free movement of pedal should be 1½". To adjust, turn turnbuckle on connecting rod at lower end of clutch pedal.

Removal—Disconnect drive shaft at front universal, remove transmission and bell housing, take out screws mounting clutch cover on flywheel, turning all screws out evenly to release clutch spring tension.

STEERING:—**Steering Gear**—Gemmer Worm-and-Roller type. See article in Steering Section for adjustments.

Front Suspension:—Conventional 'I' beam section front axle with Reverse-Elliot ends and semi-elliptic springs.

King Pin Inclination—9° crosswise.

Camber—1°.

Caster—1½°. Adjustable by installing wedge shims between spring and spring pad on axle.

Toe In—1/16-⅛" at rim. Adjustable in usual manner by changing length of tie rod.

Tread—60".

Steering Geometry—Inner wheel turned 22½°, outer wheel turned 20°. Check tie rod ends and king pins for looseness.

BRAKES:—**Service**—Bendix Duo-Servo, Single anchor, mechanically operated, vacuum power brakes. Hand lever applies all four brakes. See article in Brake Section for complete adjustment procedure.

Drum Diameter—15".

Lining—Primary (Raybestos 451), Secondary (Hyco DV 1391). Width 2½" (except left front which is 1⅞"). Thickness ¼". Length 32¼".

Clearance—Free—at heel and toe of each shoe.

Hand Brake Adjustment:—With hand brake lever fully released and cross shaft against stop, remove all slack in cable by adjusting clevis position at cross shaft end of cable until clevis pin can just be inserted in cross lever. Check brakes making sure they are fully released with hand brake in off position. Adjustment for wheel equalization should be made after lining has been worn in.

NOTE—By removing glove compartment and changing brake latch piece (#228705) operating position of hand brake lever may be moved 2" to the rear.

Power Unit:—Bendix plain type vacuum cylinder mounted on frame and linked to cross shaft lever. Controlled by valve in brake rod between brake pedal and cross shaft. See Brake Section for complete data.

ENGINE NUMBER:—First number T-1526. Stamped on boss on left side of block near distributor.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3 7/16". **Stroke**—4¼".
Displacement—237 cubic inches.
Rated Horsepower—28.4 (AMA).
Developed Horsepower—100 HP. (Std. 6.3-1 head), 103 HP, (Optl. 6.75-1 head) at 3600 R.P.M.
Compression Ratio & Pressure—As follows:
6.3-1 Std. cast-iron hd. 105 lbs. at 125 R.P.M.
6.75-1 Optl. aluminum hd. 115 lbs. at 125 R.P.M.
Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling at 6 M.P.H.

PISTONS:—Nelson Bohnalite, aluminum alloy, autothermic strut type, tin plated, cam ground.
Weight—19.0 ozs. (stripped), 25.4 ozs. (with rings and pin). **Length**—3⅞".
Removal—Pistons and rods removed from above.
Clearance—Skirt .0015". See Fitting New Pistons.

Replacement Pistons:—*See Packard Shop Notes for data.*

Fitting New Pistons:—.0015" x ½" feeler inserted between piston and cylinder wall on side opposite slot should require 12-18 lbs. pressure to withdraw.

Installing Pistons:—Slot toward valves.

PISTON RINGS:—Two compression, one oil control ring per piston, above pin. Lower ring groove drilled with twelve 5/32" oil drain holes. Rings furnished .005", .010", .020", .030", .040" oversize.

Ring	Width	End Gap	Side Clearance
Compr.	⅛"	.007-.012"	.0025-.003"
Oil Cont.	3/16"	.007-.015"	.0015-.002"

NOTE—Install #1 and #3 ring with gap away from valves, #2 compression ring gap toward valves.

PISTON PIN:—Diameter—⅞". **Length**—2 63/64".
Floating type. Furnished .003" and .006" oversize. See Connecting Rod Upper Bearing below.
Pin Fit in Piston—Finger push fit with piston heated to 160° F.
Pin Fit in Rod Bushing—Finger push fit at 70° F.
NOTE—Finish ream bushings to .87515-.87485".

CONNECTING ROD:—Weight 33⅝ ozs. **Length** 7 11/16".
Upper Bearing (Piston Pin Bushing)—Split type bushings used. Expand to tight fit and ream. Oil passage in rod must open to groove between bushings.
See Packard Shop Notes for Bushing installation.
Crankpin Journal Diameter—2 3/32".
Lower Bearing—Interchangeable steel-backed, babbitt-lined type. No shims. Bearings furnished .001", .002", .003", .015" undersize.
Clearance—.0005-.0025". **Sideplay**—.004-.010".
Bearing Adjustment:—None. Replace bearings.
Installing Rods:—Oil squirt hole to camshaft.

CRANKSHAFT:—4 bearing. Integral counterweights.
Journal Diameters—2¾" all bearings.
Bearing Type—Interchangeable steel-backed, babbitt-lined type. No. shims. Bearings furnished .001", .002" undersize.
Clearance—.001-.003".
Bearing Adjustment:—None. Replace bearings. Upper halves may be rotated in place.
End Thrust:—Taken by #1 bearing. Adjust by adding or removing shims. **Endplay**—.003-.008".

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.001-.003".
End Thrust:—Taken by thrust plate in back of camshaft sprocket. **Endplay**—.002-.004".
Timing Chain:—Morse 1866 RX. Width 1¼". Pitch .375". Length 58 links or 20¾".
Camshaft Setting:—Install chain and sprockets together with marks on sprockets adjacent and in line with a straightedge across the shaft centers with #1 piston at top dead center.
See Packard Shop Notes for Front Assembly and Radiator removal.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1.575"	.340"	5⅝"
Exhaust	1.406"	.340"	5⅝"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.300"	.0005-.00175"
Exhaust	45°	.300"	.0005-.00175"

NOTE—.0005" min. clearance at bottom of guide.
Tappet Clearance—.007" Int., .010" Exh., hot.
NOTE—Remove plate in right fender for valve adj.

Valve Guides:—Guides taper reamed. Install from above with smallest diameter at bottom.

Valve Springs:—Int. & Exh. springs interchangeable. 1938 springs only furnished for replacement.

	Spring Pressure	Spring Length
Valve Closed	36-44 lbs.	1⅝"
Valve Open	105-113 lbs.	1 5/16"

Valve Lifters:—Single piece, barrel type. Remove from above. Ream lifter holes from above working thru stem guide with Packard Tool #S.T.-5065. Camshaft need not be removed. Oversize lifters furnished .001", .002", .005".

VALVE TIMING:—See Camshaft Setting above.
Intake Valves—Open 5° BTDC. Close 39° ALDC.
Exhaust Valves—Open 45° BLDC. Close 5° ATDC.

To Check Timing:—Set tappet clearance #1 exhaust valve at .013". This valve should close with piston 5° or .0103" past top dead center when point on flywheel 2½ graduations past #1 UP.DC (top dead center mark) lines up with pointer in inspection hole in left front face of flywheel housing under starter. Reset tappet clearance at .010" with engine hot.

LUBRICATION:—Pressure. Gear type pump on right side of engine.
NOTE—Install oil pump with driving slot parallel with center line of camshaft with distributor rotor opposite #1 terminal in cap.

Normal Oil Pressure:—35 lbs. at 30 M.P.H. Warm oil.

Oil Pressure Relief Valve:—On pump cover. Not adjustable. Replace spring if pressure less than 5-8 lbs. at 2".

Crankcase Capacity:—7 quarts (dry).

CLUTCH:—Long Model 9½ CF-CS. Semi-centrifugal, single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven, 2 required. I.D. 6". O.D. 9½". Thickness .125".
Adjustment:—Pedal free travel 1½-2". Adjusting nut on connector link at clutch fork.

Removal:—With clutch pedal depressed, insert wedge (ST-879) between each throwout finger and cover (assembly can only be removed from below when in partially released position). Remove transmission (see Transmision Removal below), clutch shifter bearing, pedal rod, and cover capscrews evenly, then remove assembly from below.

TRANSMISSION:—Own—Helical gear type with synchronizing shift on second and high gears.
See article in Mechanical Equipment Section for data.
Removal:—Remove floorboards, speed. cable, ground strap, propeller shaft, housing lower cover, shifter bearing spring, engine stabilizer (frame to trans.). Remove 2 bolts at trans. end of left support, remove frame bolts in right support with jack supporting rear of engine, 4 trans.-to-housing bolts, and withdraw transmission.
NOTE—Keep engine to right when installing.

UNIVERSAL JOINTS:—Mechanics—Model 2-C. Roller bearing. 2 used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—Own—Semi-floating, hypoid gear type with Hotchkiss drive. Welded cover used.
See article in Mechanical Equipment Section for data.
Ratio—4.36-1 (std.). 4.54-1, 4.09-1 (optl.).
Backlash—.003-.005". Screw adjustment for ring gear mesh in pinion. Pinion stationary.
Removal:—With wheel, hub and brake assembly removed, axle shafts can be withdrawn from housing. Differential carrier can then be removed from housing (on car) by disconnecting rear universal joint at flange, removing housing bolt nuts (below) and screw with locknut (at top). Assembly can then be removed from below.
Wheel Bearing Adjustment—None.
NOTE—Whenever wheel bearing replaced be sure that spring washer between inner bearing race and hub installed.

SHOCK ABSORBERS:—Delco—Mod. 1960-C, D (front), 1717-A, B (rear). Double acting, piston type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Packard (Gemmer design) Worm-and-Roller type with center-steering.
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent 'Safe-T-Flex' type with coil springs.
See article in Mechanical Equipment Section for data.
NOTE—Data below applies with car on level floor, tires properly inflated and car weighted as follows: 5 pass. (375 lbs. rear seat, 300 lbs. front), 2-4 pass. (150 lbs. frt. seat, 225 lbs. rear comp't.).
Front Suspension Height—Distance from floor to top of frame side rail at spring should be 17⅝".
Kingpin Inclination—1½° crosswise.
Camber—1° plus or minus ¼°. Adjustable.
Caster—2½° plus or minus ½°. Shim adjustment.
Toe In—1/32-1/16". Adjust by turning tie rods equally (check for equal lengths after adjustment).

BRAKES:—Service—Bendix hydraul., duo-servo, single anchor type. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Diameter 1 1/16" front wheel, 15/16" rear wheel.
Drum Diameter—11".
Lining—Marshall #1915 (primary), S.R.-600 (secondary). Width 1¾". Thickness 3/16". Length per shoe 12".
Clearance—.010" at heel and toe of each shoe.
Hand Brake Adjustment—See Service Brakes.

ENGINE NUMBER:—First number X-100,001. Stamped on boss on left side of block near distributor.

ENGINE SPECIFICATIONS:—8 cylinder, 'L' head.
Bore—3¼". **Stroke**—4¼".
Displacement—282.04 cubic inches.
Rated Horsepower—33.8 (AMA).
Developed Horsepower—120 HP. at 3800 with std. 6.43-1 aluminum head.
Compression Ratio & Pressure—As follows:
6.43-1 Std. aluminum hd. 110 lbs. at 125 R.P.M.
7.0-1 Optl. aluminum hd. 118 lbs. at 125 R.P.M.
Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling at 6 M.P.H.

PISTONS:—Nelson Bohnalite, aluminum alloy, strut type (split skirt), tin plated (early cars not plated). **Weight**—17.6 ozs. (stripped), 23 ozs. (with rings and pin). **Length**—3⅞".
Removal—Pistons and rods removed from above.
Clearance—Skirt .0015". See Fitting New Pistons.
Replacement Pistons:—*See Packard Shop Notes for data.*
Fitting New Pistons:—.0015"x½" feeler inserted between piston and cylinder wall on side opposite slot should require 12-18 lbs. to withdraw.
Installing Pistons:—Slot toward valves.

PISTON RINGS:—Two compression, one oil control ring per piston, all above pin. Lower ring groove drilled with twelve 5/32" oil drain holes. Rings furnished .005", .010", .020", .030", .040" oversize.

Ring	Width	End Gap	Side Clearance
Comp.	⅛"	.007-.012"	.0025-.003"
Oil Cont.	3/16"	.007-.015"	.0015-.002"

NOTE—Install #1 and #3 ring with gap away from valves, #2 compression ring gap toward valves.

PISTON PIN:—Diameter—⅞". **Length**—2 51/64". Floating pin type. Furnished .003" and .006" oversize. See Connecting Rod Upper Bearing below.
Pin Fit in Piston—Finger push fit with piston heated to 160° F.
Pin Fit in Rod Bushing—Finger push fit at 70° F.
NOTE—Finish ream bushings to .87515-.87485".

CONNECTING ROD:—Weight 33⅝ ozs. **Length** 7 11/16".
Upper Bearing (Piston Pin Bushing)—Split type bushings used. Expand to tight fit and ream. Oil passage in rod must be open to groove bet. bushings.
See Packard Shop Notes for bushing installation.
Crankpin Journal Diameter—2 3/32".
Lower Bearing—Interchangeable steel-backed, babbitt-lined type. No shims. Bearings furnished .001", .002", .003", .015" undersize.
Clearance—.0005-.0025". **Sideplay**—.004-.010".
Bearing Adjustment:—None. Replace bearings.
Installing Rods:—Oil squirt hole to camshaft.

CRANKSHAFT:—5 bearing. Integral counterweights.
Journal Diameters—2¾" all bearings.
Bearing Type—Interchangeable steel-backed, babbitt-lined type. No shims. Bearings furnished .001", .002" undersize.
Clearance—.001-.003".
Bearing Adjustment:—None. Replace bearings. Upper halves may be rotated in place.
End Thrust:—Taken by #3 bearing. Adjust by adding or removing shims. **Endplay**—.003-.008".

CAMSHAFT:—5 bearing. Non-adjustable chain drive.
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.001-.003".
End Thrust:—Taken by thrust plate in back of camshaft sprocket. **Endplay**—.002-.004".

Timing Chain:—Morse 1866 RX. Width 1¼". Pitch .375". Length 58 links or 20¾".

Camshaft Setting:—Install chain and sprockets together with marks on sprockets adjacent and in line with a straightedge across the shaft centers with #1 piston at top dead center.
See Packard Shop Notes for Front Assembly and Radiator Removal.

VALVES—

	Head Diameter	Stem Diameter	Length
Intake	1 17/32"	.340"	.5⅝"
Exhaust	1 13/32"	.340"	.5⅝"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.300"	.0005-.00175"
Exhaust	45°	.300"	.0005-.00175"

NOTE—.0005" min. clearance at bottom of guide.
Tappet Clearance—.007" Int., .010" Exh., hot.
NOTE—Remove plate in right fender for valve adj.

Valve Guides:—Guides taper reamed. Install from above with smallest diameter at bottom.

Valve Springs:—Int. & Exh. springs interchangeable. 1938 springs only furnished for replacement.

	Spring Pressure	Spring Length
Valve Closed	36-44 lbs.	1⅝"
Valve Open	105-113 lbs.	1 5/16"

Valve Lifters:—Single piece, barrel type. Remove from above. Ream lifter holes from above working through stem guide with Packard Tool #S.T.-5065. Camshaft need not be removed. Oversize lifters furnished .001", .002", .005".

VALVE TIMING:—See Camshaft Setting above.
Intake Valves—Open 5° BTDC. Close 39° ALDC.
Exhaust Valves—Open 45° BLDC. Close 5° ATDC.

To Check Timing:—Set tappet clearance #1 exhaust valve at .013". This valve should close with piston 5° or .0103" past top dead center when point on flywheel 2½ graduations past #1 UP.DC (top dead center mark) lines up with pointer in inspection hole in left front face of flywheel housing under starter. Reset tappet clearance at .010" with engine hot.

LUBRICATION:—Pressure. Gear type pump on right side of engine.
NOTE—Install oil pump with driving slot parallel with center line of camshaft with distributor rotor opposite #1 terminal in cap.

Normal Oil Pressure:—35 lbs. at 30 M.P.H. Warm oil.

Oil Pressure Relief Valve:—On pump cover. Not adjustable. Replace spring if pressure less than 5-8 lbs. at 2".

Crankcase Capacity:—7 quarts (dry).

CLUTCH:—Long Model 10CF-CI. Semi-centrifugal, single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven, 2 required. I.D. 6". O.D. 10". Thickness .137".
Adjustment:—Pedal free travel 1½-2". Adjusting nut on connector link at clutch fork.
Removal:—With clutch pedal depressed, insert wedge (ST-879) between each throwout finger and cover (assembly can only be removed from below when in partially released position). Remove transmission (see Transmission Removal below), clutch shifter bearing, pedal rod, and cover capscrews evenly, then remove assembly from below.

TRANSMISSION:—Own—Helical gear type with synchronizing shift on second and high gears.
See article in Mechanical Equipment Section for data.
Removal:—Remove floorboards, speedometer cable, ground strap, propeller shaft, housing lower cover, shifter bearing spring, engine stabilizer (frame to transmission). Remove 2 bolts at transmission end of left support, remove frame bolts in right support with jack supporting rear of engine, 4 transmission-to-housing bolts, and withdraw transmission.
NOTE—Keep engine to right when installing.

UNIVERSAL JOINTS:—Mechanics—Model 3-C. Roller bearing. 2 used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—Own—Semi-floating, 'Angle Set', hypoid gear type with Hotchkiss drive. Welded cover used.
See article in Mechanical Equipment Section for data.
Ratio—4.09-1 (std. pass., optl. hearse), 4.54-1 (std. hearse, optl pass.), 4.36-1 (optl), 4.7-1 (optl hearse).
Backlash—.003-.005". Screw adjustment for ring gear mesh in pinion. Pinion stationary.
Removal:—With wheel, hub and brake assembly removed, axle shafts can be withdrawn from housing. Differential carrier can then be removed from housing (on car) by disconnecting rear universal joint at flange, removing housing bolt nuts (below) and screw with locknut (at top). Assembly can then be removed from below.
Wheel Bearing Adjustment—None.
NOTE—Whenever wheel bearing replaced be sure that spring washed between inner bearing race and hub installed.

SHOCK ABSORBERS:—Delco—Mod. 1960-C, D (front), 1717-A, B (rear). Double acting, piston type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Packard (Gemmer design) Worm-and-Roller type with center-steering.
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent 'Safe-T-Flex' type with coil springs.
See article in Mechanical Equipment Section for data.
NOTE—Data below applies with car on level floor, tires properly inflated and car weighted as follows: 5 pass (375 lbs. rear seat, 300 lbs. front), 2-4 pass. (300 lbs. frt. seat, 225 lbs. rear comp't.).
Front Suspension Height—Distance from floor to top of frame side rail at spring should be 18".
Kingpin Inclination—1½° crosswise.
Camber—1° plus or minus ¼°. Adjustable.
Caster—2½° plus or minus ½°. Shim adjustment.
Toe In—1/32-1/16". Adjust by turning tie rods equally (check for equal lengths after adjustment).

BRAKES:—Service—Bendix hydraul., duo-servo, single anchor type. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Diameter 1 1/16" front wheel, 15/16" rear wheel.
Drum Diameter—12".
Lining—Primary: Raybestos #451. Secondary: U.S. #589. Width 1¾". 3/16" thick. Length per shoe 13".
Clearance—.010" at heel and toe of each shoe.
Hand Brake Adjustment—See Service Brakes.

ENGINE NUMBER:—First number 395,501. Stamped on left side of engine near starter.

ENGINE SPECIFICATIONS:—8 cylinder, 'L' head.
Bore—3 3/16". **Stroke**—5".
Displacement—320 cubic inches.
Rated Horsepower—32.5 (AMA).
Developed Horsepower—130 HP. (std. 6.4-1 head), 135 HP. (optl. 7.0-1 head) at 3200 R.P.M.
Compression Ratio and Pressure—As follows:
6.4-1 Std. aluminum head. 108 lbs. at 125 R.P.M.
7.0-1 Optl. aluminum head. 119 lbs. at 125 R.P.M.
Vacuum Reading—Gauge should show steady reading of 18-19", engine idling at 350 R.P.M. or 7 M.P.H.
See Packard Shop Notes for Cylinder Block Removal instructions.

PISTONS:—Nelson Bohnalite, aluminum alloy, strut type, tin-plated (early cars not plated).
Weight—18.7 ozs. (stripped), 24.1 ozs. (with rings and pin). **Length**—4¼".
Removal—Pistons removed from above, rods from below (push assembly up to expose pin, remove pin, lift piston out, remove rod from below with engine warm).
Clearance—Skirt .0015". See Fitting New Pistons.

Replacement Pistons:—*See Packard Shop Notes for data.*

Fitting New Pistons:—.0015" x ½" feeler inserted between piston and cylinder wall on side opposite slot should require 12-14 lbs. to withdraw.

Installing Pistons:—Slot toward valves.

PISTON RINGS:—Two compression, two oil control rings per piston, all above pin. Each oil ring groove drilled with ten ⅛" oil drain holes. Rings furnished .005", .010", .020", .030", .040" oversize.

Ring	Width	End Gap	Side Clearance
Comp. (top)	⅛"	.007-.012"	.002-.0025"
Comp. (#70)	⅛"	.007-.012"	.0025"
Oil (top #85)	5/32"	.007-.015"	.0015"
Oil (X90-85)	5/32"	.007-.015"	.0015"

NOTE—Install #1 and 3 rings with gap toward valves, #2 & 4 with gap away from valves.

PISTON PIN:—Diameter—⅞". **Length**—2 47/64".
Floating type. Furnished .003" and .006" oversize. Pin hole in rod bronze-bushed.
Pin Fit in Piston—Finger push fit with piston heated to 160° F.
Pin Fit in Rod Bushing—Finger push fit at 70° F.
NOTE—Finish ream bushings to .87515-.87485".

CONNECTING ROD:—Weight—40⅜ ozs. **Length**—10⅞".
Crankpin Journal Diameter—2 3/16".
Lower Bearing—Copper lead alloy, interchangeable type. Furnished .001", .002", .003", .015" undersize.
Clearance—.001-.0015". **Sideplay**—.006". Limits—.005-.008".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps.

Installing Rods:—Oil squirt hole to camshaft.

CRANKSHAFT:—9 bearing. Bolted-on counterweights.
Journal Diameters—2⅝".
Bearing Type—Removable steel-backed, babbitt-lined type. No shims.
Clearance—.001-.002".

Bearing Adjustment:—None (no shims). Replace halves may be rotated in place.

End Thrust:—Taken by #7 bear. **Endplay**—.003-.005".

CAMSHAFT:—8 bearing. Non-adjustable chain drive.
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.0015-.0035".

End Thrust:—Taken by thrust plate in back of camshaft sprocket. **Endplay**—.001-.004".

Timing Chain:—Morse 3682-KX. Width 1½". Pitch .375". Length 70 links or 26¼".

Camshaft Setting:—Install chain and sprockets together with marks adjacent and in line with a straightedge across the shaft centers.
NOTE—Front end disassembly as follows: remove bumper, center bolt at bottom of radiator, trim strips on running board, fender-to-board and frame bolts. Fender and radiator can then be removed as an assembly.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 21/32"	.3405"	7 13/32"
Exhaust	1 15/32"	.3405"	7 13/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.358"	.0025" min.
Exhaust	45°	.358"	.004" min.

Tappet Clearance:—.006" Int., .008" Exh. hot.

Valve Guides:—Pressed in block from above. Reamed to size for correct stem clearance (see table above).

Valve Rocker Arms:—Consist of pivoted arms mounted on bracket on crankcase which transmit motion from cam to valve pushrod (valve lifter).
Removal—Remove screws in bracket on right side of crankcase, withdraw bracket and pushrod assembly.

Pushrods (Valve Lifters):—Mounted on guides seated in crankcase and held down by block which engages guide flange.

Valve Springs:—	Spring Pressure	Length
Valve Closed	68-78 lbs.	3 1/16"
Valve Open	154-164 lbs.	2 45/64"

VALVE TIMING:—See Camshaft Setting above.
Intake Valves—Open 30° BTDC. Close 65° ALDC.
Exhaust Valves—Open 65° BLDC. Close 30° ATDC.

To Check Timing:—Set tappet clearance #1 exhaust valve at .005" (or .010", then insert .005" feeler). Turn engine over until pointer over damper (at front of engine) lines up with a point 1 1/16" (plus or minus 11/32") past '1-UPDC' mark (feeler should withdraw with finger pull). Valve closes 30° or .4070" ATDC. Reset tappet clearance at .008" hot.

LUBRICATION:—Pressure type. Gear type oil pump mounted in crankcase.
Normal Oil Pressure:—55 lbs. max., 5 lbs. min. with SAE #20 oil.
Oil Pressure Relief Valve:—Located under plug on left side of crankcase. Remove acorn nut and adjust by turning screw.
Crankcase Capacity—8 quarts (dry).

CLUTCH:—Long Model 12CB-CL. Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven (Raybestos #250). 2 required. I.D. 7". O.D. 12". Thickness .137".
Adjustment—Adjust nut on pedal rod to give 1½" of free travel.
Removal:—Remove transmission (see Transmission Removal below), take out cover mounting screws evenly. Align '0' marks on flywheel and cover at reassembling.

TRANSMISSION:—Own—Helical gear type with synchronizing shift on second and high gears.
See article in Mechanical Equipment Section for data.
Removal:—Remove ground strap, propeller shaft, light switch, hand brake cable (at equalizer), two stud nuts (case bracket to rubber support) on either side, stabilizer link (left side), clutch pedal pull rod and spring, place jack under rear of engine. Remove pedal shaft inner bracket, loosen brace rod on right at rear end only, lower cross member, take out bell housing nuts and capscrews, raise rear of engine, remove 2 frame-to-vertical support members on either side and remove. Transmission can now be removed.

UNIVERSAL JOINTS:—'Detroit Universal'. Series 5350. Cross type with roller bearings. 2 used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—Own—Semi-floating, hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.69-1 (std.), 4.36-1, 4.9-1 (optl.).
Backlash—.003-.005". Screw adjustment (back off one nut, tighten other nut equal amount with bearings correctly adjusted). Pinion setting controlled by shims furnished .005", .008", .015" thick.
Removal:—With wheel, hub and brake assembly removed, axle shafts may be withdrawn from housing. Differential carrier can then be removed from housing (on car) by disconnecting rear universal joint at flange, removing housing bolt nuts (below) and locknut on screw (at top). Assembly can then be removed from below.
Wheel Bearing Adjustment—Controlled by shims between outer race of inner bearing and shoulder in housing. Remove hub asembly, backing plate, axle shaft, and inner bearing outer race. Add or remove shims to give proper clearance.
Endplay—.003" (at each wheel).

SHOCK ABSORBERS:—Delco—Model 1960 C, D (front), 1717 C and D (rear). Double acting, piston type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Packard (Gemmer design). Worm-and-Roller type with center steering.
See article in Mechanical Equipment Section for data.

Front Suspension:—Packard Safe-T-Flex, independent type.
See article in Mechanical Equipment Section for data.
NOTE—Data below applies with car on level floor and car loaded with 300 lbs. (frt.—all), 225 lbs. (rear—Coupe), 375 lbs. (rear—5 Pass.), 675 lbs. (rear—7 & 8 Pass.).
Front Suspension Height—Distance from floor to top of frame side rail at spring should be 20⅛".
Kingpin Inclination—1½° crosswise.
Camber—1° plus or minus ¼°. Adjustable.
Caster—2½° plus or minus ½°. Shim adjustment.
Toe In—1/32-⅛". Adjusted by turning tie rods equally (check for equal lengths after adjustment).

BRAKES:—Service—Bendix hydraul., duo-servo, single anchor type. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Diameters—Front wheel 1¼", rear 1⅛".
Drum Diameter—13".
Lining—Primary: Marshall Asb. #1035, Secondary: #600. Width 2½". 3/16" thick. Length per shoe 13".
Clearance—.010" at heel and toe of each shoe.

Hand Brake Adjustment:—See Service Brakes.

ENGINE NUMBER:—First number 905,501. Stamped left side of block below cylinder head.

ENGINE SPECIFICATIONS:—**Type**—Own make. 12 cylinder, 67° Vee, modified 'L' head. Both blocks and upper crankcase cast Enbloc.
Bore—3 7/16". **Stroke**—4¼".
Displacement—473 cu. ins. **Rated HP.**—56.7.
Developed Horsepower—175 HP. (Std. 6.4 head), 180 HP. (Optl. 7.0-1 head) at 3200 R.P.M.
Compression Ratio & Pressure—All cylinder heads aluminum. Ratios and pressure at 125 RPM. (cranking speed) as follows:

	Ratio	Pressure
Standard	6.4-1	110 lbs.
Optional	7.0-1	119 lbs.

See Packard Shop Notes for Cylinder Head data.
Vacuum Reading—18-20" at 375 R.P.M. or 8 M.P.H.

PISTONS:—Nelson Bohnlite, aluminum alloy, Invar strut, split skirt type, tin-plated. Recondition cylinders to take finished replacement pistons.
Weight—22 ozs. (stripped), 28.7 ozs. (with rings and pin). **Length**—4.318" (2.336" pin center-line to top.)
Removal—Pistons removed through top of engine, rods from below (push pistons up until pin is exposed, remove locking ring, push out pin, lift pistons out, lower rods and remove from below. Removal will be easier if engine is warm.
Clearance—Skirt .0015". See Fitting New Pistons.
Replacement Pistons:—*See Packard Shop Notes for data.*
Fitting New Pistons:—Use .0015" feeler, ½" wide, inserted between piston and cylinder wall on side opposite slot. Pull to withdraw feeler 12-18 lbs.
Installing Pistons:—Slot toward valves (all pistons).

PISTON RINGS:—Three compression, one oil control ring per piston, all above pin. Oil ring groove drilled with twelve ⅛" oil drain holes.

Ring	Width	End Gap	Side Clearance
Comp. (1 & 2)	⅛"	.007-.012"	.0025-.003"
Comp. (#3)	⅛"	.007-.012"	.0015-.002"
Oil (X90-85)	5/32"	.007-.015"	.0015-.002"

NOTE—On right bank, install #1 and 3 rings with gap toward camshaft, #2 and 4 away from camshaft. Reverse order on left hand bank.

PISTON PIN:—Diameter ⅞". Length—2 63/64".
Pin floats in piston and rod. Held by locking ring at each end. Pin hole in rod bronze-bushed.
Pin Fit in Piston—Finger push fit with piston heated to 160°F.
Pin Fit in Rod Bushing—.0002" clearance or thumb push fit with both parts at room temp. (70°F).

CONNECTING ROD:—Weight 38¼ ozs. **Length** 9".
Crankpin Journal Diameter—2½".
Lower Bearing—Removable steel-backed, copper-lead alloy lined type. No shims. Bearings furnished std., and .001", .002", .003", .005" undersize.
Clearance—.001-.0015". **Sideplay**—.008-.010".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps.
Installing Rods:—Install all rods with oil squirt hole toward right or starter side of engine.

CRANKSHAFT:—Four bearing. Bolted counterweights.
Journal Diameters—2¾" all bearings.
Bearing Type—Removable steel-backed, babbitt-lined. No shims.
Clearance—.001-.002".
Bearing Adjustment:—None (no shims). Replace bearings (upper halves can be rotated in place). Do not file bearing caps.
End Thrust:—Taken by #1 front bearing. Endplay .003-.005".

CAMSHAFT:—Four bearing. Between banks directly above crankshaft. Non-adjustable chain drive.
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.001-.0015". (#1, 4), .002-.0025" (#2, 3).
Endplay—.002-.006".
Timing Chain:—Morse, No. 1866. Width 1¾". Pitch .500". Length 28" or 56 links.
NOTE—Engine must be supported at front end and front casting (engine support, chain case cover, generator and water pump mounting) removed for work on chain or sprockets. Remove fenders and radiator as an assmbly.
Camshaft Setting—Sprockets marked. Mesh chain with sprockets turned so that marks are adjacent and in line with straightedge across shaft centers. Install chain endless with both sprockets off engine.

VALVES:—

	Head Diam.	Stem. Diam.	Length
Intake	1 41/64"	.3405"	6.550"
Exhaust	1 21/32"	.338"	6.550"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.3125"	.0025"
Exhaust	45°	.3125"	.005"

Tappet Clearance—None (automatic take-up).
Automatic Tappet Take-up:—Must be bled and blocked open when valves are ground and initial clearance must be checked afterward. Clearance must be .030-.045".
See article in Mechanical Equipment Section for data.
Valve Springs—Install springs with painted end down and close-spaced first coil toward valve head. Special 1/32" higher stem keeper furnished to compensate for loss of pressure caused by valve reseat'g.

	Spring Pressure	Length
Valve Closed	70 lbs.	2 7/32"
Valve Open	140 lbs.	1 29/32"

Valve Timing:—See camshaft setting above.
Intake Valves—Open at TDC. Close 45° ALDC.
Exhause Valves—Open 35° BLDC. Close 10° ATDC.
To Check Valve Timing—Intake valve for #1 (front cylinder, right bank) begins to open with piston on top dead center when '#1R-UDC' mark on dampener lines up with pointer on chain case cover. Removal of right cylinder head and dial indicator mounted over valve recommended to check opening.

LUBRICATION:—Pressure type. Gear type oil pump mounted in crankcase. Oil filter and temperature regulator mounted at right of engine.
Normal Oil Pressure—5 lbs. idling, 55 lbs. max.
Oil Pressure Regulator—Under acorn nut on right side of crankcase below filter.
Adjustment—Remove acorn nut, turn slotted screw in to increase pressure.
Crankcase Capacity—10 quarts.

CLUTCH:—**Long Model 12CB-CL.** Single plate, dry disc type with Bendix Vacuum Power operation.
See article in Mechanical Equipment Section for data.
Facings—Hyco DV-3903PDX, 2 required. Inside Diameter 7". Outside Diameter 12". Thickness .137".
Pedal & Vacuum Booster Adjustment—Free movement of pedal should be 1-1½". To adjust, remove floor boards, operate clutch 10 times, see that pedal is against toeboard spring when engaged. Loosen lockscrew at lower end of pedal in front of shaft, pull forward on front lever and rearward on middle lever until all clearance is at front of connecting pin at lower end of levers, tighten lockscrew. Depress clutch pedal exactly 1 13/16" and hold in this position, loosen locknut on clutch rod at clutch fork end, turn adjusting nut until throw-out bearing just contacts clutch release levers, tighten locknut.
Removal:—Remove transmission (see Transmission Removal below), take out clutch cover mounting screws.

TRANSMISSION:—**Own**—Constant mesh helical gears (all forward speeds), Synchronized shift (second and high).
See article in Mechanical Equipment Section for data.
Removal:—Remove ground cable, speedometer cable, propeller shaft, light switch, two stud nuts (case bracket to rubber support) at each side, hand brake cable at equalizer, left stabilizer link, clutch pedal pull-rod, and pedal spring. Support engine at rear. Remove right brace rod (rear only), lower crossmember, and bell housing nuts and capscrews. Jack up rear of engine, remove two bolts on each side (holding vertical support members to frame), remove support members, pull transmission back and remove.

UNIVERSAL JOINTS:—**Spicer.** Roller bearing type. 2 used.
See article in Mechanical Equipment Section for data.
REAR AXLE:—**Own make.** Semi-floating, 'Angle-set' hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.41-1 Std., 4.06-1 and 4.69-1 Optl.
Backlash—.003-.005". Screw adjustment (back off one nut, tighten other nut equal amount with bearings correctly adjusted). Pinion setting controlled by shims furnished .005", .008", .015" thick.
Removal:—Disconnect drive shaft at rear universal, remove wheels and hubs, backing plate (disconnect brake line), axle shafts. Take off differential carrier bolt nuts on flange and stud nuts at top (at rear of housing), remove differential carrier without disturbing housing.
Wheel Bearing Adjustment:—Remove wheel and hub asembly, backing plate (disconnect brake line), pull axle and bearing assembly, add or remove shims behind inner bearing race, use gasket paste on inner face of bearing cap when replacing.
Endplay—.003" plus or minus .001" and equal for both wheels.

SHOCK ABSORBERS:—Delco, Model 1952-A, B (front), 2006-G, H (rear). Double acting, hydraulic type.
See article in Mechanical Equipment Section for data.
STEERING:—**Steering Gear**—Packard (Gemmer) design. Worm-and-roller type with center steering.
See article in Mechanical Equipment Section for data.
Front Suspension:—Packard Safe-T-Flex, independent type.
See article in Mechanical Equipment Section for data.
NOTE—Data below applies with car loaded same as for Super Eight model (preceding page).
Front Suspension Height—20 7/16" plus or minus ¼" from top of cross-member to floor at spring.
Kingpin Inclination—1°30' crosswise.
Camber—1° plus or minus ¼°. Adjustable
Caster—0° plus 0 or minus ½°. Adjustable.
Toe In—1/16" plus or minus 1/16". Adjustable.

BRAKES:—**Service**—Bendix hydraulic duo-servo, single anchor type with Vacuum Power operation. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—1¼" Diam. (front), 1⅛" (rear).
Drum Diameter—14". Centrifuse drums.
Lining—U. S. Asbestos #714 or Raybestos #451 (primary), U. S. Asbestos #589 (secondary). Width 2¾". Thickness ¼". Length 15" per shoe.
Clearance—.010" at heel and toe of each shoe.
NOTE—Heavier (yellow) retracting spring must be attached to primary, lighter (blue) spring to secondary shoe.
Hand Brake:—See Service Brakes above.
Vacuum Power Unit:—Bendix internal valve type Vacuum Cylinder linked to brake pedal lever.
See article in Mechanical Equipment Section for data.

SERIAL NUMBER:—On front of dash (use engine number).

ENGINE NUMBER:—First number A-1336. Stamped on boss on left side of engine block at upper end.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3½". Stroke—4¼".
Displacement—245.3 cu. ins. **Rated HP.**—29.4.
Developed Horsepower—100 HP. (Std. 6.52-1 head), 103-105 HP. (Optl. 7.05-1 head) at 3600 R.P.M.
Compression Ratio and Pressure—As follows:
6.52-1 Std. cast-iron hd. 110 lbs. at 125 R.P.M.
7.05-1 Optl. aluminum hd. 120 lbs. at 125 R.P.M.
Vacuum Reading—18-20" idling at 6 M.P.H.
See Packard Shop Notes for Cylinder Head data.

PISTONS:—Nelson Bohnalite, aluminum alloy, autothermic, strut type, tin plated, cam ground.
Weight—19.5 ozs. (stripped), 26 ozs. (with rings and pin). **Length**—3⅞".
Removal—Pistons and rods removed from above.
Clearance—Skirt .0015". See Fitting New Pistons.
Original Bore & Piston Size, Replacement Pistons:—*See Packard Shop Notes for complete data.*
Fitting New Pistons:—Insert .0015" feeler ½" wide between piston and cylinder wall on side opposite slot. Pull to withdraw feeler 12-18 lbs.
Installing Pistons:—Slot toward valves.

PISTON RINGS:—Two compression (Perfect Circle #70), one oil control (#X-90-85) per piston, above pin. Lower ring groove drilled with twelve 5/32" oil drain holes. Rings furnished standard and .005", .010", .020", .030" and .040" oversize.

Ring	Width	End Gap	Side Clearance
Compr.	.1235-.1240"	.007-.015"	.0025-.003"
Oil Cont.	.1860-.1865"	.007-.015"	.0015"

NOTE—Install #1 and #3 ring with gap away from valves, #2 compression ring gap toward valves.

PISTON PIN:—Diameter—⅞". Length—3 1/64".
Pin floats in piston and rod, held by locking rings. Furnished std. and .003", .006" oversize. See Connecting Rod Upper Bearing below.
Pin Fit in Piston—Finger push fit with piston heated to 160°F.
Pin Fit in Rod Bushing—Finger push fit at 70°F. Finish ream pin hole to .87485-.87515".

CONNECTING ROD:—Weight 31.6 oz. **Length** 7 11/16".
Upper Bearing (Piston Pin Bushing)—Split type.
See Packard Shop Notes for bushing installation.
Crankpin Journal Diameter—2 3/32".
Lower Bearing—Interchangeable steel-backed, babbitt-lined type. Bearings furnished std. and .001", .002", .003", .015" undersize (marked with size).
Clearance—.0005-.0015". **Sideplay**—.004-.010".
Bearing Adjustment:—None. Replace bearings.
Installing Rods:—Oil squirt hole to camshaft.

CRANKSHAFT:—4 bearing, integral counterweights with rubber friction disc vibration damper mounted on forward end.
Journal Diameters—2¾".
Bearing Type—Interchangeable babbitt-lined steel shell type. Bearings furnished standard and .001" and .002" undersize.
Clearance—.001-.003".
Bearing Adjustment:—None (no shims). Replace bearings. Upper halves may be rotated in place.
End Thrust:—Taken by #1 bearing. Adjust by adding or removing shims. **Endplay**—.003-.008".

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
See Packard Shop Notes for Oil Pump Gear Change to be made when replacing camshaft.
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.001-.003".
End Thrust:—Taken by thrust plate in back of camshaft sprocket. **Endplay**—.002-.004".
Timing Chain:—Morse 1866 RX. Width 1¼". Pitch .375". Length 58 links or 20¾".
Camshaft Setting:—Install chain and sprockets together with '0' marks on sprockets adjacent and in line with a straightedge across shaft centers with #1 piston on top dead center.
See Packard Shop Notes for Fender & Radiator Assembly removal for work on front of engine.

VALVES:—Head Diameter Stem Diameter Length
Intake ..... 1.575" ..... .34025" ..... 5⅝"
Exhaust ..... 1 13/32" ..... .34025" ..... 5⅝"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.3175"	.002"
Exhaust	45°	.318"	.004"

Tappet Clearance—.007" Int., .010" Exh. (hot).
NOTE—Remove plate in right front fender for valve adjustment.
Valve Guides:—*See Packard Shop Notes for guide change on first cars to correct valve sticking.*
Valve Springs:—Intake and exhaust springs interchangeable. 1937 type springs used on first cars (1938 type only for replacement).

	Spring Pressure	Spring Length
Valve Closed	47-52 lbs.	1⅝"
Valve Open	114-124 lbs.	1 5/16"

NOTE—Serrated washer on top of each spring.
Valve Lifters:—New mushroom type. Remove from below with camshaft out. Ream lifter holes through stem guide. Lifters furnished standard and .001", .002", .005" oversize. *See Packard Shop Notes for lifter type used with each type camshaft.*
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 1° BTDC. Close 39° ALDC.
Exhaust Valves—Open 45° BLDC. Close 5° ATDC.
To Check Timing—Set tappet clearance #1 exhaust valve at .015". This valve should close with piston 5° or .0103" past top dead center when 5° point on flywheel (midpoint between second and third graduations after top dead center mark '#1 UP DC.') lines up with pointer on housing in inspection hole in left front face of flywheel housing below starter. Reset tappet clearance at .010" hot.

LUBRICATION:—Pressure system with gear type oil pump mounted on right side of engine.
See Packard Shop Notes for Oil Pump installation and gear change when replacing camshaft on first cars.
Normal Oil Pressure:—35 lbs. at 30 M.P.H. (warm oil).
Oil Pressure Relief Valve:—Mounted on pump cover. Not adjustable. Replace spring if pressure less than 5 to 8 lbs at 2".
Crankcase Capacity:—6 quarts (refill).

COOLING SYSTEM:—Water Pump. Centrifugal, belt-driven, packless type.
See article in Mechanical Equipment Section for data.
Removal—Remove fan belt, disconnect pump hose, remove pump mounting capscrews, lift off pump assembly.
Thermostat:—Located in top radiator tank. Operates radiator shutters. Two used in production (Early—marked 165°. Later—marked 150°).
Setting—Start to open—150°F (early), 135°F (later). Fully open 165°F (early), 150°F (later).
Water Capacity:—15 quarts.

CLUTCH:—Long Model 9½ CF-CS. Semi-centrifugal, single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven (U. S. Asbestos No. 733), 2 required. I.D. 6". O.D. 9½". Thickness .125".
Adjustment—Adjust nut on inner pedal rod to give 1½" free travel (pedal pad to floor board).
Removal:—Remove transmission (see Transmission Removal following). With clutch pedal depressed, insert wedge (ST-879) between each throwout finger and cover (assembly can only be removed when in partially released position). Remove clutch shifter bearing, pedal rod, and cover capscrews (release evenly), then remove assembly from below.

TRANSMISSION:—Own make. Helical gear type with synchronizer for second and high speeds.
See article in Mechanical Equipment Section for data.
Removal:—Remove floorboards, speedometer cable, ground strap and accelerator pedal. Disconnect propeller shaft at front universal, block shaft up against floor board. Support rear end of engine with jack, unbolt cross-member from frame, disconnect hand brake cable at equalizer, remove flywheel housing lower cover and clutch retracting spring, take out 4 capscrews in transmission mounting flange, pull transmission back and remove.

UNIVERSAL JOINTS:—Mechanics. Model 2C. Needle bearing type. Two used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—Own make. Semi-floating, hypoid gear type with Hotchkiss drive. Rear face of differential carrier now vertical (supersedes angular type used previously).
See article in Mechanical Equipment Section for data.
Ratios—4.54-1 Std. 4.36-1, 4.7-1 Optional.
Backlash—.003-.005". Screw adjustment.
Removal:—Remove wheel, hub, and brake backing plate assembly. Withdraw axle shafts. Disconnect rear universal joint and drop drive shaft. Remove nuts on carrier-to-housing bolts and withdraw carrier assembly from housing.
Wheel Bearing Adjustment—Endplay controlled by shims between flanged end of housing and brake backing plate. Adjust by removing backing plate disconnect brake tube clips on housing. Add shims at one wheel only if endplay .050" or below, at both wheels equally if above. Measure with dial indicator against end of shaft. **Endplay**—.002-.005".

SHOCK ABSORBERS:—Delco. Model 1966-A, B (front), 1751-L, M (rear). Hydraulic, double acting type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Packard (Gemmer design) Worm-and-Roller type with center steering.
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent 'Safe-T-fleX' type with coil springs.
See article in Mechanical Equipment Section for data.
NOTE—Data below applies with car on level floor, tires properly inflated and car weighted as follows: 300 lbs. front seat, 375 lbs. (rear—5 pass. bodies), 225 lbs (rear—auxiliary seat coupes).
Front Suspension Height—Distance from floor to top side of frame siderail at spring should be 18¾" plus or minus ¼".
Kingpin Inclination—1°54' crosswise.
Camber—½° plus or minus ½°. Adjustable.
Caster—1½° plus or minus ½°. Shim adjustment.
Toe In—1/32-1/16" measured at hub height. Adjust tie rods equally (rod lengths must be equal after adjustment).

BRAKES:—Service—Bendix, hydraulic, duo-servo, single anchor type. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Drum—Centrifuse. Diameter—11".
Lining—Marshall #1915 (primary, SR-600 (secondary) or Marshall #2201 (all). Width 1¾". Thickness 3/16". Length per shoe 12".
Clearance—.010" at heel and toe of each shoe.
Hand Brak Adjustment:—See Service Brakes.

SERIAL NUMBER:—Stamped on plate on front of dash (use engine number).

ENGINE NUMBER:—First number A-300001. Stamped on left side of crankcase near distributor.

ENGINE SPECIFICATIONS:—8 cylinder, 'L' head.
Bore—3¼". **Stroke**—4¼".
Displacement—282.4 cu. ins. **Rated HP.**—33.8.
Developed Horsepower—120 HP. (std. 6.6-1 al. hd.), 123-125 HP. (optl. 7.05-1 al. hd.) at 3800 R.P.M.
Compression Ratio and Pressure—As follows: 6.6-1 Std. aluminum head (110 lbs. at 125 R.P.M.). 7.05-1 Optional aluminum head.
Vacuum Reading—18-21" idling at 6 M.P.H.
See Packard Shop Notes for Cylinder Head data.

PISTONS:—Nelson Bohnalite, aluminum alloy, autothermic, strut type, tin plated, cam ground.
Weight—16⅞ ozs. (stripped), 22¾ ozs. (with rings and pin). **Length**—3⅞".
Removal—Pistons and rods removed from above.
Clearance—Skirt .0015". See Fitting New Pistons.
Original Bore & Piston Size, Replacement Pistons:—*See Packard Shop Notes for complete data.*
Fitting New Pistons:—Insert .0015" feeler ½" wide between piston and cylinder wall on side opposite slot. Pull to withdraw feeler should be 12-18 lbs.
Installing Pistons:—Slot toward valves.

PISTON RINGS:—Two compression (Perfect Circle #70), one oil control (#X-90-85) per piston, above pin. Lower ring groove drilled with twelve 5/32" oil drain holes. Rings furnished standard and .005", .010", .020", .030" and .040" oversize.

Ring	Width	End Gap	Side Clearance
Compr.	.1235-.1240"	.007-.015"	.0025-.003"
Oil Cont.	.1860-.1865"	.007-.015"	.0015"

NOTE—Install #1 and #3 ring with gap away from valves, #2 compression ring gap toward valves.

PISTON PIN:—Diameter—⅞". **Length**—2 51/64".
Pin floats in piston and rod, held by locking rings. Furnished standard and .003", .006" oversize.
Pin Fit in Piston—Finger push fit with piston heated to 160°F.
Pin Fit in Rod Bushing—Finger push fit at 70°F. Finish ream pin hole to .87485-.87515".

CONNECTING ROD:—Weight 31.6 ozs. **Length** 7 11/16".
Upper Bearing (Piston Pin Bushing)—Split type.
See Packard Shop Notes for bushing installation.
Crankpin Journal Diameter—2 3/32".
Lower Bearing—Interchangeable steel-backed, babbit-lined type. Bearings furnished std. and .001", .002", .003", .015" undersize (marked with size).
Clearance—.0005-.0015". **Sideplay**—.004-.010".
Bearing Adjustment:—None. Replace bearings.
Installing Rods:—Oil squirt hole to camshaft.

CRANKSHAFT:—5 bearing, integral counterweights with rubber friction disc vibration damper mounted on forward end.
Journal Diameters—2¾".
Bearing Type—Interchangeable babbitt-lined steel shell type. Bearings furnished standard and .001" and .002" undersize.
Clearance—.001-.003".
Bearing Adjustment:—None (no shims). Replace bearings. Upper halves may be rotated in place.
End Thrust:—Taken by #3 bearing. Adjust by adding or removing shims. **Endplay**—.003-.008".

CAMSHAFT:—5 bearing. Non-adjustable chain drive.
See Packard Shop Notes for Oil Pump Gear Change to be made when replacing camshaft.
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.001-.003".
End Thrust:—Taken by thrust plate in back of camshaft sprocket. **Endplay**—.002-.004".

Timing Chain:—Morse 1866 RX. Width 1¼". Pitch .375". Length 58 links or 20¾".
Camshaft Setting:—Install chain and sprockets together with '0' marks on sprockets adjacent and in line with a straightedge across the shaft centers with #1 piston on top dead center.
See Packard Shop Notes for Fender & Radiator Assembly removal for work on front of engine.

VALVES:—Exhaust valves interchangeable with Six.

	Head Diameter	Stem Diameter	Length
Intake	1 17/32"	.34025"	5⅝"
Exhaust	1 13/32"	.34025"	5⅝"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.3175"	.002"
Exhaust	45°	.318"	.004"

Tappet Clearance—.007" Intake, .010" Exh. (hot). NOTE—Remove plate in right front fender for valve adjustment.
Valve Guides:—*See Packard Shop Notes for guide change on first cars to correct valve sticking.*
Valve Springs:—Intake and exhaust springs interchangeable. 1937 type springs used on first cars (1938 type only for replacement).

	Spring Pressure	Spring Length
Valve Closed	47-52 lbs.	1⅝"
Valve Open	114-124 lbs.	1 5/16"

NOTE—Serrated washer on top of each spring.
Valve Lifters:—New mushroom type. Remove from below with camshaft removed. Ream lifter holes through stem guide. Lifters furnished std. and .001", .002", .005" oversize. *See Packard Shop Notes for lifter type used with each type camshaft.*
Valve Timing:—See Camshaft Setting.
Intake Valves—Open 1° BTDC. Close 39° ALDC.
Exhaust Valves—Open 45° BLDC. Close 5° ATDC.
To Check Timing—Set tappet clearance #1 exhaust valve at .015". This valve should close with piston 5° or .0103" past top dead center when 5° point on flywheel (midway between second and third graduations after dead center mark #1 UP.DC.) lines up with pointer in inspection hole in left front face of housing. Reset tappet clearance at .010" (hot).

LUBRICATION:—Pressure system with gear type oil pump mounted on right side of engine.
See Packard Shop Notes for Oil Pump installation and gear change when replacing camshaft on first cars.
Normal Oil Pressure:—35 lbs. at 30 M.P.H.
Oil Pressure Relief Valve:—Mounted on pump cover. Not adjustable. Replace spring if pressure less than 5 to 8 lbs. at 2".
Crankcase Capacity:—6 quarts (refill).

COOLING SYSTEM:—Water Pump. Centrifugal, belt-driven, packless type.
See article in Mechanical Equipment Section for data.
Removal—With water drained and fan belt removed, disconnect pump hose, remove pump mounting capscrews, and lift pump assembly off.
Thermostat:—Located in top radiator tank. Operates radiator shutters. Two used in production (Early—marked 165°. Later—marked 150°).
Setting—Start to open—150°F (early), 135°F (later). Fully open 165°F (early), 150°F (later).
Water Capacity:—16 quarts.

CLUTCH:—Long Model 10 CF-CI. Semi-centrifugal, single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven-joined, 2 required. Inside Diam. 6". Outside Diam. 10". Thickness .137".
Adjustment—Adjust nut on inner pedal rod to give 1½" free travel (pedal to toeboard), secure locknut.
Removal:—Remove transmission (see Transmission Removal following). With clutch pedal depressed, insert wedge (ST-879) between each throwout finger and cover (assembly can only be removed when in partially released position). Remove clutch shifter bearing, pedal rod and cover capscrews (remove assembly from below).

TRANSMISSION:—Own make. Helical gear type with synchronizer for second and high speeds.
See article in Mechanical Equipment Section for data.
Removal:—Remove floorboards, speedometer cable, ground strap and accelerator pedal. Disconnect propeller shaft at front universal, block shaft up against floor board. Support rear end of engine with jack, unbolt cross-member from frame, disconnect hand brake cable at equalizer, remove flywheel housing lower cover and clutch retracting spring, take out 4 capscrews in transmission mounting flange, pull transmission back and remove.

UNIVERSAL JOINTS:—Detroit. Series 5150. Cross type with roller bearings. Two used.
See article in Mechanical Equipment Section for data.
NOTE—On 1602, Intermediate self-aligning bearing used on drive shaft.

REAR AXLE:—Own make. Semi-floating, hypoid gear type with Hotchkiss drive. Rear face of differential carrier now vertical.
See article in Mechanical Equipment Section for data.
Ratios—4.36-1 (1601), 4.7-1 (1601A, 2), 4.09-1, 4.54-1 optional.
Backlash—.003-.005". Screw adjustment.
Removal:—Remove wheel, hub, and brake backing plate assembly. Withdraw axle shafts. Disconnect rear universal joint and drop drive shaft. Remove nuts on carrier-to-housing bolts and withdraw carrier assembly from housing.
Wheel Bearing Adjustment—Endplay controlled by shims between flanged end of housing and brake backing plate. Adjust by removing backing plate and disconnect brake tube clips on housing. Add shims at one wheel only if endplay .050" or below, at both wheels equally if above. Measure with dial indicator against end of shaft. **Endplay**—.002-.005".

SHOCK ABSORBERS:—Houdaille. Model OBBDI (front), OBBCP (rear). Double acting, hydr. type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Packard (Gemmer design) Worm-and-Roller type with center steering.
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent 'Safe-T-flex' type with coil springs.
See article in Mechanical Equipment Section for data.
NOTE—Data below applies with car on level floor, tires properly inflated and car weighted as follows: 300 lbs. front seat, 375 lbs. (rear—5 pass. bodies), 225 lbs. (rear—Coupe), 675 lbs. (rear—7 Pass.).
Front Suspension Height—Distance from floor to top side of frame siderail at spring should be 19¼" plus or minus ¼".
Kingpin Inclination—1°54' crosswise.
Camber—½° plus or minus ½°. Adjustable.
Caster—1½° plus or minus ½°. Shim adjustment.
Toe In—1/32-1/16" measured at hub height. Adjust tie rods equally (rod lengths must be equal after adjustment).

BRAKES:—Service—Bendix hydraulic, duo-servo, single anchor type. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Drum—Centrifuse. Diameter—12".
Lining—Primary (Raybestos No. 451). Secondary (U. S. Asbestos No. 589-F). Width 1¾" (1601), 2¼" (1601A, 2). Thickness 3/16". Length 13" per shoe.
Clearance—.010" at heel and toe of each shoe.
Hand Brake Adjustment:—See Service Brakes above.

SERIAL NUMBER:—Stamped on plate on front of dash (use engine number).

ENGINE NUMBER:—First number A-500001. Stamped on upper center left side of crankcase.

ENGINE SPECIFICATIONS:—8 cylinder, 'L' head.
Bore—3 3/16". **Stroke**—5".
Displacement—320 cubic inches.
Rated Horsepower—32.5 (A.M.A.)
Developed Horsepower—130 HP. (Std. 6.5-1 hd.), 133-135 HP. (optl. 7.05-1 hd.) at 3200 RPM.
Compression Ratio and Pressure—As follows: 6.5-1 std. aluminum head, 110 lbs. at 125 R.P.M. 7.05-1 optl. aluminum head, 119 lbs. at 125 R.P.M.
Vacuum Reading—18-19" idling at 7 M.P.H.
See Packard Shop Notes for Cylinder Head data and Block Removal directions.

PISTONS:—Nelson Bohnalite, aluminum alloy, autothermic, strut type, tin plated, cam ground.
Weight—17¾ oz. (stripped), 24 oz. (with rings and pin). **Length**—4¼".
Removal—Pistons above, rods below (push piston up to expose pin, remove locking rings, push pin out, lift piston out, lower rod and remove from below). Remove with engine warm.
Clearance—Skirt .0015". See Fitting New Pistons.
Original Bore & Piston Sizes, Replacement Pistons:—*See Packard Shop Notes for complete data.*
Fitting New Pistons:—Insert .0015" feeler ½" wide between piston and cylinder wall on side opposite slot. Pull to withdraw feeler should be 12-14 lbs.
Installing Pistons:—Slot toward valves.

PISTON RINGS:—#1 compression (plain), #2 compression (#70 Perfect Circle), #3 oil (P-C #85), #4 oil (P-C #X90-85) rings per piston, all above pin. Each oil ring groove drilled with ten ⅛" oil drain holes. Rings furnished standard and .003", .005", .010", .015", .020", .025", .030", .035" and .045" oversize. NOTE—P-C#200 ring used in #1 groove on early production.

Ring	Width	End Gap	Side Clearance
Compr.	1225-1230"	.007-.015"	.003"
Oil Cont.	.1545-.1550"	.007-.015"	.0015"

NOTE—Install #1 & 3 rings with slot toward camshaft, #2 & 4 with slot away from camshaft.

PISTON PIN:—Diameter—⅞. **Length**—2 47/64". Pin floats in piston and rod, held by locking rings. Furnished std. and .003", .006" oversize.
Pin Fit in Piston—Finger push fit with piston heated to 160°F.
Pin Fit in Rod Bushing—Finger push fit at 70°F. Finish ream pin hole to .87485-.87515".

CONNECTING ROD:—Weight—40.3 oz. **Length**—10⅞".
Crankpin Journal Diameter—2 3/16".
Lower Bearing—Copper lead alloy, interchangeable type. Furnished .001", .002", .003", .015" undersize. NOTE—Babbitt type for replacement furnished std. and .002", .005", and .015", undersize.
Clearance—.001-.0015". **Sideplay**—.005-.008".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps.
Installing Rods:—Oil hole toward camshaft.

CRANKSHAFT:—9 bearing, 8 bolted counterweights with rubber friction disc vibration damper mounted on forward end.
Journal Diameters—2⅝".
Bearing Type—Interchangeable babbitt-lined, steel shell type.
Clearance—.001-.002".
Bearing Adjustment:—None (no shims). Replace bearings. Upper halves may be rotated in place.
End Thrust:—Taken by #7 bearing.
Endplay—.003-.005".

CAMSHAFT:—8 bearing. Non-adjustable chain drive.
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.0015-.0035".
End Thrust:—Taken by thrust plate assembled in back of camshaft sprocket. **Endplay**—.001-.004".
Timing Chain:—Morse 3682-RX. Width 1½". Pitch .375". Length 70 links or 26¼".
Camshaft Setting:—Install chain and sprockets together with marks adjacent and in line with a straightedge across the shaft centers.
See Packard Shop Notes for Fender and Radiator Assembly removal for work on front of engine.

VALVES:	Head Diameter	Stem Diameter	Length
Intake	1 21/32"	.3405"	7 13/32"
Exhaust	1 15/32"	.3405"	7 13/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.354"	.003"
Exhaust	45°	.354"	.0045"

Tappet Clearance—.006" Intake, .008" Exhaust, (hot).
Valve Guides:—Pressed in block from above. Ream to size for correct stem clearance (see above).
Valve Rocker Arms:—Consist of pivoted arms mounted on bracket on crankcase which transmit motion from cam to valve pushrod (valve lifter).
Removal—Take out screws in bracket on right side of crankcase, withdraw bracket and pushrod assembly.
Pushrods (Valve Lifters):—Mounted on guides seated in crankcase and held down by engine block which engages guide flange.

Valve Springs:	Spring Pressure	Spring Length
Valve Closed	68-78 lbs.	3 1/16"
Valve Open	154-164 lbs.	2 45/64"

NOTE—Serrated washer on top of each spring.

Valve Timing:—See Camshaft Setting (above).
Intake Valves—Open 30° BTDC. Close 65° ALDC.
Exhaust Valves—Open 65° BLDC. Close 30° ATDC.
To Check Timing—Set tappet clearance #1 exhaust valve at .005" (or .010", then insert .005" feeler). Turn engine over until pointer over damper (at front of engine) lines up with a point 1 1/16" (plus or minus 11/32") past '1-UPDC' mark (feeler should withdraw with finger pull). Valve closes 30° or .4070" ATDC. Reset tappet clearance at .008" (hot).
Motor Gauge—Weidenhoff Adapter #104 (with 10 MM. adapter). Rod #5.

LUBRICATION:—Pressure system with gear type oil pump mounted in crankcase.
Normal Oil Pressure:—55 lbs. (max.), 5 lbs. (min.).
Oil Pressure Relief Valve:—Located under plug on left side of crankcase. Remove acorn nut and adjust by turning slotted screw.
Crankcase Capacity:—8 quarts.

COOLING SYSTEM:—Water Pump. Centrifugal, belt-driven, with adjustable type packing.
See article in Mechanical Equipment Section for data.
Removal—With water drained and fan belt removed, disconnect pump hose, remove nuts on pump mounting studs and lift off fan and pump assembly.
Thermostat:—Located in top radiator tank. Operates radiator shutters. Two used in production (Early—marked 165°. Later—marked 150°).
Setting—Start to open—150°F. (early), 135°F. (later). Fully open—165°F. (early), 150°F. (later).
Water Capacity:—20 quarts.

CLUTCH:—Long Model 12CB-CL. Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Moulded (Raybestos No. 250), 2 required. Inside Diam. 7". Outside Diam. 12". Thickness .137".
Adjustment—Adjust nut on pedal rod to give 1-1½" free travel (pedal pad to toe board).
Removal:—Remove transmission (see Transmission Removal following), take out cover mounting screws (release pressure evenly), lift assembly out. Align '0' marks on flywheel and cover when reassembling.

TRANSMISSION:—Own make. Helical gear type with synchronizer for second and high speeds.
See article in Mechanical Equipment Section for data.
Removal:—Remove floor boards, speedometer cable, ground strap, drop drive shaft at front universal joint. Remove light switch, two stud nuts (case bracket to rubber support) on each side, hand brake cable (at equalizer), stabilizer link (left side), clutch pedal pull rod and spring, place jack under rear of engine. Remove pedal shaft inner bracket, loosen brace rod on right side at rear only, lower cross member, take out bell housing nuts and cap-screws, jack up rear of engine, remove 2 frame-to-vertical support member bolts on each side, remove support members. Remove transmission.

UNIVERSAL JOINTS:—Detroit. Series 5350. Cross type with roller bearings. Two used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—Own make. 'Angle-Set', semi-floating, hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.69-1 (std.), 4.36-1, 4.09-1 (optl.).
Backlash—.003-.005". Screw adjustment.
Removal:—Remove wheel, hub, brake assembly, wheel bearing and axle shaft. Disconnect rear universal joint at flange, drop drive shaft, remove differential housing by removing housing bolt nuts (below), and locknut on stud (at top). Remove carrier.
Wheel Bearing Adjustment—Controlled by shims between outer race of inner bearing and shoulder in housing. Remove wheel, hub, brake assembly, wheel bearing and axle shaft. Add or remove shims Adjust each wheel independently.
Endplay .003" (plus or minus .001") at each wheel.

SHOCK ABSORBERS:—Delco. Model 1966-A, B (front), 1751-J, K (rear). Hydraulic, double acting type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Packard (Gemmer design). Worm-and-Roller type with center steering.
See article in Mechanical Equipment Section for data.
Front Suspension:—Packard Safe-T-fleX type with coil springs.
See article in Mechanical Equipment Section for data.
NOTE—Data below applies with car on level floor tires properly inflated and car loaded with 300 lbs. (frt.—all), 375 lbs. (rear—5 Pass.), 225 lbs. (rear—Coupe), 675 lbs. (rear—7 & 8 Pass.).
Front Suspension Height—Distance from floor to top of frame siderail at spring should be 20⅛" plus or minus ¼".
Kingpin Inclination—1½° crosswise.
Camber—½° (plus ¾°). Adjustable.
Caster—2½° plus or minus ½°. Shim adjustment.
Toe In—1/32-⅛". Adjust by turning tie rods equally (check for equal lengths after adjustment).

BRAKES:—Service—Bendix hydraulic, duo-servo, single anchor type. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Drum—Centrifuse. Diameter—12".
Lining—Primary (Marshall #1035), Secondary (#600). Width 2½". Thickness 3/16". Length 13".
Clearance—.010" at heel and toe of each shoe.
Hand Brake Adjustment:—See Service Brakes.

SERIAL NUMBER:—Stamped on plate on front of dash. Use engine number (below).

ENGINE NUMBER:—First number A-600001. Stamped on left side of block below distributor.

ENGINE SPECIFICATIONS:—12 cyl., modified 'L' head, 67° Vee. Blocks and upper crankcase cast Enbloc. **Bore**—3 7/16". **Stroke**—4¼".
Displacement—473 cubic inches.
Rated Horsepower—56.7 (A.M.A.)
Developed Horsepower—175 HP (std. 6.4-1 hd.), 178-180 HP. (optl. 7.0-1 hd.) at 3200 R.P.M.
Compression Ratio and Pressure—As follows:
6.4-1 std. aluminum head (110 lbs. at 125 RPM.).
7.0-1 optl. aluminum head (119 lbs. at 125 RPM.).
NOTE—6.0-1 low compression head available.
Vacuum Reading—18-20" at 375 R.P.M. or 8 MPH.
See Packard Shop Notes for Cylinder Head data.

PISTONS:—Nelson Bohnalite, aluminum alloy, autothermic strut type, tin plated, cam ground.
Weight—20 oz. (stripped), 26¾ oz. (with rings and pin). **Length**—4.318".
Removal—Pistons above, rods below (push piston up to expose pin, remove locking rings, push pin out, lift piston out, lower rod and remove from below). Remove with engine warm.
Clearance—.0015". See Fitting New Pistons.
Original Bore & Piston Sizes, Replacement Pistons:—*See Packard Shop Notes for complete data.*
Fitting New Pistons:—Insert .0015" feeler ½" wide between piston and cylinder wall on side opposite slot. Pull to withdraw feeler 12-18 lbs.
Installing Pistons:—Slot toward valves (all pistons).

PISTON RINGS:—2 compression (Perfect Circle #70), #3 oil (#85), #4 oil (#X90-85) rings per piston, above pin. Oil ring grooves drilled with twelve 5/32" oil drain holes. Rings furnished standard and .003", .005", .010", .015", .020", .030", .045" oversize.

Ring	Width	End Gap	Side Clearance
Compr.	.1225-.1230"	.007-.015"	.0025-.003"
Oil Contr.	.1545-.1550"	.007-.015"	.0015-.002"

NOTE—On left bank, ring gap #1 and #3 away from camshaft, #2 and #4 toward camshaft. The reverse for right bank.

PISTON PIN:—Diameter—⅞". **Length**—2 63/64".
Pin floats in piston and rod, held by locking rings. Furnished std. and .003", .006" oversize.
Pin Fit in Piston—Finger push fit with piston heated to 160°F.
Pin Fit in Rod Bushing—Finger push fit at 70°F. Finish ream pin hole to .87485-.87515".

CONNECTING ROD:—Weight—36 ozs. **Length**—9".
Crankpin Journal Diameter—2½".
Lower Bearing—Copper lead alloy, interchangeable type. Furnished std. and .001", .002", .003", and .015" undersize.
Clearance—.001-.0015". **Sideplay**—.008-.010".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps.
Installing Rods:—Oil hole toward starter.

CRANKSHAFT:—4 bearing, 6 bolted counterweights with rubber friction disc vibration damper mounted on forward end.
Journal Diameters—2¾".
Bearing Type—Interchangeable babbitt-lined steel shell type.
Clearance—.001-.002".
Bearing Adjustment:—None (no shims). Replace bearings. Upper halve may be rotated in place.
End Thrust:—Taken by #1 front bearing.
Endplay—.003-.005".

CAMSHAFT:—Four bearing. Between banks directly above crankshaft. Non-adjustable chain drive.
Bearing Type—Steel backed, babbitt lined.
Clearance—.001-.0015" (#1, 4). .002-.0025" (#2, 3).
End Thrust:—Taken at front bearing.
Endplay—.002-.006".
Timing Chain:—Morse No. 1866-N. Width 1¾". Pitch .500". Length 28" or 56 links.
Camshaft Setting:—Install chain and sprockets together with marks adjacent and in line with a straightedge across the shaft centers.
See Packard Shop Notes for Fender and Radiator Assembly removal for work on front of engine.

VALVES:—	Head Diameter	Stem Diameter	Length
Intake	1 41/64"	.3405"	6 35/64"
Exhaust	1 21/32"	.338"	6 35/64"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.3125"	.0025"
Exhaust	45°	.3125"	.005"

Tappet Clearance—None (automatic take-up).
Automatic Tappet Take-up:—Hydraulic type (using engine oil pressure). Check whenever valves ground.
See article in Mechanical Equipment Section for data.
Valve Springs:—Install springs with painted end down and close-spaced first coil toward valve head. Special 1/32" higher stem keeper furnished (compensating for loss of pressure due to valve reseating).

	Spring Pressure	Spring Length
Valve Closed	65-75 lbs.	2 7/32"
Valve Open	140-150 lbs.	1 29/32"

NOTE—Serrated washer on top of each spring.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open at TDC. Close 45° ALDC.
Exhaust Valves—Open 35° BLDC. Close 10° ATDC.
To Check Timing—Intake valve for #1 (front cylinder, right bank) begins to open with piston on top dead center when '#1R-UDC' mark on dampener lines up with pointer on chain case cover. Removal of right cylinder head and dial indicator mounted over valve recommended to check opening.
Motor Gauge—Weidenhoff Adapter #104 (with 10 MM. adapter), Rod #2.

LUBRICATION:—Pressure system with gear type oil pump mounted in crankcase. Oil filter and temperature regulator mounted on right side of engine.
Normal Oil Pressure:—55 lbs. (max.), 5 lbs. (min.).
Oil Pressure Relief Valve:—Located under plug on right side of crankcase below filter. Remove acorn nut and adjust by turning slotted screw.
Crankcase Capacity:—10 quarts.

COOLING SYSTEM:—Water Pump. Centrifugal, twin belt driven, with adjustable type packing.
See article in Mechanical Equipment Section for data.
Removal—With water drained and fan belts removed, disconnect pump hose, remove pump mounting bolts, lift fan and pump assembly off.
Thermostat:—Located in radiator tank. Operates radiator shutters. Two used in production (Early—marked 165°. Later—marked 150°).
Setting—Start to open—150°F (early), 135°F (later). Fully open—165°F (early), 150°F (later).
Water Capacity:—40 quarts.

CLUTCH:—Long Model 12CB-CL. Single plate, dry disc type with Bendix Vacuum Power operation.
See article in Mechanical Equipment Section for data.
Facings—Endless-compressed (Hyco DV 3903 PDX), 2 required. I.D. 7". O.D. 12". Thickness .137".
Pedal Adjustment:—Vacuum Power unit must be adjusted whenever pedal free travel insufficient. See article in Clutch Section for complete directions.
Removal:—Remove transmission (see Transmission Removal following), take out cover mounting screws (release pressure evenly), lift assembly out. Align '0' marks on flywheel and cover when reassembling.

TRANSMISSION:—Own make. Helical gear type with synchronizer for second and high speeds.
See article in Mechanical Equipment Section for data.
Removal:—Remove ground cable, speedometer cable, propeller shaft, light switch, two stud nuts (case bracket to rubber support) at each side, hand brake cable at equalizer, left stabilizer link, clutch pedal pull-rod ,and pedal spring. Support engine at rear. Remove right brace rod (rear only), lower crossmember, and bell housing nuts and capscrews. Jack up rear of engine, remove two bolts on each side (holding vertical support members to frame), remove support members, pull transmission back and remove.

UNIVERSAL JOINTS:—Spicer. Roller bearing type. Two used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—Own make. 'Angle-Set', semi-floating, hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.41-1 (std.), 4.69-1, 4.06-1 (optl.).
Backlash—.003-.005". Screw adjustment.
Removal:—Remove wheel, hub, brake assembly, wheel bearing and axle shaft. Disconnect rear universal joint at flange, drop drive shaft, remove differential from housing by removing housing bolt nuts (below), and locknut on stud (at top). Remove carrier
Wheel Bearing Adjustment—Controlled by shims between outer race of inner bearing and shoulder in housing. Remove wheel, hub and brake assembly, wheel bearing and axle shaft. Add or remove shims adjust each wheel independently.
Endplay—.003" (plus or minus .001") at each wheel.

SHOCK ABSORBERS:—Delco. Model 1952-A, B (front), 2006-G, H (rear). Hydraulic, double acting type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Packard (Gemmer design). Worm-and-Roller type with center steering.
See article in Mechanical Equipment Section for data.
Front Suspension:—Packard Safe-T-fleX type with coil springs.
See article in Mechanical Equipment Section for data.
NOTE—Data below applies with car on level floor tires properly inflated and car loaded with 300 lbs. (frt.—all), 375 lbs. (rear—5 Pass.), 225 lbs. (rear—Coupe), 675 lbs. (rear—7 & 8 Pass.).
Front Suspension Height—Distance from floor to top of frame siderail at spring should be 20½" plus or minus ¼".
Kingpin Inclination—1½° crosswise.
Camber—1° plus or minus ¼°. Adjustable.
Caster—0° (½° reverse max.). Shim adjustment.
Toe In—1/32-⅛". Adjust by turning tie rods equally (check for equal lengths after adjustment).

BRAKES:—Service—Bendix hydraulic, duo-servo, single anchor type with Vacuum Power operation. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Drum—Centrifuse. Diameter—14".
Lining—Primary (Raybestos No. 451). Secondary (U. S. Asbestos No. 589). Width 2¾". Thickness ¼". Length 15" per shoe.
Clearance—.010" at heel and toe of each shoe.
Hand Brake:—See Service Brakes.
Vacuum Power Unit:—Bendix internal valve type. Vacuum cylinder linked to brake pedal lever.
See article in Mechanical Equipment Section for data.

SERIAL NUMBER:—On front of dash (Use Engine No.).
ENGINE NUMBER:—First number B-1501. Stamped on front upper left hand side of cylinder block.
ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3½". **Stroke**—4¼".
Displacement—245.3 cu. ins. **Rated HP.**—29.4.
Developed Horsepower—100 HP. (Std. 6.52-1 head), 103-105 HP. (Optl. 6.85-1 head) at 3600 R.P.M.
Compression Ratio and Pressure—As follows:
6.52-1 Std. cast-iron hd.—110 lbs. at 125 R.P.M.
6.85-1 Optl. H.C. head—118 lbs at 125 RP.M.
NOTE—On later cars with .070" thick head gasket, these ratios reduced to 6.39-1 Std., 6.71-1 Optl.
Vacuum Reading—Steady 18-20" idling at 6 M.P.H.
See Packard Shop Notes for Cylinder Head data.

PISTONS:—Nelson Bohnalite, aluminum alloy, autothermic, strut type, tin plated, cam ground.
Weight—19.5 ozs. (stripped), 26 ozs. (with rings and pin) and equal within 4 grams. **Length**—3⅞".
Removal—Piston and rods removed from above.
Clearance—.0005-.001" skirt. See Fitting Pistons.
Original Bore & Piston Sizes, Replacement Pistons:—*See Packard Shop Notes for complete data.*
Fitting New Pistons:—Insert .0015" feeler ½" wide between piston and cylinder wall on side opposite slot. Pull to withdraw feeler should be 12-18 lbs.
Installing Pistons:—Slot toward valves.

PISTON RINGS:—2 compression (Perfect Circle #70), one oil control (X-90) per piston, all above pin.

Ring	Width	End Gap	Side Clearance
Comp. #1	.123-.1240"	.007-.017"	.0025-.003"
Comp. #2	.123-.1240"	.007-.017"	.0025-.003"
Oil Contr.	.186-.1865"	.007-.015"	.0015"

Replacement Rings:—Furnished standard and .005", .010", .020", .030", and .040" oversize.

PISTON PIN:—**Diameter**—⅞". **Length**—3 1/64"
Pin floats in piston and rod, held by locking rings. Furnished Std. and .003", .006" oversize.
Pin Fit in Piston—Finger push fit with piston heated to 160° F.
Pin Fit in Rod Bushing—Finger push fit at 70° F.

CONNECTING ROD:—**Length**—7 11/16". **Weight**—33 ozs.
IMPORTANT CHANGE—After No. B-4607, bearings are .010" thicker and rod holes .020" larger diameter. Rods with large hole marked '330613' on web at lower end. Use only thicker bearing shells (marked by inked star) in these rods.
Upper Bearing (Piston Pin Bushing)—Split type. *See Packard Shop Notes for complete data.*
Crankpin Journal Diameter—2 3/32".
Lower Bearing—Interchangeable steel-backed, babbitt-lined type. Bearings furnished std. and .001", .002", .003", .015" undersize. NOTE—Bearing shells marked with inked star, must be used with new rods marked '330613' on web at lower end.
Clearance—.0005-.0015". **Sideplay**—.004-.010".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps. Tighten bolt nuts to 715-725 in. lbs. *See Packard Shop Notes for 'Palnut' installation data.*
Installing Rods:—Oil squirt hole to camshaft.

CRANKSHAFT:—4 bearing, integral counterweights with rubber friction disc vibration damper
Journal Diameters—2¾".
Bearing Type—Interchangeable babbitt-lined steel shell type. Bearings furnished standard and .001" and .002" undersize.
Clearance—.001-.003".
Bearing Adjustment:—None (no shims). Replace bearings (upper half can be 'rotated' in place). Do not file caps. Tighten bolt nuts to 980-1020 in. lbs.
End Thrust:—Taken by front (#1) bearing. Adjust by adding or removing shims. **Endplay**—.003-.008".

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.001-.003".
End Thrust:—Taken by thrust plate in back of camshaft sprocket. **Endplay**—.002-.004".
Timing Chain:—Morse No. 3682-R. Width 1¼". Pitch .375". Length 20¾" or 58 links.
Camshaft Setting:—Install chain and sprockets together with '0' marks on sprockets adjacent and in line with a straightedge across the shaft centers.
See Packard Shop Notes for Radiator & Fender (unit) removal for work on front end of engine.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1.575"	.34025"	5⅝"
Exhaust	1 13/32"	.34025"	5⅝"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.317-.319"	.001-.003"
Exhaust	45°	.3165-.3185"	.003-.005"

Tappet Clearance:—.007" Intake, .010" Exh. (hot).
NOTE—Remove right front fender plate for adj.
Valve Guides:—New type. Press in block so upper end 31/32" below valve seat and finish-ream to size.
Valve Springs:—Intake and exhaust springs interchangeable.

	Spring Pressure	Length
Valve Closed	47-52 lbs.	1⅝"
Valve Open	114-124 lbs.	1 5/16"

NOTE—Serrated washer installed on top of spring.
Valve Lifters:—Mushroom type. Remove from below with camshaft out. Service by reaming (work through valve guide) and installing oversize lifter. Furnished .001", .002", .005" oversize.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 1° BTDC. Close 39° ALDC.
Exhaust Valves—Open 45° BLDC. Close 5° ATDC.
To Check Timing—Set tappet clearance #1 exhaust valve at .015". This valve should close with piston 5° or .0103" past top dead center when 5° point on flywheel (midpoint between second and third graduations after top dead center mark '#1 UP DC.') lines up with pointer on housing in inspection hole in left front face of flywheel housing below starter. Permissable variation 3 graduations either side of mark. Reset tappet clearance at .010" warm.

LUBRICATION:—Gear type pump (right of engine). *See Packard Shop Notes for Oil Pump Installation.*
Normal Oil Pressure:—35 lbs. at 30 M.P.H. (warm oil).
Oil Pressure Regulator:—Mounted on pump cover. Not adjustable. Replace spring if pressure less than 5 to 8 lbs. at 2".
Crankcase Capacity—6 qts. (dry), 5 qts. (refill).

COOLING SYSTEM:—**Capacity**—15.2 quarts.
Water Pump:—Packless type with ball-bearing shaft. *See article in Mechanical Equipment Section for data.*
Removal—Remove fan belt, disconnect pump hose, take out pump mounting screws, lift out pump.
Thermostat:—In top radiator tank. Operates shutters.
Setting—Starts to open 135° F. Fully open 150°.
Install 162° thermostat in cylinder head for use with heaters (remove in summer).
Adjustment—Pull back on shutter pullrod to close shutters, tighten nut on rod to remove all slack, then tighten 1 turn additional for pre-load.

CLUTCH:—**Long Model 9½ CF-CS.** Semi-centrifugal, single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven (US Asbestos 1133G), 2 required. Inside Diam. 6". Outside Diam. 9½". Thickness .125".
Adjustment—Adjust nut on pedal rod (at clutch fork) for 1½-2" pedal free movement.
Removal:—Remove Transmission (see Transmission Removal following). Disconnect and remove pedal rod, clutch throw-out bearing. Remove clutch cover capscrews, remove clutch from below.

TRANSMISSION:—**Own Make.** New type with constant-mesh, helical, ball-bearing mounted low speed gear (sliding spur gear for reverse). Synchromesh (second and high).
See article in Mechanical Equipment Section for data.
Econo-Drive Transmission:—Warner Model AS9-R6 overdrive unit with electrical control optl.
See article in Mechanical Equipment Section for data.
Transmission Control:—Own Remote Control type.
See article in Mechanical Equipment Section for data and recommended control changes on first cars.
Removal:—Disconnect shifter rods, speedometer cable, ground strap at transmission case. Disconnect drive shaft at front universal and block shaft up against floorpan. Support rear end of engine, unbolt cross-member from frame (on cars with Econo-Drive remove cross-member at rear with stabilizer, disconnect wires at solenoid). Disconnect hand brake cable at equalizer, remove flywheel housing lower cover, clutch throwout retracting spring. Take out transmission-to-bell housing mounting screws and remove assembly.

UNIVERSAL JOINT:—**Mechanics.** Model 2C (Std.), 3C (With Econo-Drive). Needle bearing type. 2 used.
See article in Mechanical Equipment Section for data.
CAUTION—Do not loosen universal flange nut on first cars (this nut controls overdrive rear bearing pre-load). In later cars (with 'M' stamped on flange), bearing pre-load controlled by spring washer and nut should be kept tight.

REAR AXLE:—**Own Make.** Semi-floating, hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.54-1 Std., 4.7-1 with Econo-Drive trans'm. Optl. ratios 4.36-1, 4.54-1, 4.7-1.
Backlash—.003-.005". Screw adjustment.
Removal:—Remove wheel, hub, and brake backing plate assembly. Withdraw axle shafts. Disconnect rear universal joint and drop drive shaft. Remove carrier-to-housing bolt nuts, withdraw carrier.
Wheel Bearing Adjustment—Endplay controlled by shims between flanged end of housing and brake backing plate. **Endplay**—.004-.007".

SHOCK ABSORBERS:—**Delco.** Model 1966-D (right frt.), 1966-C (left frt.), 1751-Z (right rear), 1751-M (left rear). Double acting, hydraulic type.
Fifth Shock Absorber (Stabilizer):—Houdaille Model NFT. Double acting, hydraulic, adjustable type.
See articles in Mechanical Equipment Section for data.

STEERING:—**Steering Gear**—Packard (Gemmer design) Worm-and-Roller type with center steering.
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent 'Safe-T-fleX' type
See article in Mechanical Equipment Section for data.
NOTE—Frame height must be set first before checking Caster and Camber.
Frame Height—With car on level floor, distance from floor to top of frame side rail at front wheel center-line 18¾" (load car until figure correct).
Kingpin Inclination—1°54' crosswise.
Camber—½° (plus ¾°, minus 0°). Adjustable.
Caster—1½° plus or minus ½°. Shim adjustment.
Toe In—1/32-1/16" at hub height. Adjust both tie rods equally (must be equal after adjustment).

BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type with eccentric adjustment. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Drums—Centrifuse. Diameter—11".
Lining—Marshall #2201 (all shoes). Width 1¾". Thickness 3/16". Length 12" per shoe.
Clearance—.010" at heel and toe of each shoe.
Hand Brake:—See Service Brakes (above).

SERIAL NUMBER:—On front of dash (use Engine No.).
ENGINE NUMBER:—First number B-300001. Stamped on front upper left hand side of cylinder block.
ENGINE SPECIFICATIONS:—8 cylinder, 'L' head.
Bore—3¼". **Stroke**—4¼".
Displacement—282.04 cu. ins. **Rated HP.**—33.8.
Developed Horsepower—120 HP. (Std. 6.41-1 hd) at 3800 R.P.M.
Compression Ratio—6.41-1 Std., 6.85-1 Optl.
Compression Pressure—110 lbs. (Std. 6.41-1 hd.), 118 lbs. (Optl. 6.85-1 hd) at 125 R.P.M.
Vacuum Reading—Steady 18-21" idling at 6 M.P.H.
See Packard Shop Notes for Cylinder Head data.

PISTONS:—Nelson Bohnalite, aluminum alloy, autothermic, strut type, tin plated, cam ground.
Weight—16⅞ ozs. (stripped), 22¾ ozs. (with rings and pin) and equal within 4 grams. **Length**—3⅞".
Removal—Pistons and rods removed from above.
Clearance—.0005-.001" skirt. See Fitting Pistons.
Original Bore & Pistons Sizes, Replacement Pistons:—*See Packard Shop Notes for complete data.*
Fitting New Pistons:—Insert .0015" feeler ½" wide between piston and cylinder wall on side opposite slot. Pull to withdraw feeler should be 12-18 lbs.
Installing Pistons:—Slot toward valves.

PISTON RINGS:—2 compression (Perfect Circle #70), one oil control (#X90-85) per piston, above pin.

Ring	Width	End Gap	Side Clearance
Comp. #1	.123-.1240"	.007-.017"	.0025-.003"
Comp. #2	.123-.1240"	.007-.017"	.0025-.003"
Oil Contr.	.186-.1865"	.007-.015"	.0015-.002"

Replacement Rings:—Furnished standard and .005", .010", .020", .030", and .040" oversize.

PISTON PIN:—**Diameter**—⅞". **Length**—2 51/64".
Pin floats in piston and rod, held by locking rings. Furnished std. and .003", .006" oversize.
Pin Fit in Piston—Finger push fit with piston heated to 160°F.
Pin Fit in Rod Bushing—Finger push fit at 70°F.

CONNECTING ROD:—**Length**—7 11/16". **Weight** 33 ozs.
IMPORTANT CHANGE—After No. B-303053, bearings are .010" thicker and rod hole .020" larger diameter. Rods with large hole marked '330613' on web at lower end. Use only thicker bearing shells (marked by inked star) in these rods.
Upper Bearing (Piston Pin Bushing)—Split type.
See Packard Shop Notes for complete data.
Crankpin Journal Diameter—2 3/32".
Lower Bearing—Interchangeable steel-backed, babbitt-lined type. Bearings furnshed std. and .001", .002", .003", .015" undersize. NOTE—.010" thicker bearing shells (marked by inked star) should be used on rods marked '330613' on web at lower end.
Clearance—.0005-.0015". **Sideplay**—.004-.010".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps. Tighten bolt nuts to 715-725 in. lbs. *See Packard Shop Notes for 'Palnut' installation data.*
Installing Rods:—Oil squirt hole to camshaft.

CRANKSHAFT:—5 bearing, integral counterweights with rubber friction disc vibration dampener.
Journal Diameters—2¾".
Bearing Type—Interchangeable babbitt-lined steel shell type. Bearings furnished standard and .001" and .002" undersize. **Clearance**—.001-.003".
Bearing Adjustment:—None (no shims). Replace bearings (upper half can be 'rotated' in place). Do not file caps. Tighten bolt nuts to 980-1020 in. lbs.
End Thrust:—Taken by #3 bearing. Adjust by adding or removing shims. **Endplay**—.003-.008".

CAMSHAFT:—5 bearing. Non-adjustable chain drive.
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.001-.003".
End Thrust:—Taken by thrust plate in back of camshaft sprocket. **Endplay**—.002-.004".
Timing Chain:—Morse No. 3682-R. Width 1¼". Pitch .375". Length 20¾" or 58 links.
Camshaft Setting:—Install chain and sprockets together with '0' marks on sprockets adjacent and in line with a straightedge across shaft centers with #1 piston on top dead center.
See Packard Shop Notes for Radiator & Fender (unit) removal for work on front end of engine.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 17/32"	.34025"	5⅝"
Exhaust	1 13/32"	.34025"	5⅝"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.317-.319"	.001-.003"
Exhaust	45°	.3165-.3185"	.003-.005"

Tappet Clearance:—.007" Intake, .010" Exh. (hot).
NOTE—Remove right front fender plate for adj.
Valve Guides:—New type. Press in block so that upper end 31/32" below valve seat and finish-ream to size.
Valve Springs:—Intake and exhaust springs interchangeable.

	Spring Pressure	Length
Valve Closed	47-52 lbs.	1 5/8"
Valve Open	114-124 lbs.	1 5/16"

NOTE—Serrated washer on top of each spring.
Valve Lifters:—Mushroom type. Remove from below with camshaft out. Service by reaming (work through valve guide) and installing oversize lifter. Furnished .001", .002", .005" oversize.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 1° BTDC. Close 39° ALDC.
Exhaust Valves—Open 45° BLDC. Close 5° ATDC.
To Check Timing—Set tappet clearance #1 exhaust valve at .015". This valve should close with piston 5° or .0103" past top dead center when 5° point on flywheel (midpoint between second and third graduations after top dead center mark '#1 UP DC.') lines up with pointer on housing in inspection hole in left front face of flywheel housing below starter. Permissible variation 3 graduations either side of mark. Reset tappet clearance at .010" warm.

LUBRICATION:—Pressure system with gear type oil pump mounted on right side of engine.
See Packard Shop Notes for Oil Pump installation.
Normal Oil Pressure:—35 lbs. at 30 M.P.H. (warm oil).
Oil Pressure Regulator:—Mounted on pump cover. Not adjustable. Replace spring if pressure less than 5 to 8 lbs. at 2".
Crankcase Capacity:—6 quarts (refill).

COOLING SYSTEM:—**Capacity**—15 quarts.
Water Pump:—Packless type with ball-bearing shaft.
See article in Mechanical Equipment Section for data.
Removal—Remove fan belt, disconnect pump hose, take out pump mounting screws, lift out pump.
Thermostat:—In top radiator tank. Operates shutters. Use 162° thermostat in cylinder head outlet for heaters. Remove this thermostat in summer.
Setting—Starts to open 135°F. Fully open 150°.
Adjustment—At room temperature with thermostat sylphon closed, pull back on shutter pullrod to close shutters, tighten nut on rod to remove all slack, then tighten 1 turn additional for pre-load.

CLUTCH:—**Long Model 10 CF-CI.** Semi-centrifugal, single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven (US Asbestos 1133G), 2 required. Inside Diam. 6". Outside Diam. 10". Thickness .125".
Adjustment—Adjust nut on pedal rod (at clutch fork) for 1½-1¾" pedal free movement.
Removal:—Remove transmission (see Transmission Removal following). Remove clutch throwout bearing, pedal rod, and mounting screws in clutch cover flange, remove clutch from below.

TRANSMISSION:—**Own Make.** New type with constant-mesh, helical, ball-bearing mounted low speed gear (sliding spur gear for reverse). Synchro-mesh (second and high).
See article in Mechanical Equipment Section for data.
Econo-Drive Transmission:—Warner Model AS9-R6 overdrive unit with electrical control optl.
See article in Mechanical Equipment Section for data and recommended control changes on first cars.
Transmission Control:—Own remote control type.
See article in Mechanical Equipment Section for data.
Removal:—Disconnect shifter rods, speedometer cable, ground strap at transmission case. Disconnect drive shaft at front universal and block shaft up against floorpan. Support rear end of engine, unbolt cross-member from frame (on cars with Econo-Drive remove cross-member at rear with stabilizer, disconnect wires at solenoid). Disconnect hand brake cable at equalizer, remove flywheel housing lower cover, clutch throwout retracting spring. Take out transmission-to-bell housing mounting screws and remove assembly.

UNIVERSAL JOINT:—**Mechanics Model 3C.** Needle bearing type. Two used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—**Own Make.** Semi-floating hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—1701—4.36-1 std., 4.54-1 with Econo-Drive. 1701A, 2—4.7-1 Std., 4.9-1 with Econo-Drive. Optional Ratios—4.54-1, 4.36-1, 5.22-1.
Backlash—.003-.005". Screw adjustment.
Removal:—Remove wheel, hub, and brake backing plate assembly. Withdraw axle shafts. Disconnect rear universal joint and drop drive shaft. Remove carrier-to-housing bolt nuts, withdraw carrier.
Wheel Bearing Adjustment—Endplay controlled by shims between flanged end of housing and brake backing plate. **Endplay**—.004-.007".

SHOCK ABSORBERS:—**Delco.** Model 1966-D (right frt.), 1966-C (left frt.), 1751-Z (right rear), 1751-M (left rear). Double acting, hydraulic type.
Fifth Shock Absorber (Stabilizer):—Houdaille Model NFT. Double acting, hydraulic, adjustable type.
See articles in Mechanical Equipment Section for data.

STEERING:—**Steering Gear**—Packard (Gemmer design) Worm-and-Roller type with center steering.
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent 'Safe-T-fleX' type
See article in Mechanical Equipment Section for data.
NOTE—Frame Height must be set first before checking Caster and Camber.
Frame Height—With car on level floor, distance from floor to top of frame side rail at front wheel center-line 19¼" (load car for correct figure).
Kingpin Inclination—1°54' crosswise.
Camber—½° (plus ¾°, minus 0°). Adjustable.
Caster—1½° (1701), 0° (1702) plus or minus ½°.
Toe In—0" (plus 1/16", minus 0") at hub height. Adjust tie rods equally (lengths must be equal after adjustment).

BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type with eccentric adjustment. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Drums—Centrifuse. Diameter—12".
Lining—Marshall #2201 (1701). US Asbestos #714—primary, #589—secondary (1701A,2). Width 1¾" (1701), 2¼" (1701A,2), Thickness 3/16". Length 13" per shoe.
Clearance—.010" at heel and toe of each shoe.
Hand Brake:—See Service Brakes (above).

SERIAL NUMBER:—On front of dash (Use Engine No.).
ENGINE NUMBER:—First number B-500001. Stamped on boss on left hand side of cylinder block.
ENGINE SPECIFICATIONS:—8 cylinder, 'L' head.
Bore—3 3/16". **Stroke**—5".
Displacement—320 cu. ins. **Rated HP.**—32.5.
Developed Horsepower—130 HP. (Std. Hd.), 135 HP. (Optl. HC. Hd.) at 3200 R.P.M.
Compression Ratio—6.45-1 Standard, 6.85-1 Optl. H.C., 6.20-1 Optl. L.C.
Compression Pressure—110 lbs. (Std. 6.45-1 hd.), 118 lbs. (Optl. 6.85-1 hd.) at 125 R.P.M.
Vacuum Reading—Steady 18-19" idling at 5 M.P.H.
See Packard Shop Notes for Cylinder Head data and Block Removal instructions.

PISTONS:—Nelson Bohnalite, aluminum alloy, autothermic, strut type, tin plated, cam ground.
Weight—17¾ ozs. (stripped), 24 ozs. (with rings and pin) and equal within 4 grams. **Length**—4¼".
Removal—Pistons from above, rods from below.
Clearance—.0005-.001" skirt. See Fitting Pistons.
Original Bore & Pistons Sizes, Replacement Pistons:—*See Packard Shop Notes for complete data.*
Fitting New Pistons:—Insert .0015" feeler ½" wide between piston and cylinder wall on side opposite slot. Pull to withdraw feeler must be 12-14 lbs.
Installing Pistons:—Slot toward valves.

PISTON RINGS:—#1 compression (plain), #2 compression (#70 Perfect Circle), #3 oil (P-C #85), #4 oil (P.C. #X-90) rings per piston, all above pin.

Ring	Width	End Gap	Side Clearance
Comp. #1 & 2	.123-.1240"	.007-.017"	.003"
Comp. #3	.123-.1240"	.007-.015"	.003"
Oil Contr	.186-.1865"	.007-.015"	.0015"

Replacement Rings:—Standard and .003", .005", .010", .015", .020", .025", .030", .035" & .045" oversize.

PISTON PIN:—**Diameter**—⅞". **Length**—2 47/64". Pin floats in piston and rod, held by locking rings.
Pin Fit in Piston—Finger push fit with piston heated to 160° F.
Pin Fit in Rod Bushing—Finger push fit at 70° F.
Replacement Pins:—Std. and .003", .006" oversize.

CONNECTING ROD:—**Length** 10⅞". **Weight** 40-40.125 ozs. (with bearings).
Crankpin Journal Diameter—2 3/16".
Lower Bearing—Copper lead alloy, interchangeable type. Furnished .001", .002", .003", .015" undersize. **Clearance**—.0007-.00125". **Sideplay**—.005-.008".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or bearing caps. Tighten rod bolt nuts to 550-570 in. lbs.
Installing Rods:—Oil hole toward camshaft.

CRANKSHAFT:—9 bearing, 8 bolted counterweights with rubber friction disc vibration dampener.
Journal Diameters—2⅝" (all bearings).
Bearing Type—Interchangeable steel-backed, babbitt-lined type. **Clearance**—.001-.002".
Bearing Adjustment:—None (no shims). Replace bearings (upper half can be 'rotated' in place). Do not file caps. Tighten bolt nuts to 800-830 in. lbs.
End Thrust:—Taken by #7 bearing. **Endplay**.003-.005".

CAMSHAFT:—8 bearing. Non-adjustable chain drive.
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.0015-.0035".
End Thrust:—Taken by thrust plate assembled in back of camshaft sprocket. **Endplay**—.003-.006".
Timing Chain:—Morse No. 3682-KX. Width 1½". Pitch .375". Length 26¼" or 70 links.
Camshaft Setting:—Install chain and sprockets together with marks adjacent and in line with a straightedge across the shaft centers.
See Packard Shop Notes for Radiator & Fender (unit) removal for work on front of engine.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 21/32"	.3405"	7 13/32"
Exhaust	1 15/32"	.3405"	7 13/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.358"	.0025-.004"
Exhaust	45°	.358"	.004-.006"

Tappet Clearance:—.006" Int., .008" Exh. (warm).
NOTE—Remove right front fender plate for adj.
Valve Guides:—New type. Press guides in block so top is 1 1/32" below valve seat and finish-ream.
Valve Rocker Arms:—Consist of pivoted arms mounted on bracket on crankcase which transmit motion from cam to valve pushrod (valve lifter).
Removal—Take out screws in bracket on right side of crankcase, withdraw bracket assembly.
Valve Lifters (Tappets):—Removable from above with valve springs removed. Operate in individual guides held in place by bottom face of cylinder block (remove block to remove guides).

Valve Springs:	Spring Pressure	Spring Length
Valve Closed	68-78 lbs.	3 1/16"
Valve Open	154-164 lbs.	2 45/64"

NOTE—Serrated washer on top of each spring.
Valve Timing.:—See Camshaft Setting (above).
Intake Valves—Open 26° BTDC. Close 69° ALDC.
Exhaust Valves—Open 61° BLDC. Close 34° ATDC.
To Check Timing—Set tappet clearance #1 exhaust valve at .005" (or .010", then insert .005" feeler). Turn engine over until pointer over damper (at front of engine) lines up with a point 1 1/16" (plus or minus 11/32") past '1-UPDC' mark (feeler should withdraw with finger pull). Valve closes 34° or .5176" ATDC. Reset tappet clearance at .008" warm.

LUBRICATION:—Gear type oil pump in crankcase.
Normal Oil Pressure:—55-60 lbs. max., 5 lbs. min. idling (SAE #20 oil, engine warm or 150° F.).
Oil Pressure Regulator:—Located under plug on left side of crankcase. To adjust, remove acorn nut, turn slotted screw.
Relief Valves—Non-adjustable relief valve located in regulator housing opens at 17 lbs. back-pressure in filter and cooler to by-pass oil to manifold. By-pass valve in oil filter opens at 7-8 lbs.
Crankcase Capacity:—7½ quarts.

COOLING SYSTEM:—**Water Capacity**—22 quarts.
Water Pump:—New ball-bearing, packless type.
See article in Mechanical Equipment Section for data.
Removal—Drain water and remove fan belt, take out pump mounting screws, lift fan and pump out.
Thermostat:—In top radiator tank. Operates shutters.
Setting—Starts to open 135° F. Fully open 150° F. NOTE—Install 162° cylinder head thermostat for use with heaters. Remove in summer.
Adjustment—Pull back on the shutter pullrod to close shutters, tighten nut to remove all slack in rod, then tighten one turn additional for pre-load.

CLUTCH:—**Long Model 11CFS-CI.** Semi-centrifugal, single plate, dry disc type (riveted assembly).
See article in Mechanical Equipment Section for data.
Facings—Woven (US Asbestos #1133G), 2 required. Inside Diam. 6½". Outside Diam. 11". Thickness .125".
Adjustment—Adjust nut on pedal rod (at clutch fork) for 1½-2" pedal free movement.
Removal:—Remove transmission (see Transmission Removal below), remove flywheel bell housing by taking out 4 screws and removing nuts on 4 studs. Remove mounting screws in clutch cover flange

TRANSMISSION:—**Own Make.** New type with constant-mesh, helical, ball-bearing mounted low-speed gear (sliding gear for reverse). Synchro-mesh
See article in Mechanical Equipment Section for data.
Econo-Drive Transmission:—Warner Model AS9-R6 overdrive unit with electrical control optl.
See article in Mechanical Equipment Section for data and recommended control changes on first cars.
Transmission Control:—Own remote control type.
See article in Mechanical Equipment Section for data.
Removal:—Disconnect shifter rods, speedometer cable, ground strap at transmission case. Disconnect drive shaft at front universal joint and block shaft up against floorpan. Support rear end of engine, unbolt cross-member from frame (on cars with Econo-Drive remove cross-member at rear with stabilizer, disconnect wires at solenoid). Disconnect hand brake cable at equalizer, remove flywheel housing lower cover, clutch throwout retracting spring. Take out transmission-to-bell housing mounting screws and remove assembly.

UNIVERSAL JOINT:—**Mechanics Model 3C.** Needle bearing type. Two used.
See article in Mechanical Equipment Section for data.
CAUTION—Do not disturb universal flange nut on first cars (this nut controls overdrive rear bearing pre-load). On later cars (with 'M' stamped on flange), bearing pre-load controlled by spring washer and nut should be kept tight.

REAR AXLE:—**Own Make.** New type, semi-floating, hypoid gear type with Hotchkiss drive. NOTE—Axle has special Ring Gear Support Roller, differential case is straight (not Angle-set), cover welded on.
See article in Mechanical Equipment Section for data.
Ratio—4.36-1 Std., 4.54-1 With Overdrive (1703), 4.54-1 Std., 4.7-1 With Overdrive (1705).
Backlash—.003-.005". Screw adjustment.
Removal:—Remove wheel, hub, brake assembly, wheel bearing and axle shaft. Disconnect rear universal joint at flange, drop drive shaft, remove differential housing mounting nuts, withdraw carrier.
Wheel Bearing Adjustment—Controlled by shims between flanged end of housing and backing plate.
Endplay—.004-.007".

SHOCK ABSORBERS:—**Delco.** Model 1966-D, C (front), 1751-Z, M (rear). Double acting, hydraulic type.
Fifth Shock Absorber (Stabilizer):—Houdaille Model NFT. Double acting, hydraulic, adjustable type.
See articles in Mechanical Equipment Section for data.

STEERING:—**Steering Gear**—Packard (Gemmer design). Worm-and-Roller type with center steering.
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent Safe-T-fleX type.
See article in Mechanical Equipment Section for data.
NOTE—Frame Height must be set first before checking Caster and Camber.
Frame Height—With car on level floor, distance from floor to top of frame side rail at front wheel center-line 19¼" (load car for correct figure).
Kingpin Inclination—1°54' crosswise.
Camber—½° plus ¾° minus 0°. Adjustable.
Caster—½° (1703, 5), 2½° (1703A) plus or minus ½°. Adjustable.
Toe In—1/32-⅛" at hub height. Adjust by turning both tie rods equally (lengths must be equal after adjustment).

BRAKES:—**Service**—Bendix hydraulic, duo-servo, single anchor type. Hand lever applies rear service brakes. *See article in Mechanical Equipment Section.*
Drum—Centrifuse. Diameter—12".
Lining—Primary Shoe—US Asbestos #714 (1703, 5), Marshall #1035 (1703A). Secondary Shoe—US Asbestos #589 (1703, 5), Marshall #600 (1703A). Width 2¼" (1703, 5), 2½" (1703A). Thickness 3/16". Length 13" per shoe.
Clearance—.010" at heel and toe of each shoe.
Hand Brake Adjustment:—See Service Brakes.

SERIAL NUMBER:—On front of dash (Use Engine No.).
ENGINE NUMBER:—First number B-600001. Stamped on left side of cylinder block below distributor.
ENGINE SPECIFICATIONS:—12 cyl., modified 'L' head, 67° Vee. Blocks and upper crankcase cast Enbloc. **Bore**—3 7/16". **Stroke**—4¼".
Displacement—473 cu. ins. **Rated HP.**—56.7.
Developed Horsepower—175 HP. (Std. 6.3-1 hd.), 180 HP. (Optl. 7.03-1 HC. head) at 3200 R.P.M.
Compression Ratio—6.3-1 Std., 6.0-1 Optl. LC., 7.03-1 Optl. HC. Cylinder heads are Aluminum.
Compression Pressure—110 lbs. (Std. 6.3-1 hd.), 118 lbs. (Optl. 7.03-1 HC. hd.) at 125 R.P.M.
Vacuum Reading—18-20" at 375 R.P.M. or 8 M.P.H.
See Packard Shop Notes for Cylinder Head data.
PISTONS:—Nelson Bohnalite, aluminum alloy, autothermic strut type, tin plated, cam ground.
Weight—20 ozs. (stripped), 26¾ ozs. (with rings and pin). **Length**—4.318".
Removal—Pistons removed from above, rods from below. Warm engine facilitates removal.
Clearance—.0005-.001". See Fitting Pistons.
Original Bore & Pistons Sizes, Replacement Pistons:—*See Packard Shop Notes for complete data.*
Fitting New Pistons:—Insert .0015" feeler ½" wide between piston and cylinder wall on side opposite slot. Pull to withdraw feeler should be 12-18 lbs.
Installing Pistons:—Slot toward valves (all pistons).
PISTON RINGS:—Four rings per piston, #1 Comp. (plain), #2 & 3 Comp. (Perfect Circle #70), #4 Oil Contr. (#X-90), all above pin. Oil ring groove drilled with twelve #30 oil drain holes.

Ring	Width	End Gap	Side Clearance
Comp. (#1, 2)	.123-.1240"	.007-.017"	.0025-.003"
Comp. (#3)	.123-.1240"	.007-.015"	.0015-.002"
Oil Contr.	.186-.1865"	.007-.015"	.0015-.002"

NOTE—On left bank, ring gap #1 and #3 away from camshaft, #2 and #4 toward camshaft. Reverse procedure for right hand bank.
Replacement Rings:—Std. and .003", .005", .010", .015", .020", .030", .045" oversize.
PISTON PIN:—Diameter—⅞". **Length**—2 63/64".
Pin floats in piston and rod, held by locking rings. Furnished std. and .003", .006" oversize.
Pin Fit in Piston—Finger push fit with piston heated to 160° F.
Pin Fit in Rod Bushing—Finger push fit at 70° F. Finish ream pin hole to .87485-.87515".
CONNECTING ROD:—Weight—36 ozs. **Length**—9".
Crankpin Journal Diameter—2½".
Lower Bearing—Copper lead alloy, interchangeable type. Furnished std. and .001", .002", .003", and .015" undersize.
Clearance—.001-.0015". **Sideplay**—.008-.010".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps.
Installing Rods:—Oil hole toward starter.
CRANKSHAFT:—4 bearing, 6 bolted counterweights with rubber friction disc vibration damper mounted on forward end. **Journal Diameters**—2¾".
Bearing Type—Interchangeable steel-backed, babbitt-lined type. **Clearance**—.001-.002".
Bearing Adjustment:—None (no shims). Replace bearings. Upper halve may be rotated in place.
End Thrust:—By #1 bearing. **Endplay**—.003-.005".
CAMSHAFT:—Four bearing. Between banks directly above crankshaft. Non-adjustable chain drive.
Bearing Type—Steel backed, babbitt-lined.
Clearance—.001-.0015" (#1, 4). .002-.0025" (#2, 3).
End Thrust:—Taken at front bearing.
Endplay—.002-.006".
Timing Chain:—Morse No. 1866-N. Width 1¾". Pitch .500". Length 28" or 56 links.
Camshaft Setting:—Install chain and sprockets together with marks adjacent and in line with a straightedge across the shaft centers.
See Packard Shop Notes for Radiator & Fender (unit) removal for work on front end of engine.

VALVES:—	Head Diameter	Stem Diameter	Length
Intake	1 41/64"	.3405"	6 35/64"
Exhaust	1 21/32"	.338"	6 35/64"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.3125"	.002-.0025"
Exhaust	45°	.3125"	.0045-.005"

Tappet Clearance—None (automatic take-up).
Automatic Tappet Take-up:—Hydraulic type (using engine oil pressure). Must be checked when valves ground.
See article in Mechanical Equipment Section for data.
Valve Springs:—Install springs with painted end down and close-spaced first coil toward valve head. Special 1/32" higher stem keeper furnished (compensating for low pressure due to reseating valves).

	Spring Pressure	Spring Length
Valve Closed	65-75 lbs.	2 7/32"
Valve Open	140-150 lbs.	1 29/32"

NOTE—Serrated washer on top of spring to prevent rotation.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open at TDC. Close 45° ALDC.
Exhaust Valves—Open 35° BLDC. Close 10° ATDC.
To Check Timing—Intake valve for #1 (front cylinder, right bank) begins to open with piston on top dead center when '#1R-UDC' mark on dampener lines up with pointer on chain case cover. (permissable variation 9/16" either side of mark). Removal of right cylinder head and dial indicator mounted over valve recommended to check opening.
Motor Gauge—Weidenhoff Adapter #104 (with 10 MM. adapter), Rod #2.
LUBRICATION:—Pressure system with gear type oil pump mounted in crankcase. Oil filter and temperature regulator mounted on right side of engine.
Normal Oil Pressure:—55-60 lbs. max., 5 lbs. min. idling (SAE #20 oil, engine warm or 150° F.).
Oil Pressure Regulator:—Located under plug on right side of crankcase below filter. Remove acorn nut and adjust by turning slotted screw.
Pressure Relief Valves—Non-adjustable relief valve in regulator housing opens at 17 lbs. back-pressure in filter and cooler and by-passes oil directly to manifold. By-pass valve in filter opens at 7-8 lbs.
Valve Silencer Metering Valve—Spring loaded type in pump body, exposed by removing pump cover.
Crankcase Capacity:—10 quarts.
COOLING SYSTEM:—Water Capacity—40 quarts.
Water Pump:—Adjustable packing type, mounted on ball bearings, driven by twin Vee belts.
See article in Mechanical Equipment Section for data.
Removal—With water drained and fan belts removed, disconnect pump hose, remove pump mounting bolts, lift fan and pump assembly off.
Thermostat:—In top radiator tank. Operates shutters.
Setting—Starts 135° F. Fully open 150° (no load). Cover stamped 150°. NOTE—Special thermostat (for heater use with permanent anti-freeze) starts to open at 160°, fully open 170-175°. Marked 175°.
Adjustment—At room temperature with thermostat sylphon closed, pull back on shutter pullrod to close shutters, tighten nut to remove all slack in rod, then tighten one turn additional for pre-load.
CLUTCH:—Long Model 12CB-CL. Single plate, dry disc type with Bendix Vacuum Power operation.
See article in Mechanical Equipment Section for data.
Facings—Endless-compressed (Hyco DV 3903 PDX), 2 required. I.D. 7". O.D. 12". Thickness .137".
Pedal Adjustment:—Vacuum Power unit must be adjusted whenever pedal free travel insufficient (should be 1-1 13/16"). *See article in Mechanical Equipment Section for complete directions.*
Removal:—Remove transmission (see Transmission Removal following), take out cover mounting screws (release pressure evenly), lift assembly out. Align '0' marks on flywheel and cover when reassembling.
TRANSMISSION:—Own Make. Helical gear type with synchronizer for second and high speeds.
See article in Mechanical Equipment Section for data.
Transmission Control:—Own remote control type.
See article in Mechanical Equipment Section for data.
Removal:—Remove ground cable, speedometer cable, propeller shaft, light switch, two stud nuts (case bracket to rubber support) at each side, hand brake cable at equalizer, left stabilizer link, clutch pedal pull-rod, and pedal spring. Support engine at rear. Remove right brace rod (rear only), lower crossmember, and bell housing nuts and capscrews. Jack up rear of engine, remove two bolts on each side (holding vertical support members to frame), remove support members, pull transmission back.
UNIVERSAL JOINTS:—Spicer Model 1351-10X (front), 1358-18X (rear). Needle bearing type, 2 used.
See article in Mechanical Equipment Section for data.
REAR AXLE:—Own Make. 'Angle-Set', semi-floating, hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.41-1 (std.), 4.69-1, 4.06-1 (optl.).
Backlash—.003-.005". Screw adjustment.
Removal:—Remove wheel, hub, brake assembly, wheel bearing and axle shaft. Disconnect rear universal joint at flange, drop drive shaft, remove differential from housing by removing housing bolt nuts (below), and locknut on stud (at top). Remove carrier.
Wheel Bearing Adjustment—Controlled by shims between outer race of inner bearing and shoulder in housing. Remove wheel, hub and brake assembly, wheel bearing and axle shaft. Add or remove shims adjust each wheel independently.
Endplay—.003" (plus or minus .001") at each wheel.
SHOCK ABSORBERS:—Delco. Model 1952-B, C (front), 2006-G, H (rear). Double acting, hydraulic type.
See article in Mechanical Equipment Section for data.
STEERING:—Steering Gear—Packard (Gemmer design) Worm-and-Roller type with push-pull adjustment. *See article in Mechanical Equipment Section.*
Front Suspension:—Packard Safe-T-fleX type with coil springs.
See article in Mechanical Equipment Section for data.
NOTE—Frame Height must be set first before checking Caster and Camber.
Frame Height—With car on level floor, distance from floor to top of frame side rail at front wheel center-line 20½" (load car for correct figure).
Kingpin Inclination—1½° crosswise.
Camber—1° plus or minus ¼°. Adjustable.
Caster—0° (½° reverse max.). Shim adjustment.
Toe In—1/32-⅛". Adjust by turning tie rods equally (check for equal lengths after adjustment).
BRAKES:—Service—Bendix hydraulic, duo-servo, single anchor type with Vacuum Power operation. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Drum—Centrifuse. Diameter—14".
Lining—Primary (Raybestos No. 451). Secondary (U.S. Asbestos No. 589). Width 2¾". Thickness ¼". Length 15" per shoe.
Clearance—.010" at heel and toe of each shoe.
Hand Brake:—See Service Brakes.
Vacuum Power Unit:—Bendix internal valve type.
See article in Mechanical Equipment Section for data.

SERIAL NUMBER:—First number (54 137" WB) 1,050,001, (54 142" WB) 1,525,001, (836, 9 136" WB) 1,070,001, (836, 9 139" WB) 1,550,001. On plate on right hand frame side member behind right front spring rear shackle.

ENGINE NUMBER:—Stamped on left hand side cylinder block below head at center.

ENGINE:—Eight cylinder In line, 'L' head type. Cylinders cast enbloc.
Dimensions—Bore 3½". Stroke 4¾". Displacement 366 cubic inches.
Horsepower—Rated 39.2. Developed (54 '32) 125 at 3000 R.P.M. (836, 9 '33) 135 at 3400 R.P.M.
Compression Ratio—5.05-1 (54 '32), 5.5-1 (836, 9 '33). No optional ratios.
Compression Pressure—Approximately 88 lbs. (5.05-1 head), 95 lbs. (5.5-1 head) at cranking speed.
Vacuum Reading—Steady reading of 18-20" at idling speed.

Pistons:—Bohn Aluminum Bohnalite, Invar Strut type. Pistons furnished in standard oversizes of .002", .004", .010", .020".
Weight—No variation allowed in complete set.
Length—4¼".
Removal—Piston and rod assembly removed from top of engine.
Clearance—Top, .019-.026", bottom, .001-.007" (across bosses), .000-.005" (at right angles to bosses).
Fitting New Pistons—Pistons should be snug on .0015" feeler and locked on .002" feeler.

Piston Rings:—Four rings per piston, #1 and 2—compression rings, #3—oil scraper ring, #4—oil control ring. Lower ring groove drilled radially with oil drain holes.

Ring	Width	End Gap	Wall Thickness	Side Clearance in Groove
Comp. (#1 & 2)	.1235"	.015-.020"	.145"	.001-.002"
Scraper (#3)	.1235"	.015-.020"	.145"	.001-.002"
Oil Cont. (#4)	.186"	.028"	.145"	.001-.002"

Piston Pin:—Diameter, .937". Length, 3 1/16". Pin is locked in rod.
Piston Pin Fit in Piston—Thumb push fit. Clearance, .0005-.0008".

Connecting Rod:—Length 9.029". Weight 37.89 ozs. ¼ oz. maximum variation allowed in entire set.
Crankpin Journal Diameter—2¼".
Big End Bearing—Centrifugally cast babbitt-lined type. No shims.
Clearance—.001-.002". Sideplay .006-.009".
Adjustment—None (no shims used). Bearings .010" and .020" undersize furnished for service.
NOTE:—Oil spray holes are drilled in both sides of connecting rod lower bearing upper half.

Crankshaft:—Nine main bearing type with integral counterweights.
Journal Sizes—2⅝" diameter (all bearings).
Bearing Type—Bronze-backed, babbitt-lined. No shims.
Clearance—.0015-.003".
Adjustment—None (no shims used).
End Thrust—Taken by #1 (front) main bearing. Endplay, .002-.004". Adjustable by adding or removing shims.

Camshaft:—Six bearing type. Camshaft drive—Non-adjustable chain.
Bearing Type—Steel-backed, babbitt-lined type.
Clearance—.002". Endplay .003-.009".
Chain—Whitney No. E-206. Width, 1½". Length, 50 links. Pitch, ½".
Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers (center the two '0' marks on camshaft sprocket on straightedge).

Valves—	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1 21/32"	.3725"	4¾"	45°	.359"
Exhaust	1 9/16"	.3715"	4¾"	45°	.359"

Stem-to-Guide Clearance—.002-.003" (intake and exhaust valves).
Tappet Clearance (54 '32)—.004" Intake, .006" Exhaust with engine hot.
Tappet Clearance (836, 9 '33)—None in service (Hydraulic valve tappet take-up used). See data below.

Valve Springs—Install springs with small end up. Flat coil spring type dampener assembled on outside of all springs at top.

Spring Specifications—Model 54 (1932)

	Spring Pressure	Spring Length
Valve Closed	50-55 lbs.	2 1/16"

Spring Specifications—Model 836, 9 (1933)

	Spring Pressure	Spring Length
Valve Closed	60-64 lbs.	2 1/16"
Valve Open	120-125 lbs.	1¾"

Valve Timing

Intake Valves Open—5° ATDC. Close—45° ALDC.
Exhaust Valves Open—40° BLDC. Close—12° ATDC.
To Check Valve Timing (54 '32)—Check tappet clearance #1 intake valve. This valve should open with piston 5° or .0115" after top dead center when flywheel mark 'IN.OP./1-8' lines up with indicator in inspection hole in flywheel housing.
Motor Gauge—Weidenhoff Adapter #102, Rod #2.
To Check Valve Timing (836, 9 '33)—Remove #1 intake hydraulic valve lifter, pull out plunger, remove spring, wash lifter assembly in gasoline, replace plunger, install lifter assembly in bracket. Check clearance between end of plunger and valve stem (clearance will be about .070" with valve closed), insert sufficient feeler stock to take up all except .010" clearance. This valve should open with piston 5° or .0115" past top dead center when flywheel mark 'IN.OP./1-8' lines up with indicator in inspection hole in flywheel housing. Remove feeler stock, reassemble hydraulic valve lifter in engine (install dry and run engine until lifter is quiet).
Hydraulic Valve Lifters—See article in Mechanical Equipment Section for complete servicing and installation directions.

LUBRICATION:—Pressure type. Gear type oil pump located in crankcase.
Normal Oil Pressure—40 lbs. at 40 M.P.H.
Oil Pressure Relief Valve—Operates at 40 lbs. Located at pump. Adjustable by adding or removing spacer washers.
Capacity and Oil—9 qts. Use SAE. #30 (summer), #20 (winter).

CLUTCH:—**Long Model 29-A.** Double plate, dry disc type. See article in Clutch Section for complete relining and assembling directions.
Facings—Moulded type, 4 required. Thickness .130". Inside Diameter 6¼". Outside Diameter 9¾".
Adjustment—Clutch pedal free movement should be ¾-1¼".

STEERING:—**Steering Gear**—Ross Cam-and Roller type. See article in Steering Section for complete adjustment directions.
Front Suspension:—Conventional 'I' beam section front axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—8° crosswise.
Caster—1¾°. Adjust by inserting wedge shims between spring and spring pad on axle.
Camber—1°. No adjustment provided.
Toe In—⅛-3/16". Adjust in usual manner by loosening clamp bolts and turning tie rod.

BRAKES (1932):—**Service**—Bendix Mechanical, Duo-Servo, Single-anchor type. Hand lever applies all four service brakes. See article in Brake Section for complete adjustment directions.
Drum Diameter—16".
Lining—Moulded type. Width 2¼". Thickness ¼". Length 32⅜" per wheel
Clearance—.010" at heel and toe for each shoe.
Hand Brake:—See Service Brake and Service Brake Adjustment above.

BRAKES (1933):—**Service**—Stewart-Warner mechanical four wheel type with transmission power unit application. Hand lever applies all four service brakes. See article in Brake Section for complete adjustment directions.
Drum Diameter—16".
Lining—Moulded type. Width 2¼". Thickness .270". Length 38" per wheel.
Clearance—.012" for heel and toe of each shoe (rear brakes), .009" for heel and toe of each shoe (front brakes).
Hand Brake:—See Service Brake and Service Brake Adjustment.
Power Unit:—Stewart-Warner Transmission type mechanical power unit. See article in Brake Section for complete data.

SERIAL NUMBER:—On plate on right hand frame side rail directly behind right front spring rear shackle. First numbers as follows:

Model	136" WB	137" WB	139" WB	142" WB	147" WB
51					
52				3,075,001	3,500,001
53		2,050,001		2,550,001	
1236	2,075,001		2,575,001		
1242		3,100,001		3,525,001	
1247				3,525,001	3,550,001

ENGINE NUMBER:—Stamped on left side of engine below cylinder head at center.

ENGINE:—Twelve cylinder, 80° V, 'L' head type. Cylinders cast enbloc for each bank.

Bore—3¼" (53 '32), 3⅜" (51, 52 '32; 1236 '33), 3½" (1242, 47 '33).

Stroke—4" all models.

Displacement—398 cu. ins. (3¼" bore), 429 cu. ins. (3⅜" bore), 462 cu. ins. (3½" bore).

Horsepower—For each engine as follows:

Model	Rated Horsepower	Developed Horsepower
51, 52 '32	54.60	150 at 3100 R.P.M.
53 '32	50.80	140 at 3100 R.P.M.
1236 '33	54.60	160 at 3400 R.P.M.
1242, 47 '33	58.80	175 at 3400 R.P.M.

Compression Ratio—5.05-1 (all models '32), 6-1 (all models '33).

Compression Pressure—Approximately 85-90 lbs. (5.05-1 head), 100-105 lbs. (6-1 head) at cranking speed.

Vacuum Reading—Steady reading of 18-20" at idling speed.

Pistons:—Bohn Aluminum, Bohnalite, Invar Strut type. Pistons furnished in standard oversizes of .002", .004", .010", .020".

Weight—No variation allowed in complete set.

Removal—Piston and rod assembly removed from top of engine.

Clearance—Top, .019-.026". Bottom, .001-.007" (across bosses), .000-.005" (at right angles to bosses).

Fitting New Pistons—New pistons should be snug on .0015" feeler and locked on .002" feeler.

Piston Rings:—Four rings per piston, #1 and 2—compression rings, #3—oil scraper ring, #4—oil control ring. Lower ring groove drilled radially with oil drain holes.

Ring	Width	End Gap	Side Clearance
Compression (all)	.1235"	.015-.020"	.001-.002"
Oil Control (#4)	.186"	.028"	.001-.002"

Piston Pin:—Diameter, .875". Length, 2.750". Pin floats in rod and piston and is held in place by two locking rings. Pin hole in upper end of connecting rod is bronze bushed.

Pin Fit in Piston—Thumb push fit at 160°F.

Pin Fit in Rod—Bushing reamed to provide clearance of .0004-.0006".

Connecting Rod:—Length, 9.936". Weight, ⅛ oz. variation allowed in entire set.

Crankpin Journal Diameter—2.1265".

Big End Bearing—Centrifugally cast babbit-lined type. No shims.

Clearance—.001-.002". Sideplay .006-.009".

Adjustment—None (no shims used). Bearings .010" and .020" undersize furnished for service.

NOTE:—Oil spray holes are drilled in both sides of connecting rod lower bearing upper half.

Crankshaft:—Seven main bearing type with integral counterweights.

Journal Sizes—2.49" diameter (all bearings).

Bearing Type—Bronze-backed, babbitt-lined. No shims.

Clearance—.0015-.003".

Adjustment—None (no shims used).

End Thrust—Taken by #1 (front) main bearing. Endplay, .002-.004". Adjustable by adding or removing shims.

Camshaft:—Four bearing type. Camshaft drive, non-adjustable chain.

Bearing Type—Steel-backed, babbitt-lined type.

Clearance—.002". End play .003-.009".

Chain—Whitney, Type CL-206-G. Width, 1½". Length, 53 links. Pitch, .500".

Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

Valves—	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1 21/32"	.3725"	4¾"	45°	.312"
Exhaust	1 9/16"	.3715"	4¾"	45°	.312"

Stem-to-Guide Clearance—.002-.003" (all valves).

Tappet Clearance (1932)—.004" Intake, .006" Exhaust with engine hot.

Tappet Clearance (1933)—None in service. Hydraulic valve tappet take-up used. See data below.

Valve Springs—Install springs with small end up. Flat coil type dampener assembled on outside of all springs at top.

Spring Specifications—1932 Models

	Spring Pressure	Spring Length
Valve Closed	50-55 lbs.	2 1/16"

Spring Specifications—1933 Models

	Spring Pressure	Spring Length
Valve Closed	60-64 lbs.	2 1/16"
Valve Open	120-125 lbs.	1¾"

Valve Timing—See Camshaft Setting above.

All 1932 Models and First 68 Cars Model 1236 (1933)

Intake Valves—Open 4° Before TDC. Close 52° After LDC.

Exhaust Valves—Open 40° Before LDC. Close 16° After TDC.

All 1933 Models Except First 68 Cars Model 1236

Intake Valves—Open 19° Before TDC. Close 69° After LDC.

Exhaust Valves—Open 56° Before LDC. Close 28° After TDC.

To Check Valve Timing (1932 Models)—Check tappet clearance #1 intake valve (front cylinder left bank). This valve should open with piston 4° or .0059" before top dead center when flywheel mark 'IN.OP.NO.1' lines up with indicator in inspection hole in flywheel housing.

To Check Valve Timing (1933 Models)—Remove #1 intake hydraulic valve lifter, pull out plunger, remove spring, wash lifter assembly in gasoline, replace plunger, install lifter assembly in bracket. Check clearance between end of plunger and valve stem (clearance will be about .070" with valve closed), insert sufficient feeler stock to take up all except .004" clearance. This valve should open with piston 4° or .0059" (First 68 cars Model 1236), 19° or .1303" (all others) before top dead center when flywheel mark 'IN.OP.NO.1' lines up with indicator in inspection hole in flywheel housing. Remove feeler stock, reassemble hydraulic valve lifter in engine (install dry and run engine until quiet).

Hydraulic Valve Lifters—See article in Mechanical Equipment Section for complete servicing and installation directions.

LUBRICATION:—Pressure type. Gear type oil pump located in crankcase.

Normal Oil Pressure—40 lbs. at 40 M.P.H.

Oil Pressure Relief Valve—Located at oil pump. Adjustable by adding or removing spacing washers.

Crankcase Capacity—14 qts. (dry), 12 qts. (refill). Use SAE. #30 (summer), #20 (winter).

CLUTCH:—**Long Model 29-A.** Double plate, dry disc type. See article in Clutch Section for complete relining and assembling directions.

Facings—Moulded type, 4 required. Thickness .130". Inside Diameter 6¼". Outside Diameter 9¾".

Adjustment—Clutch pedal free movement should be ¾-1¼".

STEERING:—**Steering Gear**—Ross Cam-and Roller type. See article in Steering Section for complete adjustment directions.

Front Suspension:—Conventional 'I' beam section front axle with Reverse-Elliott ends and semi-elliptic springs.

Kingpin Inclination—8° crosswise.

Caster—1¾°. Adjust by inserting wedge shims between spring and spring pad on axle.

Camber—1°. No adjustment provided.

Toe In—⅛-3/16". Adjust in usual manner by loosening clamp bolts and turning tie rod.

BRAKES (1932):—**Service**—Bendix Mechanical, Duo-Servo, Single-anchor type. Hand lever applies all four service brakes. See article in Brake Section for complete adjustment directions.

Drum Diameter—16".

Lining—Moulded type. Width 2¼". Thickness ¼". Length 32⅜" per wheel

Clearance—.010" at heel and toe for each shoe.

Hand Brake:—See Service Brake and Service Brake Adjustment above.

BRAKES (1933):—**Service**—Stewart-Warner mechanical four wheel type with transmission power unit application. Hand lever applies all four service brakes. See article in Brake Section for complete adjustment directions.

Drum Diameter—16".

Lining—Moulded type. Width 2¼". Thickness .270". Length 38" per wheel.

Clearance—.012" for heel and toe of each shoe (rear brakes), .009" for heel and toe of each shoe (front brakes).

Hand Brake:—See Service Brake and Service Brake Adjustment.

Power Unit:—Stewart-Warner Transmission type mechanical power unit. See article in Brake Section for complete data.

SERIAL NUMBER:—On plate on right side of frame at rear of right front spring rear shackle under fender. First number as follows:

	136" WB	138" WB	144" WB
836A	1,080,001		1,560,001
840A		2,080,001	2,580,001
840A		2,090,001	2,590,001

ENGINE NUMBER:—Stamped on left side of cylinder block below head at center.

ENGINE:—Own. Eight Cylinder, In line, 'L' head type.
Bore—3½". **Stroke**—4¾" (836A), 5" (840A, 845).
Displacement—366 cu. ins. (836A), 385 (others).
Rated Horsepower—39.2.
Developed Horsepower—135 (836A), 140 (840A, 845) at 3400 R.P.M.
Compression Ratio—5.5-1. No optional ratios.
Compression Pressure—100 lbs. at 350 R.P.M. or 80-85 lbs. at cranking speed.
Vacuum Reading—Gauge should show stead reading of 18-20" with engine idling.

Pistons:—Bohn, Bohnalite aluminum alloy, Invar Strut, split skirt type. Replacement pistons furnished in standard oversizes of .002", .004", .010", .020". Piston length, 4¼".
Weight—22.61 ozs. minimum, 22.73 ozs. maximum without rings or pin.
Removal—Pistons and rods removed from above.
Clearance—Top .019-.026". Bottom .000-.005" at right angles to bosses, .001-.007" across bosses. See Fitting New Pistons.
Fitting New Pistons—Pistons should be snug on .0015" feeler and locked on .002" feeler.
Installing Pistons—Slot should be toward left viewed from driver's seat).

Piston Rings:—Four rings per piston, three compression rings, one oil control ring, all above pin. Oil ring groove drilled radially with oil drain holes.

Ring	Width	End Gap	Side Clearance
Comp. All	.1235-.1240"	.013-.018"	.001-.002"
Oil Cont.	.1860-.1865"	.013-.018"	.001-.002"

Piston Pin:—Diameter—.937" ('34), .9355-.9359" ('35). Length 3 1/16". Pin is locked in rod.
Clearance In Piston—.0005-.0008" or thumb push fit.

Connecting Rod:—Length 9.029" (836A), 8.904-8.905" (840A, 845). Weight 21.89 ozs. (836A). ⅛ oz. variation allowed in entire set.
Crankpin Journal Diameter—2.251-2.2515".
Lower Bearing—Centrifugally cast, babbitt-lined type. No shims used.
Clearance—.001-.0025". Sideplay, .004-.007".
Adjustment—None. Replace rods. Do not file caps.

NOTE—Oil spray holes drilled in both sides of connecting rod lower bearing upper half. Rods are installed at factory with piston pin clamp on same side as piston slot (left side).

Crankshaft:—Nine bearings. Integral counterweights.
Journal Diameters—2⅝" all bearings.
Bearing Type—Steel or bronze backed, babbitt-lined type. No shims used.
Clearance—.0015-.003".
Adjustment—None. Replace the bearings. Do not file caps.
End Thrust—Taken by front bearing. Endplay, .002-.004". Adjustable by adding or removing shims.

Camshaft:—Six bearings. Non-adjustable chain drive.
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.002". Endplay, .003-.009".
Timing Chain—Whitney #CL-206. Width 1½", Pitch ½", Length 25" or 50 links.
Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that a straight-edge across the shaft centers splits the 'O' mark on the crankshaft sprocket and is midway between the two 'O' marks on the camshaft sprocket.

Valves:—

	Head Diameter	Stem Diameter	Length
Intake	1 21/32"	.3725-.3735"	4¾"
Exhaust	1 9/16"	.3715-.3725"	4¾"

	Seat Angle	Lift '34	Lift '35	Stem Clearance
Intake	45°	.359"	.355"	.0015-.0025"
Exhaust	45°	.359"	.355"	.0025-.0035"

Tappet Clearance (836A)—.004" Intake, .006" Exhaust, with engine hot.
Tappet Clearance (840A, 845)—None in service. See data below on hydraulic valve lifters.
Valve Springs—Install springs with small end up. Flat coil spring type dampener assembled on outside of all springs at top.

	Spring Pressure	Length '34	Length '35
Valve Closed	60-65 lbs.	2 1/16"	2 3/32"
Valve Open	120-128 lbs.	1¾"	1 25/32"

Valve Timing—See Camshaft Setting above.
Intake Valves—Open 5° ATDC. Close 45° ALDC.
Exhaust Valves—Open 40° BLDC. Close 12° ATDC.

To Check Valve Timing (836A)—Set tappet clearance #1 intake valve at .006". This valve should open with piston .0115" past top dead center when flywheel mark 'IN.OP/1-8' registers with indicator on flywheel housing. This mark is 5° after top dead center mark 'UDC/1-8'. Reset tappet clearance at .004" with engine hot.

To Check Timing (840A, 845)—Remove #1 intake hydraulic valve lifter, pull out plunger, remove spring, wash lifter assembly in gasoline, replace plunger, install lifter in bracket. Check clearance between end of plunger and valve stem (valve closed—clearance will be about .070"). Insert sufficient feeler stock to take up all except .010" clearance. Turn engine over until piston #1 slightly past top dead center, stop when flywheel mark 'IN.OP./1-8' lines up with indicator on housing. #1 intake valve should begin to open at this point. Remove feeler stock, reassemble hydraulic valve lifter as directed below.
Motor Gauge—Weidenhoff Adapter #114, Rod #29.
Installing Hydraulic Valve Lifters — Hydraulic valve lifters should always be installed without oil. Oil in lifter will retard escape of air and delay quieting of lifter when engine is operated. Remove plunger from lifter body, wash out all oil with gasoline. Do not interchange plungers—they are selective fit in lifter bodies—this is important. When lifters are installed (new or after grinding valves), check mechanical clearance with lifter dry (all oil removed from assembly). To check clearance, compress plunger spring by prying between plunger cap and valve stem, use feeler to check clearance. Clearance at this point must be .015". If clearance is insufficient, remove lifter from bracket, grind end of plunger slightly. Do not grind into check ball retaining pin.
Servicing Hydraulic Valve Lifters—*See article in Mechanical Equipment Section for complete data.*

Lubrication:—Pressure. Gear type oil pump located in crankcase.
Normal Oil Pressure—35 lbs. at 40 M.P.H.
Oil Pressure Relief Valve—Located at pump. Adjustable by adding or removing spacer washers.
Capacity & Oil—10 qts. (dry), 9 qts. (refill). Use SAE #30 (above 30°F), #20-W (30° to 0°F), #10-W (temperatures below 0°F).

CLUTCH:—Long Model 29-A. Double plate dry disc type. No adjustment required for wear. See article in Clutch Section for relining and assembling directions.
Clutch Pedal Adjustment — Free movement of clutch pedal must be ¾-1¼".
Clutch Facings—Moulded type, 4 required, 6¼" I.D., 9¾" O.D., .130" thick.

STEERING: — Front Suspension — Conventional axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—8° crosswise.
Caster—¾° **Camber**—1°
Toe In—¼" (⅛-3/16").

Steering Gear:—Ross Cam-and-Roller type.
See article in Mechanical Equipment Section for data.

BRAKES:—Service—Stewart-Warner mechanical four wheel type with transmission power unit application. Hand lever applies all four service brakes. See article in Brake Section for complete data.
Drum Diameter—16".
Lining—Moulded type. Width 2¼". Thickness .270" ('34), ¼" ('35). Length per wheel 38".
Clearance—.012" at heel and toe of each shoe in rear brakes, .009" at heel and toe of each shoe in front brakes.

Hand Brake Adjustment:—See Service Brakes.

Power Unit:—Stewart-Warner Transmission type mechanical power unit used. See article in Brake Section for complete data.

SERIAL NUMBER:—On plate on right side of frame at rear of right front spring rear shackle under fender. **First number (1934)**—(1240-A, 138" WB.) 3,110,001, (1240-A, 144" WB.) 3,530,001, (1248-A, 147" WB.) 3,560,001. **First number (1935)**—(1245, 138" WB.) 3,120,001, (1245, 144" WB.) 3,540,001, (1255, 147" WB.) 3,570,001.

ENGINE NUMBER:—Stamped on left side of left cylinder block below head at center.

ENGINE:—Twelve cylinder, 80° included angle Vee, 'L' head type. Cylinders cast Enbloc for each bank.
Bore—3½". **Stroke**—4".
Piston Displacement—462 cubic inches.
Rated Horsepower—58.8.
Developed Horsepower—175 at 3400 R.P.M.
Compression Ratio—6.0-1 (std.), 6.5-1 and 7.0-1 (optional). High compression heads are formed by milling off face of standard head to reduce combustion chamber.
Compression Pressure—115 lbs. at 350 R.P.M. or 80-85 lbs. at cranking speed (std. 6.0-1 head).
Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling.

Pistons:—Bohn, Bohnalite aluminum alloy, Invar Strut, split skirt type. Replacement pistons furnished .002", .004", .010", .020" oversize. Piston length 4¼".
Weight—22.70 ozs. minimum, 22.82 ozs, maximum.
Removal—Pistons and rods removed from above.
Clearance—Top .019-.026", Bottom .000-.005" at right angles to bosses, .001-.007" across bosses. See Fitting new pistons.
Fitting New Pistons—Pistons should be snug on .0015" feeler and locked on .002" feeler.
Installing Pistons—Slot should be toward left on both banks (viewed from driver's seat).

Piston Rings:—Four rings per piston, three compression rings, one oil control ring, all above pin. Oil ring groove drilled radially with oil drain holes.

Ring	Width	End Gap	Side Clearance
Comp. All	.1235-1240"	.013-.018"	.001-.002"
Oil Cont.	.1860-.1865"	.013-.018"	.001-.002"

Piston Pin:—Diameter .8749-.8751". Length 2.750" ('34), 3.031-3.041" ('35). Pin floats in piston and rod. Pin hole in rod is bronze bushed.
Pin Fit in Piston—Thumb push fit with piston at 160°F.
Clearance in Rod Bushing—.0004-.0006".

Connecting Rod:—Weight, ⅛ oz. variation allowed in entire set. Length 9.936-9.939".
Crankpin Journal Diameter—2.2160-2.2165".
Lower Bearing—Centrifugally-cast, babbitt-lined type. No shims used.
Clearance—.001-.0025".. Sdieplay, .006-.010".
Adjustment—None. Replace rods. Do not file caps. Bearings .010" and .020" undersize furnished for service.

NOTE—Oil spray holes are drilled in both sides of connecting rod lower bearing upper half. Rods are installed at factory with chamfer in crank pin bore next to crankshaft cheek (rods mounted side by side).

Crankshaft:—Seven bearings. Integral counterweights.
Journal Diameters—2.49" ('34), 2½" ('35), all bearings.
Bearing Type—Steel or bronze backed, babbitt-lined type. No shims used.
Clearance—.0015-.003".
Adjustment—None. Replace bearings. Do not file caps.
End Thrust—Taken by front bearing. Endplay, .002-.004". Adjustable by adding or removing shims.

Camshaft:—Four bearings. Non-adjustable chain drive.
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.002". Endplay, .003-.009".
Timing Chain—Whitney #CLG-206. Width 1½", Pitch ½", Length 26½" or 53 links.
Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

Valves:—

	Head Diameter	Stem Diameter	Length
Intake	1 21/32	.3725-.3735"	4¾"
Exhaust	1 9/16	.3715-.3725"	4¾"

	Seat Angle	Lift '34	Lift '35	Stem Clearance
Intake	45°	.312"	.324"	.0015-.0025"
Exhaust	45°	.324"	.324"	.0025-.0035"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.324"	.0015-.0025"
Exhaust	45°	.324"	.0025-.0035"

Tappet Clearance—None in service. See data below on hydraulic valve lifters.
Valve Springs—Install springs with small end up. Flat coil spring type dampener installed on all springs at top.

	Spring Pressure	Length '34	Length '35
Valve Closed	60-65 lbs.	2 1/16"	2 3/32"
Valve Open	120-128 lbs.	1¾"	1 25/32"

Valve Timing—See Camshaft Setting above.
Intake Valves—Open 19° BTDC. Close 69° ALDC.
Exhaust Valves—Open 56° BLDC. Close 28° ATDC.
To Check Valve Timing—Remove #1 intake hydraulic valve lifter, pull out plunger, remove spring, wash lifter assembly in gasoline to remove all oil, replace plunger, install lifter in bracket, check clearance between end of plunger and valve stem (valve closed—clearance will be about .070"). Insert sufficient feeler stock to take up all except .004" clearance, turn engine over with #11 piston on compression, stop when flywheel mark 'IN.OP.#1/' lines up with indicator on housing, #1 intake valve should begin to open at this point. Remove feeler stock, reassemble hydraulic valve lifter.
Motor Gauge—Weidenhoff Adapter #114, Rod #42.
Installing and Servicing Hydraulic Valve Lifters—See article in Equipment Section for complete data. Hydraulic valve lifters are interchangeable between 8 and 12 cylinder models except for plunger cap or plug. Short or thin caps are used on 12 cylinder models and a longer or thick cap on 8 cylinder models.

Lubrication:—Pressure. Gear type oil pump located in crankcase.
Normal Oil Pressure—40 lbs. at 40 M. P. H.
Oil Pressure Relief Valve—Located at oil pump. Adjustable by adding or removing spacing washers.
Capacity & Oil—14 qts. (dry), 12 qts. (refill). Use SAE #30 (above 30°F), #20-W (30° to 0°F), #10-W (temperatures below 0°F).

CLUTCH:—**Long Model 29-A.** Double plate dry disc type. No adjustment required for wear. See article in Clutch Section for relining and assembling directions.
Clutch Pedal Adjustment—Free movement of clutch pedal must be ¾-1¼".
Clutch Facings—Moulded type, 4 required, 6¼" I.D., 9¾" O.D., .130" thick.

STEERING:—**Front Suspension** — Conventional axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—8° crosswise.
Caster—¾°. **Camber** 1°.
Toe In—¼" (⅛-3/16").
Steering Gear:—Ross Cam-and-Lever type. See article in Steering Section for adjustments.

BRAKES:—**Service**—Stewart-Warner mechanical four wheel type with transmission power unit application. Hand lever applies all four service brakes. See article in Brake Section for complete data.
Drum Diameter—16".
Lining—Moulded type. Width 2¼". Thickness .270" ('34), ¼" ('35). Length per wheel 38".
Clearance—.012" at heel and toe of each shoe in rear brakes, .009" at heel and toe of each shoe in front brakes.
Hand Brake Adjustment:—See Service Brakes.
Power Unit:—Stewart-Warner Transmission type mechanical power unit used. See article in Brake Section for complete data.

ENGINE NUMBER:—Stamped on left side of cylinder block below head at center of engine.

ENGINE SPECIFICATIONS:—8 cylinder, In Line, 'L' hd.
Bore—3½". **Stroke**—5".
Displacement—385 cubic inches.
Rated Horsepower—39.2 (AMA).
Developed Horsepower—150 at 3400 R.P.M.
Compression Ratio—6.4-1 Std. aluminum head, no optional ratios.
Compression Pressure—148 lbs. at 2500 R.P.M. or 75-80 lbs. at cranking speed.
Vacuum Reading—Gauge should show steady reading of 19-20" with engine idling.

PISTONS:—Bohn, Bohnalite aluminum alloy, Invar strut, split skirt type or Lynite aluminum alloy, "T" slot type with Anodic finish (special hard oxide bearing surface). **Length**—4¼".
Weight—22.71 ozs. (stripped).
Removal—Pistons and rods removed from above.
Clearance—Top .025" (Bohn), .035" (Lynite), Bottom .002". See Fitting New Pistons.

Replacement Pistons:—Pistons furnished in standard oversizes of .002", .004", .010", .020".

Fitting New Pistons:—Pistons should be snug on .0015" feeler and locked on .002" feeler.

Installing Pistons:—Slot should be toward left viewed from driver's seat.

PISTON RINGS:—Before Eng. No. 314480. Four rings per piston, one plain compression ring (top), two Perfect Circle #70 scraper rings (# 2 & 3), one Perfect Circle #85 oil control ring, all above pin. Oil ring groove drilled for oil drainage.

Ring	Width	End Gap	Side Clearance
Comp. (all)	.1235-.1240"	.013-.018"	.001-.002"
Oil Cont.	.1860-.1865"	.013-.018"	.001-.002"

PISTON RINGS:—After Eng. No. 314480. Four rings per piston, two compression (Perfect Circle #70), two oil control (Perfect Circle #85). Both oil ring grooves drilled for oil drainage.

Ring	Width	End Gap	Side Clearance
Compression	.1235"	.020-.025"	.001-.002"
Oil Control	.1545"	.013-.021"	.001-.002"

Pin hole in connecting rod is bronze bushed.

PISTON PIN:—Diameter .8749". Length 3.031".
Pin floats in piston and rod. Held by retaining rings.
Pin Fit in Piston—Thumb push fit at 70° F.
Pin Fit in Rod Bushing—.0004-.0006" clearance.

CONNECTING ROD:—Weight 34.82 ozs. **Length** 8.999".
Crankpin Journal Diameter—2.251-2.2515".
Lower Bearing—Centrifugally cast, babbitt-lined type. No shims used.
Clearance—.001-.0025". Sideplay .004-.006".

Bearing Adjustment:—None (no shims). Replace rods. Do not file caps.
NOTE—Oil spray holes in both sides of connecting rod lower bearing upper half.

CRANKSHAFT:—9 bearing. Integral counterweights.
Journal Diameters—2⅝" all bearings.
Bearing Type—Removable bronze-backed, babbitt-lined. No shims.
Clearance—.0015-.003".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file caps.

End Thrust:—Taken by front bearing. Endplay .002-.004". Adjustable by adding or removing shims.

CAMSHAFT:—6 bearing. Non-adjustable chain drive.
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.002". Endplay .003-.009".

Timing Chain:—Whitney #CL-206. Width 1½". Pitch ½". Length 25" or 50 links.

Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that a straightedge across shaft centers splits the 'O' mark on the crankshaft sprocket and is midway between the two 'O' marks on the camshaft sprocket.
NOTE—Special puller tool necessary to install timing chain. Timing chain must be installed 'endless.'

VALVES:—	Head Diameter	Stem Diameter	Length
Intake	1 9/16"	.3725-.3735"	4¾"
Exhaust	1 9/16"	.3715-.3725"	4¾"

	Seat Angle	Lift	Stem Clear.
Intake	45°	.355"	.0015-.0025"
Exhaust	45°	.355"	.0025-.0035"

NOTE—Exhaust valve lift .343" on 1936 model.

Tappet Clearance—None in service. See data below on Hydraulic Valve Lifters.
See article in Mechanical Equipment Section for data.

Valve Springs:—	Spring Pressure	Spring Length
Valve Closed	60-65 lbs.	2 3/32"
Valve Open	120-128 lbs.	1 25/32"

Valve Lifters:—Hydraulic type providing automatic tappet take-up. See article in Equipment Section for complete data on servicing these units.
NOTE—Hydraulic lifters have been redesigned. Service instructions as given for previous types apply to the new type but new type lifters are not interchangeable in part or as a unit with previous lifters. Lifters used on eight and twelve cylinder engines not interchangeable (longer body used on eight). Cannot be adapted to twelve engine as previously (by changing plunger cap).
Installing Hydraulic Valve Lifters—Install this type lifter without oil. Oil in lifter will retard escape of air and delay quieting of lifter when engine is operated. Remove plunger from lifter body, wash out all oil with gasoline. Do not interchange plungers—they are selective fit in lifter bodies—this is important.

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 5° ATDC. Close 45° ALDC.
Exhaust Valves—Open 40° BLDC. Close 12° ATDC.
To Check Valve Timing—Remove #1 intake hydraulic valve lifter, pull out plunger, remove spring, wash lifter assembly in gasoline, replace plunger, install lifter in bracket. Check clearance between end of plunger and valve stem (valve closed—clearance will be about .070"). Insert sufficient feeler stock to take up all except .010" clearance. Turn engine over until piston #1 is .0123" past top dead center, stop when flywheel mark 'IN.OP./1-8' lines up with indicator on housing. #1 intake valve should begin to open at this point. Remove feeler stock, re-assemble hydraulic valve lifter as directed above.
Motor Gauge—Weidenhoff #114 Adapter, #29 Rod.

LUBRICATION:—Pressure. Gear type oil pump located in crankcase.
Normal Oil Pressure—40 lbs. at 40 M.P.H. (1936), 53 M.P.H. (1937).

Oil Pressure Regulator:—Located at pump. Opens at 50 lbs. Adjustable by adding or removing spacer washers.

Oil temperature Regulator:—Harrison Radiator Co. type.

Crankcase Capacity:—9 qts. (refill). 10 qts. (dry).

CLUTCH:—Long Model 12CB-CL. Single plate, dry disc type. See article in Clutch Section for relining and assembling directions. **No adjustment for wear** required.
Facings—Moulded type, 2 required. Inside diameter 7". Outside diameter 12". Thickness .137".
Adjustment—Free movement of clutch pedal must be ¾-1¼". Screw adjustment provided at bell housing. Pedal should have free clearance at underside of toeboard.

Removal:—Remove transmission (see Transmission Section below), remove clutch housing, take out mounting screws in clutch cover mounting flange on flywheel.

TRANSMISSION:—Warner with Overdrive. Model AS1-T82A (1937-38). Constant mesh, synchro-mesh (second and high), sliding helical gear (low and reverse).
See article in Mechanical Equipment Section for data.

Removal:—Disconnect drive shaft at front universal, take out transmission mounting bolts, pull transmission straight back.

UNIVERSAL JOINTS:—Detroit Series 5350. Roller bearing type, 2 used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—Own Make. Semi-floating, hypoid gear type with Hotchkiss drive.
Ratio—4.58-1.
Backlash—.002-.003". Shim adjustment.

STEERING:—Steering Gear—Ross Model 660. Cam-and-lever type. See article in Steering Section for adjustments.

Front Suspension:—Conventional 'I' beam section axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—8° crosswise.
Caster (1936)—¾° plus or minus ¼° for axles with plain bearings, 1° plus or minus ¼° for axles with needle bearings. Spring seat on axle should tilt down at rear 4° 15' (axles with plain bearings), 4° (axles with needle bearings). Correct caster by inserting wedge shims between spring and spring pad on axle.
Caster (1937)—1° for all cars. Adjust in same manner.
Camber—1° (plus or minus ½°). Wheel felloe at top of wheel should be not more than 15/32" or less than 5/32" outside felloe at bottom. No adjustment provided.
Toe In—3/16" plus 0" or minus 1/16" (1936), ¼" (1937). Adjust in usual manner by loosening clamp bolts and turning tie rod.
Steering Geometry—Inner wheel turned 40°, outer wheel 30°.

BRAKES:—Service—Stewart-Warner mechanical four wheel type with vacuum power operation. Hand lever applies all four service brakes.
See article in Mechanical Equipment Section for data.
Drum Diameter—16".
Lining—Moulded type. Width 2¼". Thickness ¼". Length per wheel 38".
Clearance—.009" (front wheels), .012" (rear wheels), at heel and toe of each shoe.
Hand Brake Adjustment:—See Service Brakes.
Power Unit:—Bendix vacuum power unit.
See article in Mechanical Equipment Section for data

ENGINE NUMBER:—Stamped on left cylinder block below head at center of engine.

ENGINE SPECIFICATIONS:—12 cylinder, 80° included angle Vee, 'L' head type. Cylinders cast en bloc for each bank.
Bore—3½". **Stroke**—4".
Displacement—462 cubic inches.
Rated Horsepower—58.8 (AMA).
Developed Horsepower—185 at 3400 R.P.M.
Compression Ratio—6.4-1 Std. aluminum head. No. optional ratios.
Compression Pressure—140 lbs. at 2500 R.P.M. or 80-85 lbs. at cranking speed.
Vacuum Reading—Gauge should show steady reading of 19-20" with engine idling.

PISTONS:—Bohn, Bohnalite aluminum alloy, Invar strut, split skirt type or Lynite aluminum alloy, 'T' slot type with Anodic finish (special hard oxide bearing surface). **Length**—4¼".
Weight—22.70-22.82 ozs. (stripped).
Removal—Pistons and rods removed from above.
Clearance—Top .025" (Bohn), .035" (Lynite), Bottom .002". See Fitting New Pistons.

Replacement Pistons:—Pistons furnished in standard oversizes of .002", .004", .010", .020".

Fitting New Pistons:—Pistons should be snug on .0015" feeler and locked on .002" feeler.

Installing Pistons:—Slot should be toward left on both banks (viewed from driver's seat).

PISTON RINGS (1936):—Four rings per piston, three compression, one oil control, all above pin. Oil Ring groove drilled radially with oil drain holes.

Ring	Width	End Gap	Side Clearance
Comp. (all)	.1235-.1240"	.013-.018"	.001-.002"
Oil Cont.	.1860-.1865"	.013-.018"	.001-.002"

PISTON RINGS (1937-38):—Four rings per piston, two compression (one stepped ring, one plain), two oil control, all above pin. Both oil ring grooves drilled radially with oil drain holes.

Ring	Width	End Gap	Side Clearance
Compression	.1235"	.020-.025"	.001-.002"
Oil Control	.1545"	.013-.021"	.001-.002"

PISTON PIN:—Diameter—.8749-.8751".
Length—3.031-3.041".
Pin floats in piston and rod. Held by retaining rings. Pin hole in rod is bronze-bushed.

Pin Fit in Piston:—Thumb push fit at 70° F.

Pin Fit in Rod Bushing:—.0004-.0006" clearance.

CONNECTING ROD:—Weight—35.62 ounces.
Length—9.936-9.939" (center-to-center).
Crankpin Journal Diameter—2.126-2.1265".
Lower Bearing—Centrifugally-cast, babbitt-lined type. No shims used.
Clearance—.001-.0025". Sideplay .006-.009".

Bearing Adjustment:—None (no shims). Replace rods. Do not file caps. Bearings .010" and .020" undersize furnished for service.

NOTE—Oil spray holes are drilled in both sides of connecting rod lower bearing upper half. Rods are installed at factory with chamfer in crankpin bore next to crankshaft cheek (rods mounted side by side).

CRANKSHAFT:—7 bearing. Integral counterweights.
Journal Diameters—2½" all bearings.
Bearing Type—Removable bronze-backed, babbitt-lined. No shims used.
Clearance—.0015-.003".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file caps.

End Thrust:—Taken by front bearing. Endplay .002-.004" Adjustable by adding or removing shims.

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.002". Endplay .003-.009".

Timing Chain:—Whitney CLG-206. Width 1½". Pitch ½". Length 26½" or 53 links.

Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

NOTE—Special puller tool necessary to install timing chain. Install timing chain 'endless.'

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 21/32"	.3725-.3735"	4¾"
Exhaust	1 9/16"	.3715-.3725"	4¾"

	Seat Angle	Lift	Stem Clear.
Intake	45°	.324"	.0015-.0025"
Exhaust	45°	.324"	.0025-.0035"

Tappet Clearance—None in service. See data below on hydraulic valve lifters.

Valve Springs:—Install springs with small end up. Flat coil spring type dampener installed on all springs at top.

	Spring Pressure	Length
Valve Closed	60-65 lbs.	2 3/32"
Valve Open	120-128 lbs.	1 25/32"

Valve Lifters:—Hydraulic type, providing automatic tappet take-up. See article in Equipment Section for complete data on servicing these units.

NOTE—Hydraulic lifters have been redesigned. Service instructions as given for previous types apply to the new type but new type lifters are not interchangeable in part or as a unit with previous lifters. Lifters used on eight and twelve cylinder engines not interchangeable (longer body used on eight). Cannot be adapted to twelve engine as previously

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 19° BTDC. Close 69° ALDC.
Exhaust Valves—Open 56° BLDC. Close 28° ATDC.
To Check Valve Timing—Remove #1 intake hydraulic valve lifter, pull out plunger, remove spring, wash lifter assembly in gasoline to remove all oil, replace plunger, install lifter in bracket, check clearance between end of plunger and valve stem (valve closed—clearance will be about .070"). Insert sufficient filler stock to take up all except .004" clearance, turn engine over with #11 piston on compression, stop when flywheel mark 'IN.OP.#1/' lines up with indicator on housing, #1 intake valve should begin to open at this point. Remove feeler stock, reassemble hydraulic valve lifter.
Motor Gauge—Weidenhoff #114 Adapter, #42 Rod. Piston position should be .1303" BTDC.

LUBRICATION:—Pressure. Gear type oil pump located in crankcase.

Normal Oil Pressure:—45 lbs. at 53 M.P.H.

Oil Pressure Relief Valve:—Located at oil pump. Operates at 50 lbs. Adjustable by adding or removing spacing washers.

Oil Temperature Regulator:—Harrison Radiator Co. type.

Crankcase Capacity:—11 qts. (refill).

CLUTCH:—Long Model 12CB-CL. Single plate, dry disc type. See article in Clutch Section for relining and assembling directions. No adjustment for wear required.
Facings—Moulded type, 2 required. Inside diameter 7". Outside diameter 12". Thickness .137".
Adjustment—Free movement of clutch pedal must be ¾-1¼". Screw adjustment provided at bell housing. Pedal must have free clearance at underside of toeboard.

Removal:—Remove transmission (see Transmission Section below), remove clutch housing, take out mounting screws in clutch cover mounting flange on flywheel.

TRANSMISSION:—Warner with Overdrive. Model AS1-T82A (1937-38). Constant mesh, synchro-mesh (second and high), sliding helical gear (low and reverse).
See article in Mechanical Equipment Section for data.

Removal:—Disconnect drive shaft at front universal, take out transmission mounting bolts, pull transmission straight back.

UNIVERSAL JOINTS:—Detroit Series 5350. Roller bearing type. 2 used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—Own Make. Semi-floating, hypoid gear type with Hotchkiss drive.
Ratio—4.58-1.
Backlash—.002-.003". Shim adjustment.

STEERING:—Steering Gear—Ross Model 660. Cam-and-lever type. See article in Steering Section for adjustments.

Front Suspension:—Conventional axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—8° crosswise.
Caster—¾° (1936), 1° (1937). Adjust by inserting wedge shims between spring and spring pad on axle.
Camber—1° (plus or minus ½°). Wheel felloe at top of wheel should be not more than 15/32" or less than 5/32" outside felloe at bottom. No adjustment provided.
Toe In—¼". Adjusted in usual manner by loosening clamp bolts and turning tie rod.
Steering Geometry—Inner wheel turned 40°, outer wheel 30°.

BRAKES:—Service—Stewart-Warner mechanical four wheel type with vacuum power operation. Hand lever applies all four service brakes.
See article in Mechanical Equipment Section for data.
Drum Diameter—16".
Lining—Moulded type. Width 2¼". Thickness ¼". Length per wheel 38".
Clearance—.009" (front wheels), .012" (rear wheels), at heel and toe of each shoe.

Hand Brake Adjustment:—See Service Brakes.

Power Unit:—Bendix vacuum power unit.
See article in Mechanical Equipment Section for data.

SERIAL NUMBER:—On right front door hinge pillar post.
First number each model as follows:

Six Model PC (1933)	1,759,001.
Deluxe Six Model PF (1934)	2,000,001.
Std. Six Model PF (1934)	1,859,001.
Spec. Six Model PG (1934)	1,020,001.
Deluxe Six Model PE (1934)	2,188,001.

ENGINE NUMBER:—Stamped on boss on left side of cylinder block between #1 and #2 cylinders.
NOTE—Letter 'A' following engine number indicates bore .020" larger than standard. Letter 'B' indicates main and connecting rod bearings .010" smaller than standard. Letters 'AB' indicate that bore and bearing sizes are as above. Letter 'C' indicates that connecting rod bearings outside diameter .005" larger than standard (bearings standard).

ENGINE SPECIFICATIONS:—Six cylinder, 'L' head type. Floating power engine mountings.
Bore—3⅛". Stroke—4⅛" (PC, PD), 4⅜" (PF, G, E).
Displacement—189.8 cu. ins. (PC, PD), 201.31 cu. ins. (PF, G, E).
Rated Horsepower—23.43.
Developed Horsepower—For each model as follows:
Models PC, PD—Std. 5.5-1 head—70 at 3600 R.P.M.
Models PC, PD—Opt. 6.5-1 head—76 at 3600 R.P.M.
Models PF, PG, PE—Std. 5.8-1 head—77 at 3600 R.P.M.
Models PF, PG, PE—Optl. 6.5-1 head—82 at 3600 R.P.M.
Compression Ratio—See above for std. and optl. ratios.
Compression Pressure—Approximately 95 lbs. 5.5-1 head), 100 lbs. (5.8-1 head), 110 lbs. 6.5-1 head) at cranking speed.
Vacuum Reading—Gauge should show steady reading of 16-18" at idling speed.

PISTONS:—Aluminum alloy, 'T' slot, Cam ground type. Pistons cannot be ground. Refinish cylinders to take standard oversize piston. Piston Length—3 11/16".
Weight—Held to ¼ oz. maximum variation.
Removal—Pistons and rods removed from above.
Clearance—.022" top. 0015" skirt. See Fitting Pistons.

Replacement Pistons:—Finished pistons furnished .003", .005", .010", .015", .020", .023", .025", .030", .040", .050", .060" oversize. Install same size piston in all cylinders to maintain balance.

Fitting New Pistons:—Use micrometer gauge to check piston diameter and cylinder bore or .0015" feeler between piston and cylinder wall on side opposite slot.

Installing Pistons:—Slot should be toward left or away from valves.

PISTON RINGS:—Two compression, one undercut oil wiper ring, one oil control ring per piston, all above pin. Lower ring grooves drilled radially with oil drain holes.

Ring	Width	End Gap	Side Clearance
Comp.	⅛"	.005-.010"	.003" Max.
Oil Wiper (#3)	⅛"	.007-.015"	.003" Max.
Oil Control	5/32"	.007-.015"	.003" Max.

PISTON PIN:—Diameter 55/64". **Length—2⅝".** Pin floats in piston and rod. Pin hole in rod is bronze-bushed. Pistons should be heated in boiling water to remove or install pins.
Pin Fit in Piston—Tight thumb push fit with piston heated to temperature of boiling water (212°F.).
Pin Fit in Rod Bushing—Tight thumb push fit at normal room temperature (70°F.).

CONNECTING ROD:—Length—8 1/16" (PC, PD '33), 7 15/16" (PF, G. E '34).
Weight—Held to ¼ oz. maximum variation.
Crankpin Journal Diameter—1 15/16".
Lower Bearing Type—Removable steel-backed, babbit-lined.
Clearance—.001-.00275". Sideplay .003-.009".
Adjustment:—None (no shims). Replace bearings. Do not file rods or caps. Install new bearings with small boss on bearing registering with groove in rod and cap.
Installing Rods:—Lower bearings offset. Install rods with widest half of bearing toward rear (cylinders #1, 3, 5) or toward front (cylinders #2, 4, 6). Oil hole in upper half of lower bearing must be toward camshaft on all rods.

CRANKSHAFT:—4 bearing. Integral counterweights.
Journal Diameters—2¼" all bearings.
Bearing Type—Removable, steel-backed, babbitt-lined.
Clearance—.001-.002".
Adjustment:—None (no shims). Replace bearings. Do not file bearing caps. *See Chrysler Shop Notes for Front Main Bearing Cap removal, and installation and adjustment of replacement bearings and bearing caps.*
End Thrust:—Taken by #4 rear main bearing. Endplay .003-.007".

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Bearing Type (PC, PD '33)—#1 steel-backed. babbitt-lined removable type. #2 3, 4 machined in crankcase.
Bearing Type (PF, G, E '34)—Steel-backed, babbitt-lined removable type except #4 which is machined in crankcase.
Clearance—.0015-.0025". Endplay .003-.005".
End Thrust—Taken by thrust plate at front bearing.
Timing Chain:—Morse. Width 1". Pitch .500". Length 24" or 48 links.
Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. Install chain endless with camshaft sprocket off hub.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 15/32"	11/32"	4 25/32"
Exhause	1 15/32"	11/32"	4 25/32"

NOTE—Valve length 4 11/16" for PC model.

	Seat Angle	Lift	Stem Clearance
Intake	45°	5/16"	.001-.003"
Exhaust	45°	5/16"	.003-.005"

See Chrysler Special Shop Notes for Exhaust valve seat insert removal and installation instructions.
Guide Inside Diameter (new)—.342-.343" (intake), .344-.345" (exhaust).
Tappet Clearance—.005" (intake—hot), .007" (exhaust—hot).

Valve Springs—	Pressure	Length
Valve Closed	34-38 lbs.	1¾"
Valve Open	77-85 lbs.	

Do not compress springs below 1 7/16".

Valve Timing

Intake Valves—Open 6° ATDC. Close 46° ALDC.
Exhaust Valves—Open 42° BLDC. Close 8° ATDC.
To Check Valve Timing—Set tappet clearance #6 intake valve at .011". Use regular timing gauge. This valve should open with piston .015" past top dead center. Reset tappet clearance at .005" (hot).
Motor Gauge—Weidenh ff Adapter #103, Rod #12.

LUBRICATION:—Pressure type. Oil pump located at
Oil Pressure—30-60 lbs. at normal driving speeds.
Oil Pressure Relief Valve—Models PC, PD '33—Located under plug on oil pump cover at right of engine. Not adjustable.
Oil Pressure Relief Valve—Models PF, G, E '34—Located under plug on left hand side of crankcase. Adjustable by replacing spring. Standard springs unpainted. Heavy spring (to increase oil pressure) painted green. Lighter spring (to decrease oil pressure) painted red.
Capacity and Oil—5 qts. Use SAE. #30 (summer), #20-W or 10-W (winter).

CLUTCH:—Borg and Beck Model 9A1 ('33), 9A3 ('34). Single plate, dry disc type. See article in Clutch Section for relining and assembling instructions.
Facings—Moulded type, 2 required. Thickness .133". Inside diameter 5¾". Outside diameter 9".
Adjustment—Adjust clutch pedal stopscrew at lower end of pedal at rear of shaft for highest possible position of the pedal without interference with the floor board. Pedal free movement must be 1¼" ('33), 1⅛" ('34). To adjust, loosen locknut and turn clutch release fork adjusting screw at side of clutch housing.

STEERING:—Steering Gear—Gemmer Worm-and-Sector type (PC, PD '33), Worm-and-Roller type (PF, PG, PE '34). See article in Steering Section for complete adjustment instructions.
Front Suspension (PC, PD '33; PG '34)—Conventional tubular section (PC, PD), 'I' beam section (PG) with Reverse Elliott ends and semi-elliptic springs.
Kingpin Inclination—9° crosswise.
Caster—1-3°. Adjusted by inserting wedge shims between spring and spring pad on axle.
Camber—¼-¾° No adjustment. Camber must be equal for both wheels.
Toe In—1/16". Adjusted in usual manner by loosening clamp bolts and rotating tie rod.
Front Suspension (PF, PE '34)—Independent linked parallelogram type with coil springs. See article in Steering Section for complete description and adjustment.
Kingpin Inclination—10° plus or minus ½° crosswise.
Caster—1½° (½-2½°).
Camber—½° (¼-1°).
Toe In—1/16"-⅛". Adjusted by changing length of each tie rod equally. Intermediate steering arm must point straight back with wheels turned straight ahead.

BRAKES:—Service—Lockheed Hydraulic, double anchor type. See article in Brake Section for complete adjustment instructions.
Drum Diameter—10".
Lining—Width 1½" (PC, PD '33; PF, PG '34), 2" (PE). Thickness 3/16". Length 15 25/32" per wheel.
Clearance—.012" toe, .006" heel for each shoe.

Hand Brake:—External type on drum at rear of transmission.
Adjustment—Place hand lever in released position. Remove locking wire and turn anchor adjusting screw so that clearance between lining and drum at this point is 1/16", replace locking wire. Turn adjusting nut at top of adjusting bolt so that clearance around drum is 1/16". Loosen locknut and turn nut on guide bolt, if necessary, to secure uniform clearance around drum.
Drum Diameter—6" (all models).
Lining—Width 2". Thickness 5/32". Length 18 13/32".

NOTE—Series PJ(E) do not have separate serial numbers. This series may be distinguished by letter 'E' inserted in engine number, thus: PJ-E-1001. This letter 'E' should not be confused with letters 'A', 'B', etc., following engine number.

ENGINE NUMBER:—First number PJ-1001 or PJ-E-1001 (see note above). Stamped on left side of cylinder block between #1 and 2 cylinders. Letter 'A' following engine number indicates that bore is .020" larger than standard. Letter 'B' indicates main and connecting rod bearings .010" smaller than standard. Letters 'AB' indicate bore and bearings as above and also that outside diameters of connecting rod bearings are .005" larger than standard. Letter 'C' indicates that connecting rod outside diameters are .005" larger than standard.

ENGINE:—Own. Six cylinder, 'L' head type. Floating Power engine mounting.
Bore—3⅛". Stroke—4⅜".
Piston Displacement—201.31 cubic inches.
Rated Horsepower—23.44.
Developed Horsepower—82 at 3600 R.P.M. (Series PJ), 65 at 3000 R.P.M. (Series PJE).
Compression Ratio—6.7-1. No optional ratios.
Compression Pressure—140-150 lbs. at 1000 R.P.M. or approximately 110-115 lbs. at cranking speed.
Vacuum Reading—Gauge should show steady reading of 16-18" with engine idling.

Pistons:—Aluminum alloy, 'T' slot, Cam ground type. Semi-finished pistons (head and ring grooves completely finished, skirt semi-finished) furnished for service where 'Cam' grinding equipment is available in two sizes: (1) standard to .023" oversize, (2) .025 to .050" oversize. If cam grinding equipment not available, use finished replacement pistons furnished .003", .005", .010", .015", .020", .023", .025", .030", .040", .050", .060" oversize and finish cylinder bores to provide correct clearance. Piston length — 3 11/16".
Weight—Maximum allowable variation ¼ oz.
Removal—Pistons and rods removed from above.
Clearance—.0015" at bottom.
Fitting New Pistons—Use micrometer to check piston diameter and cylinder bore. Measurement on piston made at bottom of skirt at right angles to piston pin (pin must be removed).
Installing Pistons—Slot to left (away from valves).

Piston Rngs:—Two undercut compression rings, two oil control rings per piston, all above pin, lower ring grooves drilled radially with oil drain holes. Rings furnished in same oversizes as pistons (except .023").

Ring	Width	End Gap	Side Clear.
Comp. (all)	⅛"	.007-.015"	.002"
Oil Cont. (all)	5/32"	.007-.015"	.002"

Piston Pin:—Diameter 55/64". Length 2⅝". Pin floats in piston and rod. Held by retaining rings. Piston can be heated in boiling water to remove or install pin. Pins furnished .003", .005, .008" oversize.
Pin Fit in Piston—Tight thumb push fit with piston at 120°F.
Pin Fit in Rod Bushing—Tight thumb push fit with piston at room temperature (70°F).

Connecting Rod:—Weight Maximum variation held to ¼ oz. Length 7 15/16".
Crankpin Journal Diameters—1 15/16".
Lower Bearing—Removable steel-backed, babbitt-lined type. No shims.
Clearance—.001-.00275". Sideplay .003-.009".
Adjustment—None. Replace bearings. Do not file rods or caps. Install new bearings with small boss registering with groove (both halves). Bearings furnished .010" undersize and standard size.
Installing Rods—Lower bearings are offset. Install rods with widest half of bearings toward rear of engine (#1, 3, 5) or toward front (#2, 4, 6). Oil hole in upper half of bearing must be toward camshaft side of engine on all rods.

Crankshaft:—4 bearing. Integral counterweights.
Journal Diameters—2¼" (all bearings).
Bearing Type—Removable steel-backed, babbitt-lined type.
Clearance—.001-.002".
Adjustment—None. Replace bearings. Do not file bearing caps. ***See Chrysler Shop Notes for Front Main Bearing Cap removal, Replacement Bearings, and installation and fitting of Replacement Bearing Caps.***
End Thrust—Taken by #4 (rear) bearing. Endplay .003-.007".

Camshaft:—4 bearing. Non-adjustable chain drive.
Bearing Type—Removable steel-backed, babbitt-lined type, except #4, which is machined in crankcase.
Clearance—.0015-.0025". Endplay .003-.005".
End Thrust—Taken by thrust plate at rear of the sprocket hub.
Timing Chain—Morse. Width 1". Pitch .500". Length 24" or 48 links.
Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. Install chain endless with camshaft sprocket off.

Valves:—

	Head Diameter	Steam Diam.	Length
All Valves	1 15/32"	.3405"	4 27/32"

	Seat Angle	Lift	Stem-to-Guide-Clr.
Intake	45°	5/16"	.001-.003"
Exhaust	45°	5/16"	.003-.005"

See Chrysler Special Shop Notes for Exhaust valve seat insert removal and installation instructions.
Installing New Guides—Use special tool to remove and install guides. Intake guides installed with tapered end up, exhaust guides with taper end down. Top of guide must be ⅞" below top of block. Finish ream new guides to inside diameter of .342-.343" (intake), .344-345" (exhaust) after installing.
Tappet Clearance—.006" Int., .008" Exh. with engine hot. Set exhaust clearance at .010" for sustained high speed driving. Adjustment accessible by removing housing cover under right front fender.
Valve Springs—Variable pitch type. Install springs with closer spaced coils at top. Do not compress spring to length of less than 1 7/16".

	Spring Pressure	Length
Valve Closed	34-38 lbs.	1¾"
Valve Open	77-83 lbs.	1 7/16"

Valve Timing—See Camshaft Setting (above).
Intake Valves—Open 6° ATDC. Close 46° ALDC.
Exhaust Valves—Open 42° BLDC. Close 8° ATDC.
To Check Valve Timing—Install regular timing gauge in timing plug hole over #6 piston, set tappet clearance #6 valves at .011" (intake), .012" (exhaust). Intake valve should open with piston .015" past top dead center, and exhaust valve close with piston .027" past top dead center. Reset tappet clearance at .006" (intake), .008" (exhaust) with engine hot.

Lubrication:—Pressure. Gear type oil pump located on right hand side of crankcase.
Normal Oil Pressure—30-60 lbs. at driving speeds.
Oil Pressure Relief Valve—Under plug on left hand side of crankcase. Operates at 40-45 lbs. Adjustable by changing spring. Standard springs unpainted. Heavy spring (to increase pressure) painted green. Lighter spring (to reduce pressure) painted red.
Capacity & Oil—5 qts. Use SAE. #30 (summer or #40 for sustained high speed or above 100°F), #20-W (winter 32° to 0°F), #10-W (0° to —15°F).

CLUTCH:—Borg & Beck. Single plate, dry disc type. No adjustment required for wear.
See article in Mechanical Equipment Section for data.
Clutch Pedal Adjustment—Clutch pedal should just clear underside of toeboard. Adjust by turning stopscrew located just above clutch pedal shaft. Free movement of clutch pedal must be 1 1/16". Adjust by loosening locknut and turning release fork rod adjusting nut (at clutch release fork).
Clutch Facings—Moulded Asbestos (flywheel side), Woven Asbestos (pressure plate side), one of each type required, 5⅝" I.D., 9¼" O.D., .133" thick.
NOTE—Mark clutch cover and flywheel before disassembling and reassemble in same position. Install driven plate assembly with mark 'Flywheel Side' toward flywheel (hub is offset). Use special gauge plate and adaptor to set up release levers when reassembling clutch. Release lever heights must be equal within .005".

STEERING:—Front Suspension—Conventional tubular front axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—8½° crosswise.
Caster—2° (1½—2½°). Adjust by inserting wedge plates between springs and axle pads. Wedges available in ½, 1, 2° angles.
Camber—½° (¼—¾°). No adjustment provided. Axle may be bent cold not more than ½° to correct camber. Replace axle if out more than ½°.
Toe In—1/16". Adjust in usual manner by loosening tie rod end clamps and rotating tie rod.
Steering Gear:—Gemmer Model Worm-and-Roller type. See article in Steering Section for adjustmts.

BRAKES:—Service—Lockheed hydraulic, double anchar type. Hand lever applies brake at rear of transmission. See article in Brake Section for relining and complete adjustment procedure.
Wheel Cylinders—Diameters—Front wheel (front shoe 1¼", rear shoe 1⅜"), Rear wheel (front shoe 1⅛", rear shoe 1¼").
NOTE—Wheel cylinders marked 'R' for right brakes, 'L' for left brakes, and are not interchangeable.
Drum Diameter—10".
Lining—Moulded type. Width 2". Thickness 3/16". Length per wheel 19 13/16".
Clearance—.012" toe, .006" heel ,for each shoe.

Hand Brake:—External type on drum at rear of transmission.
Adjustment—With lever in released position, remove anchor screw locking wire, turn anchor screw so that clearance between lining and drum is 1/16", lock anchor screw with wire. Turn adjusting nut at top of adjusting bolt so that clearance around drum is 1/16". Loosen locknut and turn guide bolt, if necessary, to secure uniform clearance around drum.
Drum Diameter—6".
Lining—Width 2". Thickness 5/32". Length 18 13/32".

NOTE—The letter 'E' inserted in engine number, thus: P2-E-1001 indicates that engine is equipped with smaller carburetor and intake manifold and 3.7-1 ratio rear axle.

ENGINE NUMBER:—First number—P2-1001 (see note above). Stamped on left side of cylinder block between #1 and 2 cylinders. Letter 'A' following number indicates bore .020" larger than standard. 'B' indicates main and connecting rod bearings .010" smaller than standard. 'AB' indicates that bore and bearing sizes are as above. 'C' indicates main and connecting rod bearings standard, but outside diameter of connecting rod bearings .005" larger than standard.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3⅛". **Stroke**—4⅜".
Displacement—201.31 cubic inches.
Rated Horsepower—23.44 (AMA).
Developed Horsepower—82 at 3600 R.P.M.
Compression Ratio—6.7-1 Std. cast-iron head. No optional ratios.
Compression Pressure—140-150 lbs. at 1000 R.P.M. or approximately 113 lbs. at cranking speed.
Vacuum Reading—Gauge should show steady reading of 16-18" with engine idling at 6 M.P.H.

PISTONS:—Aluminum alloy, 'T' slot, Cam ground type with anodized finish (special hard oxide formed on bearing surface). **Length**—3 11/16".
Weight—Held to two gram max. variation.
Removal—Pistons and rods removed from above.
Clearance—Top .022". Skirt .0005". Limits .0005-.001". See Fitting New Pistons.
Replacement Pistons:—Finished anodized pistons furnished in standard and .003", .005", .010", .015", .020", .023", .025", .030", .040", .050", .060" oversizes. Semi-finished pistons furnished: (1) standard to .023" oversize. (2) .025-.050" oversize, not interchangeable. Pistons should be slotted and then finished on cam grinding equipment.
Fitting New Pistons:—Micrometer gauge recommended. Check cylinder bore and piston diameter. Measurement on piston made at bottom of skirt at right angles to piston pin (pin must be removed).
Installing Pistons:—Slot should be at left or away from valves.

PISTON RINGS:—Two undercut compression rings, two oil control rings per piston, all above pin. Lower ring groove drilled with oil drain holes.

Ring	Width	End Gap	Side Clearance
Comp (all)	⅛"	.007-.015"	.002-.003"
Oil (both)	5/32"	.007-.015"	.002-.003"

Replacement Rings:—Furnished in standard and .003" .010", .020", .030", .040", .050", .060" oversizes.
NOTE—Install compression rings with step down.

PISTON PIN:—**Diameter** 55/64". **Length** 2⅝". Pin floats in piston and rod. Held by retaining rings. Pin hole in rod is bronze-bushed.
NOTE—Heat piston in boiling water to remove or install pins.
Pin Fit in Piston—Tight thumb push fit with piston heated to 130° F.
Pin Fit in Rod Bushing—Tight thumb push fit with piston and rod at 70° F.
Replacement Pins:—Pins furnished in standard and .003", .005", .008" oversizes. Ream rod bushing and pin holes in piston bosses for correct fit.

CONNECTING ROD:—**Weight**—All rods held to ¼ oz. maximum variation. **Length**—7 15/16".
Crankpin Journal Diameter—1 15/16".
Lower Bearing—Steel-backed, copper-lead lined, interchangeable. Furnished standard and .010" undersize.
Clearance—.001-.003". Sideplay .0055-0115".
Bearing Adjustment—None (no shims). Replace bearings. Do not file rods or caps. Install new bearings so small bosses engage grooves in rod and cap.
Installing Rods:—Lower bearings are offset. Install rods with widest half of bearing toward rear (#1, 3, 5) and toward front (#2, 4, 6). Oil hole in lower bearing upper half toward camshaft on all rods.

CRANKSHAFT—4 bearing. Integral counterweights.
Journal Diameters—2¼" (all bearings).
Bearing Type—Removable steel-backed, babbitt-lined (#1 and 4), copper-lined or cadmium-nickel (#2 and 3). Furnished standard & .010" undersize.
Clearance—(#1 & 4) .001-.002". (#2 & 3) .0015-.0025"
Bearing Adjustment:—None (no shims). Replace bearings. Do not file caps. *See Chrysler Shop Notes for Front Main Bearing Cap removal, and installation and fitting of replacement bearing caps.*
End Thrust:—Taken by flange faces on rear (#4) bearing. Endplay .003-.007".

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1¼".
Bearing Type—Removable steel-backed, babbitt-lined (except #4 machined in crankcase).
Clearance—.001-.003" (#1), .0015-.0035" (all others).
NOTE—New bearings require no line-reaming.
End Thrust:—Taken by thrust plate at rear of sprocket hub. Endplay .002-.006".
Timing Chain:—Morse. Width 1". Pitch .500". Length 24" or 48 links.
Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that 'O' marks are adjacent and in line with a straightedge across shaft centers. Install chain endless.
NOTE—Engine must be supported under front end of oil pan and front engine support removed for work on timing chain and camshaft.

VALVES:—

	Head Diameter	Stem Diameter	Length
All valves	1 15/32"	.340-.341"	4 25/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	5/16"	.001-.003"
Exhaust	45°	5/16"	.003-.005"

See Chrysler Special Shop Notes for Exhaust valve seat insert removal and installation instructions.
Tappet Clearance—.006" Int., .008" Exh. (hot). .010" Exh. recommended for sustained high speed.
Valve Guides:—Use special tool to remove and install guides. Insert guides with taper end up (intake) and down (exhaust). Top of guide must be ⅞" below top of block. After installing finish ream new guides to give correct stem clearance.
Valve Springs:—Variable pitch type. Install springs with close coil at top. Do not compress springs to over all length of less than 1⅜".

	Spring Pressure	Spring Length
Valve Closed	34-38 lbs.	1¾"
Valve Open	77-83 lbs.	1 7/16"

Valve Lifters:—Mushroom type. Ream guides to take following oversizes: .001", .008", .030", .060".
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 6° ATDC. Close 46° ALDC.
Exhaust Valves—Open 42° BLDC. Close 8° ATDC.
To Check Valve Timing—Install regular timing gauge in timing plug hole over #6 piston, set tappet clearance #6 valves at .011" (intake), .012" (exhaust). Intake valve should open with piston .015" past top dead center, and exhaust valve close with piston .027" past top dead center. Reset tappet clearance at .006 (intake), .008" (exhaust) with eng. hot.
Motor Gauge—Weidenhoff Adapter #103, Rod #12.

LUBRICATION:—Pressure. Gear type oil pump located at right of crankcase.
NOTE—Ignition timing should be checked whenever oil pump is installed in engine.
Normal Oil Pressure:—30-40 lbs. at 30 M.P.H.
Oil Pressure Relief Valve:—Under plug on left hand side of crankcase. Operates at 40 lbs. Adjustable by changing spring. Standard spring unpainted. Heavy spring (to increase pressure) painted green. Lighter spring (to decrease pressure) painted red.
Crankcase Capacity:—5 qts. (refill).

CLUTCH:—**Borg & Beck Model 9A6.** Single plate, dry disc type. See article in Clutch Section for data.
Facings—Woven (pressure plate side), molded (flywheel side), 2 required. Inside Diam. 5⅝". Outside Diam. 9¼". Thickness .133".
Adjustment—Clutch pedal should just clear under side of toe board with clutch engaged. To adjust, turn stopscrew located just above clutch pedal shaft. Free movement of pedal should be 1 1/16". To adjust, loosen locknut and turn adjusting nut (clevis) on clutch fork adjusting rod.
Removal—Disconnect clutch pedal linkage, remove fork pivot screw, take out clutch fork. Remove transmission (release bearing and spring are withdrawn with transmission), remove clutch housing pan, prick punch clutch cover and flywheel (install in same position to maintain balance), take out clutch mounting bolts, turning all bolts out evenly to release spring tension and avoid distortion of clutch cover. Remove clutch from below. Use pilot studs when removing and installing transmission to avoid springing clutch plate.
Automatic Clutch:—See article in Clutch Section.

STEERING:—**Steering Gear:** Gemmer Model Worm-and-Roller type. See article in Steering Section.
Front Suspension:—Conventional tubular section front axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—9½° crosswise. Limits 9-10°.
Caster—2° (1½-2½°). Adjust by inserting wedge plates between springs and axle pads. Wedges available in ½, 1, 2° angles.
Camber—½° (¼-¾°). No adjustment, Replace tubular axle if camber is out more than ½°.
Toe In—0-⅛". Adjust in usual manner by loosening tie rod end clamps and rotating tie rod.

BRAKES:—**Service**—Lockheed Hydraulic, double anchor type. Hand lever applies brake at rear of transmission or rear wheel service brakes (special equipment). See article in Brake Section.
Wheel Cylinders—Diameters, Front Wheel (Front end 1¼", Rear end 1⅜"). Rear Wheel (Front end 1⅛", Rear end 1¼").
NOTE—Wheel cylinders marked 'R' right side of car, 'L' left side of car. Not interchangeable.
Drum Diameter—10".
Lining—Moulded type. Width 2". Thickness 13/64". Length per wheel 19 13/16".
Clearance—.012" toe, .006" heel for each shoe.
Hand Brake:—External type on drum at rear of transmission. See Service Brake (above) for cars with rear wheel hand brake.
Adjustment—With lever in released position, remove anchor screw locking wire, turn anchor screw so that clearance between lining and drum is 1/16", lock anchor screw with wire. Adjust brake band guide bolt nut to give 1/16" clearance (as above) for lower portion of band, secure with locknut. Finally, adjust brake adjusting bolt nut to give 1/16" clearance (as above), making sure that groove in bolt nut is lined up with ridge lockwasher.
Drum Diameter—6".
Lining—Width 2". Thickness 5/32". Length 18 13/32".
NOTE—Clearance at anchor and saddle .005" max.

NOTE—The letter 'E' inserted in engine number, thus: P4-E-1001 indicates that engine is equipped with smaller carburetor and intake manifold and 3.7-1 ratio rear axle.

ENGINE NUMBER:—First number—P-4-1001. Stamped on left side of block between #1 and #2 cylinders. *See Chrysler Shop Notes for engine number lettering data (denoting special bore and bearing sizes).*

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3⅛". **Stroke**—4⅜".
Displacement—201.31 cubic inches.
Rated Horsepower—23.44 (AMA).
Developed Horsepower—82 at 3600 R.P.M.
Compression Ratio—6.7-1 Std. cast-iron head.
Compression Pressure—140-150 lbs. at 1000 R.P.M. or approximately 113 lbs. at cranking speed.
Vacuum Reading—Steady reading of 18-21" with engine idling at 6 M.P.H.

PISTONS:—Aluminum alloy, U-slot, cam ground type with anodized finish. **Length**—3 11/16".
Weight—14.43 ozs. (plus or minus 2 grams).
Removal—Pistons and rods removed from above.
Clearance—Top .022". Skirt .0005". Limits .0005-.001".
Replacement Pistons:—Finished pistons furnished standard and .003", .005", .010", .015", .023" .025", .030", .040", .050", .060" oversizes. Semi-finished pistons furnished (1) standard to .023" oversize, (2) .025-.050" oversize, not interchangeable. Pistons should be slotted, then cam ground.
Fitting New Pistons:—Check piston (across pin support ribs at bottom of skirt) and cylinder bore with micrometer gauge. Piston should pass through bore with slight drag (70° F), with pin removed.
Installing Pistons:—Slot to left, away from valves.

PISTON RINGS:—2 undercut compression, 2 oil control rings per piston, all above pin. Ten ⅛" oil drain holes #3 groove, five in #4 groove.

Ring	Width	End Gap	Side Clearance
Compression	⅛"	.007-.015"	.0015-.003"
Oil Control	5/32"	.007-.015"	.0015-.003"

Replacement Rings:—Furnished standard and .003", .005", .010", .015", .020", .025", .030", .040", .050", .060" oversizes.
NOTE—Install compression rings with step down.

PISTON PIN:—**Diameter** 55/64". **Length**—2⅝". Floating type. Pin hole in rod bronze bushed.
Pin Fit in Piston—Thumb push fit at 130° F.
Pin Fit in Rod Bushing—Thumb push fit at 70° F.
Replacement Pins:—Furnished standard and .003", .005", .008" oversize. Ream bushing and pin hole to size.

CONNECTING ROD:—**Weight**—31.0 ounces.
Length—7 15/16".
Crankpin Journal Diameter—1 15/16".
Lower Bearing—Steel-backed, babbitt-lined, interchangeable. Furnished standard and .0015", .010" undersize.
Clearance—.0005-.0025". **Sideplay**—.0055-.0115".
Bearing Adjustment:—None. Install new bearings with bosses engaging grooves in rod and cap.
Installing Rods:—Lower bearings offset. Install wide portion to rear on #1, 3, 5, to front on #2, 4, 6. Oil hole in lower bearing upper half toward valves.

CRANKSHAFT:—4 bearing. Integral counterweights.
Journal Diameters—2¼" (all bearings).
Bearing Type—Removable steel-backed, babbitt-lined. Furnished stand. and .0015", .010" undersize.
Clearance—.001-.002".
Bearing Adjustment:—*See Chrysler Shop Notes for Front Main Bearing Cap removed, adjustment directions, and Replacement Bearing Cap data.*
End Thrust:—Taken by flange faces on rear (#4) bearing. **Endplay**—.003-.007".

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1¼".
Bearing Type—Removable steel-backed, babbitt-lined (except #4 machined in crankcase).
Clearance—.0015-.0035".
End Thrust:—Taken by thrust plate at rear of camshaft sprocket hub. **Endplay**—.002-.006".
Timing Chain:—Morse. Width 1". Pitch .500". Length 24" or 48 links.
Camshaft Setting:—Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
All valves	1 15/32"	.340-.341"	4 25/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	5/16"	.001-.003"
Exhaust	45°	5/16"	.003-.005"

See Chrysler Special Shop Notes for Exhaust valve seat insert removal and installation instructions.
Tappet Clearance—.006" Int., .008" Exh. (hot). Remove front wheel and wheel housing to adjust.
Valve Guides:—Guides must be ⅞" below top of block. Ream guides after installing (.342-.343" Int., .344-.345" Exh.).
Valve Springs:—1⅜" limit of compression.

	Spring Pressure	Spring Length
Valve Closed	34-38 lbs.	1¾"
Valve Open	77-83 lbs.	1 7/16"

Valve Lifters:—Mushroom type. Ream guides to take following oversizes: .001", .008", .030", .060".

VALVE TIMING:—See Camshaft Setting above.
Intake Valves—Open 6° ATDC. Close 46° ALDC.
Exhaust Valves—Open 42° BLDC. Close 8° ATDC.
To Check Valve Timing:—Install timing gauge in hole over #6 piston, set intake valve at .011" (cold). Valve should open with piston .015" past top dead center. Reset tappet clearance .006" (hot).
Motor Gauge—Weidenhoff Adapter #103. Rod #12.

LUBRICATION:—Gear type oil pump on rt. of engine.
NOTE—Check ignition timing whenever oil pump installed on engine.
Normal Oil Pressure:—30-45 lbs. at 30 M.P.H.
Oil Pressure Relief Valve:—Under plug on left side of crankcase. Operates at 40-50 lbs. Adjustable. Heavy (green) spring to increase pressure, lighter (red) spring to decrease pressure.
Crankcase Capacity:—5 quarts (refill).

CLUTCH:—**Borg & Beck Mod. 9A6.** Mod. #869 stamped on cover. Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Moulded (flywheel side), woven (pressure plate side). 2 required. I.D. 5⅝". O.D. 9¼". Thickness .133".
Adjustment—Adjust stopscrew (just above clutch pedal shaft) so that pedal arm just clears floor board. Free movement of pedal should be 1 1/16" (adjust by turning release fork rod adjusting nut).
Removal:—Remove floor board, remove transmission (see Transmission Removal below), remove housing under-pan, mark cover and flywheel, remove cover bolts evenly, remove assembly from below.

TRANSMISSION:—**Own**—All helical gear type with synchronizing shift on second and high gears.
See article in Mechanical Equipment Section for data.
Removal:—Disconnect front and rear U-joints, disconnect hand brake, remove nuts from studs at clutch housing, disconnect release fork pull-back spring, pull release fork out of clutch housing, remove transmission cover assembly, remove unit with two pilot studs in upper stud holes.
NOTE—Run-out of clutch housing .003" maximum.

UNIVERSAL JOINTS:—**Detroit Universal** Series 4200. Ball and trunnion type with roller bearings. 2 used.
NOTE—Three U-joints used on 7 pass. sedan.
See article in Mechanical Equipment Section for data.
Propeller Shaft Center Bearing:—Used on 7 Pass. models. *See Chrysler Shop Notes for data.*

REAR AXLE:—**Own**—Semi-floating, hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—P-3 std. 3.9-1, optl. 3.73-1.
P-3, 4 (5.25x20" tires), P-4 (7 pass.) 4.3-1.
P-4 (5 pass.) 4.1-1, (coupe) 3.9-1.
Backlash—.006-.010". Shim adjustment.
Removal:—Remove axle shaft nut, hub and drum assembly (use hub puller, do not hammer out or bearing damage may result), disconnect brake line at wheel cylinder, remove backing plate (with oil seal). Use shaft puller to remove axle shaft and bearing. With axle shafts removed, differential carrier may be removed by disconnecting rear U-joint at flange and removing housing capscrews.
Wheel Bearing Adjustment—Controlled by shims between brake backing plates and flanged ends of housing. Remove brake backing plates (see above) and add or remove shims to give proper clearance.
Endplay—.003-.008".
NOTE—Shims supplied .010", .0125", .030" thick.

SHOCK ABSORBERS:—**Delco**—Model 1162-U (front), 1163-U (rear). Direct acting, hydraulic type.
See article in Mechanical Equipment Section for data.

STEERING:—**Steering Gear**—Chrysler (Gemmer design Model 300). Worm-and-Roller type.
See article in Mechanical Equipment Section for data.
Front Suspension:—Conventional tubular section axle, Reverse-Elliott ends, semi-elliptic springs.
Kingpin Inclination—4½-5½° crosswise.
Caster—2° (1-3°). Adjust by inserting wedge shims between spring & axle pad. ½° & 2° wedges supplied.
Camber—½° (¼-¾°). No adjustment.
Toe In—1/16" (0-⅛"). Adjust by turning tie rod.
Steering Geometry—Outer wheel turned 20°. Inner wheel turned 22°50'. 22°20' (7 pass.).

BRAKES:—**Service**—Lockheed hydraulic, double anchor type. Hand brake at rear of transmission.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Stepped or two-stage bore type:
Front Wheel—Front cyl. 1¼", Rear 1⅜".
Rear Wheel—Front cyl. 1⅛", Rear 1¼".
Drum Diameter:—10".
Lining—Moulded. Width 2". Thickness .200". Length (Rear wh. rear shoe) 7 25/64", (all others) 9 29/32".
Clearance—.012" toe, .006" heel for each shoe.
Braking Power—55% front wheels, 45% rear.
Hand Brake:—On drum at rear of transmission.
Adjustment—Fully release hand brake lever. Remove anchor screw locking wire (left side), adjust anchor screw for .025" clearance between band and drum, set anchor screw with lock wire. Free large adjusting bolt nut (upper end of band), loosen locknut, adjust guide bolt nut to .025" clearance between band and drum, set with locknut. Tighten adjusting bolt nut until tension on either end of guide bolt is just relieved (groove in nut must align with ridge in lockwasher).
Drum Diameter—6".
Lining—Width 2". Thickness 5/32". Length 16 15/16".
NOTE—Clearance at anchor and saddle .005" max.

SERIAL NUMBER:—On right front door hinge pillar post. First number as follows:

	Detroit	Los Angeles	Evansville	Canada
P-5	1,240,001	3,105,000	9,097,601	9,381,161
P-6	10,470,001	3,206,001	20,001,001	9,349,566

ENGINE NUMBER:—First number P-6-1001. Stamped on left side of block between #1 and #2 cylinders. *See Chrysler Special Shop Notes for engine number lettering data (for special bore and bearing sizes).*

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3⅛". **Stroke**—4⅜".
Displacement—201.3 cubic inches.
Rated Horsepower—23.44 (A.M.A.).
Developed Horsepower—82 HP. (std. 6.7-1 head), 86 HP. (optl. 7.0-1 head) at 3600 R.P.M.
Compression Ratio & Pressure—As follows:

Ratio	Pressure at 1000 RPM.	At 100 RPM.
6.7-1 Std. C.I. head	140-150 lbs.	Approx. 113 lbs.
7.0-1 Optl. Al. head	150-160 lbs.	Approx. 117 lbs.

Vacuum Reading—Steady 18-21" idling at 6 MPH.

PISTONS:—Aluminum alloy, U-slot, cam ground type anodized finish. **Length** 3 11/16". **Weight** 14.56 oz.
Removal—Pistons and rods removed from above.
Clearance—Top .022". See Fitting New Pistons.
Replacement Pistons:—*See Chrysler Shop Notes.*
Fitting New Pistons:—Check piston size with micrometer at right angles to pin bosses at bottom of skirt. Fit piston with slight drag using .0005-.001" feeler between piston and cylinder wall. Piston should float through cylinder with feeler removed.
Installing Pistons:—Slot away from camshaft.

PISTON RINGS:—2 undercut compression, 2 slotted oil rings per piston, above pin.

Ring	Width	End Gap	Side Clearance
Compression	⅛"	.007-.015"	.0015-.003"
Oil Control	5/32"	.007-.015"	.0015-.003"

Replacement Rings:—Furnished Std. and .005", .010", .015", .020", .025", .030", .040", .050", .060" oversize.

PISTON PIN:—**Diameter**—55/64". **Length**—2⅝". Floating type. Pin hole in rod bronze bushed.
Pin Fit in Piston—Thumb push fit with piston heated to 100°F.
Pin Fit in Rod Bushing—Thumb push fit at 70°F.
Replacement Pins:—Furnished std. & .003", .005",. 008" oversize. Ream bushing and pin hole to size.

CONNECTING ROD:—**Weight** 29.13 oz. **Length** 7 15/16".
Crankpin Journal Diameter—1 15/16".
Lower Bearing—Removable steel-backed, babbitt-lined. Furnished std. & .002", .010", .012" undersize. **Clearance**—.0005-.0025". **Sideplay**—.0055-.0115".
Bearing Adjustment:—None. Install new bearings with bosses engaging grooves in rod and cap.
Installing Rods:—Install rods with wide portion of bearing to rear on #1, 3, 5, to front on #2, 4, 6. Oil spit hole to camshaft (all rods).

CRANKSHAFT:—4 bearing type, 7 counterweights.
Journal Diameters—2¼" all bearings.
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.001-.002".
Bearing Adjustment:—*See Chrysler Shop Notes for Front Main Bearing Cap Removal, replacement bearings and bearing caps, adjustment directions, and Crankshaft Oil Seals.*
End Thrust:—Taken by flange faces on rear (#4) bearing. **Endplay**—.003-.007".

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1¼".
Bearing Type—Removable steel-backed babbitt-lined bushings (except #4 machined in block).
Clearance—.001-.003" (#1), .0015-.0035" (all others).
NOTE—Replacement bushings finish reamed.
End Thrust:—Taken by thrust plate behind camshaft sprocket hub. **Endplay**—.002-.006".
Timing Chain:—Morse #1866 (restricted bend). Width 1". Pitch .500". Length 24" or 48 links.
See Chrysler Special Shop Notes for front end removal for work on timing chain.
Camshaft Setting:—Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across the shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
All valves	1 15/32"	.340-.341"	4 25/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	5/16"	.001-.003"
Exhaust	45°	5/16"	.003-.005"

See Chrysler Special Shop Notes for Exhaust valve seat insert removal and installation instructions.
Tappet Clearance—.006" Int., .008" Exh. (hot). .010" Exh. setting recommended for sustained high speed driving. Valves accessible by removing right front wheel and wheel housing panel.
Valve Guides:—Install with round end up to ⅞" below top of block. Finish ream guides after installing to .342-.343" Int., .344-.345 Exh.
Valve Springs:—Free length approx. 2 3/32". Limit of compression 1 9/32".

Spring Pressure	Length
Valve Closed 34-38 lbs.	1 3/4"
Valve Open 77-83 lbs.	1 7/16"

Valve Lifters:—Mushroom type. Ream guides from above for following oversizes: .001", .008", .030", .060".
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 6° ATDC. Close 46° ALDC.
Exhaust Valves—Open 42° BLDC. Close 8° ATDC.
To Check Timing—Set tappet clearance #6 intake valve at .011". This valve should open with piston 6° (.0153") past top dead center when 6° ATDC. mark on crankshaft pulley at front of engine lines with pointer. Reset tappet cl. at .006" (hot).
Motor Gauge—Weidenhoff Adapter #103, Rod #12.

LUBRICATION:—Gear type oil pump on right of engine.
Normal Oil Pressure:—30-45 lbs. at 30 M.P.H.
Oil Pressure Relief Valve:—Under plug on left side of engine. Operates at 40 lbs. Adjustable. Change to heavy (green) spring to increase pressure, light (red) spring to decrease.
Crankcase Capacity:—5 quarts (refill).

COOLING SYSTEM:—**Water Pump**—Centrifugal, belt-driven, packless type.
See article in Mechanical Equipment Section.
Removal—With water drained and fan belt removed, remove fan blades and pulley (attached by 4 capscrews), disconnect pump hoses, remove nuts from pump mounting studs and lift out.
Thermostat:—Bishop & Babcock. In outlet on hd.
Setting—Start to open 150-155°F. Fully open 176°F.
Water Capacity:—14 quarts.
Drain Valves:—At lower left corner of radiator and on left side of block in front of distributor.

CLUTCH:—**Borg & Beck Model 9A6, 11A6 (P-5 Taxi).** Model #918, 917 (Taxi) stamped on cover. Single plate, dry disc type. New pressure plate oil baffle used. Spiral grooved type facings used on 11A6
See article in Mechanical Equipment Section for data.
Facings—Molded-woven (spiral grooved—Taxi only), 2 required. .133", ⅛" (Taxi) thick. I.D. 5⅝", 6½" (Taxi). O.D. 9¼", 11" (Taxi).
Adjustment—Adjust stopscrew (to rear of pedal) so that pedal arm just clears floor board. Pedal free movement must be 1 1/16". Adjusting nut provided on fork rod next to release fork.
Removal:—Remove transmission (see following), remove clutch housing underpan, mark cover and flywheel, remove cover bolts evenly, take out assembly from below.

TRANSMISSION:—**Own Make.** All helical gear type with synchro-mesh on second and high speeds.
See article in Mechanical Equipment Section for data.
Removal:—Remove floor boards, battery cable, disconnect front and rear universals (see Propeller Shaft Center Bearing below for 7 pass. sedan), free hand brake cable at clevis. Take off nuts on mounting studs, disconnect clutch release fork pull-back spring, free clevis pin on release fork rod, remove transmission cover with gear-shifter assembly and mounting stud nuts. Install two pilot studs and withdraw transmission.

UNIVERSAL JOINTS:—**Detroit-Universal.** Series 4200. Ball and trunnion type with roller bearings. 2 used. NOTE—Three universals used on 7 pass. sedan.
See article in Mechanical Equipment Section.
Propeller Shaft Center Bearing:—Used on 7 Pass. models. *See Chrysler Shop Notes for data.*

REAR AXLE:—**Own make.** Semi-floating, hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—3.54-1 (P-5 Econ.). 3.73-1 (P-5 optl., P-6 Econ.). 3.9-1 (P-5 std., P-6 Coupe). 4.1-1 (P-6 Sedan). 4.3-1 (P-5,6 with 18" or 20" tires; P-6 7 pass.).
Backlash—.006-.010". Screw adjustment.
Removal:—Remove wheel, hub, and drum assembly (using screw type hub puller). Place block under brake pedal, disconnect brake line, remove backing plate and oil seal, pull axle shaft and bearing (Tool C-158). With shafts removed, carrier may be removed by disconnecting rear universal at flange, and removing housing capscrews.
Wheel Bearing Adjustment—Controlled by shims at flanged ends of axle housing. With wheel and hub removed measure endplay with dial indicator. To adjust remove backing plate (see above) and add or remove shims (equally at both sides) to proper clearance. **Endplay**—.003-.008".

SHOCK ABSORBERS:—**Delco**—Model 1162-U (front), 1163-U (rear). Direct acting, hydraulic type.
See article in Mechanical Equipment Section.

STEERING:—**Steering Gear**—Chrysler (Gemmer design Model 300). Worm-and-Roller type.
NOTE—RHD cars equipped with Gemmer Model 305.
See article in Mechanical Equipment Section for data.
Front Suspension:—Conventional tubular section axle, Reverse-Elliott ends, semi-elliptic springs.
Kingpin Inclination—4½-5½° crosswise.
Caster—2° (1-3°). Adjust by inserting wedge plates between springs and axle center.
Camber—½° (¼-¾°). Not adjustable.
Toe In—1/16" (0-⅛"). Turn tie rod to adjust.
Steering Geometry—Outer wheel 20°. Inner 22°50'.

BRAKES:—**Service**—Lockheed hydraulic, double anchor type. Hand brakes at rear of transmission.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Stepped or two-stage bore type.
Front Wheel—Front cylinder 1¼". Rear 1⅜".
Rear Wheel—Front cylinder 1⅛". Rear 1¼".
Drum—Centrifuse. Diameter 10" (11" on 7 Pass.).
Lining—Moulded. Width 2". Thickness 13/64". Length (frt. shoe) 10 9/32", 11 5/32"—7 Pass., (rear shoe) 7 11/16", 7 31/32"—7 Pass.
Clearance—.012" toe, .006" heel for each shoe.
Braking Power—55% front, 45% rear.
Hand Brake:—External at rear of transmission.
Adjustment—*See Chrysler Shop Notes.*
Drum—Cast-iron. Diameter—6".
Lining—Width 2". Thick. 5/32". Length 17 1/16".

FRONT END ASSEMBLY (UNIT) REMOVAL:—Should be removed as a unit for work on front of engine. *See Chrysler Shop Notes for directions.*

SERIAL NUMBER:—On plate on right front door hinge pillar post. First number as follows:

	Detroit	Los Angeles	Evansville	Canada
P-7	1,298,001	3,110,001	9,150,401	9,603,586
P-8	10,630,001	3,222,001	20,027,001	9,358,626

ENGINE NUMBER:—First number P-8-1001. Stamped on left side of block between #1 and #2 cylinders. *See Chrysler Shop Notes for Engine Number Lettering ('Special Standard' bore and bearing sizes).*

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head type. **Bore**—3⅛". **Stroke**—4¾". **Displacement**—201.3 cu.ins. **Rated Horsepower**—23.44 (A.M.A.). **Developed Horsepower**—82 @ 3600 RPM. (Std. 6.7-1 hd.). 86 @ 3600 RPM. (Optl. 7.0-1 Al. hd.). **Compression Ratio & Pressure**—As follows:

Ratio	Pressure at 1000 RPM.	At 100 RPM.
6.7-1 Std. C.I. head	140-150 lbs.	Approx. 113 lbs.
7.0-1 Optl. Al. head	150-160 lbs.	Approx. 117 lbs.

Vacuum Reading—Steady 18-21" idling at 6 M.P.H.

PISTONS:—Aluminum alloy, U-slot, Cam-ground, with Anodic finish. **Length** 3 11/16". **Weight** 14.56 ozs. **Removal**—Pistons and rods removed from above. **Clearance**—Top .021". Skirt .0001-.0011".

Original Bore & Piston Sizes, Replacement Pistons:—*See Chrysler Shop Notes for sizes and markings.*

Fitting New Pistons:—Use micrometers. Check piston at bottom of skirt at right angles to pin bosses. With piston and wall dry, piston should pass through bore of own weight with slight drag (pin removed).

Installing Pistons:—Slot away from camshaft.

PISTON RINGS:—Four rings, all above pin—#1 Compression (upper inner edge beveled), #2 Comp. (lower edge stepped), #3 & 4 (slotted oil rings).

Ring	Width	End Gap	Side Clearance
Comp. (Top)	⅛"	.007-.015"	.002 -.004"
Comp. (#2)	⅛"	.007-.015"	.0015-.0035"
Oil Control	5/32"	.007-.015"	.0015-.003"

Replacement Rings:—Furnished Std. and .005", .010", .015", .020", .025", .030", .040", .050", .060" oversize.

PISTON PIN:—**Diameter**—55/64". **Length**—2⅝". Floating type. Pin hole in rod bronze bushed. **Pin Fit in Piston**—Tight thumb push fit with piston heated to 100°F. **Pin Fit in Rod Bushing**—Tight thumb push fit at normal room temperature.

Replacement Pins:—Std. & .003", .005", .008" oversize.

CONNECTING ROD:—**Weight** 29.13 oz. **Length** 7 15/16". **Crankpin Journal Diameter**—1 15/16". **Lower Bearing**—Removable steel-backed, babbitt-lined. Furnished Std. & .002", .010", .012" undersize. **Clearance**—.0005-.0025". **Sideplay**—.0055-.0115".

Bearing Adjustment:—None (no shims). Install bearings with boss engaging groove in rod and cap.

Installing Rods:—Wide portion of bearing to rear (#1, 3, 5), to front (#2, 4, 6). Oil hole to camshaft.

CRANKSHAFT:—4 bearing type with 7 counterweights. *See Chrysler Shop Notes for Replacement Main Bearing Caps and Crankshaft Front and Rear Oil Seals.* **Journal Diameters**—2¼" all bearings. **Bearing Type**—Removable, precision type steel-backed, babbitt-lined. **Clearance**—.001-.002".

Bearing Adjustment:—*See Chrysler Shop Notes for Front Main Bearing Cap removal, Replacement Bearings and Crankshaft Oil Seals.*

End Thrust:—Taken by flange faces on rear (#4) bearing. **Endplay**—.003-.007".

CAMSHAFT:—4 bearing. Non-adjustable chain drive. **Journal Diameters**—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1¼". **Bearing Type**—Removable, Steel-backed, babbitt-lined bushings (except #4 machined in block). **Clearance**—.001-.003" (#1), .0015-.0035" (all others).

End Thrust:—Taken by thrust plate behind camshaft sprocket hub. **Endplay**—.002-.006".

Timing Chain:—Morse Type 1866-N, No. 2661. Width 1". Pitch .500". Length 24" or 48 links.

Camshaft Setting:—Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across the shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
All valves	1 15/32"	.340-.341"	4 25/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	5/16"	.001-.003"
Exhaust	45°	5/16"	.003-.005"

See Chrysler Shop Notes for Exh. Valve Seat Insert data.

Tappet Clearance:—.006" Int., .008" Exh. (hot). .002" additional exhaust clearance recommended for sustained high speed driving. NOTE—Tappet screws self-locking type. Remove right front wheel and housing panel for access to valves.

Valve Guides:—Remove from above. Press new guides in (tapered end up) so top ⅞" below top of block, then finish ream to .342-.343" Int., .344-.345" Exh.

Valve Springs:—Free length 2 3/32". Limit of compression 1 9/32".

	Spring Pressure	Length
Valve Closed	34-38 lbs.	1 3/4"
Valve Open	77-83 lbs.	1 7/16"

Valve Lifters:—Mushroom type. Ream holes from above (pilot in valve stem guide) for new lifters .001", .008", .030", .060" oversize. Stem Diam. ⅝".

Valve Timing:—See Camshaft Setting above. **Intake Valves**—Open 6° ATDC. Close 46° ALDC. **Exhaust Valves**—Open 42° BLDC. Close 8° ATDC. **To Check Timing**—Set tappet clearance #6 intake valve at .011". This valve should open with piston 6° (.0153") past top dead center when 6° ATDC. mark on crankshaft pulley at front of engine lines up with pointer. Reset tappet cl. .006" (hot).

LUBRICATION:—Gear type pump (right of engine). **Normal Oil Pressure:**—30-45 lbs. at 30 M.P.H.

Oil Pressure Relief Valve:—Under cap below starter. Opens at 40-45 lbs. To increase pressure use heavy (green) spring, to decrease use light (red) spring.

Crankcase Capacity:—5 quarts (refill).

COOLING SYSTEM:—**Capacity**—14 quarts. **Radiator Core Removal**—*See Chrysler Shop Notes.*

Water Pump:—Packless type. *See article in Mechanical Equipment Section for data.* **Removal**—Drain water, remove fan blades and pulley, by-pass elbow and hose, loosen radiator outlet hose, remove nuts from pump mounting studs, take off fan belt adjusting strap at generator.

Thermostat:—Bishop & Babcock. In head outlet. **Setting**—Start to open 157-162°F. Fully open 183°.

Temperature Gauge:—Motometer (Auto-Lite) No. H-9008. *See article in Mechanical Equipment Section.*

CLUTCH:—**Borg & Beck Model 9A6, 11A6 (P-7 Taxi).** Single plate, dry disc type. Marked #918 (9A6), 931 (11A6) on cover. Pressure plate oil-baffle and new Over-center return spring (hooked to pedal) *See article in Mechanical Equipment Section for data.* **Facings**—Woven & compressed, 2 required. Inside Diam. 5⅝" (9A6), 6½" (11A6). Outside Diam. 9¼" (9A6), 11" (11A6). Thick. .133" (9A6), .125" (11A6). NOTE—Spiral grooved type facings used on 11A6.

Adjustment:—Pedal should just clear toeboard (adjust stopscrew on lower end) and have 1" free movement (adjust nut on link rod at clutch fork).

Removal:—Remove floor board, unhook clutch fork pull-back spring and take out clevis pin in connecting link. Remove transmission (see Transmission Removal below), remove housing underpan, mark cover & flywheel, remove clutch cover bolts evenly.

TRANSMISSION:—**Own Make.** All helical gear, constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse) with steering column gear shift (P-8). *See Mechanical Equipment Section.*

Transmission Control (P-8):—Remote control type. *See article in Mechanical Equipment Section for data.*

Removal:—Remove floor boards, disconnect battery ground cable, speedometer cable, front and rear universal joints (see Chrysler Shop Notes for Propeller Shaft Center Bearing on 7 Pass. models), free hand brake cable at clevis, disconnect gear shifter rod and selector cable at transmission case (P-8 only). Remove mounting stud nuts, take out cover capscrews and lift off cover assembly (with shift lever on P-7), install two pilot studs in upper mounting stud holes, withdraw transmission.

UNIVERSAL JOINTS:—**Detroit-Universal Series 4200.** Ball and trunnion type with roller bearings. *See article in Mechanical Equipment Section for data.*

Propeller Shaft Center Bearing:—On 7 pass. sedans. *See Chrysler Shop Notes for Propeller Shaft Center Bearing Removal and Installation instructions.*

REAR AXLE:—**Own Make.** Semi-floating, hypoid gear type with Hotchkiss drive. *See article in Mechanical Equipment Section for data.* **Ratio**—3.54-1 (P-7 Econ.). 3.73-1 (P-7 Spec., P-8 Econ.). 3.9-1 (P-7 Std., P-8 Coupe). 4.1-1 (P-8 Sedan). 4.3-1 (P-7, 8 with 18" or 20" tires, P-8 7 pass.). **Backlash**—.006-.010". Screw adjustment.

Removal:—Disconnect drive shaft at rear universal, remove axle shafts (see below), remove capscrews on carrier flange, pull carrier assembly out. **Axle Shaft Removal**—Remove wheel, hub and drum assembly (use screw type hub puller), block brake pedal, disconnect brake line at wheel cylinder, take off backing plate & oil seal, pull shaft & bearing.

Wheel Bearing Adjustment:—Shims between backing plate and axle housing. With wheel and hub removed check endplay with dial indicator. To adjust, remove backing plate (see above), add or remove shims equally (at both sides). **Endplay**—.003-.008".

SHOCK ABSORBERS:—**Delco.** Direct acting type. Domestic—Front 1110-C. Rear 1111-T, W (20" wh.). Exp.—Front 1114-C. Rear 1115-T, W (20" wh.). Adj. Exp.—Front 1134-E. Rear 1130-W, Y (20" wh.). Adj. *See article in Mechanical Equipment Section for data.*

STEERING:—**Steering Gear**—Chrysler (Gemmer Model 300 Std., 305 'push-pull' adj. Export). Worm & Roller. *See article in Mechanical Equipment Section for data.*

Front Suspension:—Independent, linked parallelogram type with coil springs. *See article in Mechanical Equipment Section for data.* **Kingpin Inclination**—5¼-6½° (4¾-6°—7 pass.). **Caster**—Minus ¼° to Plus 1½° (plus ½-2½° 7 pass). **Camber**—0° preferred. Limits minus ¼° to plus ½°. Minus ¼° to Plus ¾° (7 passenger). **Toe In**—1/16" (0-⅛"). Set long tie rod to 31 11/16" (between ball centers). Adjust short rod only.

Steering Geometry:—Inner wheel turned 22°30', outer wheel 20°.

BRAKES:—**Service.** Lockheed hydraulic, double anchor type. Hand lever applies independent shaft brake. *See article in Mechanical Equipment Section for data.* **Wheel Cylinders**—Stepped or two-stage bore type. **Drum**—Centrifuse. Diameter 10", 11" (7 pass.). **Lining**—Moulded type. Width 2". Thickness 13/64". Length per shoe, Front 10 9/32", 11 5/32" (7 Pass.), Rear 7 11/16", 7 31/32" (7 Pass.). **Clearance**—.012" toe, .006" heel, for each shoe.

Hand Brake:—On drum at rear of transmission. **Adjustment**—*See Chrysler Shop Notes for data.* **Drum**—Cast-iron. Diameter—6". **Lining**—Width 2". Thick. 5/32". Length 17 1/16".

1935-38 MODELS

FRONT FENDER AND RADIATOR REMOVAL:—Work on front of engine can be facilitated by removing radiator and front fenders as an assembly. Removal as follows:—Remove hood, side panels, front bumper, drain cooling system and free radiator tie rods at dash. Disconnect headlamp wires at lamps and withdraw from radiator shell. Free fenders from running boards and body, disconnect radiator and front fender support from frame cross member by removing two nuts under center of cross member. Lift off radiator and fenders as an assembly.

1939 MODELS

FRONT FENDER AND RADIATOR REMOVAL:—To facilitate work on front of engine remove front end assembly as follows: Remove hood side panels, front bumper assembly, fender-to-body and fender-to-frame brace hex head bolts, drain cooling system. Remove 6 stove bolts at top of fender side apron releasing headlamp wiring clips. Disconnect lamp wires at body side of terminal on apron, free wires from apron. Free radiator support by removing nuts on 2 support bolts under center of radiator. Lift off front end assembly as a unit.

1939 MODELS

RADIATOR CORE REMOVAL:—Drain cooling system, disconnect radiator hoses, take out 3 capscrews at each side of radiator and lift core out (rotate fan to clear radiator water outlet).

1937-38-39 MODELS

ORIGINAL BORE & PISTON SIZES:—Original bore sizes, and size of pistons installed in each cylinder bore, may be determined by letter stamped on piston head and on top face of cylinder block. Piston sizes graduated in .0005" steps as follows:

Piston & Engine Mark	Six	Eight
'A'	3.4355"	3.247"
'B'	3.436"	3.2475"
'C'	4.4365"	3.248"
'D'	3.437"	3.2485"
'E'	3.4375"	3.249"

1937-38-39 MODELS

REPLACEMENT PISTONS:—Standard. Pistons furnished in following sizes for replacement of Standard Production Pistons listed above. Sizes and part numbers for each model as follows:

1937-38

Part No. (6)	Size	Part No. (8)	Size
496949	3.4355"	549628	3.247"
496950	3.4365"	549629	3.248"
496951	3.4375"	549630	3.249"

1939

Part No.	Size	Part No.	Size
503045	3.4355"	503048	3.247"
503046	3.4365"	503049	3.248"
503047	3.4375"	503050	3.249"

First size covers 'A' and low limit 'B', Second size covers high limit 'B', 'C' and low limit 'D'. Third size covers high limit 'D' and 'E' pistons.

Oversize Replacement Pistons:—Finished pistons furnished in following oversizes: .005", .010", .020", .030". NOTE—Factory replacement pistons up to .030" oversize held to 1/16 oz. max. weight variation.

1938-39 MODELS

COMPRESSION RINGS:—Taper face ring used to lessen ring-to-cylinder wall 'break in' time. Face tapers out from top to bottom.
NOTE—Available for 1933-37 car models.

Installation—Side marked TOP toward top.

1934-39 MODELS

PISTON PIN FITTING:—Check piston pin for out-of-round. Maximum out-of-round .0002". Factory pins held within this limit. To install pins coat inside of piston bosses with graphite grease Insert pin with slotted end in lockscrew boss and press in place. Manufacturer recommends use of Piston Pin Removal and Replacing Fixture (HM-412). This fixture consists of screw press with pressure gauge attachment to prevent skirt distortion. Using this fixture, pressure to install pin should be 150-263 lbs. ('34), 200-350 lbs. ('35-36), 200-300 lbs. ('37-38-39).

1934-39 MODELS

PISTON PIN BUSHING:—To install split type bushing proceed as follows:—Press bushings in place being sure that 3/32" groove between bushings is aligned with oil hole in connecting rod. Then burnish bushings securely in rod with burnishing bar. Finally ream bushings to give .0003-.0005" clearance on piston pin. Manufacturer recommends use of following tools for servicing pin bushings:—HMJ-171—Bushing Remover. HMJ-172—Bushing Replacer (this tool fitted with shoulder which prevents bushings from being pressed through too far in rod boss). HMJ-516 ('39), HMJ-149 ('34-38) Burnishing Bar. NOTE—Tools HMJ-171, 172 used with arbor press.

1937-38-39 MODELS

CONNECTING ROD LOWER BEARING:—Removable type. No adjustment. Shims should not be used or bearing caps filed. When replacing bearings check crankpins. If scored or out-of-round and taper exceeds .001" crankshaft should be replaced.

Fitting—Use .0015" brass shim ½" wide and ⅞" long. Remove cap and lay shim across bearing. Tighten cap (with shim in place). Check bearing fit as follows:—Rod should be locked when testing end movement by hand but should slide on crankpin when tapped lightly with hammer. With shim removed rod should move freely on pin. If rod can be moved by hand with shim in place install .001" undersize bearing.

Installing Bearings—Bearing halves fitted with tangs (one on each edge of bearing). When installing bearings make sure that tangs on rod are on opposite ends of crankpin from tangs in cap.

1934-39 MODELS

HARMONIC BALANCER:—Replace for service.
Removal and Installation—Remove front assembly (see Front Fender and Radiator Removal 1st col.). Retaining screw which secures balancer in place, can be removed by using 13/16" (6), 1" (8) socket wrench and turning off. Pull balancer with suitable puller. Manufacturer recommends use of special puller (J-496). This tool consists of a bar with threaded bolt through center (engaging end of shaft) and turned ends (which engage in fan belt groove). NOTE—On 1934-38 models, balancer secured by crank nut. This nut can be removed by inserting ¾" hexagonal bar in nut and turning off.

1935-39 MODELS

MAIN BEARINGS:—Removal. Bearings can be removed with caps removed and crankshaft in place by inserting suitable tool (see NOTE following) in oil hole in shaft and rotating shaft in usual direction. NOTE—Bearing Removal Tool can be made from ⅛"x1½" cotter key. Bend each end of key up 5/16" to make ⅝" long base. With this as a base, bend key to form 59° angle. With this tool inserted in place end will just protrude far enough to engage bearing.

Installation—Insert plain edge of bearing in indented side of bearing support, slowly rotate crankshaft until bearing seated.

1937-38-39 MODELS

FITTING MAIN BEARINGS:—If the crankshaft is badly scored manufacturer recommends that it be replaced. To check bearing fit, use .002" brass shim ½" wide and 1" long. With cap removed place shim across bearing. Tighten cap (with shim in place). Test bearing fit by rocking flywheel by hand. **Do not rock flywheel more than 1" in either direction** or bearing may be damaged by shim. If crankshaft locks with shim in place and rotates freely with shim removed bearing size correct. If shaft moves with shim in place use .001" undersize bearing.

1939 MODELS

REAR MAIN BEARING OIL SEAL (Six only):—Consists of asbestos covered wiper seal fitted in groove at rear of bearing and held by retainer fitted in forward part of groove (forms trough around oil throw ring on crankshaft).

Installation—With crankshaft out and bearing shells removed, press upper half of packing and plain half of retainer in block, using Tool J-1045 placed with large diameter in front, seat packing in place by tapping tool with rawhide or lead hammer. Then cut each end of seal flush with bearing cap seat. Repeat operation for bearing cap using packing retainer with locating tangs.

1934-39 MODELS

CAMSHAFT:—Removal—Remove front assembly (see Front Fender and Radiator Removal 1st Col.), fan, harmonic balancer (see Harmonic Balancer paragraph above). Support engine at front with jack and remove front support, timing chain assembly, cylinder head, valve assembly, fuel pump, oil pump and distributor. Camshaft can then be removed from front. Center chain cover with Tool J-546 when reassembling. NOTE—On '34-36 models, valves and lifters may be blocked up by using J-527 holders.

Bearing Removal and Installation on Eight Models—All bearings except rear can be removed and installed with a driver. Rear bearing cannot be driven out due to plug at rear. Puller must be used on this bearing. Manufacturer recommends use of tool set J-550 consisting of special puller and driver. Rear bearing installed with driver.

Camshaft Bearing Finished Sizes—After installing line ream (Tool J-539) bearings to following sizes:

	Six	Eight
#1	1.9950-1.9955"	1.9950-1.9955"
#2	1.9637-1.9642"	1.9637-1.9642"
#3	1.9325-1.9330"	1.9325-1.9330"
#4	1.9012-1.9017"	1.9012-1.9017"
#5		1.8700-1.8705"

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

1939 MODELS

TIMING CHAIN COVER OIL SEAL:—Squeak Correction. If seal becomes dry forming glazed surface, squeal may develop due to seal rubbing on chain cover. This may be corrected by squirting oil and graphite fluid on seal. If seal must be replaced, rub graphite into seal thoroughly. Also, seal may be drilled with four or five ⅛" holes 3/16" deep. These holes should then be packed with graphite.

1935-39 MODELS

OIL PUMP:—Removal and Installation—Remove right hand engine side pan. Turn engine over to place #1 piston on top dead center on compression stroke with distributor rotor opposite #1 terminal, remove pump. Install pump with #1 piston as above, place prick punch mark on pump down and mesh gears. Reset ignition timing. NOTE—On '35-36 cars with conventional front axle, hoist car by frame to allow shifting of spring for pump removal. On '39 sixes, Steering Idler Arm must also be removed for pump removal.

1937-38-39 MODELS

OIL PUMP CLEARANCES:—Shaft b'ing .0005-.002". Idler gear bearing .0005-.002". Driving gear backlash .003-.004". Backlash between pump gears .006-.008". Pump Gear end clearance .002-.006".

1939 MODELS

OIL PAN REMOVAL (Eight only):—To facilitate removal and installation of front oil pan bolts, car manufacturer recommends removal of front engine insulator support assembly and replacing with a steel block (5¼" long, 1½" wide, 15/16" high). By using this block front end need not be jacked up.

Front Engine Insulator Removal—Remove hood side panels, disconnect exhaust pipe, take out 2 front engine to mounting bolts, raise engine with jack until insulator accessible, remove excess dirt from mounting, take out 2 mounting-to-frame screws, lift off mounting together with 'U' shaped shield. When reinstalling, tighten mounting bolts securely.

1938 MODELS

CLUTCH HELPER SPRING:—Removal and Installation—To remove assembly, disconnect pedal-to-cross shaft rod (allowing pedal to rest on floorboard with spring extended) and remove strut from pedal. Disconnect opposite end and remove from car. To assemble unit off car, oil lubrication felt and place in spring, install cup on pedal side of spring, insert strut with lubrication felt on top side, install cup on opposite end, compress cup and spring until cotter pin can be inserted through hole in strut holding assembly together. Lubricate pedal end of strut with lubriplate and install assembly on car. Remove cotter pin from strut and assemble connector link to pedal.

1937-38 MODELS

FRONT PROPELLER SHAFT BEARING:—Front shaft supported by bearing in rear end of shaft housing.

Checking—Overhaul assembly if oil leakage excessive or when shaft play exceeds .008" (measure by dial indicator mounted on housing, use 20-30 lbs. lifting force on shaft). With assembly dismantled, check for worn teeth on shaft and coupling, leaky oil seals. Replace worn parts.

Disassembly—Wire front universal joint trunnions together, disconnect rear propeller shaft at front universal joint, take out mounting screws in housing flange at rear of transmission case, pull shaft and housing assembly back to disengage coupling, remove from below at front. Take out universal joint flange capscrew, press shaft out of flange, remove snap ring on shaft, pull shaft out toward front. Press bearing and oil seals out toward rear (use tool made of 13/16" diameter pipe 18" long).

Assembly—Press new bearing in at rear end against shoulder in housing, install leather oil seal (lip toward bearing), offset washer (raised center portion to rear), and retainer (soak retainer felt in oil first) so that distance from retainer to end of housing is 1 9/16". Complete assembly by reversing disassembling directions above. NOTE—Manufacturer recommends use of tool J-693 to install bearing and oil seals, and J-1086 cap on end of shaft to prevent damage to oil seals when shaft installed.

Installation—When installing assembly on car, place oil filler plug on left side and slightly below center line, fill with trans. lubricant to plug level.

1937-38-39 MODELS

BRAKE BACKING PLATE ALIGNMENT:—If brake drum flange extends over edge of backing plate when installed, install sufficient gaskets (part 499930 or 499776) between axle flange and plate so that it is flush with edge of drum.

ENGINE NUMBER:—First number (1934) 987,401. On top left hand corner of engine block.

ENGINE SPECIFICATIONS:—Eight cylinder, 'L' head type.
Bore—3 3/16". **Stroke**—3½".
Displacement—223.4 cubic inches.
Rated Horsepower—32.52.
Developed Horsepower (1933)—75 at 3600 R.P.M.
Developed Horsepower (1934)—84 at 3600 R.P.M.
Compression Ratio—5.7-1 (1933), 6.2-1 (1934).
Compression Pressure—Approximately 98 lbs. (5.7-1 head), 106 lbs. (6.2-1 head) at cranking speed.
Vacuum Reading—Gauge should show steady reading of 18-20" at idling speed.

PISTONS:—Electro-plated cast-iron. Pistons are tin-plated after being finished and cannot be ground. Cylinders should be reconditioned to size for standard replacement pistons. Piston length 3.880".
Weight—26¾ ozs. Held to ⅛ oz. maximum variation.
Removal—Pistons and rods removed from above.
Clearance—Top .022". Skirt .0015-.002". See Fitting New Pistons.

Replacement Pistons:—Oversize pistons up to .030" held to same weight as standard and can be installed in one cylinder without destroying balance.

Fitting New Pistons:—Check clearance with ½" feeler stock inserted betwen piston and wall at right angles to pin bosses. Piston should fall through cylinder of own weight on .0015" feeler and hold own weight on .002" feeler. Pull required to withdraw .002" feeler should be 10-20 lbs.

PISTON RINGS:—Three compression rings above pin, one oil control ring below pin. Oil ring groove drilled radially with ten ⅛" oil drain holes.

Ring	Width	End Gap	Side Clearance
Comp	⅛"	.007-.017"	.0010-.0025"
Oil control	3/16"	.007-.017"	.0010-.0025"

PISTON PIN:—Diameter 15/16". Length 2⅞". Pin is locked in piston by locking screw in one boss. Pin hole in rod is bronze bushed. Free end of pin is slotted and is light press fit in piston to permit free expansion.
Pin Fit in Rod Bushing—.0003-.0005" clearance. Bushings should be finish-reamed to provide this clearance (bushings are split type and must be expanded with burnishing bar before being reamed).

Fitting New Pins:—Coat plain boss in piston with graphite. Insert pin in lock-boss side (slotted end first). Use special tool HM-412. Gauge reading on tool should be 150-263 for pressure required to force pin in both bosses.

CONNECTING ROD:—Length 7 11/16". Weight 32½ ozs. Held to ⅛ oz. maximum variation.
Crankpin Journal Diameter—2".
Lower Bearing Type—Spun babbitt lined. No shims.
Clearance—.0005-.002". Sideplay .005-.010".

Adjustment:—None (no shims). Replace rods. Do not file rods or caps.

Installing Rods:—Lower bearings offset. Install rods with offset (larger half of bearing) toward front of engine in cylinders #2, 4, 6, 8 and toward rear in #1, 3, 5, 7. Narrow half of bearing should be toward nearest main bearing.

CRANKSHAFT:—5 bearing. Integral counterweights.
Journal Diameters—#1, 2¼"; #2, 2 9/32"; #3, 2 5/16"; #4, 2 1/32"; #5, 2⅜".
Bearing Type—Removable steel-backed, babbitt-lined.
Clearance—.001-.003".

Adjustment:—None (no shims). Replace bearings. Do not file bearing caps. New bearings should be line-reamed.

End Thrust:—Taken by #3 center main bearing. End-play .003-.008".

CAMSHAFT:—5 bearing. Non-adjustable chain drive.
Bearing Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1 29/32"; #5, 1⅞".
Bearing Type—Steel-backed, babbitt-lined bushings.
Clearance—.0015-.0025".
NOTE—New camshaft bearings should be line-reamed after installation. See that oil hole in bushing and block line up.
End Thrust—Taken by thrust plate at front bearing. Endplay .002-.005".

Timing Chain:—Morse No. 766. Width 27/32". Pitch ⅜". Length 21" or 56 links.

Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightegde across the shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 13/32"	.310-.311"	3.880"
Exhaust	1 11/32"	.310-.311"	3.880"

	Seat Angle	Lift	Stem Clearance
Intake	30°	19/64"	Free to .0006"
Exhaust	45°	19/64"	Free to .0006"

Tappet Clearance—.009-.011" (all valves with engine hot).

Valve Springs—	Pressure	Length
Valve Closed	45-51 lbs.	1 29/32"
Valve Open	74-82 lbs.	1 19/32"

NOTE:—Springs are installed with two closed coils at top and single closed coil at bottom. Valve spring dampeners installed on top of each valve spring. Install new dampeners whenever dampener is removed from spring.

Valve Timing

Intake Valves open 5° BTDC. Close 39° ALDC.
Exhaust Valves open 45° BLDC. Close 5° ATDC.
NOTE:—Valve timing figures are correct with .0125" tappet clearance.
To Check Timing—Set tappet clearance #1 intake valve at .0125". This valve should open with piston 5° or .0082" before top dead center with the second straight line of the ignition mark '/IGN..1&8/' slightly before the pointer in the inspection hole in the left front face of the flywheel housing. Reset tappet clearance at .010" with engine hot.
Motor Gauge—Weidenhoff Adapter #114, Rod #42.

LUBRICATION:—Pressure type. Gear type oil pump located at right of crankcase on lower end of inclined accessory shaft.
Oil Pressure—20-30 lbs. at normal driving speeds.
Oil Pressure Relief Valve—Built in oil pump cover. Not adjustable. Relief valve ball clearance should be .0145-.0165".
Pump Clearances—.006-.008" (backlash between gears), .002-.006" (end clearance between gears and housing).
Crankcase Capacity—7 quarts.

CLUTCH:—**Own make.** Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Moulded type, 2 required. Thickness .125". Inside Diameter 6¼". Outside Diameter 10".
Adjustment—Clearance between pedal and underside of toeboard should be ⅝". To adjust, loosen locknut and turn stopscrew at rear of pedal shaft. Free movement of pedal must be 1". To adjust, loosen one nut and turn up second nut on clutch pedal link at throw-out shaft lever.

STEERING:—**Steering Gear**—Saginaw Worm-and-Sector type (1933), Worm-and-Roller type (1934).
See article in Mechanical Equipment Section for data.

Front Suspension (603 '33):—Conventional 'I' beam section front axle with Reverse Elliott ends and semi-elliptic springs.
Kingpin Inclination—9½° crosswise.
Caster—1½-2½°. Adjust by inserting wedge shims between spring and spring pad on axle.
Camber—1½°. No adjustment provided.
Toe In—0-⅛". Adjust in usual manner by loosening clamp bolts and rotating tie rod.

Front Suspension (605 '34):—'Knee Action' type independent front suspension. Entire suspension unit pivoted on kingpin and turns with wheel.
See article in Mechanical Equipment Section for data.
Kingpin Inclination—7° crosswise.
Caster—0° Caster effect secured by trailing wheel center behind kingpin center-line.
Camber—1-2°.
Toe In—1/32-⅛". Adjust in usual manner by loosening clamp bolts and turning tie rod.
Steering Geometry—Inner wheel turned 23-24°, outer wheel 20°.

BRAKES:—**Service (603 '33):**—Houck (own make). Two shoe, mechanically operated, internal expanding, four wheel type. Hand lever applies all four service brakes.
Drum Diameter—12".
Lining—Moulded type. Width 1¾". Thickness 3/16". Length per wheel—one piece 12 5/32" long, one piece 6 3/32" long.

Service Brakes (605 '34):—Bendix Mechanical, Duo-Servo, Single-anchor type. Hand lever applies all four service brakes. See article in Brake Section for complete adjstment directions.
Drum Diameter—12".
Lining—Moulded type. Width 1¾". Thickness 3/16" and 13/64" (one piece each thicknes). Length per wheel—2 pieces 12 31/32".

Hand Brake (all models):—See Service Brakes.

ENGINE NUMBER: — First number 6-10001. On boss on left hand top corner of cylinder block.

ENGINE:—Six cylinder, 'L' head type.
Bore—3⅜". **Stroke**—3⅞".
Piston Displacement—208 cubic inches.
Rated Horsepower—27.4 (SAE.).
Developed Horsepower—80 at 3600 R.P.M.
Compression Ratio—6.2-1. No optional ratios.
Compression Pressure—148-150 lbs. at 1000 R.P.M. or approx. 106 lbs. at cranking speed.
Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling.
See Pontiac Shop Notes for Radiator & Fender Removal.

Pistons:—Electro-plated cast-iron. Pistons are tin-plated to thickness of .00075-.00125" after finishing and cannot be ground. Standard pistons furnished in following sizes: 3.3720", 3.3730", 3.3740". Oversize pistons furnished 005", 010", 015", 020", 030" oversize and are held to same weight as standard (can be used in one cylinder without destroying balance).
Piston Length—3 25/32".
Weight—Held to 1/16 oz. variation. Not necessary to select pistons for service.
Removal—Pistons and rods removed at top.
Clearance—Top .022". Bottom .0015".
Fitting New Pistons—Use .002" feeler stock ½" wide inserted between piston and cylinder wall to check clearance. Pull required to withdraw feeler should be 10-20 lbs. Piston must not be out-of round or tapered more than .0005".

Piston Rings:—Four rings per piston, 3 compression rings above pin, one oil control ring below pin. Oil ring groove drilled radially with ten ⅛" oil drain holes.

Ring	Width	End Gap	Side Clearance
Comp. (all)	⅛"	.007-.017"	.001-.0025"
Oil Cont.	3/16"	.007-.017"	.001-.0025"

Piston Pin:—Diameter 15/16". Length 3 25/32". Pin is locked in piston (opposite end slotted to allow free movement of boss on pin).
Pin Fit in Piston—*See Pontiac Shop Notes.*
Pin Fit in Rod Bushing—.0003-.0005" clearance. See Connecting Rod upper bearing.
Fitting Pins—Use special tool HM-412 to install pins (tool checks pressure required to press pin into place). Coat bosses with graphite grease, insert slotted end of pin in lockpin boss. Pressure should be 200-350 lbs.

Connecting Rod:—Weight held to 1/16 oz. maximum variation. Length, 7 11/16".
Upper Bearing—Split bushed type 15/16" diameter. Two bushings used with 3/32" gap at center forming oil groove. Use special tool to install bushings (shoulder on tool prevents closing up gap). Drilled oil passage in rod must open into this groove. New bushings should be burnished and then reamed to size giving correct clearance.
Lower Bearing—Interchangeable steel-backed, cadmium-silver alloy lined type. Bearings furnished .0005" undersize for service.
Clearance—.0005-.0015". Sideplay .005-.010".
Adjustment—None (no shims). Replace bearings. Do not file bearing caps. Clearance must be kept below .0015".
Installing Rods—Connecting rods not offset. Install rods in same cylinders from which removed.

Crankshaft:—Four bearing type with integral counterweights.
See Pontiac Shop Notes for Harmonic Balancer data.
Journal Diameters—#1 2¼", #2 2 9/32", #3 2 5/16", #4 2⅜".
Bearing Type—Interchangeable steel-backed, cadmium-silver lined type. Upper and lower bearing halves interchangeable.
Clearance—.001-.003".
Adjustment—None (no shims). Replace bearings. Do not file bearing caps. Bearing upper halves can be removed without removing crankshaft by using special tool. Tool consists of a flat headed plug which is inserted in oil hole in crankshaft and turns out bearing as crankshaft is rotated. Install new bearings in same manner, inserting plain edge of bearing on indented side of upper bearing support. Tool furnished with bearings.

Camshaft: — Four bearing type. Non-adjustable chain drive.
See Pontiac Shop Notes for Camshaft Removal and Camshaft Bearing finished sizes.
Bearing Type—Steel-backed, babbitt-lined type.
Clearance—.0015-.0025". Endplay .002-.005".
Timing Chain—Morse Side-Guide type. Width 1". Pitch ⅜". Length 56 links.
Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across the shaft centers.

Valves:—

	Head Diameter	Stem Diameter	Seat Angle
Intake	1 17/32"	.310"	30°
Exhaust	1 15/32"	.310"	45°

Valve Lift—19/64" (all valves).
Stem-to-Guide Clearance—Free fit to .0006" clearance (for new guides).
Valve Guides—Removable, tapered guides (.001" taper to the inch, with greatest clearance at top). IMPORTANT—Measure clearance at bottom end. Valve should just fall through of own weight when started in guide. NOTE—When valves serviced, guides should be cleaned with wire brush or taper reamer (Tool P.R. 131).
Tappet Clearance—.009-.011" all valves, engine hot. Use .009" and .011" feelers as 'go' and 'no go' gauges. Hood sill must be removed to adjust clearance of valves in front cluster.
Valve Springs—Install springs with one closed coil at bottom two closed coils at top. Valve spring dampener installed on top of each spring. Use new dampener whenever dampener is removed.

	Spring Pressure	Spring Length
Valve Closed	52 lbs.	1 29/32"
Valve Open	82 lbs.	1 39/64"

Valve Timing—See Camshaft Setting (above). Intake Valves—Open 5° BTDC. Close 39° ALDC. Exhaust Valves—Open 45° BLDC. Close 5° ATDC. These figures correct with .0125" tappet clearance.
To Check Valve Timing—Set tappet clearance #1 intake valve at .0125". This valve should open with piston 5° before top dead center and first straight line of ignition mark '/IGN.1&6/' slightly past indicator. Reset tappet clearance at .010".
Motor Gauge—Weidenhoff Adapter #114, Rod #42.

Lubrication:—Pressure. Gear type oil pump on right hand side of crankcase. Dip pump gears in oil before installing (pump does not require priming).
See Pontiac Shop Notes for Pump removal & installation.
Normal Oil Pressure—5 to 40 lbs.
Oil Pressure Relief Valve—Built in pump cover. Not adjustable. Relief valve ball clearance should be .0145-.0165".
Oil Pump Clearances—Shaft bearing .0005-.002". Idle gear bearing .0005-.002". Driving gear backlash .003-.004". Backlash between pump gears .006-.008". Pump gear end clearance .002-.006".
Capacity and Oil—6 qts. Use SAE. #10-W for first 500 miles in new cars. After 500 miles use SAE. #30 (above 95°F.), #20 (32° to 95°F.), #10-W (0° to 32°F.).

CLUTCH:—Own make, single plate, dry disc type. No release lever adjustment necessary for wear.
See article in Mechanical Equipment Section for data.
Clutch Pedal Adjustment—Clearance between clutch pedal and pedal felt retainer board (on under side of toeboard) should be ⅝". Adjust by loosening lock nut and turning pedal stop screw. Lash or free movement of clutch pedal should be 1". Adjust by changing length of clutch pedal link (adjusting screw on outer end of link).
Clutch Facings—Moulded type, 2 required. 6¼" I.D., 9⅞" O.D., ⅛" thick.
NOTE—Cap screws used to hold clutch cover on flywheel are sufficiently long to relieve clutch spring tension. To disassemble clutch, back off cap screws equally, one turn at a time. Clutch springs should force cover free of flywheel flange. If cover sticks, strike sharply on radius outside spring cups before screws are completely removed.

STEERING:—**Front Suspension** — Independent type used on De Luxe Models. All data same as for Eight Cylinder Model 605 (see next page).
Standard Six Model 701-B—Conventional "I" beam section front axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—7°10' (crosswise).
Camber—1½° plus 0° minus 1° (car empty). Bending of axle to correct camber not recommended.
Caster—1¼° plus or minus ¼° (car empty). Adjust by using wedge shims between spring and axle pad.
Toe In—0-⅛" (measured 9" above floor). Adjust in usual manner by changing length of tie rod.
Steering Gear:—Saginaw Model, Worm-and-Roller type. See article in Steering Section for adjustmts.

BRAKES:—**Service**—Bendix hydraulic, Duo-Servo, single anchor type. Hand lever applies rear wheel service brakes.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Diameter (front wheels, 1"), (rear wheels—15/16"). Late 701-B (15/16"—all wheels).
Drum Diameter—12".
Lining—Width 1¾". Thickness 3/16". Length per wheel 23 3/16" (10 3/16" Primary or front shoe, 13" Secondary or rear shoe).
Clearance—.010" at heel and toe of each shoe.
Hand Brake Adjustment:—See Service Brakes.

ENGINE NUMBER:—First number, 8-1001. On boss on left hand top corner of cylinder block.

ENGINE:—Eight cylinder In line, 'L' head type.
Bore—3 3/16". **Stroke**—3½".
Piston Displacement—223.4 cubic inches.
Rated Horsepower—32.6 (SAE).
Developed Horsepower—84 at 3600 R.P.M.
Compression Ratio—6.2-1. No optional ratios.
Compression Pressure—137-139 lbs. at 1000 R.P.M. or approx. 106 lbs. at cranking speed.
Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling.
See Pontiac Shop Notes for Radiator & Fender Removal.

Pistons:—Electro-plated cast-iron. Pistons are tin-plated to thickness of .00075-.00125" after finishing and cannot be ground. Standard pistons furnished in following sizes: 3.1845", 3.1855", 3.1865". Oversize pistons furnished .005", .010", .015", .020", .030" oversize and are held to same weight as standard (can be used in one cylinder without destroying balance. Piston length 3⅞".
Weight—Held to 1/16 oz. variation. Not necessary to select pistons for service.
Removal—Pistons and rods removed at top.
Clearance—Top .022". Bottom .0015". See below.
Fitting New Pistons—Use .002" feeler stock ½" wide inserted between piston and cylinder wall to check clearance. Pull required to withdraw feeler should be 10-20 lbs.

Piston Rings:—Four rings per piston, 3 compression rings above pin, one oil control ring below pin. Oil ring groove drilled radially with ten ⅛" oil drain holes.

Ring	Width	End Gap	Side Clearance
Comp. (all)	⅛"	.007-.017"	.001-.0025"
Oil Cont.	3/16"	.007-.017"	.001-.0025"

Piston Pin:—Diameter 15/16". Length 2⅞". Pin is locked in piston (opposite end slotted to allow free movement of boss on pin).
Pin Fit in Piston—*See Pontiac Shop Notes.*
Pin Fit in Rod Bushing—.0003-.0005" clearance.
Fitting Pins—Use special tool HM-412. See Pontiac Six for instructions.

Connecting Rod:—Weight held to 1/16 oz. maximum variation. Length, 7 11/16".
Piston Pin Bushing (Upper Bearing)—Split bushed type. *See Pontiac Shop Notes for complete data.*
Lower Bearing—Interchangeable steel-backed, cadmium-silver alloy lined type. Bearings furnished .0005" undersize for service.
Clearance—.0005-.0015". Sideplay .005-.010".
Adjustment—None (no shims). Replace bearings. Do not file bearing caps. Clearance must be kept below .0015".
Installing Rods—Connecting rod lower bearings are offset. Install rods with narrow half of bearing toward nearest main bearing (widest half of bearing toward front on #2, 4, 6, 8 or toward rear on #1, 3, 5, 7).

Crankshaft:—Five bearing type with integral counterweights.
See Pontiac Shop Notes for Harmonic Balancer data.
Journal Diameters—#1 2¼", #2 2 9/32", #3 2 5/16", #4 2 11/32", #5 2⅜".
Bearing Type—Interchangeable steel-backed, babbitt-lined type. Upper and lower bearing halves are interchangeable.
Clearance—.001-.003".
Adjustment—None (no shims). Replace bearings. Do not file bearing caps. See Pontiac Six for directions on bearing removal.
End Thrust—Taken by #3 (center) bearing. Endplay .003-.008".

Camshaft:—Five bearing type. Non-adjustable chain drive.
See Pontiac Shop Notes for Camshaft Removal and Camshaft Bearing finished sizes.
Bearing Type—Steel-backed, babbitt-lined type.
Clearance—.0015-.025". Endplay .002-.005".
Timing Chain—Morse Side-Guide type. Width 25/32". Pitch ⅜". Length 56 links.
Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across the shaft centers.

Valves:—

	Head Diameter	Stem Diameter	Seat Angle
Intake	1 13/32"	.310"	30°
Exhaust	1 11/32"	.310"	45°

Valve Lift—19/64" (all valves).
Stem-to-Guide Clearance—Free fit to .0006" clearance (for new guides).
Valve Guides—Removable, tapered guides (.001" taper to the inch, with greatest clearance at top). IMPORTANT—Measure clearance at bottom end. Valve should just fall through of own weight when started in guide. NOTE—When valves serviced, guides should be cleaned with wire brush or taper reamer (Tool P.R. 131).
Tappet Clearance—.009-.011" all valves, engine hot. Use .009" and .011" feelers as 'go' and 'no go' gauges. Hood sill must be removed to adjust clearance of valves in front cluster.
Valve Springs—Install springs with one closed coil at bottom two closed coils at top. Valve spring dampener installed on top of each spring. Use new dampener whenever dampener is removed

	Spring Pressure	Spring Length
Valve Closed	52 lbs.	1 29/32"
Valve Open	82 lbs.	1 39/64"

Valve Timing—See Camshaft Setting (above).
Intake Valves—Open 5° BTDC. Close 39° ALDC.
Exhaust Valves—Open 45° BLDC. Close 5° ATDC.
These figures correct with .0125" tappet clearance.
To Check Valve Timing—Set #1 intake valve tappet clearance at .0125". This valve should open with piston 5° before top dead center with first straight line of ignition mark on flywheel '1 IGN. 1&8/' slightly past indicator. Reset tappet clearance at .010".
Motor Gauge—Weidenhoff Adapter #114, Rod #42.

Lubrication:—Pressure. Gear type oil pump on right hand side of crankcase. Dip pump gears in oil before installing (pump does not require priming).
See Pontiac Shop Notes for Pump removal & installation.
Normal Oil Pressure—5 to 40 lbs.
Oil Pressure Relief Valve—Built in pump cover. Not adjustable. Relief valve ball clearance should be .0145-.0165".
Oil Pump Clearances—Shaft bearing .0005-.002". Idle gear bearing .0005-.002". Driving gear backlash .003-.004". Backlash between pump gears .006-.008". Pump gear end clearance .002-.006".
Capacity and Oil—7 qts. Use SAE. #10-W for first 500 miles in new cars. After 500 miles use SAE. #30 (above 95°F.), #20 (32° to 95°F.), #10-W (0° to 32°F.).

CLUTCH:—Own make, single plate, dry disc type. No release lever adjustment necessary for wear.
See article in Mechanical Equipment Section for data.
Clutch Pedal Adjustment—Clearance between clutch pedal and pedal felt retainer board (on under side of toeboard) should be ⅝". Adjust by loosening lock nut and turning pedal stop screw. Lash or free movement of clutch pedal should be 1". Adjust by changing length of clutch pedal link (adjusting screw on outer end of link).
Clutch Facings—Moulded type, 2 required. 6¼" I.D., 9⅞" O.D., ⅛" thick.
NOTE—Cap screws used to hold clutch cover on flywheel are sufficiently long to relieve clutch spring tension. To disassemble clutch, back off cap screws equally, one turn at a time. Clutch springs should force cover free of flywheel flange. If cover sticks, strike sharply on radius outside spring cups before screws completely removed.

STEERING:—**Front Suspension**—Independent type. Entire suspension unit (coil spring housing with built-in shock absorber unit, wheel support arm and radius rod) pivoted on kingpin and turns with front wheel.
See article in Mechanical Equipment Section for data.
King Pin Inclination—7° (with load on wheels).
Camber—1-2° (with load on wheels). No adjustment provided. Replace front frame cross tube and check suspension unit housing and wheel support arm. Do not bend cross tube hot or cold.
Caster (King Pin Tilt)—0°. Adjust by shims at frame cross tube brackets. Frame must be absolutely level when checking caster. Use jacks to set frame height (vertical distance from floor) as follows: 15 11/16" to bottom of frame cross tube at center, 19" to lower face of rear spring horns.
Toe In—0-1/16". Adjust by changing length of tie rod.
Lubrication—Entire suspension unit must be kept filled with special Shock Insulating Fluid to level of filler plug on front of unit (capacity 2½ qts.).
NOTE—Suspension unit is removed by taking out kingpin (kingpin locked in place by tapered lock bolt in usual manner). Kingpin is carried at top and bottom on 32 loose rollers retained by convex plug and snap rings. Use special loading tool to insert rollers after kingpin has been installed. Insert kingpin at bottom with longest end (from slot) upward, tap ball thrust bearing in place between top of steering knuckle and upper support boss (with dust shield at top) before pushing kingpin up into place. Check steering knuckle endplay (between thrust bearing and upper support boss) and insert shim if more than .006". Install roller retainer plugs with convex face in.
Leveling Frame—Car is leveled by turning adjusting plugs in housing covers of suspension units. To adjust, remove cap screw in center of adjusting plug, lift out adjusting plug lock, use special wrench to turn adjusting plug until distance from lower face of cross tube yoke to bottom of brake drum is 5⅛" with car weight on wheels. Adjusting plug must not be turned in more than 2 turns from flush position with housing cover. Replace lock and cap screw.
Steering Gear:—Saginaw Model, Worm-and-Roller
See article in Mechanical Equipment Section for data.

BRAKES:—**Service**—Bendix hydraulic, Duo-Servo, single anchor type. Hand lever applies rear wheel service brakes.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Diameter (front wheels, 1"), (rear wheels—15/16").
Drum Diameter—12".
Lining—Width 1¾". Thickness 3/16". Length per wheel 23 3/16" (10 3/16" Primary or front shoe, 13" Secondary or rear shoe).
Clearance—.010" at heel and toe of each shoe.
Hand Brake Adjustment:—See Service Brakes.

NOTE:—Models 36-26A Deluxe Six and 36-26B Master Six are similar except that Knee Action standard on Model 36-26A only. All other data below applies to both models.

ENGINE NUMBER:—First number—6-84,001. Stamped on top left hand corner of block.

ENGINE SPECIFICATIONS:—Type—6 cyl. 'L' head.
Bore—3⅜". **Stroke**—3⅞".
Displacement—208 cubic inches.
Rated Horsepower—27.4 (SAE).
Developed Horsepower—80 at 3600 R.P.M.
Compression Ratio & Pressure—6.2-1 Std. cast-iron head. Pressure 149 lbs. at 1000 R.P.M. or approximately 106 lbs. at cranking speed.
NOTE—Special thick head gasket which reduces comp. ratio to 5.7-1 may be installed if desired.
Vacuum Reading—Gauge should show steady reading of 18-20" of HG. with engine idling at 360 R.P.M. or 6 M.P.H.
See Pontiac Shop Notes for Radiator & Fender Removal.

PISTONS:—Electro-plated cast-iron. Tin-plated to thickness of .00075-.00125" after finishing and cannot be ground. Use finished replacement pistons.
Length—3½".
Weight—Held to 1/16 oz. maximum variation.
Removal—Pistons and rods removed from above
Clearance—Top .022". Bottom .0015". See Fitting New Pistons.
Replacement Pistons:—Finished pistons furnished in three standard sizes (marked by letter stamped on head) as follows: 'A'—3.3720", 'B'—3.3730", 'C'—3.3740", and .005", .010", .015", .020", .030" oversize. Pistons up to .030" oversize held to same weight as standard.
Fitting New Pistons:—Check clearance by inserting .002" feeler ½" wide between piston and cylinder wall at right angles to pin hole. Pressure to withdraw feeler must be 10-25 lbs. Piston taper allowance .0005".

PISTON RINGS:—Two compression rings above pin, one oil control ring below pin per piston. Lower ring groove drilled radially with ten ⅛" oil drain holes. Piston also has two ⅛" drain holes drilled on each side above pin hole.

Ring	Width	End Gap	Side Clearance
Comp.	⅛"	.007-.017"	.001-.0025"
Oil Cont.	3/16"	.007-.017"	.001-.0025"

NOTE—Install compression rings with groove or step downward.

PISTON PIN:—Diameter 15/16". **Length** 3 1/16".
Pin is locked in piston by lock screw in one boss. Opposite end slotted to allow boss to slide freely on pin.
Pin Fit in Piston—*See Pontiac Shop Notes.*
Pin Fit in Rod Bushing—.0003-.0005" clearance. See Connecting Rod Upper Bearing.
Fitting Pins—*See Pontiac Shop Notes.*

CONNECTING ROD:—Length—7 11/16" (center-to-center). **Weight**—Held to 1/16 oz. maximum variation.
Piston Pin Bushing (Upper Bearing)—Split bushed type. *See Pontiac Shop Notes for complete data.*
Crankpin Journal Diameter—2".
Lower Bearing—Interchangeable steel-backed, cadium-silver alloy lined type. Bearings furnished .0005" undersize for service.
Clearance—.0005-.0015". Sideplay .005-.010".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps. Clearance must be kept below .0015".
Installing Rods:—Rods not offset. Install rods in same cylinders from which removed.

CRANKSHAFT:—Four bearing. Integral counterw'ts.
See Pontiac Shop Notes for Harmonic Balancer data.
Journal Diameters—#1, 2¼"; #2, 2 9/32"; #3, 2 15/16"; #4, 2⅜".
Bearing Type—Interchangeable steel-backed, cadium-silver lined type. Upper and lower bearing halves interchangeable. Bearings furnished standard and .001" undersize.
Clearance—.001-.003".
Bearing Adjustment:—None (no shims). Replace berings. Do not file bearing caps. Bearing upper halves can be removed without removing crankshaft by turning bearing out as crankshaft is rotated.
End Thrust:—Taken by #3 rear center bearing. Endplay .003-.008". Adjusted by replacing bearing.

CAMSHAFT:—Four bearing. Non-adjustable chain drive.
See Pontiac Shop Notes for Camshaft Removal and Camshaft Bearing finished sizes.
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1 29/32".
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.0015-.0025". Endplay .002-.005".
End Thrust:—Taken by steel thrust plate assembled behind camshaft sprocket. Endplay .002-.005". Adjusted by replacing thrust plate.
Timing Chain:—Morse. Width 1". Pitch ⅜". Length 56 links or 21".
Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that 'O' marks are adjacent and in line with a straightedge across the shaft centers.

VALVES:—Head Diameter Stem Diameter Length
Intake ..... 1 17/32" ..... .310-.311" ..... 4 15/16"
Exhaust ..... 1 15/32" ..... .310-.311" ..... 4 15/16"

	Seat Angle	Lift	Stem Clearance
Intake	30°	19/64"	Free fit to .0006"
Exhaust	45°	19/64"	Free fit to .0006"

Tappet Clearance—.009-.011" all valves (hot). For sustained high speed driving .011" exhaust setting is recommended. Use .009" and .011" feelers as 'go' and 'no go' gauges. Hood sill must be removed to adjust clearance of front valves.
Valve Guides:—Removable, tapered guides (.001" taper to the inch, with greatest clearance at top). IMPORTANT—Measure clearance at bottom end. Valve should just fall through of own weight when started in guide. NOTE—When valves serviced, guides should be cleaned with wire brush or taper reamer (Tool P.R. 131).
Valve Springs:—Install with one closed coil at bottom two closed coils at top. Dampners installed on top of each spring. Use new dampner whenever dampner is removed.

	Spring Pressure	Spring Length
Valve Closed	52 lbs	1 29/32"
Valve Open	82 lbs	1 19/32"

Valve Lifters:—Single piece cast-iron. Furnished .005" oversize. Use special piloted reamer (J-551) when installing oversize lifter. Clearance .0005-.0015".
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 5° BTDC. Close 39° ALDC.
Exhaust Valves—Open 45° BLDC. Close 5° ATDC.
NOTE—Figures correct with .0125" lash.
To Check Valve Timing—Set tappet clearance on #6 intake valve at .0125". This valve should open with piston 5° (.0092") before top dead center and first straight line of ignition mark '/IGN. 1&6/' slightly past indicator (left front face of housing). Reset tappet clearance .010".
Motor Gauge—Weidenhoff Adapter #114 Rod # 42.

LUBRICATION:—Pressure. Gear type oil pump on right hand side of crankcase.
NOTE—Whenever oil pump is to be removed turn engine over until #1 piston is at top dead center on compression stroke. On cars with conventional front springs, jack up frame until pump will clear spring. Dip pump gears in oil before installing. Prick punch mark on pump is down when gears are correctly meshed and distributor rotor in #1 position. After installing reset ignition timing.
Oil Pump Drive Clearances—Shaft bearing .0005-.002". Drive gear backlash .003-.004".
Oil Pump Gear Clearances—Idle gear bearing .0005-.002". Backlash .006-.008". End clearance .002-.006".
Normal Oil Pressure:—35-45 lbs. with oil warm.
Oil Pressure Regulator:—In oil pump, non-adjustable.
Crankcase Capacity:—6 qts. (full).

CLUTCH:—Own Make with Long 10CF-CS driven member. Single plate, dry disc type. See article in Clutch Section for relining and assembling directions.
Facings—Moulded type, 2 required. Inside Diam. 6¼". Outside Diam. 9⅞". Thickness ⅛".
Adjustment—Clearance between clutch pedal and underside of toeboard should be ⅝". Adjust by loosening locknut and turning stopscrew at lower end of pedal under shaft. Free movement or lash of pedal should be 1". Adjust by turning link screw at clutch fork end of link.
Removal—Remove floor and toeboards and front seat, disconnect universal joint, support engine at rear and remove rear engine support cross member, block up support tube against body cross sill and slide universal joint yoke and ball back as far as possible with yoke horizontal, remove transmission lowering engine slightly at rear if necessary to clear support tube. Then remove clutch housing bottom cover, clutch control countershaft, unhook clutch pedal pull-back spring, remove clutch fork ball support, clutch fork and throwout bearing. Loosen capscrews mounting clutch cover on flywheel turning all screws out evenly to release springs. If clutch cover sticks in flywheel strike cover plate sharply on radius outside spring cups before removing screws completely. Remove clutch from below without taking off housing.

STEERING:—Steering Gear—Saginaw Worm-and-Roller type.
See article in Mechanical Equipment Section for data.
Front Suspension Model 36-26A:—Independent 'Knee Action' type. See article in Steering Section.
NOTE—All specifications are identical with those given for eight cylinder Model 36-28 on next page.
Front Suspension Model 36-26B:—Conventional 'I' beam section front axle with reverse-elliott ends and semi-elliptic springs.
Kingpin Inclination—7°10' crosswise.
Caster—1¼° plus or minus ¼°. Adjustable by inserting wedge shims between axle and spring.
Camber—1½° plus 0° or minus 1°. No adjustment. Bending of axle to correct camber not recommended.
Toe In—0-⅛" measured 9" above floor. Adjustable in usual manner by changing length of tie rod.
Steering Geometry—Inner wheel turned 38°, outer wheel 29°. Check tie rod ends and kingpin for looseness, replace steering arms.

BRAKES:—Service—Bendix Hydraulic, Duo-Servo, Single anchor type. Hand lever applies rear wheel brakes.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—(36-26A) 1" diameter on front wheels, 15/16" rear wheels, (36-26B) 15/16" diameter all wheels.
Drum Diameter—12".
Lining—Woven & Moulded type. Width 1¾" Thickness 3/16". Length 23 1/16" per wheel.
Clearance—.010" at heel and toe of each shoe.
Hand Brake Adjustment—See Service Brakes.

ENGINE NUMBER:—First number—8-44,001. Stamped on boss on left hand top corner of block.

ENGINE SPECIFICATIONS:—**Type**—8 cyl., 'L' head **Bore**—3¼". **Stroke**—3½". **Displacement**—232.3 cubic inches. **Rated Horsepower**—33.8 (SAE). **Developed Horsepower**—87 at 3800 R.P.M. **Compression Ratio & Pressure**—6.2-1 Std. Cast-iron head. Pressure 144 lbs. at 1000 R.P.M. or approximately 106 lbs. at cranking speed.
NOTE—Special thick head gasket which reduces comp. ratio to 5.7-1 may be installed if desired.
Vacuum Reading—Gauge should show steady reading of 18-20" of HG. with engine idling at 360 R.P.M. or 6 M.P.H.
See Pontiac Shop Notes for Radiator & Fender Removal.

PISTONS:—Electro-plated cast-iron. Tin-plated to thickness of .00075-.00125" after finishing and cannot be ground. Use finished replacement pistons. **Length**—3 9/16". **Weight**—All pistons held to 1/16 oz. max. variation. **Removal**—Pistons and rods removed from above. **Clearance**—Top .022". Bottom .0015". See Fitting New Pistons.

Replacement Pistons:—Finished pistons furnished in three standard sizes (marked by letter stamped on head) as follows: 'A'—3.247", 'B'—3.248", 'C'—3.249" and .005", .010", .015", .020", .030" oversize. Pistons up to .030" oversize held to same weight as standard.

Fitting New Pistons:—Check clearance by inserting .002" feeler ½" wide between piston and cylinder wall at right angles to pin hole. Pressure required to withdraw feeler must be 10-25 lbs. Piston taper allowance .0005".

PISTON RINGS:—Two compression rings above pin, one oil control ring below pin per piston. Lower ring groove drilled radially with ten ⅛" oil drain holes. Piston also has two ⅛" drain holes drilled on each side above pin hole.

Ring	Width	End Gap	Side Clearance
Comp.	⅛"	.007-.017"	.001-.0025"
Oil Cont.	3/16"	.007-.017"	.001-.0025"

NOTE—Install compression rings with groove or step downward.

PISTON PIN:—Diameter 15/16". Length 2⅞". Pin is locked in piston by lock screw. Opposite end slotted to allow boss to slide freely on pin. **Pin Fit in Piston**—*See Pontiac Shop Notes.* **Pin Fit in Rod Bushing**—.0003-.0005" clearance. See Connecting Rod Upper Bearing (below). **Fitting Pins**—*See Pontiac Shop Notes.*

CONNECTING ROD:—**Length**—7 11/16" (center-to-center). **Weight**—Held to 1/16 oz. max. variation. **Piston Pin Bushing (Upper Bearing)**—Split bushed type. *See Pontiac Shop Notes for complete data.* **Crankpin Journal Diameter**—2". **Lower Bearing**—Interchangeable steel-backed, cadium-silver alloy lined type. Bearings furnished .0005" undersize for service. **Clearance**—.0005-.0015". Sideplay .005-.010".

Bearing Adjustment:—None (no shims) Replace bearings. Do not file bearing caps. Clearance must be kept below .0015".

Installing Rods:—Connecting rod lower bearings are offset. Install rods with narrow half of bearing toward nearst main bearing (widest half of bearing toward front on #2, 4, 6, 8 or toward rear on #1, 3, 5, 7).

CRANKSHAFT:—Five bearing. Integral counterweights. *See Pontiac Shop Notes for Harmonic Balancer data.* **Journal Diameters**—#1, 2¼"; #2, 2 9/32"; #3, 2 5/16"; #4, 2 11/32"; #5 2⅜". **Bearing Type**—Interchangeable steel-backed, cadium-silver lined type. Upper and lower bearing halves interchangeable. Bearings furnished standard and .001" undersize. **Clearance**—.001-.003".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps. Bearing upper halves can be removed without removing crankshaft by turning bearing out as crankshaft is rotated.

End Thrust:—Taken by #3 (center) bearing. Endplay .003-.008". Adjusted by replacing bearing.

CAMSHAFT:—Five bearing. Non-adjustable chain drive. *See Pontiac Shop Notes for Camshaft Removal and Camshaft Bearing finished sizes.* **Journal Diameters**—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1 29/32"; #5, 1⅞". **Bearing Type**—Steel-backed babbitt-lined. **Clearance**—.0015-.0025". Endplay .002-.005".

End Thrust:—Taken by a thrust plate assembled behind camshaft sprocket. Endplay .002-.005". Adjusted by replacing thrust plate.

Timing Chain:—Morse. Width 25/32". Pitch ⅜". Length 56 links or 21".

Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that 'O' marks are adjacent and in line with a straightedge across the shaft centers.

VALVES:—Head Diameter Stem Diameter Length
Intake .....1 13/32".....310-.311".....4¾"
Exhaust .....1 11/32".....310-.311".....4¾"

	Seat Angle	Lift	Stem Clearance
Intake	30°	19/64"	Free fit to .0006"
Exhaust	45°	19/64"	Free fit to .0006"

Tappet Clearance—.009-.011" all valves (hot). For sustained high speed driving .011" exhaust setting recommended. Use .009" and .011" feelers as 'go' and 'no go' gauges. Hood sill must be removed to adjust clearance of front valves.

Valve Guides:—Removable, tapered guides (.001" taper to the inch, with greatest clearance at top). IMPORTANT—Measure clearance at bottom end. Valve should just fall through of own weight when started in guide. NOTE—When valves serviced, guides should be cleaned with wire brush or taper reamer (Tool P.R. 131).

Valve Springs:—Install with one closed coil at bottom, two closed coils at top. Dampners installed on top of each spring. Use new dampner whenever dampner is removed.

	Spring Pressure	Spring Length
Valve closed	52 lbs.	1 29/32"
Valve Open	82 lbs.	1 19/32"

Valve Lifters:—Single piece cast-iron. Furnished .005" oversize. Use special piloted reamer (J-551) when installing oversize lifter. Clearance .0005-.0015".

Valve Timing:—See Camshaft Setting above. **Intake Valves**—Open 5° BTDC. Close 39° ALDC. **Exhaust Valves**—Open 45° BLDC. Close 5° ATDC. NOTE—Figures corect with .0125" lash. **To Check Valve Timing**—Set tappet clearance on #8 intake valve at .0125". This valve should open with piston 5° (.0082") before top dead center and first straight line of ignition mark '/IGN. 1&8/' slightly past indicator (left front face of housing). Reset tappet clearance .010". **Motor Gauge**—Weldenhoff Adapter #114 Rod #42.

LUBRICATION:—Pressure. Gear type oil pump on right hand side of crankcase.
NOTE—Whenever oil pump is to be removed, turn engine over until #1 piston at top dead center on compression stroke. On cars with conventional front springs jack up frame until pump will clear spring. Dip pump gears in oil before installing. Prick punch mark on pump is down when gears are correctly meshed and distributor rotor in #1 position. After installing reset ignition timing. **Oil Pump Drive Clearances**—Shaft bearing .0005-.002". Drive gear backlash .003-.004". **Oil Pump Gear Clearances**—Idle gear bearing .0005-.002". Backlash .006-.008". End clearance .002-.006".

Normal Oil Pressure:—35-45 lbs. with oil warm.

Oil Pressure Regulator:—In oil pump, non-adjustable.

Crankcase Capacity:—7 qts. (full).

CLUTCH:—Own make with Long 10CF-CS driven member. Single plate, dry disc type. See article in Clutch Section for relining and assembling directions. **Facings**—Moulded type, 2 required. Inside Diam. 6¼". Outside Diam. 9⅞". Thickness ⅛". **Adjustment**—Clearance between clutch pedal and underside of toeboard should be ⅝". Adjust by loosening locknut and turning stopscrew at lower end of pedal under shaft. Free movement or lash of pedal should be 1". Adjust by turning link screw at clutch fork end of link. **Removal**—Remove floor and toeboards and front seat, disconnect universal joint, support engine at rear and remove rear engine support cross member, block up support tube against body cross sill and slide universal joint yoke and ball back as far as possible with yoke horizontal, remove transmission lowering engine slightly at rear if necessary to clear support tube. Then remove clutch housing bottom cover, clutch control countershaft, unhook clutch pedal pull-back spring, remove clutch fork ball support, clutch fork and clutch throwout bearing. Loosen capscrews mounting clutch cover on flywheel turning all screws out evenly to release springs. If clutch cover sticks in flywheel strike cover plate sharply on radius outside spring cups before removing screws completely. Remove clutch from below without taking off housing.

STEERING:—**Steering Gear**—Saginaw Worm-and-Roller type.
See article in Mechanical Equipment Section for data.

Front Suspension:—Independent 'Knee Action' type. See article in Steering Section. All specifications below apply with car weight on wheels. **Wheel Setting (Front Suspension Height)**—5⅜" from bottom of cross tube to bottom of brake drum. **King Pin Inclination**—8¾° crosswise. **Camber**—Minus ¼° to plus ¼°. Not adjustable. **Caster**—0°. Caster effect secured by trailing wheel behind suspension unit. **Toe In**—0-1/16". Adjustable in usual manner by changing length of tie rod. **Tread**—58 13/32". **Steering Geometry**—Inner wheel turned 38°, outer wheel 29°. Check tie rod ends and kingpin for looseness.

BRAKES:—**Service**—Bendix Hydraulic, Duo-Servo, Single anchor type. Hand lever applies rear wheel brakes.
See article in Mechanical Equipment Section for data. **Wheel Cylinders**—1" diameter (front), 15/16" diameter (rear). **Drum Diameter**—12". **Lining**—Woven & Moulded type. Width 1¾". Thickness 3/16". Length 23 1/16" per wheel. **Clearance**—.010" at heel and toe of each shoe.

Hand Brake Adjustment:—See Service Brake Adjustment.

NOTE:—Hood Panel. To remove, unfasten wing nuts on inside, two (rear), one (top front).

ENGINE NUMBER:—First number, 6-220001. Stamped on top left corner of engine block.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3 7/16". **Stroke**—4".
Displacement—222.7 cubic inches.
Rated Horsepower—28.3 (S.A.E.).
Developed Horsepower—85 at 3600 R.P.M.
Compression Ratio & Pressure—6.2-1 Std. cast-iron head. Pressure 140-143 lbs. @ 1000 R.P.M. or approx. 115 lbs. at cranking speed.
Vacuum Reading—18-20" steady at 7 M.P.H.
See Pontiac Shop Notes for Radiator & Fender Removal.

PISTONS:—Electro-plated, chrome nickel alloy. Tin-plated .00075-.00125" thick after finishing and cannot be ground. Use finished replacement pistons. Pistons fitted in following standard sizes (marked by letter on top of head and on top of cylinder block)—'A'—3.4355", 'B'—3.436", 'C'—3.4365", 'D'—3.437", 'E'—3.4375". See Replacement Pistons below.
Length—3 37/64".
Weight—Held to 1/16 oz. maximum variation.
Removal—Pistons and rods removed from above.
Clearance—Skirt .002". See Fitting New Pistons.

Original Bore Size:—*See Pontiac Shop Notes.*

Replacement Pistons:—*See Pontiac Shop Notes.*

Fitting New Pistons:—Insert .002" feeler ½" wide between piston and cylinder wall at right angles to pin hole. Pressure to withdraw feeler must be 10-25 lbs. Piston taper allowance .0005".

PISTON RINGS:—Two undercut compression rings above pin, one oil control ring below pin, per piston. Lower ring groove drilled radially with ten .1402" oil drain holes (2 in each boss for pin lub.).

Ring	Width	End Gap	Side Clearance
Compression..	⅛"	.007-.012"	.0015-.003"
Oil Control	3/16"	.007-.012"	.001-.0025"

NOTE—Install comp. rings with groove down.

PISTON PIN:—Diameter—15/16". **Length**—3 1/16". Pin is locked in piston by lockscrew in one boss. Opposite end slotted, slides freely in boss.
Pin Fit in Piston—*See Pontiac Shop Notes.*
Pin Fit in Rod Bushing—.0003-.0005". See Connecting Rod Upper Bearing below.
Replacement Pins—Three oversize pins furnished in service. Can be identified by daub of paint on end of pins as follows: .001" (red and brown), .003" (red), .005" (blue).
Fitting Pins—*See Pontiac Shop Notes.*

CONNECTING ROD:—Length—7 9/16" (center-to-center). Weight—32 ozs. Held to 1/16 oz. variation.
Piston Pin Bushing (Upper Bearing)—Split bushed type. *See Pontiac Shop Notes for complete data.*
Crankpin Journal Diameter—2".
Lower Bearing—Removable steel-backed, babbitt-lined type. Bearings furnished std. and .001" under.
Clearance—.0005-.0015". **Sideplay**—.005-.010".

Bearing Adjustment:—None (no shims). *See Pontiac Shop Notes for Fitting and Installing Bearings.*

Installing Rods:—Rods not offset. Install rods in same cylinder from which removed.

CRANKSHAFT:—4 bearing. Integral counterweights.
See Pontiac Shop Notes for Harmonic Balancer data.
Journal Diameters—#1, 2⅜"; #2, 2 13/32"; #3, 2 15/16"; #4, 2½".
Bearing Type—Interchangeable steel-backed, babbitt-lined type. Upper and lower halves interchangeable. Bearings furnished std. and .001" undersize.
Clearance—.001-.003".

Bearing Adjustment:—None (no shims). *See Pontiac Shop Notes for Fitting and Installing Bearings.*

End Thrust:—Taken by #3 (rear center) bearing. Endplay .003-.008". No adjustment other than replacing bearing.

CAMSHAFT:—4 bearing, non-adjustable, chain-drive.
See Pontiac Shop Notes for Camshaft Removal and Camshaft Bearing finished sizes.
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1 29/32".
Bearing Type—Removable steel-backed, babbitt-lined type.
Clearance—.0015-.0025".

End Thrust:—Taken by steel thrust plate assembled behind camshaft sprocket. **Endplay** .002-.005". No adjustment. Replace plate.

Timing Chain:—Morse. Width ¾" (nominal). Pitch ⅜". Length 56 links or 21".

Camshaft Setting:—Sprockets marked. Mesh chain with sprockets turned so that 'O' marks are adjacent and in line with a straightedge across the shaft centers.

VALVES:—	Head Diam.	Stem Diam.	Length
Intake	1 19/23"	.310-.311"	4 15/16"
Exhaust	1 15/32"	.310-.311"	4 15/16"

	Seat Angle	Lift	Stem Clearance
Intake	30°	19/64"	Free fit to .0006"
Exhaust	45°	19/64"	Free fit to .0006"

Tappet Clearance—.011-.013" all valves (hot). For sustained high speed driving .013" exhaust setting is recommended. Use .011" and .013" feelers as 'go' and 'no go' gauges.

Valve Guides:—Removable, tapered guides (.001" taper to the inch, with greatest clearance at top). IMPORTANT—Measure clearance at bottom end. Valve should just fall through of own weight when started in guide. NOTE—When valves serviced, guides should be cleaned with wire brush or taper reamer (Tool P.R. 131).

Valve Springs:—Install with two close coils at top. Dampeners installed on top of each spring. Use new dampeners whenever removed from engine. Use care when removing split type spring keepers.

	Spring Pressure	Spring Length
Valve Closed	56 lbs.	1 29/32"
Valve Open	96 lbs.	1 39/64"

Valve Lifters:—Single piece cast-iron. Furnished .005" oversize. Use special piloted reamer (J-551) when installing oversize lifter. **Clearance**—.0005-.0015".

VALVE TIMING:—See Camshaft Setting above.
Intake Valves—Open 5° BTDC. Close 39° ALDC.
Exhaust Valves—Open 45° BLDC. Close 5° ATDC.

To Check Valve Timing:—Set tappet clearance #6 intake valve at .0125". This valve should open with piston 5° (.0096") before top dead center and first straight line of ignition mark '/IGN.1&6/' slightly past indicator (left front face of housing).
Motor Gauge—Weldenhoff Adapter #114, Rod #42.

LUBRICATION:—Pressure. Gear type oil pump on right hand side of engine.
See Pontiac Shop Notes for Pump Clearances.
NOTE—Whenever oil pump is to be removed (remove right engine side pan) turn engine over until #1 piston is at top dead center on compression stroke. To assemble, dip gears in oil, place prick-punch mark on oil pump gear down, see that distributor rotor is in #1 position, mesh gears, reset ignition timing.

Normal Oil Pressure:—35-45 lbs. with warm oil.

Oil Pressure Regulator:—In oil pump, non-adjust.

Crankcase Capacity:—6 quarts (refill).

CLUTCH:—Own—Long 10CF-CS driven member. Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven type, 2 required, I.D. 6", O.D. 10", .125" thick.
Adjustment—Clearance between pedal and underside of pedal felt retainer board should be ½". Adjust by loosening locknut and turning stopscrew at lower end of pedal. Free movement of pedal should be ¾". Adjustable link provided.

Removal:—Remove transmission (see Transmission Removal below), bottom housing cover, unlock pedal pull-back spring, remove fork ball support, fork, and throwout bearing. Loosen mounting screws evenly to release springs. Remove assembly from below.

TRANSMISSION:—Pontiac—Synchro-mesh in second and high gears. All gears helical type.
See article in Mechanical Equipment Section for data.

Removal:—Remove floor center panel, front seat, disconnect rear universal joint (wire trunnions), remove shaft housing to transmission capscrews, rear engine support bolts, jack up rear of engine, remove fastening bolts, pull unit straight back freeing main drive gear, then up and forward at front, removing transmission and coupling from front propeller shaft and housing. Remove assembly through floor opening.

UNIVERSAL JOINTS:—Mechanics—Model 2C. Roller bearing type. Two used.
See article in Mechanical Equipment Section for data.
Front Propeller Shaft Bearing:—*See Pontiac Shop Notes for complete data.*

REAR AXLE:—Pontiac, semi-floating, spiral bevel gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.375-1 Std., 4.625-1 Mt., 4.125-1 Plains.
Backlash—.003-.010" new. Shim adjustment.

Removal:—To remove axle shaft, remove wheel, brake drum, 4 nuts freeing backing plate, static collector, pull axle shaft bearing retainer away from backing plate (do not shift backing plate or brake line damage may result) and withdraw axle shaft and bearing assembly (Tool No. J-942). Replace one nut to hold backing plate in place. With axle shafts removed, differential assembly may be removed by disconnecting rear universal joint and removing housing capscrews.
Wheel Bearing Adjustment—None.

SHOCK ABSORBERS:—Delco—Model 1947-A,B (front), 1174-U (rear). Double acting, piston type. Direct acting on rear.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Saginaw Worm-and-Roller type with center steering. Specifications below apply with car weight on wheels (curb weight).
See article in Mechanical Equipment Section for data.

Front Suspension:—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
Kingpin Inclination—4½-5°.
Caster—Minus ¾° to minus 1¼°. Adjustable.
Camber—¾° to 1¼°. Adjustable (½ turn max. adj.).
Toe In—0-1/16".
Steering Geometry—Inner wheel 22½-23½°. Outer wheel 20°.

BRAKES:—Service—Bendix Hydraulic, duo-servo, single anchor type. Hand lever applies rear service brks.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Front wheel—1", rear 15/16".
Drum Diameter—12". Out-of-round—.004-.005".
Lining—Moulded type. Width 1¾". Thickness 3/16". Length per wheel 23 1/16".
Clearance—.010" at heel and toe of each shoe.

Hand Brake Adjustment:—See Service Brakes.

NOTE:—Hood Panel. To remove, unfasten wing nuts on inside, two (rear), one (top front).

ENGINE NUMBER:—First number 8-83001. Stamped on boss on left hand top corner of block.

ENGINE SPECIFICATIONS:—8 cylinder, 'L' head.
Bore—3¼". **Stroke**—3¾".
Displacement—248.9 cubic inches.
Rated Horsepower—33.8 (S.A.E.)
Developed Horsepower—100 at 3800 R.P.M.
Compression Ratio & Pressure—6.2-1 std. cast-iron head. Pressure 140-143 lbs. @ 1000 R.P.M. or approx. 115 lbs. at cranking speed.
Vacuum Reading—Steady reading of 18-20" with engine idling at 376 R.P.M. or 7 M.P.H.
See Pontiac Shop Notes for Radiator & Fender Removal.

PISTONS:—Electro-plated, chrome nickel alloy. Tin-plated .00075-.00125" thick after finishing and cannot be ground. Use finished replacement pistons. Pistons fitted in following standard sizes (marked by letter on top of head and on top of cylinder block)—'A'—3.247", 'B'—3.2475", 'C'—3.248", 'D'—3.2485", 'E'—3.249". See Replacement Pistons below.
Length—3 19/32".
Weight—Held to 1/16 oz. maximum variation.
Removal—Pistons and rods removed from above.
Clearance—Skirt .002". See Fitting New Pistons.
Original Bore Size:—*See Pontiac Shop Notes.*
Replacement Pistons:—*See Pontiac Shop Notes.*
Fitting New Pistons:—Insert .002" feeler ½" wide between piston and cylinder wall at right angles to pin hole. Pressure to withdraw feeler must be 10-25 lbs. Piston taper allowance .0005".

PISTON RINGS:—Two undercut compression rings, above pin, one oil control ring below pin, per piston. Lower ring groove drilled radially with ten .1402" oil drain holes. Also two drain holes in each boss for pin lubrication.

Ring	Width	End Gap	Side Clearance
Compression	.124"	.007-.012"	.0015-.003"
Oil Control	.186"	.007-.012"	.001-.0025"

NOTE—Install comp. rings with groove down.

PISTON PIN:—Diameter—15/16". **Length** 2⅞".
Pin is locked in piston by lockscrew in one boss. Opposite end slotted, slides freely in boss.
Pin Fit in Piston—*See Pontiac Shop Notes.*
Pin Fit in Rod Bushing—.0003-.0005". See Connecting Rod Upper Bearing below.
Replacement Pins—Three oversize pins furnished in service. Can be identified by daub of paint on end of pin as follows: .001" (red and brown), .003" (red), .005" (blue).
Fitting Pins—*See Pontiac Shop Notes.*

CONNECTING ROD:—Length—7 9/16" (center to center). **Weight**—29⅞ oz. Held to 1/16 oz. max. var.
Piston Pin Bushing (Upper Bearing)—Split bushed type. *See Pontiac Shop Notes for complete data.*
Crankpin Journal Diameter—2".
Lower Bearing—Removable steel-backed, babbitt-lined type. Furnished standard and .001" undersize.
Clearance—.0005-.0015". **Sideplay**—.005-.010".
Bearing Adjustment:—None (no shims). *See Pontiac Shop Notes for Fitting and Installing Bearings.*
Installing Rods:—Rods not offset. Install rods in same cylinder from which removed.

CRANKSHAFT:—5 bearing. Integral counterweights.
See Pontiac Shop Notes for Harmonic Balancer data.
Journal Diameters—#1, 2⅜"; #2, 2 13/32"; #3, 2 7/16"; #4, 2 15/32"; #5, 2½".
Bearing Type—Interchangeable steel-backed, babbitt-lined type. Upper and lower halves interchangeable. Furnished std., .001" undersize.
Clearance—.001-.003".
Bearing Adjustment:—None (no shims). *See Pontiac Shop Notes for Fitting and Installing Bearings.*
End Thrust:—Taken by #4 (rear center) bearing. Endplay .003-.008". No adjustment other than replacing bearing.

CAMSHAFT:—5 bearing, non-adjustable chain drive.
See Pontiac Shop Notes for Camshaft Removal and Camshaft Bearing finished sizes.
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1 29/32"; #5, 1⅞".
Bearing Type—Removable steel-backed, babbitt-lined.
Clearance—.0015-.0025".
End Thrust:—Taken by steel thrust plate assembled behind camshaft sprocket. **Endplay** .002-.005". No adjustment. Replace plate.
Timing Chain:—Morse. Width 1". Pitch ⅜". Length 56 links or 21".
Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that 'O' marks are adjacent and in line with a straightedge across the shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 15/32"	.310-.311"	4¾"
Exhaust	1 11/32"	.310-.311"	4¾"

	Seat Angle	Lift	Stem Clearance
Intake	30°	19/64"	Free fit to .0006"
Exhaust	45°	19/64"	Free fit to .0006"

Tappet Clearance—.011-.013" all valves (hot). For sustained high speed driving .013" exhaust setting is recommended. Use .011" and .013" feelers as 'go' and 'no go' gauges.
Valve Guides:—Removable, tapered guides (.001" taper to the inch, with greatest clearance at top). IMPORTANT—Measure clearance at bottom end. Valve should just fall through of own weight when started in guide. NOTE—When valves serviced, guides should be cleaned with wire brush or taper reamer (Tool P.R. 131).
Valve Springs:—Install with two close coils at top. Dampeners installed on top of each spring. Use new dampeners whenever removed from engine. Use care when removing split type spring keepers.

	Spring Pressure	Spring Length
Valve Closed	56 lbs.	1 29/32"
Valve Open	96 lbs.	1 39/64"

Valve Lifters:—Single piece cast-iron. Furnished .005" oversize. Use special piloted reamer (J-551) when installing oversize lifter. **Clearance**—.0005-.0015".

VALVE TIMING:—See Camshaft Setting above.
Intake Valves—Open 5° BTDC. Close 39° ALDC.
Exhaust Valves—Open 45° BLDC. Close 5° ATDC.
To Check Valve Timing:—Set tappet clearance #1 intake valve at .0125". This valve should open with piston 5° (.0089") before top dead center, and first straight line of ignition mark '/IGN. 1&8/' slightly past indicator (left front face of housing).
Motor Gauge—Weidenhoff Adapter #114, Rod #42.

LUBRICATION:—Pressure. Gear type oil pump on right hand side of crankcase.
See Pontiac Shop Notes for Pump Clearances.
NOTE—Whenever oil pump is to be removed (remove right engine side pan) turn engine over until #1 piston is at top dead center on compression stroke. To assemble, dip gears in oil, place prick-punch mark on oil pump gear down, see that distributor rotor is in #1 position, mesh gears, reset ignition timing.
Normal Oil Pressure:—35-45 lbs. with warm oil.
Oil Pressure Regulator:—In oil pump, non-adjust.
Crankcase Capacity:—7 quarts, refill.

CLUTCH:—Own—Long 10 CF-CS driven member. Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven type, 2 required, I.D. 6", O.D. 10", .125" thick.
Adjustment—Clearance between pedal and underside of pedal felt retainer board should be ½". Adjust by loosening locknut and turning stopscrew at lower end of pedal. Free movement of pedal should be ¾". Adjustable link provided.
Removal:—Remove transmission (see Transmission Removal below), bottom housing cover, unlock pedal pull-back spring, remove fork ball support, fork, and throwout bearing. Loosen mounting screws evenly to release springs. Lower assembly.

TRANSMISSION:—Pontiac—Synchro-mesh on second and high gears. All gears helical type.
See article in Mechanical Equipment Section for data.
Removal:—Remove floor center panel, front seat, disconnect rear universal joint (wire trunnions), remove shaft housing to transmission capscrews, rear engine support bolts, jack up rear of engine, remove fastening bolts, pull unit straight back freeing main drive gear, then up and forward at front removing transmission and coupling from front propeller shaft and housing. Remove assembly through floor opening.

UNIVERSAL JOINTS:—Mechanics—Model 2C. Roller bearing type. 2 used.
See article in Mechanical Equipment Section for data.
Front Propeller Shaft Bearing:—*See Pontiac Shop Notes for complete data.*

REAR AXLE:—Pontiac, semi-floating, spiral bevel gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.375-1 Std., 4.625-1 Mt., 4.125-1 Plains.
Backlash—.003-.010" new. Shim adjustment.
Removal:—To remove axle shaft, remove wheel, brake drum, 4 nuts freeing backing plate, static collector, pull axle shaft bearing retainer away from backing plate (do not shift backing plate or brake line damage may result) and withdraw axle shaft and bearing assembly (Tool No. J-942). Replace one nut to hold backing plate in place. With axle shafts removed, differential assembly may be removed by disconnecting rear universal joint and removing housing capscrews.
Wheel Bearing Adjustment—None.

SHOCK ABSORBERS:—Delco—Model 1947-A, B (front), 1174-U (rear). Double acting, piston type. Direct acting on rear.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Saginaw Worm-and-Roller type with center steering. Specifications below apply with car weight on wheels (curb weight).
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
Kingpin Inclination—4½-5°.
Caster—Minus ¾° to minus 1¼°. Adjustable.
Toe In—0-1/16".
Steering Geometry—Inner wheel 22½-23½°. Outer wheel 20°.

BRAKES:—Service—Bendix Hydraulic, duo-servo, single anchor. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Front wheel—1", rear 15/16".
Drum Diameter—12". **Out-of-round**—.004-.005".
Lining—Moulded type. Width 1¾". Thickness 3/16". Length per wheel 23 1/16".
Clearance—.010" at heel and toe of each shoe.
Hand Brake Adjustment:—See Service Brakes.

SERIAL NUMBER:—First number 6DA-1001. On top left frame siderail under engine hood.

ENGINE NUMBER:—First number 6-399501. Stamped on boss on top left front corner of block.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3 7/16". **Stroke**—4".
Displacement—222.7 cu. ins. **Rated HP.**—28.3.
Developed Horsepower—85 at 3520 R.P.M.
Compression Ratio—6.2-1 Std. cast-iron head.
Compression Pressure—140-143 lbs. at 1000 R.P.M. or approximately 115 lbs. at cranking speed.
Vacuum Reading—Steady 18-20", 376 RPM., 7 MPH.

PISTONS:—Electro-plated, chrome nickel alloy. Tin-plated .00075-.00125" thick after finishing. Cannot be ground.
Length—3 37/64". **Weight**—26.68 ozs.
Removal—Pistons and rods removed from above.
Clearance—Top .023". Skirt .002".
Original Bore & Piston Sizes:—*See Pontiac Shop Notes.*
Replacement Pistons:—*See Pontiac Shop Notes.*
Fitting New Pistons:—Insert .002"x½" feeler between piston and cylinder wall. Pull to withdraw feeler must be 10-25 lbs. Piston taper .0005" max.

PISTON RINGS:—Two compression rings above pin, one oil control ring below pin. Lower ring groove drilled radially with 10 oil drain holes. Rings furnished in .005", .010", .020", & .030" oversizes.
See Pontiac Shop Notes for Compression Ring data.

Ring	Width	End Gap	Side Clearance
Compression	.1235-.1240"	.007-.017"	.0015-.003"
Oil Control	.1860-.1865"	.007-.017"	.001-.0025"

PISTON PIN:—Diameter—15/16". **Length**—3 1/16". Pin locked in piston. Other end slotted.
Pin Fit in Piston—*See Pontiac Shop Notes.*
Pin Fit in Rod Bushing—.0003-.0005".
Replacement Pins:—.001", .003", .005" oversize.
Fitting Pins:—*See Pontiac Shop Notes for data.*

CONNECTING ROD:—Length—7 9/16". **Weight**—32 ozs.
Piston Pin Bushing (Upper Bearing)—Split bushed type. *See Pontiac Shop Notes for data.*
Crankpin Journal Diameter—2".
Lower Bearing—Removable steel-backed, white bearing metal alloy type. Furnished standard and .001" undersize.
Clearance—.0005-.0015". **Sideplay**—.005-.010".
Bearing Adjustment:—None (no shims). *See Pontiac Shop Notes for Fitting and Installing Bearings.*
Installing Rods:—Rods not offset. Connecting rods may be installed in either direction.

CRANKSHAFT:—4 bearing, integral counterweights.
See Pontiac Shop Notes for Balancer data.
Journal Diameters—#1, 2⅜"; #2, 2 13/32"; #3, 2 15/32"; #4, 2½".
Bearing Type—Interchangeable steel-backed, white bearing metal alloy type. Furnished standard and .001" undersize. **Clearance**—.001-.003".
Bearing Adjustment:—See Pontiac Shop Notes.
End Thrust:—Taken by #3 (rear center) bearing.
Endplay—.003-.008". To adjust, replace bearing.

CAMSHAFT:—Four bearing, non-adjustable chain drive.
See Pontiac Shop Notes for Camshaft Removal and Bearing finished sizes.
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1 29/32".
Bearing Type—Removable steel-backed, babbitt lined type. **Clearance**—.0015-.0025".
End Thrust:—Taken by steel thrust washer assembled behind camshaft sprocket. No adjustment other than replacing plate. **Endplay**—.002-.005".
Timing Chain:—Morse. Width 1" (¾" nominal). Pitch ⅜". Length 56 links or 21".
Camshaft Setting:—Sprockets are marked. Mesh chain with '0' marks on sprockets adjacent and in line with a straightedge across the shaft centers.

VALVES:—	Head Diameter	Stem Diameter	Length
Intake	1 19/32"	.310-.311"	4 15/16"
Exhaust	1 15/32"	.310-.311"	4 15/16"

	Seat Angle	Lift	Stem Clearance
Intake	30°	19/64"	Free fit to .0006"
Exhaust	45°	19/64"	Free fit to .0006"

Tappet Clearance—.011-.013" all valves (hot). High limit .013" exhaust setting recommended for sustained high speed driving. Use .011" feeler as 'go', .013" feeler as 'no go'.
Valve Guides:—Removable, tapered guides (.001" taper to the inch, with greatest clearance at top). IMPORTANT—Measure clearance at bottom end. Valve should just fall through of own weight when started in guide. NOTE—When valves serviced, guides should be cleaned with wire brush or taper reamer (Tool P.R. 131).
Valve Springs:—Intake and exhaust springs identical. Install with two closed coils at top. Dampeners installed on top of each spring. Always use new dampeners. **Spring Free Length**—2 9/16".

	Spring Pressure	Spring Length
Valve Closed	54½ lbs.	1 29/32"
Valve Open	96 lbs.	1 19/32"

Valve Lifters:—Single piece, cast iron. Furnished .005" oversize. Use special pilot reamer (J-551) when installing oversize lifter. **Clearance**—Free fit.

VALVE TIMING:—See Camshaft Setting above.
Intake Valves—Open 5° BTDC. Close 39° ALDC.
Exhaust Valves—Open 45° BLDC. Close 5° ATDC.
To Check Valve Timing:—Set tappet clearance #6 intake valve at .0125". This valve should open with piston 5° (.0096") before top dead center and first straight line of ignition mark '/IGN.ONE/' slightly past indicator (left front face of housing).
Motor Gauge—Weidenhoff Adapter #114, Rod #42.

LUBRICATION:—Pressure system. Gear type oil pump located on right side of engine.
See Pontiac Shop Notes for Oil Pump Removal, Installation, and gear clearances.
Normal Oil Pressure:—35-45 lbs. with warm oil.
Oil Pressure Regulator—In pump. Non-adjustable.
Crankcase Capacity:—6 quarts.

COOLING SYSTEM:—Water Pump. Centrifugal, belt-driven, packless type.
See article in Mechanical Equipment Section for data.
Removal—Drain radiator and block, disconnect hose, remove mounting bolts and lift off fan and pump as an assembly.
Thermostat:—Harrison. In cyl. head water outlet.
Setting—Closed 140°F. Start to open 145°F. Fully open 172°F.
Water Capacity—16 quarts.

CLUTCH:—Own—Long 10CF-CS driven member. Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven Joined type, 2 required, I.D. 6", O.D. 10", thickness ⅛".
Pedal Adjustment:—Clearance between pedal and underside of felt retainer board should be ½". Adjust by loosening lockscrew and turning adjusting screw. Free movement of pedal should be 1" plus or minus ¼". Adjustable rod provided.
Clutch Helper Spring:—*See Pontiac Shop Notes.*
Removal:—Remove transmission (see Transmission Removal below), remove bottom housing cover, unlock pedal pull-back spring, remove fork ball support, fork and throwout bearing. Loosen cover bolts remove assembly from below.

TRANSMISSION:—Own—All helical gear type with synchro-mesh shift on second and high.
Safety Shift Gear Control—Positive remote control shift by lever mounted on steering column below wheel. Available as optional equipment.
See article in Mechanical Equipment Section for data.
Removal:—Remove floor center panel, front seat assembly, and speedometer cable. (On cars with Safety Shift Gear Control disconnect control cable from selector plate hook and transmission case, withdraw cable and disconnect outer lever from cover shift shaft). Disconnect rear U-joint, remove shaft housing to transmission capscrews, rear engine support bolts, jack up rear of engine to have drain plug clear crossmember, remove fastening bolts. Pull unit straight back (use support at rear to keep in alignment) freeing clutch shaft, then up and forward at front, removing transmission with coupling from propellor shaft. Lift assembly out through floor opening.
NOTE—On cars with Safety Shift Gear Control check shift linkage adjustments after installing transmission.

UNIVERSAL JOINTS:—Mechanics—Model 2C. Roller bearing type. Two used.
See article in Mechanical Equipment Section for data.
Front Propeller Shaft Bearing:—*See Pontiac Shop Notes for complete data.*

REAR AXLE:—Own—Semi-floating, spiral bevel gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—Std. 4.375-1. Mt. 4.625-1. Plains 4.125-1.
Backlash—Not less than .003".
Removal:—To remove axle shaft, remove wheel, brake drum, 4 nuts freeing backing plate, static collector, pull axle shaft (Tool J-942). NOTE—Do not shift backing plate or brake line damage may result. With axle shafts removed, differential assembly may be removed by disconnecting rear U-joint and removing housing capscrews.
Wheel Bearing Adjustment—None.

SHOCK ABSORBERS:—Delco—Model 1947-A, B (front), P-1193-U (rear). Hydraulic, double acting type. Direct acting on rear only.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Saginaw Worm-and-Roller type with center steering.
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
Specifications below apply with car weight on wheels (at curb weight) with tires properly inflated.
Kingpin Inclination—4½-5°.
Caster—Minus ¾° to minus 1¼°. Adjustable.
Camber—Minus ½° to 1° pos. ½ turn max. adj.
Toe In—0-1/16".
Steering Geometry—Inner wheel 22½-23½°. Outer wheel 20°.

BRAKES:—Service—Bendix Duo-Servo, hydraulic, single anchor type. Hand lever applies rear brakes.
See article in Mechanical Equipment Section for data.
Wheel Cylinder Bore—Front wheel 1". Rear 15/16".
Drum—12". Chrome nickel iron. Out-of-round .005". (maximum indicator reading).
Lining—Moulded type. Width 1¾". Thickness 3/16". Length per wheel 23 1/16".
Clearance—.010" at heel and toe of each shoe.
Braking Power—53% front wheels. 47% rear.
Hand Brake Adjustment:—See Service Brakes above.

SERIAL NUMBER:—First number 8DA-1001. On top left frame siderail just ahead of steering gear.

ENGINE NUMBER:—First number 8-140001. Stamped on boss on top left front corner of engine.

ENGINE SPECIFICATIONS:—8 cylinder, 'L' head.
Bore—3¼". **Stroke**—3¾".
Displacement—248.9 cu. ins. **Rated HP.**—33.8.
Developed Horsepower—100 HP. at 3700 R.P.M.
Compression Ratio—6.2-1 Std. cast-iron head.
Compression Pressure—140-143 lbs. at 1000 R.P.M. or approximately 115 lbs. at cranking speed.
Vacuum Reading—Steady 18-20", 376 RPM., 7 MPH.

PISTONS:—Electro-plated, chrome nickel-alloy. Tin-plated .00075-.00125" thick after finishing.
Length—3 19/32". **Weight**—24.25 oz. (stripped).
Removal—Pistons and rods removed from above.
Clearance—Top .023". Skirt .002".
Original Bore & Piston Sizes:—*See Pontiac Shop Notes.*
Replacement Pistons:—*See Pontiac Shop Notes.*
Fitting New Pistons:—Insert .002" X ½" feeler between piston and cylinder wall. Pull to withdraw feeler must be 10-25 lbs. Piston taper .0005" max.

PISTON RINGS:—Two compression rings above pin, one oil control ring below pin. Lower ring groove drilled radially with 10 oil drain holes. Rings furnished in .005", .010", .020", and .030" oversizes.
See Pontiac Shop Notes for Compression Ring data.

	Width	End Gap	Side Clearance
Compression	.1235-.1240"	.007-.017"	.0015-.003"
Oil Control	.1860-.1865"	.007-.017"	.001-.0025"

PISTON PIN:—Diameter—15/16". **Length**—2⅞". Pin locked in piston by lockscrew. Other end slotted.
Pin Fit in Piston—*See Pontiac Shop Notes.*
Pin Fit in Rod Bushing—.0003-.0005".
Replacement Pins:—Oversize pins (painted on ends) .001" (Red & Brown), .003" (Red), .005" (Blue).
Fitting Pins:—*See Pontiac Shop Notes for data.*

CONNECTING ROD:—Length 7 9/16". **Weight** 31¾ oz.
Piston Pin Bushing (Upper Bearing)—Split bushed type. *See Pontiac Shop Notes for data.*
Crankpin Journal Diameter—2".
Lower Bearing—Removable steel-backed, white bearing metal alloy type. Furnished standard and .001" undersize.
Clearance—.0005-.0015". **Sideplay**—.005-.010"
Bearing Adjustment:—None (no shims). *See Pontiac Shop Notes for Fitting and Installing Bearings.*
Installing Rods:—Rods not offset. Connecting rods may be installed in either direction.

CRANKSHAFT:—5 bearing, integral counterweights.
See Pontiac Shop Notes for Balancer data.
Journal Diameters—#1, 2⅜"; #2, 2 13/32"; #3, 2 7/16"; #4, 2 15/32"; #5, 2½".
Bearing Type—Interchangeable, steel-backed, white bearing metal alloy type. Furnished standard and .001" undersize. **Clearance**—.001-.003".
Bearing Adjustment:—None (no shims). *See Pontiac Shop Notes for Fitting and Installing Bearings.*
End Thrust:—Taken by #4 (rear center) bearing.
Endplay—.003-.008". Adjust by replacing bearing.

CAMSHAFT:—Five bearing, non-adjustable chain drive. *See Pontiac Shop Notes for Camshaft Removal and Bearing finished sizes.*
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1 29/32"; #5, 1⅞".
Bearing Type—Removable steel-backed, babbitt lined type. **Clearance**—.0015-.0025".
End Thrust:—Taken by steel thrust washer assembled behind camshaft sprocket. No adjustment other than replacing plate. **Endplay**—.002-.005".
Timing Chain:—Morse. Width 1". (¾" nominal). Pitch ⅜". Length 56 links or 21".
Camshaft Setting:—Sprockets are marked. Mesh chain with '0' marks on sprockets adjacent and in line with a straightedge across the shaft centers.

VALVES:

	Head Daimeter	Stem Diameter	Length
Intake	1 15/32"	.310-.311"	4¾"
Exhaust	1 11/32"	.310-.311"	4¾"

	Seat Angle	Lift	Stem Clearance
Intake	30°	19/64"	Free fit to .0006"
Exhaust	45°	19/64"	Free fit to .0006"

Tappet Clearance—.011-.013" all valves (hot). High limit .013" exhaust setting recommended for sustained high speed driving. Use .011" feeler as 'go,' .013" feeler 'no go.'
Valve Guides:—Removable, tapered guides (.001" taper to the inch, with greatest clearance at top). IMPORTANT—Measure clearance at bottom end. Valve should just fall through of own weight when started in guide. NOTE—When valves serviced, guides should be cleaned with wire brush or taper reamer (Tool P.R. 131).
Valve Springs:—Intake and exhaust springs identical. Install with two closed coils at top. Dampeners installed on top of each spring. Always use new dampeners if removed. **Spring Free Length**—2 9/16".

	Spring Pressure	Spring Length
Valve Closed	54½ lbs.	1 29/32"
Valve Open	96 lbs.	1 19/32"

Valve Lifters:—Single piece, cast iron. Furnished .005" oversize. Use special pilot reamer (J-551) when installing oversize lifter. **Clearance**—Free fit.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 5° BTDC. Close 39° ALDC.
Exhaust Valves—Open 45° BLDC. Close 5° ATDC.
To Check Timing—Set tappet clearance #3 intake valve at .0125". This valve should open with piston 5° or .0089" before top dead center with first straight line of flywheel mark '/IGN.ONE/' slightly past indicator in inspection hole in left front face of flywheel housing.
Motor Gauge—Weidenhoff Adapter #114, Rod #42.

LUBRICATION:—Pressure system. Gear type oil pump located on right side of engine.
See Pontiac Shop Notes for Oil Pump Removal, Installation, and gear clearances.
Normal Oil Pressure:—35-45 lbs. at 40 M.P.H.
Oil Pressure Regulator—In pump. Non-adjustable.
Crankcase Capacity:—7 quarts.

COOLING SYSTEM:—Water Pump. Centrifugal, belt-driven, packless type.
See article in Mechanical Equipment Section for data.
Removal—Drain radiator and block, disconnect hose, remove mounting bolts and lift off fan and pump as an assembly.
Thermostat:—Harrison. In cyl. head water outlet.
NOTE—Install thermostat with bellows down.
Setting—Closed 140°F. Start to open 145°F. Fully open 172°F.
Water Capacity:—19 quarts.

CLUTCH:—Own—Long 10CF-CS driven member. Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Woven Joined type, 2 required, I.D. 6", O.D. 10", thickness ⅛".
Pedal Adjustment:—Clearance between pedal and underside of felt retainer board should be ½". Adjust by loosening lockscrew and turning adjusting screw. Free movement of pedal should be 1" plus or minus ¼". Adjustable rod provided.
Clutch Helper Spring:—*See Pontiac Shop Notes.*
Removal:—Remove transmission (see Transmission Removal below), remove bottom housing cover, unlock pedal pull-back spring, remove fork ball support, fork and throwout bearing. Loosen cover bolts evenly remove assembly from below.

TRANSMISSION:—Own—All helical gear type with synchromesh shift on second and high.
Safety Shift Gear Control—Positive remote control shift by lever mounted on steering column below wheel. Available as optional equipment.
See article in Mechanical Equipment Section for data.
Removal:—Remove floor center panel, front seat assembly, and speedometer cable. (On cars with Safety Shift Gear Control disconnect control cable from selector plate hook and transmission case, withdraw cable and disconnect outer lever from cover shift shaft). Disconnect rear U-joint, remove shaft housing to transmisson capscrews, rear engine support bolts, jack up rear of engine to have drain plug clear crossmember, remove fastening bolts. Pull unit straight back (use support at rear to keep in alignment) freeing clutch shaft, then up and forward at front, removing transmission with coupling from propeller shaft. Lift assembly out.
NOTE—On cars with Safety Shift Gear Control check shift linkage adjustments after installing transmission.

UNIVERSAL JOINTS:—Mechanics—Model 2C. Roller bearing type. Two used.
See article in Mechanical Equipment Section for data.
Front Propeller Shaft Bearing:—*See Pontiac Shop Notes for complete data.*

REAR AXLE:—Own—Semi-floating, spiral bevel gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—Std. 4.375-1. Mt. 4.625-1. Plains 4.125-1.
Backlash—Not less than .003".
Removal:—To remove axle shaft, remove wheel, brake drum, 4 nuts freeing backing plate, static collector, pull axle shaft (Tool J-942). NOTE—Do not shift backing plate or brake line damage may result. With axle shafts removed, differential assembly may be removed by disconnecting rear U-joint and removing housing capscrews.
Wheel Bearing Adjustment—None.

SHOCK ABSORBERS:—Delco—Model 1947-A,B (front), S-1163-U (rear). Hydraulic, double acting type. Direct acting on rear only.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Saginaw Worm-and-Roller type with center steering.
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
Specifications below apply with car weight on wheels (at curb weight) with tires properly inflated.
Kingpin Inclination—4½-5°.
Caster—Minus ¾° to minus 1¼°. Adjustable.
Camber—Minus ½° to 1° pos. ½ turn max. adj.
Toe In—0-1/16".
Steering Geometry—Inner wheel 22½-23½°. Outer wheel 20°.

BRAKES:—Service—Bendix Duo-Servo, hydraulic, single anchor type. Hand lever applies rear brakes.
See article in Mechanical Equipment Section for data.
Wheel Cylinder Bore—Front wheel 1". Rear 15/16".
Drum—Chrome nickel iron. Diameter—12". Out-of-round .005" (maximum indicator reading).
Lining—Moulded type. Width 1¾". Thickness 3/16". Length per wheel 23 1/16".
Clearance—.010" at heel and toe of each shoe.
Braking Power—53% front wheels, 47% rear.
Hand Brake Adjustment:—See Service Brakes above.

FRONT FENDER & RADIATOR (UNIT) REMOVAL:—*See Pontiac Shop Notes for complete instructions.*

SERIAL NUMBER:—First number 6EA-1001 (Deluxe 115), 6EB-1001 (Deluxe 120) with prefixes as follows: P—Pontiac, Mich., C—South Gate, Calif., L—Linden, N. J. On plate on left end of frame front cross member under hood.

ENGINE NUMBER:—First number 6-486200. Stamped on boss on top left front corner of engine block.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3 7/16". **Stroke**—4".
Displacement—222.7 cu. ins. **Rated HP.**—28.3.
Developed Horsepower—85 at 3520 R.P.M.
Compression Ratio—6.20-1 standard cast-iron head.
Compression Pressure—140-143 lbs. at 1000 R.P.M. or approximately 115 lbs. at cranking speed.
Vacuum Reading—18-20" steady at 7 M.P.H.

PISTONS:—Electro-plated, chrome nickel type with rib between bosses. Cannot be ground.
Length—3 37/64". **Weight**—27⅛ ozs. (stripped).
Removal—Pistons and rods removed from above.
Clearance—Top .0175-.0295". Skirt .002".
Original Bore & Piston Sizes, Replacement Pistons:—*See Pontiac Shop Notes for data.*
Fitting New Pistons:—Insert .0015"x½" feeler between piston and cylinder wall. Pull to withdraw feeler must be 10-25 lbs. Piston taper .0005" max.

PISTON RINGS:—Two compression rings above pin, one oil control ring below pin. Oil ring groove drilled radially with 10 oil drain holes.
See Pontiac Shop Notes for compression ring data.

Ring	Width	End Gap	Side Clearance
Compression	.0930-.0935"	.009-.014"	.0015-.003"
Oil Control	.1860-.1865"	.007-.017"	.001-.0025"

Replacement Rings:—.005", .010", .020", .030" oversize.

PISTON PIN:—**Diameter**—15/16". **Length**—3 1/16". Pin locked in one boss. Free end slotted.
Pin Fit in Piston—*See Pontiac Shop Notes.*
Pin Fit in Rod Bushing—.0003-.0005".
Replacement Pins:—.001", .003", .005" oversize.
Fitting Pins:—*See Pontiac Shop Notes for data.*

CONNECTING ROD:—**Length** 7 9/16". **Weight** 2.16 lbs.
Piston Pin Bushing (Upper Bearing)—Split bushed type. *See Pontiac Shop Notes for complete data.*
Crankpin Journal Diameter—2⅛".
Lower Bearing—Removable steel-backed, babbitt-lined type. Furnished std. & .001" undersize.
Clearance—.0005-.0015". **Endplay**—.005-.010".
Bearing Adjustment:—None (no shims). *See Pontiac Shop Notes for Fitting and Installing Bearings.*

CRANKSHAFT:—4 bearing type with integral counterweights. Balancer mounted on forward end.
See Pontiac Shop Notes for Balancer Removal and Rear Main Bearing Oil Seal Renewal.
Journal Diameters—#1, 2½"; #2, 2 17/32"; #3, 2 19/32"; #4, 2⅝".
Bearing Type—Interchangeable steel-backed, babbit-lined type. Furnished Std. & .001" undersize.
Clearance—.001-.003".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file caps. *See Pontiac Shop Notes.*
End Thrust:—Taken by #3 (rear center) bearing.
Endplay—.003-.008". To adjust, replace bearing.

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
See Pontiac Shop Notes for Camshaft Removal and Camshaft Bearing Finished Sizes.
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1 29/32".
Bearing Type—Removable steel-backed, babbitt-lined type. **Clearance**—.0015-.0025".
End Thrust:—Taken by steel thrust plate assembled behind camshaft sprocket. No adjustment other than replacing plate. **Endplay**—.002-.005".

Timing Chain:—Morse. Width 1" (¾" nominal). Pitch ⅜". Length 56 links or 21".
See Pontiac Shop Notes for Timing Chain Cover Oil Seal squeak correction data.
Camshaft Setting:—Sprockets are marked. Mesh chain with '0' marks on sprockets adjacent and in line with straightedge across shaft centers.

VALVES:—	Head Diameter	Stem Diameter	Length
Intake	1 19/32"	.310-.311"	5.718"
Exhaust	1 15/32"	.310-.311"	5.718"

	Seat Angle	Lift	Stem Clearance
Intake	30°	19/64"	Free fit to .0006"
Exhaust	45°	19/64"	Free fit to .0006"

Tappet Clearance:—.011-.013" all valves (hot and running). Use .011" and .013" feelers as 'go' and 'no go' gauges. NOTE—Car manufacturer recommends .013" exhaust clearance for high speed driving.
Valve Guides:—Removable, tapered guides (.001" taper to the inch, with greatest clearance at top). IMPORTANT—Measure clearance at bottom end. Valve should just fall through guide of own weight when started in guide. NOTE—Guides should be cleaned with wire brush or taper reamer Tool P.R. 131. Replacement guides straight cut, ream to fit valve after installing with reamer P.R. 131.
Valve Springs:—Intake and exhaust springs identical. Install with two closed coils at top and dampener on top of each spring. New dampeners should be used whenever springs installed. **Free Length**—2 5/16".

	Spring Pressure	Spring Length
Valve Closed	54½ lbs.	1 29/32"
Valve Open	96 lbs.	1 19/32"

Valve Lifters:—Single piece, cast-iron, cylindrical type. Furnished .005" oversize. Use pilot reamer J-706-P when installing oversize lifter to insure alignment of lifter hole and valve stem.
Clearance—Free fit. Lifter should just be free enough to move freely with finger touch.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 5° BTDC. Close 39° ALDC.
Exhaust Valves—Open 45° BLDC. Close 5° ATDC.
To Check Timing—Set tappet clearance #6 intake valve at .0125". This valve should open with piston 5° or .0096" before top dead center with first straight line of flywheel mark '/IGN.ONE/' slightly past indicator in left front face of flywheel housing
Motor Gauge—Weidenhoff Adapter #114, Rod #42.

LUBRICATION:—Gear type pump (right of engine).
See Pontiac Shop Notes for Oil Pump Removal Instructions and Pump Gear Clearances.
Normal Oil Pressure:—35-45 lbs. with warm oil.
Oil Pressure Regulator—In pump. Non-adjustable.
Crankcase Capacity:—6 quarts (refill).

COOLING SYSTEM:—**Capacity**—17 quarts.
See Pontiac Shop Notes for Radiator Core Removal.
Water Pump:—Packless, sealed ball-bearing shaft.
See article in Mechanical Equipment Section for data.
Removal—Remove fan belt, pump mounting bolts and lower hose. Lift off pump and fan assembly.
Thermostat:—Harrison. In cylinder head outlet.
Setting—Closed 140° F. Start 145°. Fully open 172°.
Temperature Gauge:—AC. #1510771 (dash), #1510772 (engine). Electric type.
See article in Mechanical Equipment Section for data.

CLUTCH:—**Inland.** 'Diaphragm' type, single plate, dry disc type with Long 9CF-CS driven member.
See article in Mechanical Equipment Section for data.
Facings—Moulded type, 2 required. Inside Diam. 5¾". Outside Diam. 9". Thickness .125".
NOTE—Install plain facing toward flywheel, facing with cushioned segments on pressure plate side.
Pedal Adjustment:—Pedal free movement ⅞-1⅛" (adjusting nut under locknut at fork end of pedal link). Pedal toeboard clearance (felt retainer to pedal arm) 1" (setscrew and locknut at lower end).
Removal:—Remove transmission (see below), take off bottom housing cover, unlock pedal pull-back spring, remove fork ball support, fork and throwout bearing. Remove cover screws (turn screws out a few turns at a time until tension relieved). Move clutch away from flywheel at bottom and remove.

TRANSMISSION:—**Own.** All helical gears, constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse) with remote shift control.
Transmission Control:—Pontiac 'Safety Shift' type.
See articles in Mechanical Equipment Section for data.
Removal:—Remove floor mat, floor center panel and front seat assembly. Disconnect speedometer cable and selector control cable at transmission. Remove selector shaft outer lever (on left side). Remove propeller shaft by disconnecting rear U-joint and pulling to rear to disengage U-joint front yoke from transmission main shaft. Support transmission at rear and remove transmission mounting capscrews. Pull unit straight back freeing main drive gear, then up and forward at front lifting out through floor opening. NOTE—See Mechanical Equipment Section for Shifter Linkage adjustment.

UNIVERSAL JOINTS:—**Mechanics Type 2C.** Roller bearing. *See article in Mechanical Equipment Section.*

REAR AXLE:—**Own.** Semi-floating, hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—3.9-1 (Plains 25). 4.1-1 (Std. 25, Plains 26). 4.3-1 (Mount. 25, Std. 26). 4.55-1 (Mount. 26).
Backlash—Not less than .003". Limits .003-.012".
Removal:—Disconnect drive shaft at rear universal, remove axle shafts (see below), remove capscrews on carrier flange, pull carrier assembly out.
Axle Shaft Removal—Hoist rear of car, remove wheel, brake drum and 4 nuts which secure backing plate to housing (do not shift backing plate to prevent brake line damage). Pull shaft (Puller J-942) taking care not to drag shaft on oil seal.
Wheel Bearing Adjustment—None (sealed type).

SHOCK ABSORBERS:—**Delco.** Model 1947-C (right front), 1947-D (left frt.), 1116-V (rear—Dom.), 1754-A,B (rear—Exp.). Double acting, hydraulic type. Valve changes made during production. Direct acting on rear (Domestic) only.
See article in Mechanical Equipment Section for data.

STEERING:—**Steering Gear.** Saginaw Worm-and-Roller type. New type tie rod and drag link.
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
Kingpin Inclination—4½-5°.
Caster—0° to minus ¾°. Adjustable.
Camber—Neg. ½° to pos. 1°. ½ turn max. adj'mt.
Toe In—0-1/16". Adjust tie rod for each wheel.
Steering Geometry—Inner wh'12½-23½°.Outer 20°.

BRAKES:—**Service**—Bendix hydraulic, duo-servo, single anchor type without eccentric adjustment. Hand lever applies rear wheel service brakes.
See article in Mechanical Equipment Section for data.
Drums—Chrome nickel iron. Diameter 11".
Wheel Cylinder Bore—Front wheel 1". Rear 15/16".
Lining—D-R Multibestos (primary), L-8 Multibestos (secondary). Width 1¾". Thickness 3/16". Length per wheel 21 5/16".
Clearance—.015" (both ends of secondary shoe).
Braking Power—47% rear, 53% front.
Hand Brake:—See Service Brakes above.

FRONT FENDER & RADIATOR (UNIT) REMOVAL:—*See Pontiac Shop Notes for complete instructions.*

SERIAL NUMBER:—First number 8EA-1001 with prefixes as follows: P—Pontiac, Mich., C—South Gate, Calif., L—Linden, N. J. On plate on left end of frame front cross member under hood.

ENGINE NUMBER:—First number 8-159601. Stamped on boss on top left front corner of engine block.

ENGINE SPECIFICATIONS:—8 cylinder, 'L' head.
Bore—3¼". **Stroke**—3¾".
Displacement—248.9 cu. ins. **Rated HP.**—33.8.
Developed Horsepower—100 (6.2-1 Std. cast-iron hd.), 110 (7.0-1 Optl. HC. cast-iron hd.) at 3700 RPM.
Compression Ratios & Pressures—As follows:

Head	Pressure: at 1000 RPM	at Crank'g Speed
6.2-1 Standard	140-143 lbs.	Approx. 115 lbs.
7.0-1 High Comp	169 lbs.	Approx. 137 lbs.

Vacuum Reading—18-20" steady at 7 M.P.H.

PISTONS:—Electro-plated, chrome nickel type with rib between bosses. Cannot be ground.
Length—3 19/32". **Weight**—24.25 ozs. (stripped).
Removal—Pistons and rods removed from above.
Clearance—Top .0175-.0295". Skirt .002".
Original Bore & Piston Sizes, Replacement Pistons:—*See Pontiac Shop Notes for data.*
Fitting New Pistons:—Insert .0015"x½" feeler between piston and cylinder wall. Pull to withdraw feeler must be 10-25 lbs. Piston taper .0005" max.

PISTON RINGS:—Two compression rings above pin, one oil control ring below pin. Oil ring groove drilled radially with 10 oil drain holes.
See Pontiac Shop Notes for compression ring data.

Ring	Width	End Gap	Side Clearance
Compression	.0930-.0935"	.009-.014"	.0015-.003"
Oil Control	.1860-.1865"	.007-.017"	.001-.0025"

Replacement Rings:—.005", .010", .020", .030" oversize.

PISTON PIN:—**Diameter**—15/16". **Length**—2⅞".
Pin locked in one boss. Free end slotted.
Pin Fit in Piston—*See Pontiac Shop Notes.*
Pin Fit in Rod Bushing—.0003-.0005".
Replacement Pins:—.001" (red & brown), .003" (red), .005" (blue) oversize. Painted on ends.
Fitting Pins:—*See Pontiac Shop Notes.*

CONNECTING ROD:—**Length** 7 9/16". **Weight** 29⅞ ozs.
Piston Pin Bushing (Upper Bearing)—Split bushed type. *See Pontiac Shop Notes for complete data.*
Crankpin Journal Diameter—2".
Lower Bearing—Removable steel-backed, babbitt-lined type. Furnished std. & .001" undersize.
Clearance—.0005-.0015". **Sideplay**—.005-.010".
Bearing Adjustment:—None (no shims). *See Pontiac Shop Notes for Fitting and Installing Bearings.*

CRANKSHAFT:—5 bearing with integral count'weights. *See Pontiac Shop Notes for Balancer Removal.*
Journal Diameters—#1, 2⅜"; #2, 2 13/32"; #3, 2 7/16"; #4, 2 15/32"; #5, 2½".
Bearing Type—Interchangeable steel-backed, babbit-lined type. Furnished Std. & .001" undersize.
Clearance—.001-.003".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file caps. *See Pontiac Shop Notes.*
End Thrust:—Rear center (#4) bearing.
Endplay—.003-.008".

CAMSHAFT:—5 bearing. Non-adjustable chain drive. *See Pontiac Shop Notes for Camshaft Removal and Camshaft Bearing Finished Sizes.*
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1 29/32"; #5, 1⅞".
Bearing Type—Removable steel-backed, babbitt-lined type. **Clearance**—.0015-.0025".
End Thrust:—Thrust plate behind camshaft sprocket.
Endplay—.002-.005".

Timing Chain:—Morse. Width 1" (¾" nominal). Pitch ⅜". Length 56 links or 21".
See Pontiac Shop Notes for Timing Chain Cover Oil Seal squeak correction data.
Camshaft Setting:—Sprockets are marked. Mesh chain with '0' marks on sprockets adjacent and in line with a straightedge across shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 15/32"	.310-.311"	5.53"
Exhaust	1 11/32"	.310-.311"	5.53"

	Seat Angle	Lift	Stem Clearance
Intake	30°	19/64"	Free fit to .0006"
Exhaust	45°	19/64"	Free fit to .0006"

Tappet Clearance:—.011-.013" all valves (hot and running). Use .011" and .013" feelers as 'go' and 'no go' gauges. NOTE—Car manufacturer recommends .013" exhaust clearance for high speed driving.
Valve Guides:—Removable, tapered guides (.001" taper to the inch, with greatest clearance at top). IMPORTANT—Measure clearance at bottom end. Valve should just fall through guide of own weight when started in guide. NOTE—Guides should be cleaned with wire brush or taper reamer Tool P.R. 131. Replacement guides straight cut, ream to fit valve after installing with reamer P.R. 131.
Valve Springs:—Intake and exhaust springs identical. Install with two closed coils at top and dampener on top of each spring. New dampeners should be used whenever springs installed. **Free Length**—2 5/16".

	Spring Pressure	Spring Length
Valve Closed	54½ lbs.	1 29/32"
Valve Open	96 lbs.	1 19/32"

Valve Lifters:—Cast-iron, barrel type. Furnished .005" oversize. Use pilot reamer J-551 when installing oversize lifter to insure alignment of lifter hole and valve stem.
Clearance—Free fit. Lifter should move freely with finger touch.
Valve Timing:—See Camshaft Setting.
Intake Valves—Open 5° BTDC. Close 39° ALDC.
Exhaust Valves—Open 45° BLDC. Close 5° ATDC.
To Check Timing—Set tappet clearance #8 intake valve at .0125". This valve should open with piston 5° or .0089" before top dead center with first straight line of flywheel mark '/IGN.ONE/' slightly past pointer in left front face of flywheel housing.
Motor Gauge—Weidenhoff Adapter #114, Rod #42.

LUBRICATION:—Pressure type (pump on right side of engine). *See Pontiac Shop Notes for Oil Pump data.*
Normal Oil Pressure:—35-45 lbs. with warm oil.
Oil Pressure Regulator—On pump. Not adjustable.
Crankcase Capacity:—7 quarts (refill).

COOLING SYSTEM:—**Capacity**—19 quarts.
See Pontiac Shop Notes for Radiator Core Removal.
Water Pump:—Packless, sealed ball-bearing shaft. *See article in Mechanical Equipment Section for data.*
Removal—Remove fan belt, lower hose and pump mounting bolts. Lift off pump and fan assembly.
Thermostat:—Harrison. In cylinder head outlet.
Setting—Closed 140° F. Start 145°. Fully open 172°.
Temperature Gauge:—AC. #1510771 (dash), #1510772 (engine). Electric type.
See article in Mechanical Equipment Section for data.

CLUTCH:—**Inland.** 'Diaphragm' type, single plate, dry disc type with Long 9¼CF-CS driven member. *See article in Mechanical Equipment Section for data.*
Facings—Moulded type, 2 required. Inside Diam. 5¾". Outside Diam. 9¼". Thickness .125".
NOTE—Install plain facing toward flywheel, facing with cushioned segments on pressure plate side.
Pedal Adjustment:—Pedal free movement ⅞-1⅛" (adjusting nut under locknut at fork end of pedal link). Pedal toeboard clearance (felt retainer to pedal arm) 1" (setscrew and locknut at lower end of pedal).
Removal:—Remove transmission (see Transmission Removal below), take off bottom housing cover, unlock pedal pull-back spring, remove fork ball support, fork and throwout bearing. Loosen cover screws a little at a time to relieve tension, then take screws out. Move clutch assembly away from flywheel at bottom and lower assembly out.

TRANSMISSION:—**Own.** All helical gears, constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse) with remote shift control.
Transmission Control:—Pontiac 'Safety Shift' type. *See articles in Mechanical Equipment Section for data.*
Removal:—Remove floor mat, floor center panel and front seat assembly. Disconnect speedometer cable and selector control cable at transmission. Remove selector shaft outer lever (on left side). Remove propeller shaft by disconnecting rear U-joint and pulling to rear to disengage U-joint front yoke from transmission main shaft. Support transmission at rear and remove mounting capscrews. Pull unit straight back freeing main drive gear, then up and forward at front lifting out through floor opening. NOTE—See Mechanical Equipment Section for shifter linkage adjustment.

UNIVERSAL JOINT:—**Mechanics Type 2C.** Roller bearing. *See article in Mechanical Equipment Section.*

REAR AXLE:—**Own.** Semi-floating, hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.1-1 Std. 4.3-1 Mount. 3.9-1 Plains.
Backlash—Not less than .003". Limits .003-.012".
Removal:—Disconnect drive shaft at rear universal (wire trunnions to prevent loss of rollers), remove axle shafts (see below), remove capscrews on carrier flange, pull carrier assembly out.
Axle Shaft Removal—Hoist rear of car, remove wheel, brake drum and 4 nuts which secure backing plate to housing (do not shift backing plate preventing brake line damage). Pull shaft (Puller J-942) taking care not to drag shaft on oil seal.
Wheel Bearing Adjustment—None (sealed type).

SHOCK ABSORBERS:—**Delco.** Model 1947-C (right front), 1947-D (left front), 1116-V (rear-Domestic), 1754-A, B (rear-Export). Double acting, hydraulic type. Valve changes made during production. Direct acting on rear (Domestic) only.
See article in Mechanical Equipment Section for data.

STEERING:—**Steering Gear.** Saginaw Worm-and-Roller type. New type tie rod and drag link.
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
Kingpin Inclination—4½-5°.
Caster—0° to minus ¾°. Adjustable.
Camber—Neg. ½° to pos. 1°. ½ turn max. adj'mt.
Toe In—0-1/16". Adjust tie rod for each wheel.
Steering Geometry—Inner wh'12 2½-23½°. Outer 20°.

BRAKES:—**Service**—Bendix hydraulic, duo-servo, single anchor type without eccentric adjustment. Hand lever applies rear wheel service brakes.
See article in Mechanical Equipment Section for data.
Wheel Cylinder Bore—Front wheel 1". Rear 15/16".
Drums—Chrome nickel iron. Diameter 11".
Lining—D-R Multibestos (primary), L-8 Multibestos (secondary). Width 1¾". Thickness 3/16". Length per wheel 21 5/16".
Clearance—.015" (both ends of secondary shoe).
Braking Power—47% rear, 53% front.
Hand Brake:—See Service Brakes above.

ENGINE NUMBER:—Stamped on upper left hand corner of cylinder block.

ENGINE:—Own model. Six cylinder, 'L' head type.

Bore—3⅜". **Stroke**—5".

Piston Displacement—268 cubic inches.

Rated Horsepower—27.3.

Developed Horsepower—85 at 3200 R.P.M.

Compression Ratio—5.3-1 ('33), 5.4-1 ('34-35).

Compression Pressure—95 lbs. at 1000 R.P.M. or 78-82 lbs. at cranking speed.

Pistons:—Lynite, Lo-EX aluminum alloy, 'T' slot, cam ground type. Refinish cylinders to take standard replacement pistons furnished .005", .010", .020", .030", .040", .050", .060" oversize as well as semi-finished. Exact size of piston is stamped on head. Piston length 4".

Weight—.81 lbs. stripped, 1.29 lbs. with rings and pin.

Removal—Pistons removed from above, rods from below. To remove assemblies, take off rod bearing caps, install brass guards on rod bolts (necessary to avoid marring crankpin surface), push piston up until pin is exposed, remove retaining rings and push out pin, remove piston from above, remove rod from below. Use new retaining rings when installing pistons.

Clearance—.030" top. .0006-.0014" bottom.

Fitting New Pistons—Use standard oversize piston (size stamped on head), refinish cylinder bore to size giving correct clearance. Do not use feeler gauges to check clearance.

Installing Pistons—Slot should be at left. Piston stamped with arrow and word 'Front.' Arrow should point toward front of engine on all pistons.

Piston Pins:—Diameter .9834". Length 2.903". Pin floats in piston and rod. Held by retaining rings. See Removal of Piston above.
Clearance in Rod—.0003".
Clearance in Piston—.0000-.0003" with piston and pin at normal temperature (70°F.).

Piston Rings:—Two compression rings, two oil control rings per piston. Lower ring groove drilled radially with oil drain holes.

Ring	Width	End Gap	Wall Thickness
Comp All	3/32"	.007-.015"	.145"
Oil Cont. (3)	5/32"	.007-.015"	.145"
Oil Cont. (4)	3/16"	.007-.015"	.145"

Connecting Rod:—Weight 2.47 lbs. Length 10½".
Crankpin Journal Diameter—2 3/16".
Lower Bearing Type—Spun-babbitt lined integral with rod and bearing cap. No shims.
Clearance—.0015-.0025". Sideplay .003-.007".
Adjustment—None (no shims). Replace rods. Do not file bearing caps.

Crankshaft:—Seven bearings. Integral counterweights.
Journal Diameters—2.625" all bearings.
Bearing Type—Precision type steel-backed, babbitt-lined. No shims.
Clearance—.002".

Adjustment—None (no shims). Replace removable bearings. Bearings are precision type and need not be line-reamed after installing. All bearings should be replaced as a set. When installing bearings see that lip on bearing is engaged in slot in crankcase and bearing cap (necessary to prevent bearing from rotating).
End Thrust—Taken by rear bearing. Endplay .003-.007".

Camshaft:—Four bearings. Non-adjustable chain drive.
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.0015-.002".

End Thrust—Taken by spring-loaded plunger or thrust plug in camshaft sprocket and thrust plate on chain case cover.
Timing Chain—Morse 766 Bushed Joint type. Width 1½". Pitch .500". Length 24" or 48 links.

Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. Install chain with camshaft sprocket off engine. Insert dowel-type capscrew with ground shoulder first (in reamed-top hole) to center camshaft sprocket. Sprocket capscrews are offset so that sprocket cannot be installed incorrectly.

Valves:—

	Head Diameter	Stem Diameter	Length
All Valves	1 13/16"	.3437"	5¾"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	5/16"	.002-.004"

Tappet Clearance—.007" (intake), .008" (exhaust) engine warm.

Valve Springs—	Spring Pressure	Spring Lgth.
Valves Closed	58-62 lbs.	2⅜"
Valves Open	90 lbs.	2 1/16"

Valve Timing—See Camshaft Setting above.
Intake Valves open—at TDC. Close—50° ALDC.
Exhaust Valves open—48° BLDC. Close— 2° ATDC.

To Check Valve Timing:—Set tappet clearance #1 intake valve at .012". This valve should open with piston on top dead center when flywheel mark 'UDC.#1' lines up with indicator in inspection hole in flywheel housing (right hand side of engine). Reset tappet clearance at .007" with engine warm.

Lubrication:—Pressure type. Gear type oil pump located in oil pan.
Normal Oil Pressure—30 lbs. at 35 M.P.H.
Oil Pressure Relief Valve—Operates at 30-35 lbs. Located under nut on left hand side of crankcase. Adjustable by turning nut. Turn nut in (clockwise) to increase, or out (counter-clockwise) to decrease oil pressure.
Capacity and Oil—6 qts. Use SAE. #30 (summer), #20 (winter).

CLUTCH:—**Own Make (S2, 3, 4), Long Model 9AB (S7).** Single plate, dry disc type. NOTE—Long Model 9AB may be used for replacement on Model S4.
See article in Mechanical Equipment Section for data.
Facings—Woven type, 2 required. Thickness 5/16". Inside Diameter 6⅛". Outside Diameter 9¾".

Automatic Clutch:—Own (Reo) type. Optional equipment.
Clutch Pedal Adjustment—Free movement of clutch pedal must be 1". Adjustment is made by means of transverse bolt at bottom of clutch pedal.

STEERING—**Steering Gear**—Ross Cam-and-Roller type. See article in Steering Section for complete adjustment instructions.

Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott type ends and semi-elliptic springs.
Kingpin Inclination—8° crosswise.
Caster—4°. Use wedge shims installed between spring and spring seat on axle to correct caster.
Camber—1½°. Axle may be bent cold for minor corrections of camber.
Toe In—0-⅛". Adjust in usual manner by loosening clamp bolts and turning tie rod.

BRAKES:—**Service**—Lockheed hydraulic, double anchor type. See article in Brake Section for complete adjustment instructions.
Drum Diameter—12".
Lining—Moulded type. Width 1¾". Thickness .177". Length 24 5/16" per wheel.
Clearance—.010" toe, .005" heel for each shoe.

Hand Brake:—External contracting type on drum at rear of transmission.
Adjustment—With lever in fully released position, adjust position of brake band lever on pull link so that clearance at ends of brake bands is 1/32". Anchor bracket is not adjustable.
Drum Diameter—7".
Lining—Width 2½". Thickness 3/16". Length 20 5/16".
Clearance—1/32" uniformly around band.

SERIAL NUMBER:—First number 6A-100 (1935), 6D-100 (1936). On front end of left frame siderail under fender.

ENGINE NUMBER:—Stamped on upper left hand corner of cylinder block.

ENGINE SPECIFICATIONS:—Type—6 cyl., 'L' head.
Bore—3⅜". **Stroke**—4¼".
Displacement—228 cubic inches.
Rated Horsepower—27.3 (SAE).
Developed Horsepower—85 (1935), 90 (1936) at 3400 R.P.M.
Compression Ratio—7.0-1 (1935), 6.5-1 (1936).
Compression Pressure—115 lbs. at 1000 RPM. or 90 lbs. at cranking speed (1935), 110 lbs. at 1000 RPM. or 85 lbs. at cranking speed (1936).
Vacuum Reading—Gauge should show steady reading of approximately 17" with engine idling at 350 R.P.M.

PISTONS:—Own Lo-ex aluminum alloy, 'T' slot, cam ground type. Use finished replacement pistons (see Replacement Pistons).
Length—4".
Weight—12.96 ounces (stripped).
Removal—Pistons removed from above, rods from below. To remove assemblies, take off rod bearing caps, install brass guards on rod bolts (necessary to avoid marring crankpin surface), push piston up in cylinder until pin is exposed, remove retaining rings, push pin out, remove piston from above, remove rod from below. Use new retaining rings when installing pistons.
Clearance—Top .027-.033", bottom .0024-.0032".
Replacement Pistons:—Refinish cylinders to take standard replacement pistons furnished .005", .010", .020", .030", .040" oversize and also semi-finished. Exact size of piston stamped on head.
Fitting New Pistons:—Use standard oversize piston (size stamped on top), refinish cylinder bore to size giving correct clearance.
Installing Pistons:—Slot should be at left. Pistons stamped with arrow and word (Front). Arrow must point toward front of engine on all pistons.

PISTON RINGS:—Two compression, two oil control rings per piston, all above pin. Lower ring grooves drilled radially with oil drain holes.

Ring Specifications—1935

Ring	Width	End Gap	Wall Thickness
Comp. All	⅛"	.007-.012"	.145"
Oil Cont. (3)	5/32"	.009-.014"	.145"
Oil Cont. (4)	3/16"	.009-.014"	.145"

Ring Specifications—1936

Ring	Width	End Gap	Side Clear.
Comp. (#1, 2)	3/32"	.009-.014"	.0015-.0025"
Oil (#3)	3/32"	.009-.014"	.0015-.0025"
Oil (#4)	¼"	.009-.014"	.0015-.0025"

PISTON PIN:—Diameter—63/64". **Length**—2.903-2.898". Pin floats in piston and rod. Held by retaining rings at each end. See Piston Removal above.
Pin Fit in Piston—.0000-.0003" tight with piston at room temperature of 70° F. Heat piston to 160° when installing pin.
Pin Fit in Rod Bushing—.000-.0003" clearance.

CONNECTING ROD:—Length—10½" (cent.-to-cent.).
Weight—41.02 ounces (assembled).
Upper Bearing (Piston Pin Bushing)—Bronze.
Crankpin Journal Diameter—2.1875".
Lower Bearing—Removable steel-backed, babbitt-lined type.
Clearance—.0015-.0025". Sideplay .005-.010".
Bearing Adjustment:—Shims (1935), None (no shims) 1936. Replace bearings. Do not file rods or caps.
Installing Rods:—Rods are marked. Install with marks and oil spray hole in lower end toward camshaft side of engine.

CRANKSHAFT:—Seven bearing. Integral and removable counterweights.
Journal Diameters—2⅝" all bearings.
Bearing Type—Precision type, removable steel-backed, babbitt-lined.
Clearance—.001-.003".
Bearing Adjustment:—Shims (1935), None (no shims) 1936. Replace bearings. Do not file bearing caps.
End Thrust:—Taken by rear (#7) bearing. Endplay .003-.007".

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2 3/16"; #2, 2⅛"; #3, 2 1/16"; #4, 1½".
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.0015".
End Thrust:—Taken by spring-loaded hardened steel plunger in camshaft hub and thrust plate on chain case cover. See that spring and plunger are in place when replacing cover.
Timing Chain:—Morse. Type DO-7654. Width 1". Pitch .500". Length 48 links or 24".
Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. Install chain with camshaft sprocket off engine. Insert dowel-type capscrew with ground shoulder first (in hole with reamed top) to center camshaft sprocket. Capscrew holes are offset so that sprocket cannot be assembled incorrectly.

VALVES:—

	Head Diameter	Stem Diameter	Length
All valves	1 13/16"	.34475"	6.078"
	Seat Angle	**Lift**	**Stem Clearance**
All valves	45°	5/16"	.001-.0035"

NOTE—Alloy steel exhaust valve seat inserts used.
Tappet Clearance—.007" Int., .008" Exh. engine hot.
Valve Guides:—Pressed in block and finish reamed for correct stem clearance.

Valve Springs:—	**Spring Pressure**	**Spring Length**
Valve Closed	50-54 lbs.	2⅜"
Valve Open	135-145 lbs.	2 1/16"

Valve Lifters:—One piece nickel-iron and steel, mushroom type. Diameter ⅝". Clearance in guides .0005-.001". Serviced by replacing guides.
Valve Timing (1935):—See Camshaft Setting above.
Intake Valves—Open At TDC. Close 50° ALDC.
Exhaust Valves—Open 48° BLDC. Close 2° ATDC.
To Check Valve Timing—Set tappet clearance #1 intake valve at .012". This valve should open with piston #1 on top dead center when flywheel mark 'UDC.#1' lines up with indicator in inspection hole in flywheel housing at right of engine. Reset tappet clearance at .007" with engine warm.
Motor Gauge—Weidenhoff Adapter #104, Rod #2.
Valve Timing (1936):—See Camshaft Setting above.
Intake Valves—Open 5° BTDC. Close 45° ALDC.
Exhaust Valves—Open 35° BLDC. Close 5° ATDC.
To Check Valve Timing—Set tappet clearance #1 intake valve at .012". This valve should open with piston 5° or .0100" before top dead center when flywheel mark 'Intake Opens' lines up with pointer in inspection hole in right front of flywheel housing. Reset tappet clearance at .007" hot.
Motor Gauge—Weidenhoff #104 Adapter, #2 Rod.

LUBRICATION:—Pressure. Gear type oil pump located in oil pan.
Normal Oil Pressure:—40 lbs. at 40 M.P.H.
Oil Pressure Relief Valve:—Operates at 35 lbs. when engine is hot. Located under nut on left hand side of crankcase. Adjustable by turning nut. Turn nut in or clockwise to increase pressure and out or counter-clockwise to decrease.
Crankcase Capacity:—6 qts. (refill).

CLUTCH:—Borg & Beck Model 10-A6. Single plate, dry disc type. See article in Clutch Section for relining and asembling directions.
Facings—Woven (pressure plate side), moulded flywheel side), 2 required. Inside Diam. 6". Outside Diam. 9⅞". Thickness ⅛".
Adjustment—Free movement of clutch pedal must be 1". To adjust, loosen transverse bolt which clamps pedal to shaft, move pedal forward to provide 1" free movement, tighten bolt.
Removal—Disconnect drive shaft and remove transmission (jack up rear of engine if necessary). Remove throwout bearing and collar assembly, loosen pedal bolt on shaft and drop flywheel under-pan. Take out short (right) shaft and yoke by turning shaft until capscrews can be removed from below. Pry and block release levers in disengaged position. Then take out capscrews in pressure plate and remove clutch disc and pressure plate from below.

STEERING:—Steering Gear—Ross Model 540, Cam-and-lever type. See article in Steering Section for adjustment procedure.
Front Suspension:—Conventional 'I' beam section front axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—8° crosswise.
Camber—1½°. Axle may be bent cold for minor corrections.
Caster—1½°. Use wedge shims inserted between spring and spring seat to correct caster.
Toe In—0-1/16". Adjust in usual manner by loosening clamp bolts and turning tie rods.
Tread—59 3/16" (front), 61¼" (rear).

BRAKES:—Service—Lockheed Hydraulic, double anchor type. Hand lever applies separate brake at rear of transmission. See article in Brake Section for complete adjustment procedure.
Drum Diameter—11".
Lining—Moulded type. Width 1¾". Thickness ¼". Length 28¼" per wheel.
Clearance—.010" at heel, .005" at toe.
Hand Brake:—Drum diameter 6". Woven type lining. Width 2". Thickness 5/32". Length 18 9/16".
Clearance—1/32-3/64".
Adjustment—With lever in fully released position, adjust position of brake band lever on pull link so that clearance at ends of brake band is 1/32-3/64".

1939 MODELS

ENGINE HOOD:—Champion—Engine hood hinged at cowl and lifts from forward end. To raise hood, pull out hood lock handle (radiator emblem) at bottom, lift hood up at forward end.

1939 MODELS

HOOD SIDE PANEL REMOVAL:—To remove the separate hood side panels, take out two screws on top side of panel and two wing screws on bottom side, lift panel out.

1939 MODELS

RADIATOR REMOVAL:—To remove radiator, remove brace rods, uncouple hose connections, free radiator from shell and lift straight up.

1935-39 MODELS

ORIGINAL BORE SIZE:—May be determined by marks stamped on top of block opposite each cylinder bore as follows:

Dictator 1935-37		Six, Comm. 1938-39		President 1935-39	
Mark	Size	Mark	Size	Mark	Size
'8'	3.248"	'25'	3.3125"	'25'	3.0625"
'85'	3.2485"	'3'	3.313"	'2'	3.0620"
'9'	3.249"	'35'	3.3135"	'15'	3.0615"
'95'	3.2495"	'4'	3.314"	'1'	3.061"
'0'	3.250"	'45'	3.3145"	'5'	3.0605"

NOTE—Sizes listed for President above also apply to Commander Model 1B (1935).

Champion Model

Mark	Size
0	3.000"
05	3.0005"
1	3.001"
15	3.0015"
2	3.002"
25	3.0025"

NOTE—Variation in any one engine is held to .001" maximum difference between individual bores.

1939 MODELS

CYLINDER HEAD INSTALLATION:—Coat both bottom of head gasket and lower face of cylinder head with Perfect Seal Gasket Cement (use sparingly), coat head capscrews with white lead. Tighten head screws to tension of 600-650 in. lbs. (Champion), 1000 in. lbs. (Commander & President) and recheck before starting engine.

1939 MODELS

CONNECTING ROD 'PALNUT' INSTALLATION:—Used on some cars only. Consists of special patented locknut installed on top of regular nut instead of cotterpin. To install Palnut, tighten regular nut to tension of 650 in. lbs., turn up Palnut until it contacts regular nut (open face of Palnut out), then tighten Palnut ¼-⅓ turn additional to lock it in place.
NOTE—On Champion tighten regular nut to 300-325 in. lbs. tension.

1939 MODELS

PISTON PIN REMOVAL & INSTALLATION:—Champion—Tapered pin and nut secures pin in rod. To remove pin, place rod and piston on assembling fixture No. J1293, take nut off and install on opposite end of pin and turn nut down pulling pin out. To install, place pin on fixture, slip piston and rod on pin, tighten pin nut (rock rod to insure lock pin seats properly). One nut only used on tapered lock pin.

1939 MODELS

SELF-LOCKING TAPPETS:—Champion—Tappet screws slotted on upper end and require no locknuts. When tappet screws replaced, car manufacturer recommends that screws must check as follows: Pull required to move tappet screw must be 25 in. lbs. minimum (4 lbs. pull on 6" wrench).

1936-39 MODELS

VIBRATION DAMPENER:—President—Consists of a spring-loaded flywheel mounted on four tapered rubber cushions between a friction facing on the fan pulley and a damper plate on the front end of the crankshaft. The flywheel oscillation is controlled by the friction of the friction facing and the compression of the rubber cushions. Flywheel radial movement is controlled by a fibre ring on the fan pulley hub. Spring tension is adjusted by shims under spring in flywheel, compression of rubber cushions adjusted by shims on bolt sleeve between cushion and damper plate.

Servicing—Damper can be removed from crankshaft as an assembly. If disassembled, note position of all parts and reassemble in same order. Fibre ring should be press fit on pan pulley hub and should have .004-.006" clearance in flywheel. Install shims under springs, as required, to secure 50 lbs. pressure per spring or 200 lbs. total with damper bolts tightened. Install shims on rubber cushions so that cushions compressed .015" (.020" for 1936) with bolts tightened (plate against spacers).
NOTE—When installing crankshaft nut, make certain that copper-asbestos gasket in place under nut (necessary to prevent oil leaks at this point).

Commander Model:—Consists of a flywheel mounted on two rubber rings on forward end of crankshaft. Compression of rubber rings is limited by length of vibration damper and fan pulley hub and does not require checking or adjusting.

1935-39 MODELS

CAMSHAFT GEAR:—Sizes—Furnished in three sizes: 'S'—Standard, 'H'—High Limit, 'L'—Low Limit. When replacing gear on engine with considerable service, install next largest size. For reconditioned engine with new camshaft and main bearings, use same size gear.

Removal & Installation—Gear hub recess threaded for installation of special pullers and pushers. Do not drive on gear with hammer which may loosen gear on hub. Use gear pusher.
NOTE—Champion gear hubs not threaded. Use Puller HM-925 screwed in holes provided in gears and also for crankshaft fan driving pulley removal. Use Pusher No. HM-861X to install gears and pulley.

1938-39 MODELS

OIL PUMP INSTALLATION:—Commander. To insure correct rotor position of distributor when pump installed, install pump as follows: Remove distributor, crank engine over (with piston #1 on compression) until vibration damper mark 'UDC/1-6' lines up with pointer on gear case, sight down distributor shaft hole and mesh oil pump drive gear so that drive tongue on shaft is 30° from the horizontal and offset toward the top.

Champion:—Install oil pump as follows: Turn engine over until #1 piston at TDC. entering power stroke (flywheel mark U.D.C.1-6 in line with pointer on left rear engine plate). Engage pump shaft with camshaft gear with key-way pointing down (keyway will rotate to rear when gears meshed), assemble pump to engine. Check distributor drive tongue position by sighting down distributor shaft hole (distributor out). With #1 cylinder in firing position, tongue should be parallel with camshaft and offset (narrow half of shaft) toward camshaft.

President:—Install oil pump as follows: Turn engine over until piston #1 is on TDC entering power stroke with vibration damper mark 'UDC/1-8' lined up with pointer on gear case, turn pump shaft so that distributor drive slot is two teeth clockwise (viewed from below) from correct installed position with slot parallel to camshaft (wide side of shaft toward camshaft). Shaft will be rotated into position as gears are meshed. Check by sighting down distributor shaft hole (distributor out) to see that shaft slot parallel to camshaft and wide halve of shaft toward camshaft.

1935-39 MODELS

REAR SUPPORT INSTALLATION (OVERDRIVE TRANSMISSION):—On cars with Overdrive, rear support (must be removed to remove transmission) should be installed with original shims in same location in order to maintain alignment. These shims located between support and frame at each end. If shims lost or readjustment necessary, install support as follows: Hold support in place under transmission case, install sufficient shims at each end to take up all except 1/16" clearance between support and frame, install frame bolts, tighten bolts securely with shims in place. This clearance will provide correct compression of the support rubber cushions.
NOTE—1/32" clearance at each end for 1935 cars.

1936-39 MODELS

HILL HOLDER ADJUSTMENT:—On cars with Hill-Holder (optional equipment), check action whenever clutch adjusted to make certain that brakes release just before clutch engages.

Adjustment—Loosen locknut on end of Hill-holder control rod, shorten rod for earlier brake release, lengthen rod for later release, tighten locknut.

NOTE—On Champion, adjusting sleeve and locknut provided on rod.

1938-39 (Dictator 1935-37)

VALVE SPRING SERVICING:—Commander—Valve springs will not clear lifter and tappet adjusting screw when in extended position and should be installed as follows: Place spring seat in place on bottom of spring, use 'C' type valve lifter to compress spring slightly so that it will clear tappet adjusting screw as it is pressed up into place, install valves, compress spring, install valve spring seat locks. NOTE—Make certain that valve lifter tension spring installed on top of each valve lifter ('36-39).

SERIAL NUMBER:—First number 5,133,401. On plate on left frame side rail under front fender.

ENGINE NUMBER:—Stamped on front center of engine block directly behind water pump.

ENGINE:—Six cylinder, 'L' head type. Cylinders cast enbloc.
Dimensions—Bore 3¼". Stroke 4⅝". Displacement 230 cubic inches.
Horsepower—Rated 25.4. Developed 85 at 3200-3600 R.P.M.
Compression Ratio—5.5-1 Standard, 6.0-1 Optional.
Compression Pressure—Approximately 95 lbs. (5.5-1 head), 100-105 lbs. (6.0-1 head) at cranking speed.
Vacuum Reading—Steady reading of 18-20" at idling speed

Pistons:—Own make. Cast-iron, electro-plated type. Piston skirt is tin-plated after finishing and cannot be ground. Recondition cylinders to size for which finished replacement piston available.
Length—3⅞".
Weight—1.68 lbs. (stripped), 2.3 lbs. (with rings and pin).
Removal—Pistons and rods removed from above.
Clearance—.012-.018" top, .002" skirt.
Fitting New Pistons—Use .002" feeler stock to check clearance.

Piston Rings:—Four rings per piston, three compression, one oil control, all above pin.

Ring	Width	End Gap	Wall Thickness
Compression	⅛"	.013-.018"	.135"
Oil Control	3/16"	.018-.021"	.135"

Piston Pin:—Diameter ⅞". Length 2⅞". Pin is locked in rod.
Pin Fit in Piston—.0001-.0003" clearance.

Connecting Rod:—Weight 39½ ozs. Length 9 1/32".
Crankpin Journal Diameter—2⅛".
Lower Bearing Type—Spun babbitt integral with rod and cap.
Clearance—.0005-.002". Sideplay .005-.009".
Adjustment—None (no shims). Replace rods. Do not file rods or caps.

Crankshaft:—Four bearing. Integral counterweights.
Journal Diameters—2½" all bearings.
Bearing Type—Removable steel-backed, babbitt-lined.
Clearance—.0005-.0025".
Adjustment—None (no shims). Replace bearings. Do not file bearing caps.
End Thrust—Taken by #3 intermediate main bearing. Endplay .003-.006".

Camshaft:—Four bearing. Spiral gear drive.
Timing Gears—Crankshaft gear cast-iron. Camshaft gear Celeron.
Camshaft Setting—Gears are marked. Mesh marked tooth of crankshaft gear between two marked teeth of camshaft gear.

Valves:	Head Diameter	Stem Diameter	Length
Intake	1⅝"	11/32"	5⅜"
Exhaust	1½"	11/32"	5⅜"

	Seat Angle	Lift	Stem Clearance
Intake	45°	5/16"	.001-.003"
Exhaust	45°	5/16"	.001-.003"

Tappet Clearance—.004" Int., .006" Exh., engine hot.

Valve Springs—	Pressure	Length
Valve Closed	48-53 lbs.	2 1/32"
Valve Open	71-76 lbs.	1 23/32"

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 5° ATDC. Close 53° ALDC.
Exhaust Valves—Open 38° BLDC. Close 10° ATDC.
To Check Valve Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston 5° or .0111" after top dead center when flywheel mark 'IN.OP/1-6' lines up with indicator in inspection hole in top surface of flywheel housing. Reset tappet clearance at .004" with engine hot.
Motor Gauge—Weidenhoff Adapter #104. Rod #2.

Lubrication:—Pressure type. Gear type oil pump mounted on right side of crankcase.
Normal Oil Pressure—20 lbs. at 25 M.P.H.
Oil Pressure Relief Valve—Operates at 27 lbs. Located on right hand side of crankcase. Not adjustable.
Capacity & Oil—7 qts. (dry), 6 qts. (refill). Use SAE. #30 or 20 (summer, #10 (winter).

CLUTCH:—**Long Model 9ABM.** Single plate dry disc type. See article in Clutch Section for complete relining and assembling directions.
Facings—Moulded type, 2 required. Thickness 9/64". Inside Diameter 5½". Outside Diameter 9¼".
Adjustment—Free movement of clutch pedal should be 1". To adjust, loosen locknut and turn adjusting screw on clutch throw-out shaft lever.

STEERING:—**Steering Gear**—Ross Cam-and-Lever type. See article in Steering Section for complete adjustment directions.

Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott type ends and semi-elliptic springs.
Kingpin Inclination—8° crosswise.
Caster—½-1½°. Adjust by inserting wedge shims between spring and spring pad on axle.
Camber—1°. No adjustment provided.
Toe In—1/16-⅛". Adjust in usual manner by loosening clamp bolts and turning tie rod.

BRAKES:—**Service**—Bendix Duo-Servo Mechanical type with vacuum power operation. Hand lever applies all four service brakes. See article in Brake Section for complete adjustment directions.
Drum Diameter—12⅛".
Lining—Moulded type. Width 1½". Thickness ¼". Length 26 3/16" per wheel.
Clearance—.008" at heel and toe of each shoe.

Hand Brakes:—See Service Brakes above.

Power Unit:—Bendix Vaccum cylinder with internal valve. See article in Brake Section for complete data.

SERIAL NUMBER:—First number, 5,145,001 (Year Ahead Model) 5,200,001. On plate on left frame side member under left front fender.

ENGINE NUMBER:—Stamped on left hand side of cylinder block at center.

ENGINE:—Six cylinder, 'L' head type. Cylinders cast enbloc.
Dimensions—Bore, 3¼". Stroke, 4⅛". Displacement, 205.3 cu. ins.
Horsepower—Rated, 25.4. Developed, 88 H.P. at 3600 R.P.M.
Compression—6.3-1. Compression pressure, 137 lbs. at 1200 R.P.M. or 109.5-116 lbs. at 150 R.P.M. (cranking speed).
Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling.

Pistons:—Lynite, aluminum alloy, slotted skirt, cam ground type. Piston diameter is smaller (.00825-.01075") across pin bosses. Piston skirt is also tapered from top to bottom (.000-.001" larger diameter at bottom). Service pistons stamped with exact size as measured at right angles to piston pin bosses ¼" up from bottom of skirt. Standard oversize pistons, 002", .004" .010", .015", .020", .030".

NOTE:—Four ring piston superseded by three ring piston. Replacement pistons are three ring type.
Length—3¾".
Weight—15 ozs. (stripped), 22.08 ozs. (with rings and pin).
Removal—Piston and rod assembly removed from top of engine.
Clearance—Top, .032-.036". Bottom, .0015" selective fit.
Installing New Pistons—Use .0015" feeler stock ½" wide to check clearance insert feeler in cylinder at right angles to pin bosses on side opposite slot (invert piston, insert in bore with pin parallel to crankpin). Pull required to withdraw feeler should be 9-14 lbs. Piston selected for bore should be within this range.

NOTE:—Install pistons with slot on minimum pressure side (away from camshaft).

Piston Rings:—4 rings (early), 3 rings (later) per piston, all above pin. 3 compression (early), 2 compression (later), 1 oil (all) ring. Lower ring groove drilled radially with ten 5/32" oil drain holes.

NOTE:—Top groove on later 4 groove piston unfinished. No ring should be fitted in this groove.

Ring	Width	End Gap	Wall Thickness	Groove Depth
Comp. (all)	⅛"	.013-.018"	.135-.145"	.146-.153"
Oil Cont.	3/16"	.013-.018"	.125-.135"	.184-.190"

NOTE:—Compression rings are Perfect Circle '70' and should be installed with the step downward. Oil control ring is Perfect Circle '85'.

Piston Pin:—Diameter .8741-.8745". Length, 2⅞". Pin is clamped in rod. Piston pin hole in piston is line reamed and burnished.
Pin Fit in Piston:—Light push fit. Clearance, .0001-.0003". With this clearance rod should rock on piston of its own weight.

NOTE:—New pins are fitted and furnished with all replacement pistons.

Connecting Rod:—Weight, 33.44 ozs. Length, 8¼"
Big End Bearing—Spun babbitt-lined type. No shims.
Clearance—.0005-.002". Sideplay .005-.009".
Adjustment—None (no shims). Do not file bearing caps.

Crankshaft:—Four main bearing type with integral counterweights.
Journal Sizes—2.2495-2.5000" (2¼") diameter (all bearings).
Bearing Type—Steel-backed, babbitt-lined type. No shims.
Clearance—.0005-.0025".
Adjustment—None (no shims). Replace removable bearings. Do not file bearing caps.
End Thrust—Taken by #1 (front) main bearing. Endplay, 003-.006". Adjusted by shims.

Camshaft:—Four bearing type. Camshaft drive—Non-adjustable chain.
Bearing Type—Split, steel-backed, babbitt-lined type.
Clearance—.00075-.00225" (front), .002-.00375" (all others).
Camshaft Endplay—Controlled by spring loaded plug in camshaft which bears on thrust plug plate on chain case cover. Thrust taken by thrust plate behind camshaft hub. Not adjustable. Do not stretch or tamper with thrust plug spring. See that thrust plug is in place when replacing cover.
Chain—Morse #1866. Width, 1¼". Length, 23" or 46 links. Pitch, .500".
Camshaft Setting—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

Valves:—	Head Diameter	Stem Diameter	Length	Seat Angles	Lift
Intake	1 15/32"	11/32"	5 7/32"	45°	.3437"
Exhaust	1 9/32"	11/32"	5 7/32"	45°	.3437"

Stem-to-Guide Clearance—.001-.003" (all valves).
Tappet Clearance—.004" (intake), .006" (exhaust) engine hot.
Valve Springs—Taper type with flat coil type damper installed on all springs at top. Thread damper down over spring from top to provide minimum clearance of 7/32" between top of damper and top of spring (spring not compressed). Install springs with small end up.

	Spring Pressure	Spring Length
Valve Closed	59-64 lbs.	2 3/32"
Valve Open	98-108 lbs.	1 ¾"

NOTE—Valve lifter guides are integral with crankcase. Special support tools or clamps (HMJ-593) can be used to hold lifters up while camshaft is being removed. Valve lifters are removed from bottom of engine.

Valve Timing

Intake Valves Open—15° BTDC. Close—43° ALDC.
Exhaust Valves Open—48° BLDC. Close—10° ATDC.
To Check Valve Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston #1 15° or .0876" before top dead center when flywheel mark 'IN.OP./1-6' registers with indicator on housing (inspection hole on left hand front face of flywheel housing below starter). Reset tappet clearance at .004".
Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Lubrication:—Pressure type. Gear type oil pump located on lower end of inclined accessory shaft at right of crankcase.
Oil Pressure—40 lbs. at 26.8 M.P.H.
Oil pressure Relief Valve—Operates at 40 lbs. Adjustable.

CLUTCH:—Borg & Beck Models 9A1, 9A3 (Yr. Ahead). Clutch Model No. 554 (9A1), 853 (9A3) stamped on cover. Single plate, dry disc type. No adjustment required for wear. See article in Clutch Section for relining and assembling directions.
Clutch Pedal Adjustment—Free movement of clutch pedal must be 1" minimum. Adjust by turning clutch release adjustment lever set screw (on left hand side of clutch housing). On cars with free-wheeling check setting of free-wheeling unit positive lock control rod after adjusting clutch pedal.
Free-Wheeling control rod—To adjust, remove clevis pin holding control rod on clutch release shaft lever, turn control rod clevis until clevis pin can just be inserted with free-wheeling unit positive lock pin lever in the extreme rear position and both springs (thrusting against lock pin lever swivel) compressed equally. Gear shift lever must be in neutral and free-wheeling control in free-wheeling position.
Clutch Facings—Moulded type, 2 required, 5¾" ID., 9" OD., .133" thick.

STEERING:—Steering Gear—Ross Model 140, Cam-and-Lever type. See article in Steering Section for adjustments.

Front Suspension:—Conventional 'I' beam section front axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—9½° crosswise.
Caster—1-1½°. Adjust by inserting wedge shims between spring and spring pad on axle. Spring pad should incline 1½° down toward rear.
Camber—1-1½°. No adjustment. Axle may be bent cold to correct camber.
Toe In—1/16-⅛". Adjust in usual manner by changing length of tie rod.

BRAKES:—Service—Midland Steeldraulic, single shoe, self-energizing, internal expanding, mechanically operated brakes. Hand lever applies all four service brakes. See article in Brake Section for relining and complete adjustment procedure.
Drum Diameter—11⅛".
Lining—Moulded type. Width 1¾". Thickness ¼". Length per wheel 29⅛".
Clearance—.010" at heel and toe of each shoe.

Hand Brake Adjustment:—See Service Brakes.

Power Unit:—Bendix vacuum power unit used as standard equipment on 'Year Ahead Models.' See article in Brake Section for complete data.

SERIAL NUMBER:—First number (73 '33) 8,040,001 (B '34) 8,045,001 (Year Ahead B '34) 8,100,001. Stamped on plate on left frame side member under front fender.

ENGINE NUMBER:—Stamped on boss on upper left center of engine block.

ENGINE (1933):—Eight cylinder, In line, 'L' head type.
Dimensions—Bore 3 1/16". Stroke 4". Displacement 236 cubic inches.
Horsepower—Rated 30. Developed 100 at 3800 R.P.M.
Compression Ratio—5.5-1 Standard, 6.0-1 Optional.
Compression Pressure—Approximately 95 lbs. (5.5-1 head), 100-105 lbs. (6.0-1 head) at cranking speed.
Vacuum Reading—Steady reading of 18-20" at idling speed.

ENGINE (1934):—Eight cylinder, In line, 'L' head type.
Dimensions—Bore, 3 1/16". Stroke, 3¾". Displacement, 221 cu. ins.
Horsepower—Rated, 30. Developed, 103 H.P. at 4000 R.P.M.
Compression—6.3-1. Compression pressure, 128 lbs. at 1200 R.P.M. or 101.5-106 lbs. at 150 R.P.M. (cranking espeed).
NOTE:—The standard 6.3-1 cylinder head is aluminum.
Vacuum Reading—Steady reading of 18-20" at idling speed.

Pistons (73 '33):—Own make. Cast-iron electro-plated type. Pistons are tin-plated after finishing and cannot be ground. Recondition cylinders to size for which finished replacement pistons available.
Length—3 13/16".
Weight—1.56 lbs. (stripped), 2.2 lbs. (with rings and pin).
Clearance—.012-.018" top, .002" skirt.
Fitting New Pistons—Use .002" feeler stock to check clearance.

Pistons (All B '34):—Lynite, aluminum alloy, cam-ground, slotted. Piston diameter is smaller (.00825-.01075") across pin bosses. Piston skirt also tapered from top to bottom (000-.001" larger diameter at bottom). Service pistons stamped with exact size as measured at right angles to piston pin bosses ¼" up from bottom of skirt. Standard oversize pistons, .002", .004", .010", .015", .020", .030".
NOTE—Four ring piston superseded by three ring piston. Replacement pistons are three ring type.
Length—3¾".
Weight—13.44 ozs. (stripped), 19.68 ozs. (with rings and pin).
Removal—Piston and rod assembly removed from top of engine.
Clearance—Top, .030-.036". Bottom, .0015" selective fit.

Installing New Pistons—Use .0015" feeler stock ½" wide to check clearance (invert piston, insert in bore with pin parallel to crankshaft and feeler on side opposite slot). Use spring scale to check feeler tension. Pull required to withdraw feeler should be 9-14 lbs. Piston selected should be within this range.
NOTE:—Install pistons with slot on minimum pressure side (to left or away from camshaft).

Piston Rings:—4 rings ('33, '34 B), 3 rings (Yr. Ah'd) per piston, all above pin. 3 compression ('33, '34 B), 2 compression (Yr. Ah'd), 1 oil control (all). Lower ring groove drilled radially with ten 5/32" oil drain holes.
NOTE—Top groove on later 4 groove (aluminum) pistons unfinished. No ring should be fitted in this groove.

Ring	Width	End Gap	Wall Thickness - 1933 — 1934
Compression (all)	⅛"	.013-.018"	.125" .125-.135"
Oil Control (#4)	3/16"	.013-.021"	.125" .115-.125"

Compression rings are Perfect Circle '70' and should be installed with the step downward. Oil Control ring is Perfect Circle '85'.

Piston Pin:—Diameter, .8741-.8745". Length, 2⅝". Pin is clamped in rod. Piston pin hole in piston is line-reamed and burnished.
Pin Fit in Piston—Light push fit. Clearance, .0001-.0003". With this clearance, connecting rod should rock freely on piston of its own weight.
NOTE:—New pins are fitted and furnished with all replacement pistons.

Connecting Rod:—Weight 26 ounces (1933), 28.96 ounces (1934).
Length—8⅛" (1933), 8¼" (1934).
Crankpin Journal Diameter—1⅞" all models.
Big End Bearing—Spun babbitt-lined type. No shims used.
Clearance—.0005-.002". Sideplay .005-.010".
Adjustment—None (no shims used). Do not file bearing caps.

Crankshaft:—Nine main bearing type with bolted-on counterweights.
Journal Sizes—2.3435-2.3440" (2 11/32") diameter (all bearings).
Bearing Type—Steel-backed, babbitt-lined or lead-bronze (Clevite) type. No shims used.
Clearance—.0005-.0025".
Adjustment—None (no shims used). Do not file bearing caps. Replace removable bearings.
End Thrust—Taken by #1 (front) main bearing. Endplay, .003-.006". Adjustable by adding or removing shims.

Camshaft:—Six bearing type. Camshaft drive, helical gears.
Bearing Type—Split, steel-backed, babbitt-lined type.
Clearance—.00075-.00225" (front), .002-.00375" (all others).
Camshaft Gears—Cast-iron (crankshaft), Bakelite and Fabric (camshaft).
Camshaft Setting—Gears are marked. Mesh marked tooth on crankshaft gear between two marked teeth on camshaft gear. Use gear pullers and pushers to remove and install gears.

Valves:—	Head Diameter	Stem Diameter	Length	Seat Angle
Intake	1 13/32"	11/32"	5 7/32"	45°
Exhaust	1 9/32"	11/32"	5 7/32"	45°

Valve Lift—.34375" ('73 '33, First B '34), .28125" (Year Ahead B '34).
Stem-to-Guide Clearance—.001-.003" (all valves).
Tappet Clearance—.004" (intake), .006" (exhaust) engine hot.

Valve Springs:—	Pressure & Length 1933	Pressure & Length 1934
Valve Closed	48-53 lbs. at 2 1/32"	59-64 lbs. at 2 3/32"
Valve Open	71-76 lbs. at 1 23/32"	98-108 lbs. at 1 ¾"

Valve Timing:—See Camshaft Setting above.

Model 73 ('33), First B ('34)
Intake Valves—Open 15° BTDC. Close 43° ALDC.
Exhaust Valves—Open 48° BLDC. Close 10° ATDC.

Year Ahead Model B (1934)
Intake Valves—Open At TDC. Close 40° ALDC.
Exhaust Valves—Open 45° BLDC. Close 11° ATDC.
To Check Valve Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston 15° or .0846" ('73 '33), .0876" (First B '34) when flywheel mark 'IN.OP./1-8' lines up with indicator on housing for 73 '33 and First B '34 cars, or when piston reaches top dead center with flywheel mark 'UDC/1-8' at indicator on Year Ahead Model B '34. Reset tappet clearance at .004" with engine hot.
Motor Gauge—Weidenhoff Adapter #104, Rod #2.

LUBRICATION:—Pressure type. Gear type oil pump located in crankcase.
Normal Oil Pressure—30 lbs. at 30 M.P.H. (1933), 40 lbs. at 20 M.P.H. (1934).
Oil Pressure Relief Valve—Operates at 30 lbs. (1933), 40 lbs. (1934). Located under plug on left side of crankcase in front of oil filler. Not adjustable.
Capacity & Oil—6½ qts. Use SAE. #30 (summer) or #40 for high speed driving, #20 or #10 (winter).

CLUTCH:—Long Model 9ABM. Single plate, dry disc type. See article in Clutch Section for complete relining and assembling directions.
Facings—Moulded type, 2 required. Thickness 9/64". Inside Diameter 5½". Outside Diameter 9¼".
Adjustment—Free movement of clutch pedal should be 1". To adjust, loosen locknut and turn clutch release adjustment screw on left side of clutch housing. Check free-wheeling control setting after adjusting clutch.
Free-Wheeling Control Setting—Place shift lever in neutral and free-wheeling button in free-wheeling position. Remove clevis pin linking control rod to clutch release shaft lever, turn control rod clevis until pin can just be inserted with free-wheeling positive lock pin lever in the extreme rear position and both springs compressed equally.

STEERING:—Steering Gear—Ross Cam-and-Roller type. See article in Steering Section for complete adjustment directions.
Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott type ends and semi-elliptic springs.
Kingpin Inclination—8° crosswise.
Caster—½-1½° (73), 1-1½° (B). Adjust by inserting wedge shims between spring and spring pad on axle.
Camber—0-1°. No adjustment provided.
Toe In—1/16-⅛". Adjust in usual manner by loosening clamp bolts and turning tie rod.

BRAKES:—Service—Bendix Duo-Servo Mechanical type with vacuum power operation. Hand lever applies all four service brakes. See article in Brake Section for complete adjustment directions.
Drum Diameter—12⅛".
Lining—Moulded type (1933), Composite (1934). Width 1½". Thickness ¼". Length 26 3/16" (1933), 26⅞" (1934) per wheel.
Clearance—.008" (1933), .010" (1934) at heel and toe of each shoe.
Hand Brake:—See Service Brake and Service Brake adjustment.
Power Unit:—Bendix vacuum cylinder with internal valve. See article in Brake Section for complete data.

SERIAL NUMBER:—First number (82) 7,040,001, (C) 7,045,001, (Yr. Ahead 'C') 7,100,001. On plate on left hand frame side member under left front fender.

ENGINE NUMBER:—Stamped on boss on upper left center of engine block.

ENGINE:—Eight cylinder In Line, 'L' head type. Cylinders cast enblock.

Dimensions—Bore, 3 1/16". Stroke, 4¼". Displacement, 250.4 cu. ins.

Horsepower—Rated, 30. Developed, 110 H.P. at 3600 R.P.M.

Compression Ratio—5.5-1 Std. 82, 6.0-1 Optl. 82. 6.3-1 Std. Model C and Yr. Ahead C.

Compression Pressure—Approximately 95 lbs. (5.5-1 head), 100-105 lbs. (6.0-1 head), 114-117 lbs. (6.3-1 head) at cranking speed (150 R.P.M.).

Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling.

Pistons (82 '33):—Nelson Bohnalite, aluminum alloy, Invar strut, split skirt type. Replacement pistons furnished in standard and .002", .004", .010", .015", .020", .030" oversize.

Weight—14.72 ozs. (stripped), 21.60 ozs. (with rings and pin).

Removal—Pistons and rods removed from above.

Clearance—Top .0305-.0355". Bottom .0015" selective fit.

All other data same as for Lynite pistons below.

Pistons (C & Yr. Ahd. C):—Lynite aluminum alloy, slotted, cam ground type. Diameter is smaller (.00825-.01075") across pin bosses. Piston skirt is also tapered from top to bottom (.000-.001" larger diameter at bottom). Service pistons are stamped with exact size as measured at right angles to piston pin bosses ¼" up from bottom of piston skirt. Standard oversize pistons, .002", .004", .010", .015", .020", .030".

NOTE—Four ring piston superseded by three ring piston. Replacement pistons are three ring type.

Length—3¾".

Weight—13.44 ozs. (stripped), 19.68 ozs. (with rings and pin).

Removal—Piston and rod assembly removed from top of engine.

Clearance—Top, .030-.036". Bottom, .0015" selective fit.

Installing New Pistons—Use .0015" feeler stock ½" wide inserted between piston and cylinder wall on pressure side (opposite side from slot) with piston inverted in bore and piston pin bosses parallel to slot. Use spring scale to check feeler tension. Pull required to withdraw feeler should be 9-14 lbs. Piston selected for bore should be within this range.

NOTE:—Install pistons with slot on minimum pressure side (to left or away from camshaft).

Piston rings:—4 rings ('33, '34 C), 3 rings (Yr. Ah'd) per piston, all above pin. 3 compression ('33, '34 C) 2 compression (Yr. Ah'd), 1 oil control (all). Lower ring groove drilled radially with ten 5/32" oil drain holes.

NOTE—Top groove on later 4 groove pistons unfinished. No ring should be fitted in this groove.

Ring	Width	End Gap	Wall Thickness
Compression (all)	⅛"	.013-.018"	.125-.135"
Oil Control (#4)	3/16"	.013-.021"	.115-.125"

NOTE:—Compression rings are Perfect Circle '70' and should be installed with step downward. Oil Control Ring is Perfect Circle '85'.

Piston Pin:—Diameter, .8741-.8745". Length, 2⅝". Pin is clamped in rod. Piston pin hole in piston is line-reamed and burnished.

Pin Fit in Piston—Light push fit. Clearance, .0001-.0003". With this clearance, rod should rock freely in piston of its own weight.

NOTE:—New pins are fitted and furnished with all replacement pistons.

Connecting Rod:—Weight—30 ozs. ('33), 32 ozs. ('34). **Length**—8" (center-to-center).

Crankpin Journal Diameter—1⅞".

Lower Bearing—(82 '33) Spun babbitt type. (C & Yr. Ahd. C) Removable lead-bronze (Clevite) bearings.

Clearance—.0005-.0020" (82), .00075-.00275" (C & Yr. Ah'd C); Sideplay .005-.009" (82), .005-.010" (C & Yr. Ah'd C).

Adjustment—None (no shims). Do not file caps. Replace rods (82), bearings (C and Yr. Ahead C). Bearings furnished in standard .005", .010", .020" undersize. Bearings cannot be reamed and crankshaft journals must be turned down to provide correct clearance (.0005-.002") when new bearings are installed.

NOTE:—Bearings are provided with small integral tongue which fits into recess in rod and bearing cap. In installing new bearings, see that tongue enters recess so that bearings are restrained from turning, see that oil holes line up, and that bearings do not project beyond edges of rod and bearing cap after bearings have been pressed into place.

Crankshaft:—Nine main bearing type with bolted-on counterweights.

Journal Sizes—2.3435-2.3440" (2 11/32") diameter (all bearings).

Bearing Type—Removable steel-backed, babbitt-lined type (82), removable lead-bronze type (C & Yr. Th'd C).

Clearance—.0005-.0025" (82). .001-.003" (C).

Adjustment—None (no shims). Do not file bearing caps. Replace removable bearings.

End Thrust—Taken by #1 (front) main bearing. Endplay, .003-.006". Adjustable by adding or removing shims.

Camshaft:—Six bearing type. Camshaft drive, helical gears.

Bearing Type—Split, steel- backed, babbitt-lined type.

Clearance—.00075-.00225" (front), .002-.00375" (all others).

Camshaft Gears—Cast-iron (crankshaft), Bakelite and Fabric (camshaft).

Camshaft Setting—Gears are marked. Mesh marked tooth on crankshaft gear between two marked teeth on camshaft gear. Use gear pullers and pushers to remove and install gears.

Valves:—	Head Diameter	Stem Diameter	Length
Intake	1 13/32"	11/32"	5 7/32"
Exhaust	1 9/32"	11/32"	5 7/32"

Seat Angle—45° (all valves). Lift .34375".

Stem-to-Guide Clearance—.004" (intake), .006" (exhaust) engine hot.

Tappet Clearance—.004" (intake), .006" (exhaust) engine hot.

Valve Springs (82 '33)—	Spring Pressure	Spring Length
Valve Closed	48-53 lbs.	2 1/32"
Valve Open	71-76 lbs.	1 23/32"

Valve Springs (1934)—	Spring Pressure	Spring Length
Valve Closed	59-64 lbs.	2 3/32"
Valve Open	98-108 lbs.	1 ¾"

Valve Timing

Intake Valves open 15° BTDC. Close 43° ALDC.
Exhaust Valves open 48° BLDC. Close 10° ATDC.

To Check Valve Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston #1 15° or .0915" before top dead center when flywheel mark 'IN.OP./1-8' lines up with indicator on housing. Reset tappet clearance at .004" with engine hot or cold.

Lubrication—Pressure type. Gear type oil pump located in crankcase.

Oil Pressure—30 lbs. at 30 M.P.H. (82), 40 lbs. at 27.4 M.P.H. (1934).

Oil Pressure Relief Valve—Under plug on left hand side of crankcase in front of oil filter. Operates at 30 lbs. ('33), 40 lbs. ('34).

Crankcase Capacity—6½ qts. (for 1933 and 1934 models).

CLUTCH:—Long Model 9ABM. Single plate, dry disc type. No adjustment required for wear. See article in Clutch Section for relining and assembling directions.

Facings—Moulded type, 2 required. Thickness 9/64". Inside Diameter 5½". Outside Diameter 9¾".

Adjustment—Free movement of clutch pedal 1". To adjust, loosen locknut and turn clutch release adjustment screw on left side of clutch housing. Check free-wheeling control setting after adjusting clutch.

Free-Wheeling Control Setting—Place shift lever in neutral and free-wheeling button in free-wheeling position. Remove clevis pin linking control rod to clutch release shaft lever, turn control rod clevis until pin can just be inserted with free-wheeling positive lock pin lever in the extreme rear position and both springs compressed equally.

STEERING:—Steering Gear—Ross Cam-and-Roller type. See article in Steering Section for complete adjustment directions.

Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott type ends and semi-elliptic springs.

Kingpin Inclination—8° crosswise.

Caster—½-1½°. Adjust by inserting wedge shims between spring and spring pad on axle.

Camber—1°. No adjustment provided.

Toe In—1/16-⅛". Adjust in usual manner by loosening clamp bolts and turning tie rod.

BRAKES:—Service—Bendix Duo-Servo Mechanical type with vacuum power operation. Hand lever applies all four service brakes. See article in Brake Section for complete adjustment directions.

Drum Diameter—13⅛".

Lining—Moulded type. Width 1¾". Thickness ¼". Length per wheel 28".

Clearance—.008" (1933), .010" (1934) at heel and toe of each shoe.

Hand Brake:—See Service Brake and Service Brake adjustment.

Power Unit:—Bendix vacuum cylinder with internal valve. See article in Brake Section for complete data.

NOTE—Models designated as '1-A' have conventional front axle, '2-A' types have independently sprung front wheels. All other data is the same for all cars.

SERIAL NUMBER: — First number (1-A) 5,500,001, (2-A) 5,212,001. On plate on left frame side member under front fender.

ENGINE NUMBER:—Stamped on left center of cylinder block.

ENGINE:—Dictator, Six cylinder, 'L' head type.
Bore—3¼". **Stroke**—4⅛".
Piston Displacement—205 cubic inches.
Rated Horsepower—25.4.
Developed Horsepower—88 at 3600 R.P.M. (std. hd.).
Compression Ratio—6.3-1 Std., 6.9-1 Optl.
Compression Pressure—109.5-116 lbs. (Std. 6.3-1 head), 110-120 lbs. (Optl. 6.9 head) at cranking speed (150 R.P.M.).
Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling.

NOTE—Special 6.9-1 head is aluminum and special copper-asbestos head gasket must be used (steel-bestos gasket used with standard cast-iron head).

Pistons: — Lynite, aluminum alloy, 'T' slot, cam ground type (.00825-.01075") smaller diameter across pin bosses, skirt is not tapered vertically).
Weight—.94 lbs. (without rings or pin).
Removal—Pistons and rods removed from above.
Clearance—Top .016-.018". Bottom .0015".
Original Bore Size—*See Studebaker Shop Notes.*
Replacement Pistons—Pistons with pins fitted furnished .002", .004", .010", .015", .020", .030" oversize. Replacement pistons stamped on head with exact size as measured at right angles to pin bosses ¼" up from bottom of skirt. Piston length 3¾".
Fitting New Pistons—Use .002" feeler stock 1" wide to check clearance. Insert piston in bore upside down with pin bosses parallel to crankshaft, and feeler between piston and cylinder wall midway between bosses on camshaft side (opposite side from piston slot). Pull required to withdraw feeler should be 7-15 lbs. Piston selected for bore should be within this range.
Installing Pistons—Slot should be on minimum pressure side (away from camshaft).

Piston Rings:—Three rings per piston, two compression, one oil control, all above pin. Oil ring groove is drilled radially with ten 5/32" oil drain holes. Compression rings are Perfect Circle '70' and should be installed with the step downward. All pistons have a heat insulating groove above the top compression ring, this groove is slightly narrower than ring grooves and no ring is fitted.

Ring	Width	End Gap	Wall Thickness
Comp. All	⅛"	.013-.021"	.145"
Oil Cont.	3/16"	.013-.021"	.135"

Piston Pin:—Diameter ⅞". Length 2⅞". Pin is locked in rod. Pin hole in piston is line-reamed and burnished.
Clearance in Piston—.0001-.0003" or light push fit. With this clearance rod will rock on piston of own weight. Pins are fitted and furnished with new pistons.

Connecting Rod:—2.09 lbs. Length 8¼".
Crankpin Journal Diameter—2.06175-2.06275".
Lower Bearing—Integral spun babbitt-lined type.
Clearance—.0005-.002". Sideplay .005-.009".
Adjustment—None. Replace rods. Do not file caps.

Crankshaft:—Four bearings. Integral counterweights.
Journal Diameters—2.2495-2.250" all bearings.
Bearing Type—Interchangeable steel-backed, babbitt-lined type.
Clearance—.0005-.0025".
Adjustment—None. Replace bearings. Do not file caps.
End Thrust—Taken by #1 (front) bearing. End-play .003-.006". Adjusted by shims.

Camshaft:—Four bearing. Helical gear drive.
NOTE—High lift camshaft used starting with Engine No. D-47576. See Valves (following) for changes in specifications for these cars.
Bearing Type—Split steel-backed, babbitt-lined type.
Clearance—.00075" (front), .002-.00375" (all others).
End Thrust—Taken by steel thrust washer between #1 bearing and camshaft gear.
Timing Gears—Crankshaft gear cast-iron. Camshaft gear Celeron Fabric. Camshaft gear furnished for service in three sizes: 'S' standard, 'L' low limit, 'H' high limit.
See Studebaker Special Shop Notes for Camshaft Gear Removal.
Camshaft Setting—Gears are marked. Mesh marked tooth on crankshaft gear between two marked teeth on camshaft gear. Use gear pullers and pushers to remove or install gears.

Valves:—

	Head Diameter	Stem Diameter	Length
Intake	1 15/32"	11/32"	5 7/32"
Exhaust	1 9/32"	11/32"	5 7/32"

	Seat Angle	Lift	Stem-to-Guide Clearance
All Valves	45°	5/16"	.001-.003"

Tappet Clearance—.004" Int., .006" Exh. Hot (Before Engine No. D-47576), .016" all valves with engine cold (After Eng. No. D-47576).
Valve Springs—New type. Install springs with closed coils at top. No spring damper used.

	Spring Pressure	Length
Valve Closed	63-68 lbs.	2 1/16"
Valve Open	98-108 lbs.	1¾"

See Studebaker Special Shop Notes for Valve Spring Installation Instructions.
Valve Timing—See Camshaft Setting above.

Cars before Engine No. D-47576
Intake Valves—Open 5° BTDC. Close 40° ALDC.
Exhaust Valves—Open 40° BLDC. Close 5° ATDC.

Cars with Engine No. D-47576 and up
Intake Valves—Open 15° BTDC. Close 43° ALDC.
Exhaust Valves—Opens 48° BLDC. Close 10° ATDC.
To Check Valve Timing—Set tappet clearance #1 intake valve at .010" (Before Eng. No. D-47576), .020" (After Eng. No. D-47576). This valve should open with piston 5° or .0098" BTDC. (Before Eng. No. D-47576), 15° or .0942" (After Eng. No. D-47576) when flywheel mark 'IN.OP.1-6' lines up with indicator in inspection hole in left front face of flywheel housing below starter. Reset tappet clearance at .004" hot (Before No. D-47576), .016" cold (After No. D-47576).
Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Lubrication:—Pressure. Gear type oil pump located on right side of crankcase.
Normal Oil Pressure—40 lbs. at 26.8 M.P.H.
Oil Pressure Relief Valve—Operates at 40 lbs. Located on right hand front corner of crankcase. Screw adjustment.
Capacity and Oil—5 qts. Use SAE. #30 (summer 45° to 90°F.—average driving), #40 (summer above 90°F.—high speed driving), #20 (winter 45° to 0°F.), #10 (winter below 0°F.).

CLUTCH:—**Borg & Beck Model 9A6. Single plate, dry disc type. No adjustment required for wear.**
See article in Mechanical Equipment Section for data.
Clutch Pedal Adjustment — Free movement of clutch pedal must be 1" minimum. Adjust by turning clutch release adjustment lever set screw (on left hand side of clutch housing). On cars with free-wheeling check setting of free-wheeling unit positive lock control rod after adjusting clutch pedal.
Free-wheeling Control Rod—To adjust, remove clevis pin holding control rod on clutch release shaft lever, turn control rod clevis until clevis pin can just be inserted with free-wheeling unit positive lock pin lever in the extreme rear position and both springs (thrusting against lock pin lever swivel) compressed equally. Gear shift lever must be in neutral and free-wheeling control in free-wheeling position.
Clutch Facings—Moulded type, 2 required, 5¾" I. D.. 9" O. D., ⅛" thick.
Installing New Facings—Driven plate is segmented (alternate segments convex and concave) with horseshoe tongue in each segment. Each facing is riveted separately to convex side of plate segments. Old rivets should be drilled out to avoid damage to tongues. Insert new rivets with head on plate side (if split) or on facing side (if rolled).

NOTE—In reassembling clutch, release levers must be set to equal height within .005". Use special clutch finger setting disc HMJ-285.

STEERING:—**Front Suspension**—**(2-A)**—Independent with transverse spring. All specifications and service for this type suspension same as for Commander and President Models (see next page).
See article in Mechanical Equipment Section for data.
(1-A)—Conventional 'I' beam section axle with Reverse-Elliott ends and semi-elliptic springs. Specifications and data below.
Kingpin Inclination—9½° crosswise.
Caster—1-1½°. Adjust by inserting wedge shims between spring and spring pad on axle. Spring pad should incline 1½° down toward rear.
Camber—1-1½°. No adjustment. Axle may be bent cold to correct camber.
Toe In—1/16-⅛". Adjust in usual manner by changing length of tie rod.
Steering Gear:—Ross Model, Cam-and-Lever type.
See article in Mechanical Equipment Section for data.

BRAKES:—**Service**—Lockheed Hydraulic, four wheel type. Hand lever applies rear wheel brakes.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Stepped or two-stage bore type:
Front Wheel—Front Shoe Cyl. 1⅜". Rear—1".
Rear Wheels—Front Shoe Cyl. 1¼". Rear—1".
NOTE—Wheel cylinder bore size marked on casting. Cylinders not interchangeable.
Brake Drum Diameter—11⅛".
Lining—Moulded type. Width 1¾". Thickness ¼". Length per wheel 23".
Clearance—.010" toe, .005" heel on each shoe.
Hand Brake Adjustment:—**See Service Brakes.**

SERIAL NUMBER:—First number (Comm.) 8,103,001, (Pres.) 7,101,001. On plate on left frame side member under front fender.

ENGINE NUMBER:—Stamped on boss on upper left center of cylinder block.

ENGINE:—Own. Eight cylinder, In line, 'L' head type.
Bore—3 1/16". **Stroke**—4¼".
Piston Displacement—250 cubic inches.
Rated Horsepower—30.
Developed Horsepower—(Comm.) 107 at 3800 R.P.M. (Pres.) 110 at 3600-3800 R.P.M.
Compression Ratio—(Comm.) 6.0-1 (cast-iron head), (Pres.) 6.5-1 (aluminum head). The 6.5-1 aluminum head is optional on Commander models.
Compression Pressure—94-104 lbs. (6.0-1 head), 105-115 lbs. (6.5-1 head) at cranking speed (150 R.P.M.).
Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling.

Pistons:—Lynite, aluminum alloy, "T" slot, cam ground type (.00825-.01075" smaller diameter across pin bosses, piston not tapered vertically).
Weight—.84 lbs. (without rings or pin).
Removal—Pistons and rods removed from above.
Clearance—Top .015-.018". Bottom .0015".
Original Bore Size—*See Studebaker Shop Notes.*
Replacement Pistons—Pistons with pins fitted furn. .002", .004", .010", .015", .020", .030" oversize. Replacement pistons stamped on head with exact size as measured at right angles to pin bosses ¼" from bottom of skirt. Piston length 3¾".
Fitting New Pistons—Use .003" feeler stock 1" wide to check clearance. Insert piston in bore upside down with pin bosses parallel to crankshaft, and feeler between piston and cylinder wall midway between bosses on camshaft side (opposite side from slot). Pull required to withdraw feeler should be 7-13 pounds.
Installing Pistons—Slot should be on minimum pressure side (away from camshaft).

Piston Rings:—Three rings per piston, two compression, one oil control, all above pin. Oil ring groove is drilled radially with ten 5/32" oil drain holes. Compression rings are Perfect Circle '70' and should be installed with step downward. All pistons have a heat insulating groove above the top compression ring, this groove is slightly narrower than ring grooves, and no ring is fitted.

Ring	Width	End Gap	Wall Thickness
Comp. All	⅛"	.013-.018"	.135"
Oil Cont.	3/16"	.013-.018"	.125"

NOTE—Inner rings installed back of oil ring.

Piston Pin:—Diameter ⅞". Length 2⅝". Pin is locked in rod. Pin holes in piston are line-reamed and burnished.
Clearance in Piston—.0001-.0003" or light push fit. With this clearance rod will rock on piston of own weight. Fitted pins furn. with new pistons.

Connecting Rod:—Weight 2 lbs. Length 8".
Crankpin Journal Diameter—1.87425-1.87525".
Bearing Type—Removable Clevite (steel-backed, lead-bronze lined type).
Clearance—.00075-.00275". Sideplay .005-.009".
Adjustment—None. Replace bearings. Do not file caps. New bearings should be pressed in place in rod and cap (upper and lower halves interchangeable) so that tongues on bearings engage grooves in rod and cap and oil holes line up. Bearings cannot be reamed, and crankpins must be turned down to size giving correct clearance. Bearings furnished .005", .010", .020" undersize and standard.

Crankshaft:—Nine bearings. Bolted-on counterweights.
Journal Diameters—2.3435-2.3440" all bearings.
Bearing Type—Interchangeable steel-backed, babbitt-lined type.
Clearance—.001-.003".
Adjustment—None. Replace bearings. Do not file caps.
End Thrust—Taken by #1 (front) bearing. End-play .003-.006. Adjusted by shims.

Camshaft:—Six bearings. Helical gear drive.
Bearing Type—Split steel-backed, babbitt-lined.
Clearance—.00075" (front), .002-.00375" (all others).
End Thrust—Taken by steel thrust washer between #1 bearing and camshaft gear.
Timing Gears—Crankshaft gear cast-iron, camshaft gear Celeron Fabric. Camshaft gears furnished for service in three sizes, 'S' standard, 'L' low limit, 'H' high limit.
See Studebaker Special Shop Notes for Camshaft Gear Removal.
Camshaft Setting—Gears are marked. Mesh marked tooth of crankshaft gear between two marked teeth on camshaft gear. Use gear pullers.

Valves:—	Head Diameter	Stem Diameter	Length
Intake	1 13/32"	11/32"	5 7/32"
Exhaust	1 9/32"	11/32"	5 7/32"

	Seat Angle	Lift	Stem-to-Guide Clearance
All Valves	45°	11/32"	.001-.003"

Tappet Clearance—.004" Int., .006" Exh. eng. hot.
NOTE—On engines so marked on valve cover plate, set tappet clearance at .016" cold (all valves).
Valve Springs—Springs installed with closed coils at top. Cup type valve cages used on all springs at top.

	Spring Pressure	Length
Valve Closed	59-64 lbs.	2 3/32"
Valve Open	98-108 lbs.	1¾"

Valve Timing—See Camshaft Setting (above).
Intake Valves—Open 15° BTDC. Close 43° ALDC.
Exhaust Valves—Open 48° BLDC. Close 10° ATDC.
To Check Valve Timing—Set tappet clearance #1 intake valve at .010" (or .020" when regular running clearance of .016" used). This valve should open with piston 15° or .0915" before top dead center when flywheel mark 'IN.OP/1-8' lines up with indicator. Reset tappet clearance at .004" hot (or .016" cold on engines so marked).
Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Lubrication:—Pressure. Gear type oil pump located in crankcase.
Normal Oil Pressure—40 lbs. at 27.4 M.P.H.
Oil Pressure Relief Valve—Operates at 40 lbs. On left front corner of crankcase. Screw adjustment.
Capacity and Oil—8 qts. Use SAE. #30 (summer 45° to 90°F.—average driving), #40 (summer above 90°F.—high speed driving), #20 (winter 45° to 0° F.), #10 (winter below 0°F.).

CLUTCH:—Long Model 9AB. Single plate, dry disc type. No adjustment required for wear. See article in Clutch Section for relining and assembling directions.
Clutch Pedal Adjustment—Free movement of clutch pedal must be 1" minimum. Adjust by turning clutch release adjustment lever set screw (on left hand side of clutch housing). On Commander cars check setting of free-wheeling unit positive lock control rod after adjusting pedal.
Free-wheeling Control Rod—To adjust, loosen clevis pin holding control rod on clutch release shaft lever, turn control rod clevis until clevis pin can just be inserted with free-wheeling unit positive lock pin lever in the extreme rear position and both springs (thrusting against lock pin lever swivel) compressed equally. Gear shift lever must be in neutral and free-wheeling control in free-wheeling position.
Clutch Facings—Moulded type, 2 required, 5½" I.D., 9¾" O.D., 9/64" thick.
Installing New Facings—One facing riveted to main driving plate, one facing riveted to spring segments. To remove old facings, drill out 12 iron rivets holding sections together, then drill out brass facing rivets after separating sections. Spring segments should be riveted to facings so that clearance is between center portion of spring segment and facing at outer circumference (center portion of spring segments will bear against main plate when sections assembled).
NOTE—Use alignment shaft and adjusting sleeve HMJ-278, HMJ-278-2 to set up release levers in reassembling clutch, or use straightedge across top of stamped steel cover plate and set lever height at ⅞" below. Levers must be equal within .020".

STEERING:—Front Suspension—Independent type with transverse spring.
See article in Mechanical Equipment Section for data.
Kingpin Inclination—9½° crosswise.
Caster—½° (-¼ to +¾°) with car weight on wheels, tires properly inflated, and frame level (car unloaded). Caster determined by spring mounting. No adjustment possible.
Camber—1-1½° with car weight on wheels, car unloaded and on level floor, frame height normal (bounce car up and down several times), tires properly inflated. Camber adjusted by adding or removing shims located between steering knuckle support arm and steering knuckle support arm outer bearing. Shims are 1/32" thick. One shim will change camber angle ¼°. Maximum allowable number of shims is six.
Toe In—1/16-⅛". Adjust by changing length of longer tie rod (shorter tie rod need not be adjusted). Tie rod has right and left hand threads.

Steering Gear:—Ross Model, Cam-and-Lever type.
See article in Mechanical Equipment Section for data.

BRAKES:—Lockheed Hydraulic, four wheel type. Hand lever applies rear wheel brakes. See article in brake Section for complete adjustment procedure.
Wheel Cylinders—Stepped or two-stage bore type: Front Wheels—Front Shoe Cyl. 1⅜". Rear 1".
Rear Wheels—Front Shoe Cyl. 1¼". Rear 1".
NOTE—Wheel cylinder bore size marked on casting. Not interchangeable.
Drum Diameter—12⅛" (1-B), 13⅛" (1-C).
Lining—Moulded type. Width 1¾". Thickness ¼". Length per wheel 25" (1-B), 27½" (1-C).
Clearance—.010" toe, .005" heel, for each shoe.
Hand Brake Adjustment:—See Service Brakes.

ENGINE NUMBER:—First number—D-63,001. Stamped on left center of engine block.

ENGINE SPECIFICATIONS:—**Type**—6 cyl., 'L' head.
Bore—3¼". **Stroke**—4⅜".
Displacement—217.8 cubic inches.
Rated Horsepower—25.4 (NACC).
Developed Horsepower—90 at 3400 R.P.M.
Compression Ratio & Pressure—6.3-1 Std. cast-iron head. Pressure 105 lbs. at cranking speed of 150 R.P.M.
Vacuum Reading—Gauge should show steady reading of 18" with engine idling at 450 R.P.M. or 8 M.P.H.

PISTONS:—Lynite, aluminum alloy, 'T' slot, Cam Ground type with .00825-.01075" greater diameter at right angles to piston pin bosses.
Weight—15.2 ozs. **Length**—3¾".
Removal—Pistons and rods removed from above.
Clearance—.0005" as measured ¼" up on skirt at right angles to pin bosses for new pistons. See Fitting New Pistons.
Original Bore Sizes:—*See Studebaker Shop Notes.*
Replacement Pistons:—Finished pistons with fitted pins furnished .002", .004", .010", .015", .020", .030" oversize. Exact size of all new pistons as measured ¼" up on skirt at right angles to pin bosses is stamped on head.
Fitting New Pistons:—Check clearance by inserting .002" hardened feeler 1" wide between piston and cylinder wall on pressure or camshaft side at right angles to pin bosses. Piston should be inserted in inverted position with slot away from camshaft. Pressure required to withdraw feeler must be between 7-15 lbs.
Installing Pistons:—Slot should be on minimum pressure side or away from camshaft.

PISTON RINGS:—Two compression, one oil control ring per piston, all above pin. Lower ring groove drilled with ten 5/32" oil drain holes.
NOTE—Narrow heat deflector groove located above top ring groove. No ring fitted in this groove.

Ring	Width	End Gap	Wall Thickness
Comp.	⅛"	.013-.018"	.135"
Oil Cont.	3/16"	.013-.018"	.145"

NOTE—Compression rings are undercut. Install these rings with step or groove down.

PISTON PIN:—Diameter ⅞". Length 2⅞".
Pin is locked in connecting rod.
Pin Fit in Piston—.0002" clearance or light push fit.
NOTE—New pins fitted and furnished with all new replacement pistons.

CONNECTING ROD:—Weight 33.2 ozs. Length 8⅛".
Crankpin Journal Diameter—2.18675-2.18775".
Lower Bearing—Integral spun-babbitt lined type.
Clearance—.0005-.002". **Sideplay** .005-.009".
Bearing Adjustment:—None (no shims). Replace rods on exchange basis. Do not file rods or caps. Rods furnished with bearings standard and .010", .020" undersize.
Installing Rods:—Lower bearings are offset. Install rods with narrow half of bearing toward front in cylinders #1, 3, 5 and toward rear in #2, 4, 6. Marks on rods and caps must be together and oil escape hole in upper half of rod lower bearing must be toward right or camshaft side of engine on all rods.

CRANKSHAFT:—Four bearing. Integral counterweights.
Journal Diameters—2½" all bearings .
Bearings—Interchangeable steel-backed, babbitt-lined type. No shims.
Clearance—.0005-.0025".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps. No fitting or line reaming necessary for new bearings.
End Thrust:—Taken by thrust plate assembled between front main bearing and crankshaft gear. Adjusted by adding or removing shims between thrust plate and bearing. Endplay should be .003-.006".

CAMSHAFT:—Four bearing. Helical gear drive.
Bearings—Split, steel-backed, babbitt-lined type.
Clearance—.00075-.00225" (front), .002-.00375" (all others).
NOTE—When bushings installed see that oil holes in bushing and block line up.
End Thrust:—Taken by steel thrust washer and spacer between gear hub and front bearing. Endplay .006" maximum.
Timing Gears:—Cast-iron (crankshaft), Celoron Fabric (camshaft). Camshaft gears furnished in three sizes marked 'S'—standard, 'H'—high limit, 'L'—low limit. Use next largest size to take up backlash when replacing gears.
NOTE—Screw thread for gear puller and pusher formed in camshaft gear hub recess. Gear must not be driven on or off of shaft.
Camshaft Setting:—Gears are marked. Mesh marked tooth on crankshaft gear between two marked teeth on camshaft gear.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 15/32"	11/32"	5 7/32"
Exhaust	1 9/32"	11/32"	5 7/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.001-.003"
Exhaust	45°	11/32"	.001-.003"

Tappet Clearance—.016" all valves (cold).
Valve Guides:—Pressed in block from upper end.
Valve Springs:—No damper used. Install springs with closed-coil end at top. Replace springs if more than 10% weaker than specifications given below.

	Spring Pressure	Spring Length
Valve Open	1¾"	125-135 lbs.

NOTE—Valve spring will not clear tappet adjusting screw when extended. To install spring, place spring seat in position on spring, compress spring slightly with compressor so that it clears tappet adjusting screw, insert valve, compress spring fully and install valve spring seat locks.
Valve Lifters:—Barrel type operating directly in cylinder block (no separate guides). Lifters are same diameter throughout and can be removed from top or bottom.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open at 15° BTDC. Close 49° ALDC.
Exhaust Valves—Open 54° BLDC. Close 10° ATDC.
To Check Valve Timing—Set tappet clearance #1 intake valve at .020". This valve should open with piston 15° or .0942" before top dead center when mark 'IN.OP/1-6' on vibration dampener at front of engine line up with pointer on gear case cover. Reset tappet clearance at .016".
Motor Gauge—Weidenhoff #114 Adapter, #2 Rod.

LUBRICATION:—Pressure type. Gear type oil pump located on right side of crankcase.
Normal Oil Pressure—40 lbs. min. at 40 M.P.H.
Oil Pressure Regulator—Located at right front corner of engine. Operates at 40 lbs. Not adjustable. Timing gears lubricated by overflow from regulator.
Crankcase Capacity—6 qts.
NOTE—Whenever oil pump is taken off engine, drive gear must be properly remeshed when pump is replaced so that distributor rotor position will be correct. To install pump, remove distributor, turn engine over until mark 'UDC/1-6' on vibration dampener lines up with pointer on chain case cover, sight down distributor shaft hole, mesh oil pump gear so that distributor drive slot is horizontal and offset toward top.

CLUTCH:—**Borg & Beck Model 9A6.** Single plate dry disc type. See article in Clutch Section for relining and assembling instructions.
Facings—Woven (pressure plate side), molded (flywheel side), 2 required. Inside Diam. 5⅝". Outside Diam. 9¼". Thickness .133".
Adjustment—Free movement of clutch pedal must be 1" minimum. To adjust, loosen locknut and turn adjustment lever setscrew on left side of clutch housing. Check Hill-Holder after adjusting clutch
Hill-Holder Adjustment:—On cars with Hill-Holder, check action after adjusting clutch to see that brakes release just before clutch engages. Adjust by loosening locknut and turning adjusting nut at end of hill holder control rod. Shorten rod for earlier brake release or lengthen rod for later release.
Clutch Removal:—Disconnect drive shaft at front universal, support engine at rear end, remove transmission and clutch cover, take out screws mounting clutch on flywheel turning all screws out evenly to release clutch spring tension.

STEERING:—**Steering Gear:** Ross Cam-and-Lever type. Model 140—first cars, Model T-14—later cars beginning with following serial numbers—**3A** 5526354 (South Bend), 5851960 (Pacific Coast) except 5526359-5526376 inc., **4A** 5246240 (South Bend), 5801504 (Pacific Coast) except 5801547, 5801655, and 5801657. See article in Steering Section.
Front Suspension Model 3A—Conventional 'I' beam section front axle with semi-elliptic springs.
King Pin Inclination—9½° crosswise.
Caster—1-1½°. Adjusted by inserting wedge shims between spring and spring pad on axle. Spring pad should incline 1½° toward rear (see Spring Camber)
Camber—1-1½°. No adjustment. Axle may be bent cold for minor camber adjustments.
Toe In—1/16-⅛". Adjust in usual manner by changing length of tie rod.
Spring Camber—⅛" minimum. Measure by stretching cord between spring eye centers and noting distance from cord to top of spring main plate at center. Camber must be positive (cord above spring) between each spring and bearing) is 1⅜".
Front Suspension Model 4-A:—Planar type independent suspension with transverse spring. See article in Steering Section for complete description and adjustment procedure.
NOTE—All specifications for this type same as for President Model 2C (see next page).

BRAKES:—**Service**—Lockhead Hydraulic, four wheel type. Hand lever applies rear wheel brakes.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Stepped or two-stage bore type:
Front Wheels—Front Shoe Cyl. 1⅜". Rear—1".
Rear Wheels—Front Shoe Cyl. 1¼". Rear—1".
NOTE—Wheel cylinder bore size marked on casting. Cylinders not interchangeable.
Brake Drum Diameter—11⅛".
Lining—Moulded type. Width 1¾". Thickness ¼". Length per wheel 23".
Clearance—.010" toe, .005" heel on each shoe.
Hand Brake Adjustment:—See Service Brakes.
Hill-Holder:—Optional on all models. See article in Brake Section and also Clutch Section above.

ENGINE NUMBER:—First number—B-7901. Stamped on left center of engine block.

ENGINE SPECIFICATIONS:—Type—8 cyl., 'L' head.
Bore—3 1/16". **Stroke**—4¼".
Displacement—250.4 cubic inches.
Rated Horsepower—30 (NACC).
Developed Horsepower—115 at 3600 R.P.M.
Compression Ratio—6.5-1 Std. aluminum head.
Compression Pressure—105-115 lbs. at cranking speed of 150 R.P.M.
Vacuum Reading—Gauge should show steady reading of 18" with engine idling at 450 R.P.M. or 8 M.P.H.
NOTE—Tighten aluminum cylinder heads only when engine is cold.

PISTONS:—Lynite, aluminum alloy, "T" slot, Cam Ground type with elliptical skirt .00825-.01075" greater in diameter at right angles to pin bosses. Recondition cylinders to take finished replacement pistons.
Weight—13.6 ozs. **Length**—3¾".
Removal—Pistons and rods removed from above.
Clearance—.0015" as measured ¼" upon skirt at right angles to pin bosses for new pistons. See Fitting New Pistons.
Original Bore Size:—*See Studebaker Shop Notes.*
Replacement Pistons:—Finished pistons with fitted pins furnished .002", .004", .010", .015", .020", .030" oversize. Exact size of all new pistons as measured ¼" up on skirt at right angles to pin bosses is stamped on head.
Fitting New Pistons:—Check clearance by inserting .003" hardened feeler 1" wide between piston and cylinder wall on pressure or camshaft side at right angles to pin bosses. Piston should be inserted in inverted position with slot away from camshaft. Pressure requried to withdraw feeler must be between 7-13 lbs.
Installing Pistons:—Slot should be on minimum pressure side or away from camshaft.

PISTON RINGS:—Two compression, one oil control ring per piston, all above pin. Lower ring groove drilled radially with ten 5/32" oil drain holes. Do not increase size or number of holes.
NOTE—A narrow heat deflector groove is located above the top compression ring. No ring it fitted in this groove.

Piston Ring Specifications.

Ring.	Width.	End Gap.	Wall Thickness.
Comp.	⅛"	.013-.018"	.135"
Oil Cont.	3/16"	.013-.018"	.145"

NOTE—Compression rings are undercut or stepped and must be installed with this step downward. Inner rings used behind oil ring on all engines.

PISTON PIN:—Diameter ⅞". **Length** 2⅝".
Pin is locked in connecting rod.
Clearance in Piston—.0002" or light push fit.
NOTE—New pins are fitted and furnished with all new replacement pistons.

CONNECTING ROD:—Weight 32 ozs. **Length** 8".
Crankpin Journal Diameter—1.87425-1.87525".
Lower Bearing—Removable steel-backed, lead-bronze lined type.
Clearance—.00075-.00275". Sideplay .005-.010".
Bearing Adjustment:—None. Replace bearings. Do not file caps. New bearings should be pressed in place in rod and cap (upper and lower halves interchangeable) so that tongues on bearings engage grooves in rod and cap and oil holes line up. Bearings cannot be reamed, and crankpins must be turned down to size giving correct clearance. Bearings furnished .005", .010", .020" undersize and standard.
Installing Rods:—Oil escape hole in upper half of rod lower bearing must be toward right or camshaft side of engine on all rods.

CRANKSHAFT:—Nine bearings with bolted-on counterweights.
See Studebaker Shop Notes for Damper data.
Journal Diameters—2 11/32" all bearings.
Bearings—Interchangeable steel-backed, babbitt lined type. No shims.
Clearance—.001"-.003".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps. No fitting or line reaming necessary for new bearings.
End Thrust:—Taken by thrust plate assembled between front main bearing and crankshaft gear. Adjusted by adding or removing shims between thrust plate and bearing. Endplay should be .003-.006".

CAMSHAFT:—Six bearing. Helical gear drive.
Bearings—Split, steel-backed, babbitt-lined type.
Clearance—.00075-.00225" (front), .002-.00375" (all others).
NOTE—When new bearing installed, see that oil holes in bearings and block line up.
End Thrust:—Taken by steel thrust washer and spacer assembled between gear hub and front bearing. Endplay .006" maximum.
Timing Gears:—Cast-iron (crankshaft), Celoron Fabric (camshaft). Camshaft gears furnished in three sizes marked 'S'—standard, 'H'—high limit, 'L'—low limit. Use next largest size to take up backlash when replacing gears.
NOTE—Screw thread for gear puller and pusher formed in camshaft gear hub recess. Gears must not be driven on or off of shaft.
Camshaft Setting:—Gears are marked. Mesh marked tooth of crankshaft gear between two marked teeth on camshaft gear.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 13/32"	11/32"	5 7/32"
Exhaust	1 9/32"	11/32"	5 7/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.001-.003"
Exhaust	45°	11/32"	.001-.003"

Tappet Clearance—.016" all valves (cold).
Valve Guides:—Pressed in block from upper end.
Valve Springs:—Springs installed with closed coils at top. Damper (cup type valve cage) used on all springs at top. Replace springs if more than 10% weaker than specifications below.

	Spring Length	Spring Pressure
Valve Open	1¾"	125-135 lbs.

Valve Lifters:—Mushroom type with separate guides. Guide assemblies (groups of four) bolted to crankcase and removable from above.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 15° BTDC. Close 49° ALDC.
Exhaust Valves—Open 54° BLDC. Close 10° ATDC.
To Check Valve Timing—With tappet clearance of .020", #1 intake valve should open with piston 15° or .0915" before top dead center when mark 'IN.OP/1-8' on flywheel lines up with pointer in inspection hole in right top surface of housing.
Motor Gauge—Weidenhoff #104 Adapter, #2 Rod.

LUBRICATION:—Force-feed by oil pump to main bearings, connecting rod bearings, camshaft bearings, and valve lifters. Splash from connecting rod bearing escape hole to cylinder walls and piston pins. Timing gears lubricated by oil by-passed by oil pressure regulator relief valve.
Normal Oil Pressure—40 lbs. minimum at 40 M.P.H.
Oil Pressure Relief Valve—Operates at 40 lbs. Located at right front cor. of engine. Not adjustable.
Crankcase Capacity—8 qts.
Oil Pump:—Gear type located in the oil pan. Driven by vertical shaft from camshaft (drive gear on oil pump shaft—distributor driven through tongue-and-slot coupling above gear).
NOTE—Whenever oil pump is taken off engine, drive gear must be properly meshed with camshaft so that distributor rotor position will be correct. To install pump, turn engine over until #1 piston is on top dead center entering power stroke with flywheel mark 'UDC/1-8' at indicator on clutch housing. Turn pump shaft so that distributor drive slot is two teeth clockwise (viewed from below) from correct installed position with slot parallel to camshaft and wide half of coupling toward camshaft. Shaft will be rotated to this position as gears are meshed. Check by sighting down distributor drive shaft hole (distributor off engine) or see that rotor is opposite #1 segment in distributor cap (see wiring diagram).

CLUTCH:—Long Model 9AB-10CI. Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Moulded type, 2 required. Inside Diam. 6". Outside Diam. 10". Thickness .137".
Adjustment—Free movement of clutch pedal must be 1" minimum. To adjust, loosen locknut and turn adjustment lever setscrew on left side of clutch housing. Check Hill-Holder setting.
Hill-Holder Adjustment:—On cars with Hill-Holder, check action after adjusting clutch. Brakes should be released just before clutch engages. Adjust by loosening locknut and turning adjusting nut at end of hill-holder control rod. Shorten rod for earlier brake release or lengthen rod for later release.
Clutch Removal:—Disconnect clutch pedal linkage, disconnect drive shaft at front universal, remove transmission, take off clutch pan under clutch housing, take out clutch mounting screws turning all screws out evenly to release clutch spring tension, remove clutch from below.

STEERING:—Steering Gear—Ross Model 620 Cam-and-lever type with cam lever follower mounted on roller bearings.
See article in Mechanical Equipment Section for data.
Front Suspension:—Planar type independent suspension with transverse spring.
See article in Mechanical Equipment Section for data.
Kingpin Inclination—9½° crosswise.
Caster—Minus ¼ to plus ¾°. Not adjustable.
Camber—1-1½°. Check with tires properly inflated, car on level floor, after bouncing car up and down several times so that wheels are in normal running position.
Toe In—3/16" (⅛-7/32"). Adjustable.

BRAKES:—Lockheed Hydraulic, four wheel type. Hand lever applies rear wheel brakes.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Stepped or two-stage bore type:
Front Wheels—Front Shoe Cyl. 1⅜". Rear 1".
Rear Wheels—Front Shoe Cyl. 1¼". Rear 1".
NOTE—Wheel cylinder bore size marked on casting. Not interchangeable.
Drum Diameter—12⅛".
Lining—Moulded type. Width 1¾". Thickness ¼". Length per wheel 25".
Clearance—.010" toe, .005" heel on each shoe.
Hand Brake Adjustment:—See Service Brakes.
Hill-Holder:—Optional on all models.
See article in Mechanical Equipment Section for data.

ENGINE NUMBER:—First number D-112,601. Stamped on left center of engine block.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3¼". **Stroke**—4⅜".
Displacement—217.8 cubic inches.
Rated Horsepower—25.4 (NACC).
Developed Horsepower—90 at 3400 R.P.M.
Compression Ratio & Pressure—6.0-1 cast-iron head. Pressure 105 lbs. at 150 R.P.M. (cranking speed).
Vacuum Reading—Steady reading of 18" with engine idling at 450 R.P.M. or 8 M.P.H.
NOTE—Optl. 7.0-1 aluminum head (devel. 94 HP. at 3400 R.P.M.) used at altitudes of 5000 ft. and over. Compression press. 111-118 lbs. at cranking speed. Ign. and valve timing same as std. head.

PISTONS:—Lynite, aluminum alloy, T-slot, cam ground (.00825-.01075" larger diam. 90° from pin bosses). **Weight**—15.2 ozs. **Length**—3¾".
Removal—Pistons and rods removed from above.
Clearance—.0005" new. Measure ¼" up on skirt 90° from pin bosses. See Fitting New Pistons.
Original Bore Sizes:—*See Studebaker Shop Notes.*
Replacement Pistons:—Finished pistons (pins fitted) furnished .002", .004", .010", .015", .020", .030", oversize. Exact size stamped on piston head.
Fitting New Pistons:—Insert .002"x1" hardened feeler between piston and wall on camshaft side (T-slot away from camshaft, piston inverted). 7-15 lbs. to withdraw feeler.
Installing Pistons:—T-slot away from camshaft.

PISTON RINGS:—2 compression, 1 oil control, all above pin. Ten 5/32" oil drain holes in lower ring groove. Ring oversizes: .010", .020", .030". Heat deflector groove above top ring groove.

Ring	Width	End Gap	Wall Thickness
Compression	⅛"	.013-.018"	.145"
Oil Control	3/16"	.013-.018"	.135"

NOTE—Install comp. rings with step down.

PISTON PIN:—Diameter—⅞". **Length**—2⅞".
Pin locked in connecting rod.
Pin Fit in Piston—.0002" clearance or light push fit.
NOTE—Replacement pistons have pins fitted.

CONNECTING ROD:—Weight—33.2 ozs. **Length**—8⅛".
Crankpin Journal Diameter—2.18675-2.18775".
Lower Bearing—Integral spun-babbitt lined type.
Clearance—.0005-.002". **Sideplay**—.005-.009".
Bearing Adjustment:—None. Replace rods. Rods furnished std. and .010", .020" undersize on exchange basis.
Installing Rods:—Install rods with narrow half of bearing toward front in cylinders #1, 3, 5, toward rear in #2, 4, 6. Marks on caps and rods must be together and oil hole toward camshaft.

CRANKSHAFT:—4 bearing, integral counterweights.
Journal Diameters—2½" all bearings.
Bearing Type—Removable steel-backed, babbitt-lined. **Clearance**—.0005-.0025".
Bearing Adjustment:—None. (No shims). Replace bearings (no fitting or line reaming required). Furnished std., .010", .020" undersize.
End Thrust:—Thrust plate between front main bearing and crankshaft gear. Shim adjustment.
Endplay—.003-.006".

CAMSHAFT:—Four bearing. Helical gear drive.
Bearings—Split, steel-backed, babbitt-lined type.
Clearance—.00075-.00225" (#1), .002-.00375" (others).
NOTE—Oil holes in bushing and block must match.
End Thrust:—Steel thrust washer and spacer between gear hub and front bearing. **Endplay**—.003-.006".
Timing Gears:—Cast-iron (crankshaft), Celeron Fabric (camshaft). Camshaft gears furnished in 3 sizes marked 'S' standard, 'H' high limit, 'L' low limit. Use next largest size gear to takeup backlash.
NOTE—Screw thread for gear puller and pusher formed in camshaft gear hub recess. Do not drive gear on or off shaft.
Camshaft Setting:—Mesh gears so that marked tooth on camshaft gear meshes with two marked teeth on crankshaft gear.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 15/32"	11/32"	5 7/32"
Exhaust	1 9/32"	11/32"	5 7/32"

	Seat Angle	Lift	Stem Clearance
All valves	45°	11/32"	.001-.003"

Tappet Clearance—.016" all valves (cold). Remove right hood side panel for work on valves.
Valve Guides—Pressed in block from above (1 5/32" below upper rim of valve seat) with stepped end down. Ream inside diameter to .3430-.3445".
Valve Springs:—Install with closed-coil at top. Damper used on top of spring. Replace springs if 10% weaker than specifications listed below.

	Spring Pressure	Spring Length
Valve Open	125-135 lbs.	1¾"

NOTE—Spring will not clear tappet adjusting screw when extended. To install spring, place spring seat in position on spring, compress spring slightly with compressor so that it clears tappet adjusting screw, insert valve, compress spring fully and install valve spring seat locks.
Valve Lifters:—Barrel type (no separate guides). Can be removed from top. Furnished .0005", .001" ov'size.

VALVE TIMING:—See Camshaft Setting above.
Intake Valves—Open 15° BTDC. Close 49° ALDC.
Exhaust Valves—Open 54° BLDC. Close 10° ATDC.
To Check Valve Timing:—Set tappet clearance #1 intake valve at .020". This valve should open with piston 15° or .0942" before top dead center when mark 'IN.OP/1-6' on vibration dampener at front of engine lines up with pointer on gear case cover. Reset tappet clearance at .016" (cold—70° F.).
Motor Gauge—Weidenhoff Adapter #104, Rod #2.

LUBRICATION:—Pressure. Gear type oil pump.
Normal Oil Pressure—40 lbs. min. at 40 M.P.H.
Oil Pressure Regulator—Located at right front corner of engine. Operates at 40 lbs. Not adjustable. Timing gears lubricated by overflow from regulator.
Crankcase Capacity—5½ quarts (dry).
NOTE—Install oil pump as follows (to insure correct rotor position on distributor): remove distributor, turn engine over until mark 'UDC/1-6' on vibration dampener lines up with pointer on gear case cover, sight down distributor shaft hole, mesh oil pump gear so that distributor drive slot is horizontal and offset toward top.

CLUTCH:—Borg & Beck Model 9A6. Mod. #869 stamped on cover. Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Moulded (flywheel side) and woven (pressure plate side), 2 required. I.D. 5⅝", O.D. 9¼", .133" thick.
Adjustment—Free movement of clutch pedal must be 1" minimum. To adjust, loosen locknut and turn adjustment lever setscrew on left side of clutch housing. Check Hill-Holder after adjusting clutch.
Hill-Holder Adjustment:—On cars with Hill-Holder check action after adjusting clutch to see that brakes release just before clutch engages. Adjust by loosening locknut and turning adjusting nut at end of hill-holder control rod. Shorten rod for earlier brake release or lengthen rod for later release.
Removal:—Remove transmission (see Transmission Removal below), support engine at rear, remove clutch housing, turn mounting screws out evenly to release spring tension, remove clutch assembly.

TRANSMISSION:—Warner—Model AS23-T86 (std.), AS29-T86 (with overdrive). All helical gear type with synchronizing shift on second and high gears.
See article in Mechanical Equipment Section for data.
Removal:—Disconnect front and rear universal joints at companion flanges, remove capscrews at clutch housing, pull transmission back and up.
NOTE—On cars with overdrive, rear support should be shimmed to give 1/16" clearance between frame and each end of support before frame bolts are tightened. *See Studebaker Shop Notes.*

UNIVERSAL JOINTS:—Thompson Products—Rubber bushing type, two used.
NOTE—Single punch mark at front and double punch marks at rear must be aligned with respective marks at each coupling.
See Article in Mechanical Equipment Section.

REAR AXLE:—Spicer—Semi-floating, hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—Std. 4.55-1. Optl. 4.82-1.
Backlash—.005-.007". Shim adjustment.
Removal:—Disconnect brake cables and fluid tube, rear universal joint, remove spring U-bolts, and disconnect springs. Axle assembly can then be removed.
Wheel Bearing Adjustment—Controlled by shims between brake backing plates and flanges on housing. Endplay .001-.005". Difference in shim thickness on either side must not exceed .005".

SHOCK ABSORBERS:—Delco—Early: Models 1173-L (5A—front), 1171-S (6A—front), 1172-U (rear—all models). **Late:** Models 1180-L (5A—front), 1181-S (6A—front), 1182-U (rear—all models). Direct acting hydraulic types. Late type is adjustable.
See separate articles in Mechanical Equipment Section.

STEERING:—Steering Gear—Ross Cam-&-Lever type. Model T-14.
See article in Mechanical Equipment Section for data.
Front Suspension Model 5A:—'I' beam axle with Reverse-Elliott ends and semi-elliptic springs. Specifications below apply with car unloaded on level floor.
King Pin Inclination—9½° crosswise.
Caster—1-1½°. Adjusted by inserting wedge shims between spring and spring pad on axle. Spring pad should incline 1½° toward rear (see Spring Camber).
Camber—1-1½°. No adjustment. Axle may be bent cold for minor camber adjustments.
Toe In—1/16-⅛". Adjust by changing length of tie rod.
Spring Camber—⅛" minimum. Measure by stretching cord between spring eye centers and noting distance from cord to top of spring main plate at center. Camber must be positive (cord above spring).
Front Suspension Model 6A:—Planar type independent suspension. See President 3C, 4C (next page) for specifications.

BRAKES:—Service. Lockheed Hydraulic, double anchor type. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Stepped or two-stage bore type:
Front Wheels—Front shoe cyl. 1⅜". Rear 1".
Rear Wheels—Front shoe cyl. 1¼". Rear 1".
NOTE—Wheel cylinder bore size marked on casting.
Drum Diameter—11".
Lining—Front shoe—woven. Rear shoe—moulded. Width 1¾". Thickness 3/16". Length per wheel 9 11/16".
Clearance—.010" toe, .005" heel, for each shoe.
Braking Power—45% rear.
Hand Brake Adjustment:—See Service Brakes.
Hill-Holder:—Optional on all models. See separate article in Brake Section for adjustments.

SERIAL NUMBER:—Stamped on plate on left frame side member under front fender. First number 7,111,001 (South Bend), 7,800,801 (Los Angeles).

ENGINE NUMBER:—Stamped on left side of engine First number B-15501.

ENGINE SPECIFICATIONS:—8 cylinder, 'L' head.
Bore—3 1/16". **Stroke** 4¼".
Displacement—250.4 cu. ins. **Rated HP.**—30.
Developed Horsepower—115 at 3600 R.P.M.
Compression Ratio—6.5-1 Al. head Std.
Compression Pressure—105-115 lbs. @ 150 R.P.M.
Vacuum Reading—18" idling at 450 RPM. or 8 MPH.

PISTONS:—Lynite, aluminum alloy, T-slot, tin-plated, cam ground type.
Weight—13.6 ozs. **Length**—3¾".
Removal—Pistons and rods removed from above.
Clearance—.0015" (¼" up on skirt 90° from pin).

Original Bore Sizes:—*See Studebaker Shop Notes.*

Replacement Pistons:—Finished pistons (pins fitted) furnished .002", .004", .010", .015", .020", .030" oversize. Exact size stamped on piston head.

Fitting New Pistons:—Insert .003"x1" hardened feeler between piston and wall on camshaft side (T-slot away from camshaft, pin bosses parallel with crank shaft). Pull to withdraw feeler 7-15 lbs.

Installing Pistons:—T-slot away from camshaft.

PISTON RINGS:—2 compression, 1 oil control, all above pin. Ten 5/32" oil drain holes in lower ring groove. Oversize rings furnished .010", .020", .030". Heat deflector groove above top ring groove.

Ring	Width	End Gap	Side Clearance
Compression	⅛"	.013-.018"	.0015-.002"
Oil Control	3/16"	.013-.018"	.0015-.002"

NOTE—Install comp. rings with step down. Inner ring used behind oil control ring.

PISTON PIN:—Diameter—⅞". Length—2⅝".
Pin is locked in rod.
Pin Fit in Piston—.0001-.0003" clearance or light push fit.
NOTE—Replacement pistons have pins fitted.

CONNECTING ROD:—Weight—32 ozs. **Length**—8".
Crankpin Journal Diameter—1.87425-1.87525".
Lower Bearing—Removable steel-backed, lead-bronze lined type.
Clearance—.00075-.00275". **Sideplay**—.005-.010".

Bearing Adjustment:—None. Replace bearings. Press in new bearings so that tongues engage in slots and oil holes line up. Crankpins must be turned down to size. Bearings furnished .005", .010", .020" undersize and standard. Bearing halves identical.

Installing Rods:—Oil hole in rod toward camshaft.

CRANKSHAFT:—9 bearing, bolted counterweights. Rubber and friction disc vibration damper mounted on forward end. See Studebaker Shop Notes for vibration damper data.
Journal Diameters—2 11/32" all bearings.
Bearing Type—Interchangeable steel-backed, babbitt-lined. No shims. **Clearance**—.001-.003".

Bearing Adjustment:—None. Replace bearings. (No line reaming or fitting necessary). Furnished .010", .015" undersize.

End Thrust:—Thrust plate between front main bearing and crankshaft gear. Shim adjustment.
Endplay—.003-.006".

CAMSHAFT:—Six bearing. Helical gear drive.
Bearings—Split, steel-backed, babbitt-lined.
Clearance—.00075-.00225" (#1), .002-.00375" (others)
NOTE—Oil holes in bushing and block must match.

End Thrust:—Steel thrust washer and spacer between gear hub and front bearing. **Endplay**—.003-.006".

Timing Gears:—Cast-iron (crankshaft), Celeron Fabric (camshaft). *See Studebaker Shop Notes for Gear Sizes and Gear Removal Instructions.*

Camshaft Setting:—Mesh gears so that marked tooth on camshaft gear meshes with two marked teeth on crankshaft gear.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 13/32"	11/32"	5 7/32"
Exhaust	1 9/32"	11/32"	5 7/32"

	Seat Angle	Lift	Stem Clearance
All valves	45°	11/32"	.001-.003"

Tappet Clearance—.016" cold—all valves.

Valve Guides:—Pressed in block from above (1 5/16" below top of block) with stepped end down. Ream inside diameter to .343-.344".

Valve Springs:—Install with closed-coil at top. Damper used on top of spring. Replace springs if 10% weaker than specifications listed below.

	Spring Length	Spring Pressure
Valve Open	1¾"	125-135 lbs.

Valve Lifters:—Mushroom type with bolted-on guides (in clusters of four). Can be removed from side.

VALVE TIMING:—See Camshaft Setting above.
Intake Valves—Open 15° BTDC. Close 49° ALDC.
Exhaust Valves—Open 54° BLDC. Close 10° ATDC.

To Check Valve Timing:—With tappet clearance of .020", #1 intake valve should open with piston 15° or .0915" before top dead center when mark 'IN.OP./1-8' on flywheel lines up with pointer in inspection hole on right top side of flywheel housing. Reset tappet clearance at .016" cold.
Motor Gauge—Weldenhoff Adapter #104, Rod #2.

LUBRICATION:—Pressure. Gear type oil pump.
See Studebaker Shop Notes for Oil Pump Installation directions.
Normal Oil Pressure—40 lbs. min. at 40 M.P.H.
Oil Pressure Regulator—Located at right front corner of engine. Operates at 40 lbs. Not adjustable.
Crankcase Capacity—8 quarts (dry).

COOLING SYSTEM:—Water Pump—Centrifugal, belt driven, with adjustable type packing.
See article in Mechanical Equipment Section for data.
Removal—With all water drained and fan belt removed, disconnect pump inlet hose, take out pump mounting bolts, lift fan and pump assembly off.

Thermostat:—Bishop & Babcock or Fulton. In upper radiator hose.
Setting—Start to open 148-153°F.

Water Capacity:—16 quarts.

CLUTCH:—Long Model 9AB-10CI. Single plate, dry disc type. *See article in Mechanical Equipment Section.*
Facings (3C)—Molded type, 2 required. Inside diam. 6". Outside Diam. 10". Thickness .137".
Facings (4C)—Chevron or spiral wound (flywh. side) molded (pressure plate side). 1 of each required. Inside diam. 6". Outside Diam. 9½". Thick. .125".
Adjustment—Free movement of clutch pedal must be 1" min. Adjustment lever setscrew at housing Check Hill-Holder after adjusting clutch.

Hill-Holder Adj.:—*See Studebaker Shop Notes.*

Removal:—Disconnect clutch pedal linkage, remove transmission (see Transmission Removal below), support engine at rear, remove clutch bell housing, clutch mounting screws, pull assembly out.

TRANSMISSION:—Warner. All helical gear type with synchronizing shift on second and high. Overdrive (automatic—no free wheeling) optional.
See article in Mechanical Equipment Section for data.

Removal:—Disconnect front and rear universal joints. On cars with vacuum shift, disconnect vacuum power cylinder rod. On cars with overdrive, disconnect rear support at frame ends (attach washers at each end for proper clearance when reinstalling support). Remove transmission mounting capscrews at clutch housing, pull transmission back and lift out. *See Studebaker Shop Notes for Overdrive Rear Support Installation instructions.*

UNIVERSAL JOINTS:—**Spicer.** Model 1311 (frt.), 1318 (rear). Needle bearing type.
See article in Mechanical Equipment Section for data.
NOTE—Arrows on front universal yoke and propeller shaft must be in alignment.

REAR AXLE:—Spicer Model 41-2. Semi-floating, hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio (3C)—4.55-1 Standard. 4.73-1 Optional.
Backlash—.005-.007". Shim adjustment.

Removal:—Hoist rear of car, disconnect propeller shaft at rear universal, brake line, and shock absorbers, remove spring U-bolts, disconnect rear spring shackles, pull axle assembly out.
NOTE—Bleed brake lines when axle reinstalled.

Wheel Bearing Adjustment—Shims provided between flanged end of axle housing and brake backing plate. To adjust, remove wheel, hub, drum, and backing plate (retained by 6 nuts). Remove shims to decrease endplay, add shims to increase. Shim thickness at both wheels must be equal within .005".
Endplay—.001-.005". Measure with dial indicator.

SHOCK ABSORBERS:—Delco (3C)—Early: Models 1171S (front), 1172X (rear). **Late:** 1181S (front), 1182X (rear). Direct acting type. Late type adjustable.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Ross Cam-&-Lever type. Model T-14.
See article in Mechanical Equipment Section for data.

Front Suspension:—Planar type independent suspension with transverse spring. Specifications below apply with car unloaded on level floor.
See article in Mechanical Equipment Section for data.

Kingpin Inclination—As follows:

9½°	Dictator (South Bend)	Ser. #5,258,246 & before.
	(Pacific)	Ser. #5,803,288 & before.
	President	Ser. #7,111,836 & before.

5½°—3C, 6A (after above Serial Nos.).
Caster—Minus ¼° to plus ¾°. Not adjustable.
Camber—1-1½°. Adjustable.
Toe In—⅛-7/32". Adjustable.

BRAKES:—Lockheed Hydraulic, double anchor type. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Stepped or two-stage bore type:
Front Wheels—Front shoe cyl. 1⅜". Rear 1".
Rear Wheels—Front shoe cyl. 1¼". Rear 1".
NOTE—Wheel cylinder bore size marked on casting.
Drum—Budd composite. Diameter—11".
Lining—Front shoe—woven. Rear shoe—moulded. 3C—Width 1¾". Thick. ¼". Length per wheel 21½".

Hand Brake Adjustment:—See Service Brakes.

Hill-Holder:—Optional equipment.
See article in Mechanical Equipment Section for data.

1938 MODEL NOTE:—First 7A cars called Studebaker Six, later cars Commander. First 8A cars called Commander, later cars State Commander.

SERIAL NUMBER:—Stamped on plate on frame under left front fender. First numbers as follows:

	7A	8A	9A
South Bend	5,582,001	4,090,001	4,110,001
Los Angeles	5,857,501	4,800,001	4,802,301

ENGINE NUMBER:—First number H-101 ('38), H-42501 ('39). Stamped on boss on left side of block at rear.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3 5/16". Stroke—4⅜".
Displacement—226 cubic inches.
Rated Horsepower—26.35 (NACC).
Developed Horsepower—90 HP. (Std. head), 94 HP. (Optl. high altitude head) at 3400 RPM.
Compression Ratio—6.0-1 Std. cast-iron head. 7.0-1 aluminum hd. Optl. (high altitude only).
See Studebaker Shop Note for Head installation.
Compression Pressure—105 lbs. (Std. head), 110 lbs. (Optl. head)at 150 RPM. (cranking speed).
Vacuum Reading—18-20" at 450 RPM. or 8 MPH.

PISTONS:—Lynite, aluminum alloy, tin-plated, T-slot, cam ground type. **Length**—3¾".
Removal—Pistons and rods removed from above.
Clearance—.0005" new. Measure ¼" up on skirt 90° from pin bosses. See Fitting New Pistons.
Original Bore Sizes:—*See Studebaker Shop Notes.*
Replacement Pistons:—Finished pistons (pins fitted) furnished std. and .002", .004", .010", .015", .020", .030" oversize. Exact size stamped on piston head.
Fitting New Pistons:—Insert .002" X 1" feeler between piston and wall on camshaft side (pin parallel to crankshaft, T-slot away from camshaft). Pull to withdraw feeler must be between 7-15 lbs.
Installing Pistons:—T-slot away from camshaft.

PISTON RINGS:—2 (P-C#70) compression, 1 (#85) oil ring per piston, all above pin. Narrow heat-dam groove (no ring fitted) above top ring. Oil ring groove drilled with ten 5/32" oil drain hole.

Ring	Width	End Gap	Side Clearance
Compression	⅛"	.013-.018"	.0015-.002"
Oil Control	3/16"	.013-.018"	.0015-.002"

NOTE—Install compression rings with step down.
Replacement Rings:—Oversizes .010", .020", .030".

PISTON PIN:—Diameter—⅞". **Length**—2⅞".
Pin locked in connecting rod.
Pin Fit in Piston—Light push fit (rod should rock in piston of own weight. Clearance .0001-.0003".
NOTE—Replacement pistons have pins fitted.

CONNECTING ROD:—Weight—33.2 ozs. **Length**—8⅛".
Crankpin Journal Diameter—2.18675-2.18775".
Lower Bearing—Spun babbitt. Rods exchanged.
Clearance—.0005-.002". **Sideplay**—.005-.009".
Bearing Adjustment:—None. Replace rods. Rods furnished std. and .010", .020" undersize. Ream to give clearance of .0005-.002". *See Studebaker Shop Notes for 'Palnut' installation (some cars).*
Installing Rods:—Install rods with narrow half of bearing toward front in cylinders #1, 3, 5, toward rear in #2, 4, 6. Marks on caps and rods must be together and oil hole toward camshaft.

CRANKSHAFT:—4 bearing, integral counterweights with vibration dampener at forward end.
Journal Diameters—2.4995-2.500" all bearings.
Journal Diameters—2½".
Bearing Type—Removable steel-backed, babbitt-lined type. **Clearance**—.0005-.0025".
Bearing Adjustment:—None (no shims). Replace bearings. Furnished Std., .010", .020" undersize. Tighten bearing cap bolts to 1100 in. lbs.
End Thrust:—Thrust plate assembled between front bearing and crankshaft gear. Controlled by shims between plate and bearing. **Endplay** .003-.006".

CAMSHAFT:—Four bearing. Helical gear drive.
Bearings—Steel-backed, babbitt-lined, split type bushings. When replacing, oil holes in block and bushing must be in alignment.
Clearance—.00075-.00225"(#1), .002-.00375"(others).
End Thrust:—Steel thrust washer and spacer between gear hub and front bushing.
Timing Gears:—Crankshaft (cast-iron). Camshaft (Celeron Fabric). *See Studebaker Shop Notes for Gear Removal & Replacement Gear size selection.*
Camshaft Setting:—Mesh marked camshaft gear tooth with two marked teeth on crankshaft gear.

VALVES:

	Head Diameter	Stem Diameter	Length
Intake	1 15/32"	11/32"	5 7/32"
Exhaust	1 9/32"	11/32"	5 7/32"

	Seat Angle	Lift	Stem Clearance
All valves	45°	11/32"	.001-.003"

Tappet Clearance—.016" all valves (cold). Remove right hood side panel for work on valves. *See Studebaker Shop Notes for Side Panel Removal.*
Valve Guides:—Pressed in block from above (1 5/32" below upper edge of valve seat) with stepped end down. Ream to inside diameter of .3435-.3445".
Valve Springs:—Install with closed coil at top. Damper on top of spring. Replace spring if 10% weak. *See Studebaker Shop Notes for Valve Spring Installation instructions.*

	Spring Pressure	Spring Length
Valve Open	125-135 lbs.	1¾"

Valve Lifters:—Barrel type (no separate guides). Can be removed from top. Furnished .0005", .001" ov'size.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 15° BTDC. Close 49° ALDC.
Exhaust Valves—Open 54° BLDC. Close 10° ATDC.
To Check Timing—Set tappet clearance #1 intake valve at .020". This valve should open with piston 15° or .0942" before top dead center when mark 'IN-OP.1-6/' on vibration damper at front of engine lines up with pointer on gear case cover. Reset tappet clearance at .016" (cold).
Motor Gauge—Weidenhoff Adapter #104, Rod #2.

LUBRICATION:—Pressure system with oil pump mounted on right of engine. *See Studebaker Shop Notes for Oil Pump installation instructions.*
Normal Oil Pressure:—40 lbs. (min.) at 40 MPH.
Oil Pressure Regulator:—Located on right front corner of engine. Operates at 40 lbs. Not adjustable.
Crankcase Capacity:—5½ qts. ('38), 6 qts. ('39).

COOLING SYSTEM:—Capacity—14½ qts.
Water Pump:—Centrifugal with adjustable packing. *See article in Mechanical Equipment Section for data.*
Removal—With water drained and fan belt removed, disconnect pump inlet hose, take out pump mounting bolts, lift fan and pump assembly off.
Thermostat:—Bishop & Babcock or Fulton. In cylinder head water outlet. Install with bellows down.
Setting—Starts to open 148-153° ('38), 156-160° ('39).

CLUTCH:—Borg & Beck Model 9A6. Model #869 stamped on cover. Single plate, dry disc type. *See article in Mechanical Equipment Section for data.*
Facings—Moulded (flywheel side), Woven (opposite side). Inside Diam. 5⅝". Outside Diam. 9¼". Thickness .133".
Adjustment—Free travel 1" (min.). Sleeve adjustment on rod connecting pedal to shaft lever. Turn sleeve out for greater travel, in for less. Check Hill-Holder after adjusting clutch.
Hill-Holder Adjustment:—On cars with Hill-Holder check action after adjusting clutch to see that brakes release just before clutch engages. Adjust by loosening locknut and turning adjusting nut at end of hill-holder control rod. Shorten rod for earlier brake release or lengthen rod for later release.
Removal:—Remove transmission (see Transmission Removal following), support engine at rear, remove rear engine mountings, remove clutch housing. Take out mounting screws and remove clutch.

TRANSMISSION:—Warner. Synchro-mesh, all helical gear, 'horizontal' type with conventional shift lever Std. Overdrive Transmission Optl. (1939 type has electrical 'kick-down' control).
See article in Mechanical Equipment Section for data.
1939 Overdrive Note—Adjust Overdrive control whenever accelerator pedal linkage disturbed.
Transmission Control:—Evans-Studebaker vacuum type (1938), Own remote control (1939) Optional. *See article in Mechanical Equipment Section for data.*
Removal:—Remove shift lever or disconnect shifter shafts, disconnect drive shaft at front and rear universals, disconnect rear support at frame ends (Overdrive transmissions). Remove transmission mounting screws at clutch housing, pull transmission back and lift out. *See Studebaker Shop Notes for Overdrive Rear Support Installation directions.*

UNIVERSAL JOINTS:—Thompson (1938). Spicer Models 1271-OIX front, 1278-OIX rear (1939).
See article in Mechanical Equipment Section for data.

REAR AXLE:—Spicer Model 41-2. Semi-floating, hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.55-1 Std., 4.82-1 Optl.
Backlash—.005-.007". Shim adjustment
Removal:—Hoist rear of car, disconnect propeller shaft at rear universal, brake line, and shock absorbers, remove spring U-bolts, disconnect rear spring shackles, withdraw axle assembly.
Wheel Bearing Adjustment—Shims provided between flanged end of axle housing and brake backing plate. To adjust, remove wheel, hub, drum, and backing plate (retained by 6 nuts). Remove shims to decrease endplay, add shims to increase. Shim thickness at both wheels must be equal within .005".
Endplay—.001-.005". Measure with dial indicator.

SHOCK ABSORBERS:—Houdaille. Front—BEDVS ('38), BBFS ('39), Rear—ASC ('38), ACHS ('39). Double acting, hydraulic, adjustable type with thermostatic control (rear only).
See article in Mechanical Equipment Section.

STEERING:—Steering Gear—Ross Cam-and-Twin-Lever type. Model T-14.
See article in Mechanical Equipment Section for data.
Front Suspension:—Planar type independent suspension with transverse spring. Specifications below apply with car unloaded on level floor.
See article in Mechanical Equipment Section for data.
Kingpin Inclination—5½°.
Caster—Minus ¼° to plus ¾°. Not adjustable.
Camber—¼-¾°. Adjustable.
Toe In—1/16-⅛". Adjusted by turning right hand ('38), center ('39) tie rod. Other tie rods not adjustable.

BRAKES:—Service—Lockheed hydraulic, double anchor type. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Stepped or two-stage bore type: Front Wheels—Front shoe cylinder 1⅜". Rear 1". Rear Wheels—Front shoe cylinder 1¼". Rear 1".
NOTE—Wheel cylinder bore size marked on casting.
Drum—Budd composite. Diameter—11".
Lining—Front shoe—woven. Rear—moulded. Width 2". Thick. 3/16". Length per wheel 19 11/16".
Clearance—.010" toe, .005" heel, for each shoe.
Hand Brake Adjustment:—See Service Brakes.
Hill-Holder:—Optional equipment.
See article in Mechanical Equipment Section for data.

SERIAL NUMBER:—Stamped on plate on frame under left front fender. First numbers as follows:

	South Bend	Los Angeles
4C	7,120,101	7,801,801
5C	7,125,501	7,802,501

ENGINE NUMBER:—First number B-24601 ('38), B-30201 ('39). Stamped on left side of engine at rear.

ENGINE:—**Own.** 8 Cyl., 'L' head type.
Bore—3 1/16". **Stroke**—4¼".
Displacement—250.4 cubic inches.
Rated Horsepower—30 AMA.
Developed Horsepower—110 at 3600 RPM.
Compression Ratio—6.0-1 Std. cast-iron head.
Compression Pressure—105 lbs. at 150 RPM.
Vacuum Reading—18" at 450 RPM., 8 MPH.
See Studebaker Shop Notes for Head Installation.

PISTONS:—Lynite, aluminum alloy, T slot, Cam-ground, tin-plated type. **Length** 3¾".
Weight—13.6 ozs. (stripped).
Removal—Pistons and rods removed from above.
Clearance—.0015" (¼" up on skirt 90° from pin).
Original Bore Sizes:—***See Studebaker Shop Notes.***
Replacement Pistons:—Finished pistons (with pins fitted) furnished .002", .004", .010", .015", .020", .030" oversize. Exact size stamped on piston head.
Fitting New Pistons:—Install .003" x 1" hardened feeler between piston and cylinder wall on camshaft side (T slot away from camshaft, pin bosses parallel to crankshaft). Pull to withdraw feeler must be 7-15 lbs.
Installing Pistons:—T-slot away from camshaft.

PISTON RINGS:—Two compression, 1 oil control ring, all above pin with narrow heat-dam groove (no ring) above top ring groove. Oil ring groove drilled with ten 5/32" oil drain holes.

Ring	Width	End Gap	Side Clearance
Compr.	⅛"	.013-.018"	.0015-.002"
Oil Contr.	3/16"	.013-.018"	.0015-.002"

NOTE—Install Compression rings with step down. Inner ring used with oil ring only.
Replacement Rings:—Oversizes .010", .020", .030".

PISTON PIN:—**Diameter** ⅞". **Length** 2⅝". Pin is locked in rod by clampscrew.
Pin Fit in Piston—Light push fit (rod should rock in piston of own weight). Clearance .0001-.0003". NOTE—Replacement pistons have pins fitted.

CONNECTING ROD:—**Weight** 32 ozs. **Length** 8".
Crankpin Journal Diameter—1.87425-1.87525".
Lower Bearing—Removable, steel-backed, lead-bronze lined type.
Clearance—.00075-.00275". **Sideplay** .005-.010".
Bearing Adjustment:—None. Replace bearings. Furnished Std. and .005, .010", .020" undersize. Crankpin must be turned down to size (bearings should not be reamed). See that tongues on bearings engage slots and that oil holes line up.
See Studebaker Shop Notes for 'Palnut' installation
Installing Rods:—Oil hole in rod toward camshaft.

CRANKSHAFT:—9 bearing with bolted counterweights. Vibration dampener mounted on forward end. ***See Studebaker Shop Notes for Vibration Dampener data.***
Journal Diameters—2.3435-2.3440" all bearings.
Bearing Type—Removable steel-backed, babbitt-lined type. **Clearance** .001-.003".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps. Tighten bearing cap bolts to 1100 in. lbs. Bearings furnished .010", .015" undersize.
End Thrust:—Thrust plate between front main bearing and crankshaft gear with shim adjustment.
Endplay—.003-.006".

CAMSHAFT:—Six bearing. Helical gear drive.
Bearings—Split steel-backed, babbitted bushings.
Clearance—.00075-.00225"(#1), .002-.00375"(others). NOTE—Oil holes in bushing & block must line up.
End Thrust:—Steel thrust washer and spacer between gear hub and bearing. **Endplay**—.003-.006".
Timing Gears:—Cast-iron (crankshaft), Celeron Fabric (camshaft). ***See Studebaker Shop Notes for Gear Removal and Replacement Gear Size selection.***
Camshaft Setting:—Mesh marked tooth on camshaft gear between two marked teeth on crankshaft gear.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 13/32"	11/32"	5 7/32"
Exhaust	1 9/32"	11/32"	5 7/32"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	11/32"	.001-.003"

Tappet Clearance:—.016" all valves, engine cold. Remove right hood side panel for work on valves. ***See Studebaker Shop Note for Side Panel Removal.***
Valve Guides:—Pressed in block from above (1 5/16" below top of block) with stepped end down. Ream to inside diameter of .343-.344".
Valve Springs:—Install with closed-coil up and dampener on top of spring. Replace springs if 10% weak.

	Spring Pressure	Spring Length
Valve Open	125-135 lbs.	1¾"

Valve Lifters:—Mushroom type in bolted-on guide brackets (clusters of four). Assemblies may be removed through valve opening on side of engine.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 15° BTDC. Close 49° ALDC.
Exhaust Valves—Open 54° BLDC. Close 10° ATDC.
To Check Valve Timing—Set tappet clearance #1 intake valve at .020". This valve should open with piston 15° or .0915" before top dead center when 'IN.OP/1-8' mark on vibration dampener at front of engine lines up with pointer on gear cover. Reset tappet clearance at .016" cold.
Motor Gauge—Weidenhoff Adapter #104. Rod #40.

LUBRICATION:—Pressure type. Gear type oil pump in crankcase. ***See Studebaker Shop Notes for Oil Pump Installation directions.***
Normal Oil Pressure—40 lbs. min .at 40 MPH.
Oil Pressure Regulator—Located at right front corner of engine. Opens at 40 lbs. Not adjustable.
Crankcase Capacity—8 qts.

COOLING SYSTEM:—**Capacity**—17 quarts.
Water Pump:—Centrifugal with adjustable packing. ***See article in Mechanical Equipment Section for data.***
Removal—Drain water, remove fan belt, disconnect hose, take out mounting bolts, lift pump out.
Thermostat:—Bishop & Babcock or Fulton. In cylinder head outlet. Install with bellows down.
Setting—Starts to open 148-153° ('38), 156-160° ('39).

CLUTCH:—**Long Model 9½CF-CS ('38), Inland ('39).** Single plate, dry disc types. Semi-centrifugal (Long), Diaphragm type (Inland). NOTE—Long 9½CF-CS driven member also used with Inland clutch.
See article in Mechanical Equipment Section for data.
Facings—Moulded (flywheel side), Woven (away from flywheel). Inside Diam. 6". Outside Diam. 9½". Thickness .125".
Adjustment:—Clutch pedal free movement must be 1" Min. Sleeve adjustment on rod connecting pedal and shaft lever. Check Hill Holder after adjusting
Hill Holder Adjustment:—***See Studebaker Shop Notes.***
Removal:—Disconnect clutch pedal linkage, remove Transmission (see Transmission Removal below), support engine at rear, remove rear engine mountings and clutch housing, take out mounting screws in clutch cover flange (turn all screws out evenly), remove clutch assembly. CAUTION—Support pressure plate by hand to avoid distorting pressure plate tension springs (Inland Clutch).

TRANSMISSION:—**Warner.** Synchro-mesh, all helical gear, 'horizontal' type with conventional shift lever Std., Overdrive Transmission Optl. (1939 type has electrical 'kick-down' control).
See article in Mechanical Equipment Section for data.
1939 Overdrive Note—Adjust Overdrive control whenever accelerator pedal linkage disturbed.
Transmission Control:—Evans-Studebaker vacuum type (1938), Own remote control (1939) Optional.
See article in Mechanical Equipment Section for data.
Removal:—Remove shift lever or disconnect shifter shaft and cable, disconnect drive shaft at front and rear universals, disconnect rear support at frame ends (Overdrive transmission only). Remove transmission mounting screws at clutch housing, pull transmission straight back and lift out. ***See Studebaker Shop Notes for Overdrive Rear Support Installation directions.***

UNIVERSAL JOINTS:—**Spicer.** Model 1271-01X (front), 1278-01X (rear). Needle bearing type.
See article in Mechanical Equipment Section for data.

REAR AXLE:—**Spicer Model 41-2.** Semi-floating, Hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.55-1 Std., 4.82-1 Optl.(Std.with Overdrive).
Backlash—.005-.007". Shim adjustment.
Removal:—Hoist rear of car, disconnect brake line, shock absorbers, drive shaft at rear universal, rear spring U bolts and rear spring shackles, withdraw axle assembly from beneath car. NOTE—Bleed brake lines when axle installed.
Wheel Bearing Adjustment:—Shims located between flanged end of axle housing and brake backing plate. To adjust, remove wheel, hub, brake drum, and backing plate (retained by 6 bolts). Remove shims (shim thickness at each wheel must be equal within .005").
Endplay—.001-.005" (measured with dial indicator).

SHOCK ABSORBERS:—**Houdaille.** Front—BEDVS ('38), BBFS ('39). Rear—ACS ('38), ACHS ('39). Double acting, hydraulic, adjustable type with thermostatic control (rear only).
See article in Mechanical Equipment Section for data.

STEERING:—**Steering Gear**—Ross Model T-14. Cam-and-twin lever type.
See article in Mechanical Equipment Section for data.
Front Suspension:—Planar type independent suspension with transverse spring. Specifications below apply with car weight on wheels but without load.
See article in Mechanical Equipment Section for data.
Kingpin Inclination—5½° crosswise.
Caster—Minus ¼° to plus ¾°. Not adjustable.
Camber—¼-¾°. Adjustable.
Toe In—1/16-⅛". Adjustable by turning right hand ('38), center ('39) tie rod. Other tie rods not adjustable.

BRAKES:—**Service**—Lockheed hydraulic, double anchor type. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Stepped or two-stage bore type:
Front—Front Shoe Cylinder 1⅜". Rear 1".
Rear—Front Shoe Cylinder 1¼". Rear 1".
NOTE—Wheel cylinder bore size marked on casting.
Drum—Budd Composite. Diameter 11".
Lining—Front shoe—woven. Rear shoe—moulded. Width 2¼". Thickness 3/16". Length per wheel 19 11/16".
Clearance—.010" toe, .005" heel each shoe.
Brake Power—45% rear, 55% front.
Hill-Holder:—Optional equipment.
See article in Mechanical Equipment Section for data.
Hand Brake:—See Service Brakes above.

ENGINE HOOD & SIDE PANEL:—*See Studebaker Shop Notes.*

SERIAL NUMBER:—On plate on frame under left front fender. 1st number G-0001 (South Bend), G-800001 (Los Angeles).

ENGINE NUMBER:—Stamped on pad at the upper left front of cylinder block. First number 101.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3". **Stroke**—3⅞".
Displacement—164.3 cu. in. **Rated HP.**—21.6.
Developed Horsepower—78 at 4000 RPM.
Compression Ratio—6.5-1 Std. cast-iron hd.
Compression Pressure—100 lbs. at 130 RPM. (cranking speed).
Vacuum Reading—Steady 17-18" at 8 MPH. Idle speed.
See Studebaker Shop Notes for Head installation.

PISTONS:—Aluminum alloy, tin-plated, T-slot, cam ground type.
Length—2⅝". **Weight**—.53 lbs.
Removal—Pistons and rods removed from above.
Clearance—.0005" new. See Fitting New Pistons.
Original Bore Size:—*See Studebaker Shop Notes.*
Replacement Pistons:—Finished pistons (pins fitted) furnished standard and .002", .004", .010", .015", .020", .030" oversize. Exact size stamped on piston head.
Fitting New Pistons:—Insert .002"x1" feeler between piston and wall on camshaft side (pin parallel to crankshaft, T-slot away from camshaft). Pull to withdraw feeler must be between 16 to 22 lbs. NOTE—Cylinder bore out-of-round and taper .002" maximum.
Installing Pistons:—T-slot away from camshaft.

PISTON RINGS:—3 rings, all above pin—#1 Comp. P-C 200 (with step up), #2 Comp. P-C 70 (with step down), #3 Oil P-C 85 (slotted type). Oil ring groove drilled with drain holes. Heat-dam groove (no ring) above #1 ring groove.

Ring	Width	End Gap	Side Clearance
Comp. (Top)	3/32"	.007-.017"	.0015-.002"
Comp. (#2)	⅛"	.007-.017"	.0015-.002"
Oil Control	3/16"	.007-.017"	.0015-.002"

Replacement Rings:—.010", .020", .030" oversize.

PISTON PIN:—**Diameter** .7491-.7495". **Length** 2⅝". Pin locked in rod by tapered lockscrew and nut (small end of connnecting rod not split).
Pin Fit in Piston—.0001-.0003" clearance or light push fit. Replacement pistons have fitted pins.
See Studebaker Shop Notes for Pin removal and installation instructions.

CONNECTING ROD:—**Length** 6 7/16". **Weight** 1.28 lbs.
Crankpin Journal Diameter—1.81175-1.81275".
Lower Bearing—Spun babbitt. Exchange rods furnished std. and .010" and .020" undersize.
Clearance—.0005-.002". **Sideplay**—.005-.009".
Bearing Adjustment:—None. Replace rods. *See Studebaker Shop Notes for 'Palnut' installation.*
Installing Rods:—Narrow portion of bearing to front (#1,3,5), to rear (#2,4,6). Side marked with number and oil spray hole toward camshaft.

CRANKSHAFT:—4 bearing, integral counterweights.
Journal Diameters—2.437-2.4375".
Bearing Type—Removable steel-backed, babbitt-lined type. **Clearance**—.0005-.0025".
Bearing Adjustment:—None (no shims). Replace bearings. Furnished Std., .010", .020" undersize. Tighten bearing cap screws to 1100 in. lbs.
NOTE—Front oil pan seal block may be removed for access to front main bearing cap by removing lower timing gear cover screws (on front face).
End Thrust:—Thrust plate assembled between front bearing and crankshaft gear. Controlled by shims between plate & journal face. **Endplay** .003-.006".

CAMSHAFT:—Four bearing with helical gear drive.
Journal Diameters—#1, 1.74750-1.74800"; #2, 1.71625-1.71700"; #3, 1.68575-1.68650; #4, 1.62325-1.62400".
Bearings—Steel-backed, babbitt-lined bushings. Align oil hole in block and bushing.
Clearance—.00075-.00225" (#1), .001-.00275" (others).
End Thrust:—Steel thrust washer and spacer assembled between gear hub and front bushing.
Timing Gears:—Crankshaft (cast-iron), Camshaft (Celeron Fabric). *See Studebaker Shop Notes for Gear Removal & Replacement Gear size selection.*
Backlash—.001-.003".
Camshaft Setting:—Mesh marked camshaft gear tooth between two marked teeth on crankshaft gear.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 11/32"	.310-.311"	4 11/32"
Exhaust	1 9/32"	.310-.311"	4 11/32"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	5/16"	.001-.0035"

Tappet Clearance:—.016" (cold) all valves. *See Studebaker Shop Notes for Hood Side Panel removal and Self-Locking tappet data.*
Valve Guides:—Pressed in block from above 1 3/16" below top of block. Finish ream to .312-.3135".
Valve Springs:—Install with closed coils at top. Replace if springs 10% weak.

	Spring Pressure	Spring Length
Valve Open	77-83 lbs.	1 7/16"

Valve Lifters:—Mushroom type. Lifter clearance in block .0005-.0015".
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 15° BTDC. Close 49° ALDC.
Exhaust Valves—Open 54° BLDC. Close 10° ATDC.
To Check Timing—Set tappet clearance #1 intake valve at .020". This valve should open with piston 15° or .0835" before top dead center when flywheel mark 'IN.OP.1-6/' lines up with pointer on left rear engine plate. Reset tappet clearance at .016" (cold).

LUBRICATION:—Pressure system with oil pump mounted on right side of engine. *See Studebaker Shop Notes for Oil Pump installation instructions.*
Normal Oil Pressure:—40 lbs. at 40-60 M.P.H.
Oil Pressure Regulator:—Opens with 40 lbs. pressure. On right front corner of block. Not adjustable.
Crankcase Capacity:—5 quarts.

COOLING SYSTEM:—**Capacity**—10½ quarts.
Water Pump:—Packless, sealed ball-bearing shaft.
See article in Mechanical Equipment Section for data.
Removal—Drain water, remove fan belt, fan blades and pulley, pump hose and 3 pump mounting cap screws.
Thermostat:—In cylinder head water outlet.
Setting—Starts to open 156° F. to 160° F.
Temperature Gauge:—Auto-Lite (Motometer) Vapor tension type. Part No. H-9210.
See article in Mechanical Equipment Section for data.

CLUTCH:—**Borg & Beck Model 8A7.** Single plate, dry disc type. Identified by #925 stamped on cover.
See article in Mechanical Equipment Section for data.
Facings—Molded (flywheel side), woven (pressure plate side), Inside Diam. 5⅛". Outside Diam. 7⅞". Thickness .125".
justing sleeve on connector link. Check Hill-holder.
Adjustment—Free travel 1" (min.). Turn clutch adjusting sleeve on connector link. Check Hill-holder.
Removal:—Remove transmission (see below), take off clutch housing, take out mounting screws in clutch cover flange (turn all screws out evenly), remove clutch.

TRANSMISSION:—**Warner.** Model AS1-T84F (std.), AS2-T84F-R7A (overdrive with electrical 'kick-down' control, optl.). Helical gear and synchro-mesh (second & high), sliding spur (low & reverse).
NOTE—R7A overdrive can be installed on std. transmission by removing transmission extension.
Transmission Control:—Remote control, steering column mounted mechanical shift.
See articles in Mechanical Equipment Section for data.
Removal (Std.):—Disconnect shift rods and speedometer cable, remove propeller shaft. Place jack under engine rear plate, free rear engine mountings. Take out transmission mounting bolts, pull transmission out.
Overdrive Model—Same as Std. (above) except that top radiator hose must be disconnected, exhaust pipe loosened at manifold and engine rear plate, clutch shaft pulled free of engine, overdrive shift lever and solenoid leads disconnected, engine rear support cross-member removed, and rear of engine lowered so that transmission clears underside of frame X-member when removed.

UNIVERSAL JOINTS:—**Spicer, 1261-01 (front), 1268-02 (rear).** Needle bearing type.
See article in Mechanical Equipment Section for data.

REAR AXLE:—**Spicer Model 23.** Semi-floating, hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.56-1 standard. 4.1-1 optional.
Backlash—.005-.007". Shim adjustment.
Removal:—Hoist rear of car, disconnect propeller shaft at rear universal, hydraulic brake lines, brake cables, and shock absorbers. Remove spring U-bolts, disconnect rear spring shackles, and withdraw axle assembly from car.
Wheel Bearing Adjustment—Shims provided between flanged end of axle housing and brake backing plate. To adjust, remove wheel, hub and drum assembly (Puller J-446), and backing plate. Remove shims to decrease endplay, add shims to increase. Shims furnished .003", .005", .010", .030" thick.
Endplay—.001-.005". Measure with dial indicator.

SHOCK ABSORBERS:—**Houdaille.** Double acting, hydraulic, adjustable type.
See article in Mechanical Equipment Section for data.

STEERING:—**Steering Gear**—Ross Model T-12. Cam-and-Twin Lever type.
See article in Mechanical Equipment Section for data.
Front Suspension:—Planar type independent suspension with transverse spring.
See article in Mechanical Equipment Section for data.
Kingpin Inclination—5½°.
Caster—5½-6½°.
Camber—¼-¾°. Shim adjustment.
Toe In—1/16-⅛". Adjustable tie rod at center (between steering & idler arms). End rods not adjustable.

BRAKES:—**Service.** Lockheed hydraulic, single anchor type. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Drums—Diameter 9".
Lining—Front shoe (U.S. #714) 10 3/16". Rear shoe (Man. DV-2921) 7 13/16". Width 1¾". Thickness 3/16".
Clearance—.010" toe, .006" heel, for each shoe.
Braking Power—43% rear.
Hand Brake Adjustment:—See Service Brakes.
Hill-Holder:—Optional equipment.
See article in Mechanical Equipment Section for data.

ENGINE NUMBER:—First number 5001 (K '32), 20,501 (KU '33). Stamped on left hand side of engine block at center of engine.

ENGINE:—Own make. Six cylinder, 'L' head type.
Dimensions—Bore 2 15/16". Stroke 4¾". Displacement 193 cubic inches.
Horsepower—Rated 20.7. Developed 70 HP. at 3200 R.P.M. (Std. 5.8-1 head), 80 HP. at 3200 R.P.M. (Optl. 7.1-1 head).
Compression Ratio—5.8-1 Std. 7.1-1 Optl. Ratio of each head cast in upper surface of head casting.
Compression Pressure—Approximately 80 lbs. (Std. 5.8-1 head), 125 lbs. at 200 R.P.M. (Optl. 7.1-1 head).
Vacuum Reading—Gauge should show steady reading of 18-19" at idling speed.

Pistons:—Own. Aluminum alloy, 'T' slot, 'Cam' ground type with greater greater clearance across pin bosses. Finished replacement pistons furnished for cylinder bores of size indicated (see Reconditioning Cylinders below): 'B' 2.9375-2.938", 'D' 2.9385-2.939", 'F' 2.9395-2.940", 'J' 2.9415", 'L' 2.9425", 'BO' 2.9475-2.948", 'DO' 2.9485-2.949", 'FO' 2.9495-2.950", 'LO' 2.9525", 'BB' 2.9575", 'DD' 2.9585", 'FF' 2.9595". Letter designating size is stamped on head.
Weight—9¼ ounces stripped. Length 3 3/16".
Removal—Pistons and rod assembly removed from below by removal of crankshaft counterweights.
Clearance—Top, .016". Bottom, .0005".
Reconditioning Cylinders—Size of original bore indicated by letter stamped on edge of valve chamber opposite cylinder as follows: 'A' 2.9375", 'B' 2.938", 'C' 2.9385", 'D' 2.939", 'E' 2.9395", 'AO' 2.9475", 'BO' 2.948", 'CO' 2.9485", 'DO' 2.949", 'EO' 2.9495". Recondition cylinder to standard size for which piston and rings are available (see Piston and Ring Sections). Same size piston must be installed in all cylinders to maintain balance.
Fitting New Pistons—Use feeler gauge .0015-.002" thick to check clearance. Pull of 3-4 lbs. should be required to withdraw feeler from between piston and cylinder wall at right angles to pin boss on side opposite slot.
NOTE:—Install pistons with 'T' slot to left.

Piston Rings:—Two compression, two oil rings per piston, all above pin. Lower (oil ring) groove drilled radially with oil drain holes.
NOTE—Use standard or oversize rings of size indicated for replacement pistons marked as follows: 'B, D, F' 2.937", 'J' 2.940", 'L' 2.942", 'BO, DO, FO' 2.947", 'LO' 2.952", 'BB, DD, FF' 2.957".

Ring	Width	End Gap	Wall Thickness	Groove Depth
Comp. (both)	3/32"	.006-.016"	.123"	.156"
Oil Cont. (Upper)	⅛"	.006-.016"	.128"	.156"
Oil Cont. (Lower)	3/16"	.006-.016"	.128"	.156"

Piston Pin:—Diameter, ¾". Length, 2 7/16". Pin floats in piston and rod and is held by retaining rings. Pin hole in connecting rod is bronze-bushed.
NOTE—Pins furnished standard and .002", .005", .010" oversize
Pin Fit in Piston—Snug fit with piston heated to 200°F.
Pin Clearance in Rod Bushing—.0003".

Connecting Rod:—Weight, 29.44 ozs. Length, 8 3/16" (center-to-center).
Crankpin Journal Diameter—1 15/16".
Big End Bearing—Spun babbitt type. Laminated shims used.
Clearance—.001". Sideplay .006-.010".
Adjustment—Shims (laminated type). Do not file rods or caps.
NOTE:—Connecting rod lower bearings are offset. Install rods with right hand offset in cylinders #1, 2, 4 and left hand offset in cylinders #3, 5, 6.

Crankshaft:—Three main bearing type with integral counterweights.
Journal Sizes—#1—2 11/32", #2—2⅜", #3—2 13/32" diameter.
Bearing Type—Removable bronze-backed, babbitt-lined type. Shims used.
Bearing Clearance—.001".
Adjustment—Shims (laminated type).
End Thrust—Taken by #2 (center) main bearing. Endplay, .006-.012"

Camshaft:—Gear driven from crankshaft.
Gear Type—Crankshaft gear—steel. Camshaft gear—GE. Bakelite.
End Thrust—Taken by spring and plunger on front end of shaft.
Camshaft Setting—Gears are marked. Mesh marked tooth on camshaft gear between two marked teeth on crankshaft gear.

Valves:	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
All Valves	1⅜"	5/16"	5 3/32"	45°	11/32"

Stem-to-Guide Clearance—.0015-.003" (intake), .003-.005" (exhaust).

Tappet Clearance—	Running (engine hot)	Timing
Intake	.006"	.010"
Exhaust	.008"	.010"

Valve Springs—Spring pressure 53 lbs. with valve closed.

Valve Timing

Intake Valves Open—10°40' BTDC. Close—60° ALDC.
Exhaust Valves Open—50° BLDC. Close—18°44' ATDC.
NOTE:—Timing figures are correct for .010" tappet clearance.

To Check Timing—Set tappet clearance #1 intake valve at .010". This valve should close with piston .0528" before top dead center when a point on the flywheel approximately 2.55 teeth before top dead center mark lines up with indicator in inspection hole in left front face of flywheel housing. Reset tappet clearance at .006" with engine hot.
Motor Gauge—Weidenhoff Adapter #114. Rod #42.

LUBRICATION:—Duo-flow (splash) system with positive pump feed to oil troughs and timing gears by oscillating plunger type pump. Pump mounted on right side of crankcase.
Normal Oil Pressure—3 lbs.
Oil Pressure Relief Valve—Operates at 3 lbs. Not adjustable. Located on right side of crankcase at rear of engine. Combined with oil pressure signal light switch. See article on Hudson Signal Lights in Electrical Equipment Section for complete data.
Capacity & Oil—6 qts. (refill). Use SAE. #30 (above 40° F.). #20W (40° to 0°F.).

CLUTCH:—Single plate type operating in oil. No adjustment for wear required
Clutch Pedal Adjustment—Pedal position should be adjusted so that clevis pin in yoke at rear end of clutch link is at rear of slot with clutch engaged and pedal against rubber bumper on toeboard. To adjust, remove clevis pin, loosen locknut, turn yoke on pedal rod.
Clutch Lubrication—Oil in clutch should be drained and replaced at 5000 mile intervals. To drain oil, turn flywheel until filler plug on front face is visible in inspection hole in left front of flywheel housing, remove plug, turn flywheel so that plug hole is down, allow sufficient time for old oil to drain out, turn flywheel and insert mixture of 1/6 pint light engine oil and 1/6 pint kerosene. See that plug is replaced securely.
Facings—Driven plate is 5⅜" inside diameter, 8 11/16" outside diameter, .203" thick. Facing consists of 90 cork inserts mounted on driven plate.

STEERING:—Steering Gear—Gemmer Worm-and-Sector type. See article in Steering Section for complete adjustmnt instructions.

Front Suspension:—Conventional 'I' beam section front axle with Elliott type ends and semi-elliptic springs.
Kingpin Inclination—7° crosswise.
Caster—3°. Adjust by inserting wedge shims between spring and spring pad on axle.
Camber—2°. No adjustment. Axle may be bent cold for minor corrections.
Toe In—0-⅛". Adjusted in usual manner by loosening clamp bolts and turning tie rod.

BRAKES:—Service—Bendix Mechanical, Duo-Servo, Single anchor type. Hand lever applies all four service brakes. See article in Brake Section for complete adjustment instructions.
Drum Diameter—11" (K '32), 9" (KU '33).
Lining (K '32)—Moulded type. Width 1¾". Thickness 5/32". Length 21" per wheel.
Lining (KU '33)—Moulded type. Width 1¾". Thickness 3/16". Length 19" per wheel.
Clearance—.008" anchor pin end, .014" adjusting screw end of each shoe.

ENGINE NUMBER:—First number 15,001. Stamped on left side of cylinder block at center.

ENGINE:—Own make. Eight cylinder, In line, 'L' head type.

Dimensions—Bore 2 15/16". Stroke 4½". Displacement 244 cubic inches.

Horsepower—Rated 27.6. Developed 94 at 3200 R.P.M.

Compression—5.8-1. No optional heads. Pressure 80 lbs. at 125 R.P.M.

Vacuum Reading—Gauge should show steady reading of 18-19" with engine idling.

Pistons:—Own. Aluminum alloy, 'T' slot type. Pistons are 'cam' ground with greater clearance across pin bosses. Finished replacement pistons furnished for cylinder bores of size indicated (see Reconditioning Cylinders below): 'B' 2.9375-2.938", 'D' 2.9385-2.939", 'F' 2.9395-2.940", 'J' 2.9415", 'L' 2.9425", 'BO' 2.9475-2.948", 'DO' 2.9485-2.949", 'FO' 2.9495-2.950", 'LO' 2.9525", 'BB' 2.9575", 'DD' 2.9585", 'FF' 2.9595". Letter designating size is stamped on head.

Weight—9¼ ounces stripped. Length 3 3/16".

Clearance—Top, .016". Bottom, .0005".

Removal—Pistons and rod assembly removed from below by removal of crankshaft counterweights.

Reconditioning Cylinders—Size of original bore indicated by letter stamped on edge of valve chamber opposite cylinder as follows: 'A' 2.9375", 'B' 2.938", 'C' 2.9385", 'D' 2.939", 'E' 2.9395", 'AO' 2.9475", 'BO' 2.948", 'CO' 2.9485", 'DO' 2.949", 'EO' 2.9495". Recondition cylinder to standard size for which piston and rings are available (see Piston and Ring Sections). Same size piston must be installed in all cylinders to maintain balance.

Fitting New Pistons—Use feeler gauge .0015-.002" thick to check clearance. Pull of 3-4 lbs. should be required to withdraw feeler from between piston and cylinder wall at right angles to pin boss on side opposite slot.

NOTE:—Install pistons with 'T' slot to left.

Piston Rings:—Two compression, two oil rings used per piston. Lower (oil ring) groove is drilled radially.

NOTE—Use standard or oversize rings of size indicated for replacement pistons marked as follows: 'B, D, F' 2.937", 'J' 2.940", 'L' 2.942", 'BO, DO, FO' 2.947", 'LO' 2.952", 'BB, DD, FF' 2.957".

Ring	Width	End Gap	Wall Thickness	Groove Depth
Comp. (2)	3/32"	.006-.016"	.123"	.156"
Oil Ring (Upper)	⅛"	.006-.016"	.128"	.156"
Oil Ring (Lower)	3/16"	.006-.016"	.128"	.156"

Wrist Pin:—Diameter, ¾". Length, 2 7/16". Pin floats in piston and rod.

NOTE—Pins furnished for service standard and .002", .005", .010" oversize.

Clearance in Rod Bushing—.0003". Pin hole in connecting rod is broached, and diamond-bored in piston. Bearing in rod is bronze bushing.

Pin Fit in Piston—Snug fit with piston at 200°F.

Connecting Rod:—Weight, 29.44 ozs. Length, 8 3/16" center-to-center.

Crankpin Journal Diameter—1 15/16".

Big End Bearing Type—Spun babbitt. Diamond-bore finish.

Clearance—.001". Sideplay .006-.010".

Adjustment—Shims (laminated type). Do not file rods or caps.

NOTE:—Connecting rod lower bearings are offset. Install rods with right hand offset in cylinders #1, 3, 5, 7 and left hand offset in cylinders #2, 4, 6, 8.

Crankshaft:—Five main bearing type with eight counterweights.

Journal Sizes—#1—2 9/32". #2—2 5/16". #3—2 11/32". #4—2⅜". #5—2 13/32".

Bearing Type—Separate babbitt-lined, bronze-backed type.

Bearing Clearance—.001".

Adjustment—Shims (laminated type).

End Thrust—Taken by #3 (center) bearing. End clearance, .006-.012".

Camshaft:—Gear driven from crankshaft.

Gear Type—Crankshaft gear, steel. Camshaft gear, GE. Bakelite.

Camshaft Setting—Gears are marked. Mesh marked tooth on crankshaft gear between two marked teeth on camshaft gear.

Valves:—	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1½"	5/16"	5 3/32"	45°	11/32"
Exhaust	1⅜"	5/16"	5 3/32"	45°	11/32"

Stem-to-Guide Clearance—.0015-.003" (intake), .003-.005" (exhaust).

Tappet Clearance—	Running (hot)	Timing
Intake	.006"	.010"
Exhaust	.008"	.010"

Valve Springs—Spring pressure 53 lbs. with valve closed.

Valve Timing

Intake Valves Open—10°40' BTDC.	Close—60° ALDC.
Exhaust Valves Open—50° BLDC.	Close—18°44' ATDC.

NOTE:—Timing figures are correct for .010" tappet clearance.

To Check Timing—Set tappet clearance #1 intake valve at .010". This valve should open with the piston .0494" before top dead center when a point on the flywheel approximately 2.55 teeth before the dead center mark lines up with the indicator in the inspection hole in the left front face of the flywheel housing. Reset tappet clearance at .006" with engine hot.

Motor Gauge—Weidenhoff Adapter #114. Rod #42.

LUBRICATION:—Duo-flow (splash) system with positive pump feed to oil troughs and timing gears by oscillating plunger type pump. Pump mounted on right side of crankcase.

Normal Oil Pressure—3 lbs.

Oil Pressure Relief Valve—Operates at 3 lbs. Not adjustable. Located on right side of crankcase at rear of engine. Combined with oil pressure signal light switch. See article on Hudson Signal Lights in Electrical Equipment Section for complete data.

Capacity & Oil—7 qts. (refill). Use SAE. #30 (above 40° F.), #20W (40° to 0°F.).

CLUTCH:—**Own Make.** Single plate type operating in oil. No adjustment for wear required.

Clutch Pedal Adjustment—Free movement of clutch pedal should be 1½". To adjust, take out clevis pin at lower end of clutch pedal connecting link, loosen locknut on clevis at lower end, turn clevis.

Clutch Lubrication—Oil in clutch should be drained and replaced at 5000 mile intervals. To drain oil, turn flywheel until filler plug on front face is visible in inspection hole in left front face of flywheel housing, remove plug, turn flywheel so that plug hole is down, allow sufficient time for old oil to drain out, turn flywheel and insert mixture of 1/6 pint light engine oil and 1/6 pint kerosene. See that plug is replaced securely.

Facings—9 13/16" driven plate with cork inserts.

STEERING:—**Steering Gear**—Gemmer Worm-and-Sector type. See article in Steering Section for complete adjustmnt instructions.

Front Suspension:—Conventional 'I' beam section front axle with Elliott type ends and semi-elliptic springs.

Kingpin Inclination—7° crosswise.

Caster—3°. Adjust by inserting wedge shims between spring and spring pad on axle.

Camber—2°. No adjustment. Axle may be bent cold for minor corrections.

Toe In—0-⅛". Adjusted in usual manner by loosening clamp bolts and turning tie rod.

BRAKES:—**Service**—Bendix Mechanical, Duo-Servo, Single anchor type. Hand lever applies all four service brakes. See article in Brake Section for complete adjustment instructions.

Drum Diameter—9".

Lining—Moulded type. Width 2¼". Thickness 3/16". Length 19" per wheel.

Clearance—.008" anchor pin end, .014" adjusting screw end of each shoe.

Hand Brake:—See Service Brakes above.

ENGINE NUMBER:—First number 48,000 ('34), 103,001 ('35). Stamped on left hand side of crankcase opposite #1 cylinder ('34), #6 cylinder ('35).

ENGINE:—Own. Six cylinder, 'L' head type.
Bore—3". **Stroke**—5".
Piston Displacement—212.058 cubic inches.
Rated Horsepower—21.6.
Developed Horsepower, Compression Ratio & Pressures—To check pressure, remove spark plugs, crank engine with wide open throttle.

Model	Ratio	Horsepower	Pressure at 150 R.P.M.
K, KU, KS	5.75-1	80 @ 3600	80 lbs.
K, KU, KS	6.25-1	85 @ 3600	116 lbs.
K, KU, KS	7.00-1	89½ @ 3600	128 lbs.
G, GU	6.00-1	88 @ 3800	111 lbs.
G, GU	7.00-1	100 @ 3800	128 lbs.

NOTE—6.25-1 and 7.0-1 heads are aluminum composite. High octane fuel must be used with these heads.
Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling.

Pistons:—Own, Lo-Ex silicon-aluminum alloy, "T" slot, cam ground type. Use finished replacement pistons when reconditioning engine. See Reconditioning paragraph .
Weight—9.6 ozs. ('34), 10.88 ozs. ('35) stripped; 14.5 ozs. ('34), 12.99 ozs. ('35) with rings and pin.
Length—3 3/16".
Removal—Pistons and rods removed from above.
Clearance—Top .016". Bottom .0005" ('34), .002" ('35).
NOTE—1935 pistons may be installed in 1934 engines as complete sets only.
Reconditioning Cylinders—Size of original bore indicated by letter stamped on lower edge of valve chamber opposite cylinder as follows: A-3.000", B-3.0005", C-3.001", D-3.0015", E-3.002", AO-3.010", BO-3.0105", CO-3.001", DO-3.0115", EO-3.012". Recondition cylinder to standard oversize for which replacement piston and rings are available (see piston and ring data below).
Replacement Pistons—Standard and oversize pistons marked by letter on head available for cylinder bores of size indicated: 'B'-3.000 & 3.0005", 'D'-3.001 & 3.0015", 'F'-3.002 & 3.0025", 'J'-3.004", 'L'-3.005". 'BO'-3.010 & 3.0105", 'DO'-3.011 & 3.0115", 'FO'-3.012 & 3.0125", 'LO'-3.015", 'BB'-3.020", 'DD'-3.021, 'FF'-3.022". All pistons installed in engine must be of same weight as indicated by mark on head.
Fitting New Pistons—Use feeler gauge .0015-.002" thick to check clearance. It should be possible to withdraw feeler from between piston and cylinder wall on side opposite slot when grasped between thumb and forefinger with 3-4 lbs. pull.
Installing Pistons—Slot should be to left or away from valves.

Piston Rings:—Four rings per pistons, two compression, two oil control rings ('34—all rings above pin, '35—lower oil control ring below pin). Lower ring groove drilled radially with oil drain holes. Rings are positioned by pin in piston ring groove.

1934 Piston Rings

Ring	Width	End Gap	Wall Thickness
Comp. (all)	3/32"	.006-.016"	.123"
Oil Cont. (upper)	⅛"	.006-.016"	.128"
Oil Cont. (lower)	3/16"	.006-.016"	.128"

1935 Piston Rings

Comp.	.093"	.006-.016"	.123"
Oil Cont.	.187"	.006-.016"	.128"

NOTE—Use standard or oversize rings of size indicated for replacement pistons (see Replacement Piston section above); 3.000"—B, D, F,; 3.003"—J; 3.005"—L; 3.010"—BO, DO, FO; 3.015"—LO; 3.020"—BB, DD, FF. If rings are filed, clearance at pin must be kept uniform with end gap.
Piston Pin:—Diameter ¾". Length 2 7/16". Pin floats in piston and rod. Held by retaining rings. Pins furnished standard, .002", .005", .010" oversize.
Pin Fit in Piston—Snug fit with piston at 200°F.
Clearance in Rod Bushing—.0003".
Connecting Rod:—Weight 28.96 ozs. Length 8 3/16".
Crankpin Journal Diameter—1 15/16".
Lower Bearing—Spun-babbitt lined type.
Clearance—.001". Sideplay .006-.010".
Adjustment—Shims (laminated type). Do not file rod or caps.
Installing Rods—Connecting rod lower bearings are offset. Install rods with right hand offset (widest half of bearing toward rear) in cylinders #1, 2, 4, and rods with left hand offset (widest half of bearing toward front) in #3, 5, 6.
Crankshaft:—Three bearings. Integral counterweights.
Journal Diameters—#1, 2 11/32"; #2, 2⅜"; #3, 2 13/32".
Bearing Type—Removable bronze-backed, babbitt-lined.
Clearance—.001".
Adjustment—Laminated shims. Do not file caps.
End Thrust—Taken by #2 (center) bearing. End-play .006-.012".
Camshaft:—Three bearing. Gear driven.
Timing Gears—Crankshaft gear Steel. Camshaft gear GE. Bakelite.
End Thrust—Taken by spring-loaded plunger in camshaft gear and thrust plate on gear cover.
Camshaft Setting—Gears are marked. Mesh marked tooth on crankshaft gear between two marked teeth on camshaft gear.

Valves:—

	Head Diam.	Stem Diam.	Length
All Valves	1⅜"	5/16"	5 11/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.0015-.003"
Exhaust	45°	11/32"	.003-.005"

Tappet Clearance—.006" Int., .008" Exh. engine hot.
Valve Spring—Cages installed on all springs at bottom. Install with open side toward cylinder.

	Spring Pressure	Length
Valve Closed	44 lbs.	2"
Valve Open	102 lbs.	1 21/32"

Valve Timing—See Camshaft Setting (above).
Intake Valves—Open 10°40' BTDC. Close 60° ALDC.
Exhaust Valves—Open 50° BLDC. Close 18°44' ATDC
To Check Valve Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0562" before top dead center when a point on the flywheel approximately 3.17 teeth before top dead center mark 'UDC.1-6' lines up with the indicator. Reset tappet clearance at .006" with engine warm and running.
Motor Gauge—Weldenhoff Adapter #114, Rod #43.

LUBRICATION:—Duo-flow (splash) system with positive pump feed to oil troughs and timing gears. Oscillating plunger type oil pump mounted on right side of crankcase.
Normal Oil Pressure—3 lbs.
Oil Pressure Relief Valve—Operates at 3 lbs. Located on right hand side of crankcase at rear (combined with oil pressure signal light switch). See Signal Lights in Equipment Section. No adjustment required.
Capacity & Oil—5 qts. (refill), 6 qts. (dry). Use SAE. #30 (above 40°F), 20-W (40° to 0°F), #10-W (0° to —15°F).

CLUTCH:—**Own make.** Single plate type operating in oil. No adjustment for wear required.
See article in Mechanical Equipment Section for data.
Clutch Pedal Adjustment—Free movement of clutch pedal must be 1½". To adjust, loosen locknut on clutch pedal connecting link, remove clevis pin at lower end of link, turn clevis until free movement of pedal is 1½", replace pin and tighten locknut. See adjustment for Automatic Clutch linkage below.
Automatic Clutch Control—On cars with Automatic clutch, check control linkage whenever clutch pedal is adjusted. Depress accelerator pedal, pull back on clutch control unit cable left side of engine), check clearance between back of slot in cable yoke and clevis pin which attaches it to operating lever. This clearance should be ⅞".
Clutch Lubrication—Oil in clutch should be drained and replaced at 5000-15000 mile intervals. To drain oil, turn flywheel until filler plug is visible in inspection hole (left hand front face of flywheel housing), remove plug, turn flywheel until star stamped on flywheel is visible in inspection hole, allow at least one minute in this position for draining, turn flywheel until filler plug hole is visible, insert 1/3 pint Hudsonite Clutch Compound, replace filler plug.
Clutch Facings—Driven plate is 5⅜" I.D., 8⅝" O.D., .203" thick. Facing consists of 90 cork inserts mounted on driven plate.

STEERING:—**Front Suspension**—Conventional 'I' beam section front axle with Elliott type ends and semi-elliptic springs (standard), or Axle-flex articulated axle (optional). Data and adjustments for both types are the same.
Kingpin Inclination—7° crosswise.
Caster—2½-3½° ('34), 3¼-3¾° ('35). Adjust by inserting wedge shims between springs and spring pad on axle.
Camber—½°. No adjustment. Axle may be bent cold to correct camber.
Toe In—⅛" measured 10" above ground. Adjust by loosening tie rod end clamp bolts and rotating tie rod in direction that wheels revolve to increase toe-in, or in opposite direction to decrease toe-in.
NOTE—End thrust on kingpin is taken by five ball bearings in plug above kingpin. Bearing lower race is machined directly in kingpin end.
Steering Gear:—Gemmer Worm-and-Sector type. See article in Steering Section for adjustments.

BRAKES:—**Service**—Bendix mechanical, Duo-Servo, Single anchor type. Hand lever applies all service brakes. See article in Brake Section for complete adjustment procedure.
Drum Diameter—9".
Lining—Moulded type. Width 1¾" (except KU), 2¼" (KU only). Thickness 3/16". Length per wheel 19 3/16".
Clearance—.008" toe, .014" heel, for each shoe.
Hand Brake Adjustment:—See Service Brakes.

AUTOMATIC SHIFT (ELECTRIC HAND):—Bendix electro-pneumatic type optional on 1935 models.
See article in Mechanical Equipment Section for data.

ENGINE NUMBER:—First number—157,000. Stamped on left side of cylinder block opposite #6 cylinder.

ENGINE SPECIFICATIONS:—Type—6 cyl. 'L' head.
Bore—3". **Stroke**—5".
Displacement—212 cubic inches.
Rated Horsepower—21.6 (AMA).
Developed Horsepower—88 at 3800 R.P.M. (Std. 6.0-1 head), 100 at 3800 R.P.M. (Optl. 7.0-1 head).
Compression Ratio & Pressure—To check pressures, remove spark plugs, crank engine with throttle wide open.
Std. 6.0-1 Head .....111 lbs. at 215 R.P.M.
Optl. 7.0-1 Head .....127 lbs. at 207 R.P.M.
Vacuum Reading—Gauge should show steady reading of 18-19" of HG. with engine idling at 350 R.P.M. or 7 M.P.H.
NOTE—High Octane fuel must be used in engines with optional high compression 7.0-1 head.

PISTONS:—Own Lo-Ex aluminum alloy, 'T' slot, Cam ground type. Use finished replacement pistons when reconditioning engine. See Reconditioning parag'ph.
Weight—10.5 ozs. stripped. Stamped on piston head.
Length—3 3/16".
Removal—Pistons and rods removed from above.
Clearance—Top .016". Skirt .002". See Fitting New Pistons.
NOTE—These pistons are interchangeable with 1935 and may be installed in complete sets on 1934 model.

Reconditioning Cylinders:—Size of original bore indicated by letter stamped on lower edge of valve chamber opposite cylinder as follows: A-3.000", B-3.0005", C-3.001", D-3.0015", E-3.002", AO-3.010", BO-3.0105", CO-3.011", DO-3.0115", EO-3.012". Recondition cylinder to standard oversize for which replacement piston and rings are available (see piston and ring data below).

Replacement Pistons:—Standard and oversize pistons marked by leter on head available for cylinder bores of size indicated: 'B'-3.000&3.0005", 'D'-3.001&3.0015", 'F'-3.002 & 3.0025", 'J'-3.004", 'L'-3.005", 'BO'-3.010 & 3.0105", 'DO'-3.011 & 3.0115", 'FO'-3.012 & 3.0125", 'LO'-3.015", 'BB'-3.020", 'DD'-3.021", 'FF'-3.022". All pistons installed in engine must be of same weight as indicated by mark on head.

Fitting New Pistons:—Use .0015" feeler ½" wide on side opposite slot at right angles to pin bosses to check clearance. Tension to withdraw feeler must be 3-4 lbs.

Installing Pistons:—Slot toward left or away from camshaft.

PISTON RINGS:—Two compression, one oil ring above pin, one oil ring below pin per piston. Upper oil ring groove drilled with twelve 5/16" oil drain holes and two 5/16" holes to pins. Lower oil ring groove drilled with four 5/16" holes and two oil drain slots. Rings are straight cut and are positioned by pin in piston ring groove.

Ring	Width	End Gap	Wall Thickness
Comp.	3/32"	.005" Min.	.123"
Oil (both)	3/16"	.005" Min.	.128"

NOTE—Use standard or oversize rings of size indicated for replacement pistons (see Replacement Piston section above): 3.000"—B, D, F; 3.003"—J; 3.005"—L; 3.010"—BO, DO, FO; 3.015"—LO; 3.020"—BB, DD, FF. If rings are filed, clearance at pin must be kept uniform with end gap.

PISTON PIN:—Diameter ¾". **Length** 2 7/16".
Pin floats in piston and rod. Held by locking ring at each end. Pin hole in rod is bronze-bushed. Pins furnished standard, .002", .005", .010" oversize.
Pin Fit in Piston—Hand push fit with piston heated to 200° F.
Pin Fit in Rod Bushing—.0003" clearance. With this clearance rod will just turn of own weight.

CONNECTING ROD:—Weight 29.4 ozs. **Length** 8 3/16".
Crankpin Journal Diameter—1 15/16".
Lower Bearing—Spun-babbitt lined type. Rods serviced on 'exchange' basis.
Clearance—.001". **Sideplay**—.006-.010".

Bearing Adjustment:—Laminated shims. Do not file rods or caps.

Installing Rods:—Lower bearings are offset. Install rods with right hand offset (widest half of bearing toward rear) in cylinders #1, 2, 4, and rods with left hand offset (widest half of bearing toward front) in cylinders #3, 5, 6. Oil scoop on bearing cap must be toward camshaft on all rods.

CRANKSHAFT:—3 bearing. Integral counterweights.
See Hudson Shop Notes for Crankshaft and Vibration Dampener removal, Main Bearing Removal, Installation and Line-Reaming data.
Journal Diameters—#1, 2 11/32"; #2, 2⅜"; #3, 2 13/32".
Bearing Type—Removable bronze-backed, babbitt-lined. Bearings furnished for service reamed to standard size or unfinished (1/32" extra stock).
Clearance—.001".

Bearing Adjustment:—Shims. *See Hudson Shop Notes.*

End Thrust:—Taken by flanges on #2 (center) main bearing. Endplay .006-.012". Adjusted by replacing bearing.

CAMSHAFT:—Three bearing. Gear driven.
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1½".
Bearing Clearance—.0015".

End Thrust:—Taken by spring-loaded plunger in end of camshaft and thrust plate on gear case cover.
NOTE—If gear case cover removed, see that spring and plunger are in place when cover is replaced.

Timing Gears:—Crankshaft gear cast-iron. Camshaft gear GE. or Cont. Diamond Fibre Bakelite.

Camshaft Setting:—Gears are marked. Mesh marked tooth of crankshaft gear between two marked teeth on camshaft gear.

VALVES:—	Head Diameter	Stem Diameter	Length
All valves	1⅜"	⅜"	5 11/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.0015-.003"
Exhaust	45°	11/32"	.003-.005"

Tappet Clearance:—.006" Intake, .008" Exhaust (hot).

Valve Guides:—Removable type. Pressed in block. Finish ream guides after installation to size giving correct clearance.

Valve Springs:—Cages installed on bottom of all springs. Springs should be installed with open side of cage toward cylinder.

	Spring Pressure	Spring Length
Valve Closed	44 lbs.	2"
Valve Open	102 lbs.	1 21/32"

Valve Lifters:—Slipper type operating in individual removable guides. Lifter is prevented from turning by pin in guide.

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 10°40' BTDC. Close 60° ALDC.
Exhaust Valves—Open 50° BLDC. Close 18°44' ATDC.
These figures correct with .010" tappet clearance.
To Check Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0562" before top dead center when point on flywheel approximately 3.94 teeth before 'UDC.1-6/' mark lines up with indicator in hole in left front face of flywheel housing. Reset tappet clearance at .006". hot.
Motor Gauge—Weldenhoff #114 Adapter, #44 Rod.

LUBRICATION:—Duo-flow (splash) system. Force feed by oil pump to conecting rod troughs and timing gears. Splash to all other points from troughs.
Normal Oil Pressure—3 lbs.
Oil Presure Regulator—Operates at 3 lbs. Located on right side of crankcase. Not adjustable.
Crankcase Capacity—6 qts. refill.

Oil Pump:—Oscillating plunger type pump mounted on right side of crankcase and driven by gears from the camshaft.

Oil Pressure Indicator:—Consists of signal light on instrument panel and switch built in oil pressure regulator. See article in Equipment Section for complete data.

CLUTCH:—Own Make. Single plate, cork insert type operating in oil. Driven plate can be recorked but is customarily replaced.
See article in Mechanical Equipment Section for data.
Clutch Plate—Thickness .203". Inside diameter 5.375" Outside Diameter 8.625". **Facing**—90 cork inserts.

Adjustment:—Free movement of clutch pedal must be 1½" at all times. To adjust, remove clevis pin in clutch pedal link rod (between frame and leg of 'X' member below clutch pedal shaft), loosen locknut at top of clevis, turn clevis to shorten or lengthen rod as required, tighten locknut, replace clevis pin. On cars with automatic clutch control, check linkage whenever clutch is adjusted.
Automatic Clutch Linkage Adjustment—Hold accelerator pedal in depressed position, pull backward on clutch control power unit rod at left of engine. With rod in extreme rear position check clearance between back of slot in rod yoke and clevis pin which attaches it to operating lever. Clearance at this point must be ⅞".

Servicing:—Oil in clutch should be renewed at 5000 mile intervals. *See Hudson Special Shop Notes for instructions.*

STEERING:—Steering Gear—Gemmer Worm-and-Sector type. See article in Steering Section for adjustments.
NOTE—An adjustable drag link with ¾" adjustment (made by shifting shims from front to rear of pitman arm ball seat) is used on Model 61 after #6110394 (except 6110601 to 6110650), Model 62 after #623419 (except 623506 to 623661 incl.).

Front Suspension:—Conventional 'I' beam section front axle with Elliott type ends and semi-elliptic springs. Torque arm at each end of axle connected to frame at rear by rubber-bushed bolt maintains axle alignment.
Specifications & Adjustment—Kingpin inclination, Caster, Camber, Toe In, Steering Geometry, and Kingpin thrust bearing specifications and adjustment same as Hudson (see 1936 Hudson 8 page).

BRAKES:—Service—Bendix hydraulic, Duo-Servo, Single Anchor type. Brake pedal connected to rear wheel brakes through cable linkage for additional reserve mechanical aplication of brakes. Hand lever aplies rear wheel brakes through this same linkage.
See article in Mechanical Equipment Section for data.
Brake Drum Diameters—10 1/16".
Brake Lining—Moulded & Woven type. Width 1¾". Thickness 7/32". Length 22⅛" per wheel.
Brake Clearance—.010" heel and toe of each shoe.

Brake Pedal Adjustment:—For correct mechanical follow-up feature, adjust position of nut on connecting rod so that clearance between face of nut and end of push rod is 1 29/32" with equalizer against stop.
Hand Brake Adjustment:—See Service Brakes.

AUTOMATIC SHIFT (ELECTRIC HAND):—Bendix electro-pneumatic type. Optional equipment.
See article in Mechanical Equipment Section for data.

SERIAL NUMBER:—First Number:—Commercial Model (70) 70101, Deluxe (71) 71101, Super (72) 72101. Stamped on plate on right front door hinge pillar post.

ENGINE NUMBER:—First number 250,000 (all models). Stamped on left side of block opposite #6 cylinder.

ENGINE SPECIFICATIONS:—6 cyl. L head type.
Bore—3". **Stroke**—5". **Displacement**—212 cu. ins.
Rated Horsepower—21.6 A.M.A.

Developed Horsepower—	70, 71	72
Std. 6.25-1	96 @ 3900	101 @ 4000
Optl. 7.0-1 'Super Power'	102 @ 3900	107 @ 4000

Compression Ratio & Pressure—Check at cranking speed, spark plugs removed, throttle wide open.
Std. 6.25-1 head ..... 103 lbs. at 170 R.P.M.
Optl. 7.0-1 head ..... 119 lbs. at 170 R.P.M.
Vacuum Reading—18-21" at 350 R.P.M. or 7 M.P.H.

PISTONS:—Own Lo-Ex aluminum alloy, 'T' slot, cam ground type. Use finished replacement pistons.
Weight—10.5 ozs. stripped. **Length** 3 3/16".
Removal—May be removed from above or below.
Clearance—.016" top, .002" skirt (see below).
Original Bore Size:—*See Hudson Shop Notes.*
Replacement Pistons:—*See Hudson Shop Notes.*
Fitting New Pistons:—3-4 lb. tension should be required to withdraw .0015" feeler ½" wide from between piston and cylinder wall on side opposite slot at right angles to pin bosses.
Installing Pistons:—Slot away from camshaft side.

PISTON RINGS:—Two compression, one oil ring above pin, 1 oil ring below pin. Rings positioned by pin in grooves.

Ring	Width	End Gap	Side Clearance
Compression	3/32"	.009-.011"	.001"
Oil (both)	3/16"	.009-.011"	.001"

Replacement Rings:—*See Hudson Shop Notes.*

PISTON PIN:—**Diameter**—¾". **Length**—2 7/16".
Pin floats in piston and rod, held by locking rings. Pin hole in rod bronze-bushed. Pins furnished std., .002", .005", .010" oversize.
Pin Fit in Piston—.0003" clearance or hand push fit with piston heated to 200° F.
Pin Fit in Rod Bushing—.0003" clearance.

CONNECTING ROD:—**Weight** 29.4 ozs. **Length** 8 3/16".
Crankpin Journal Diameter—1 15/16".
Lower Bearing—Spun-babbitt. Rods exchanged. Finished bearings furnished standard and undersize (special order).
Clearance—.001". **Sideplay**—.006-.010".
Bearing Adjustment:—Laminated shims. Do not file.
Installing Rods:—Offset. Install rods with widest half of bearing toward rear (#1, 2, 4), toward front (#3, 5, 6). Oil scoop on all rods toward camshaft.

CRANKSHAFT:—3 bearing, integral counterweights *See Hudson Shop Notes for Crankshaft and Vibration Dampener removal, Main Bearing Removal, Installation and Line-Reaming data.*
Journal Diameters—#1, 2 11/32; #2, 2⅜"; #3, 2 13/32".
Bearing Type—Bronze-backed, babbitt-lined. Furnished std., and unfinished (1/32" extra stock—ream to desired undersize). **Clearance**—.001".
Bearing Adjustment:—Shims. *See Hudson Shop Notes.*
End Thrust:—Taken by center bearing. Replace bearing to adjust. Endplay.006-.012".

CAMSHAFT:—Three bearing. Gear driven.
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1½".
Bearing Clearance—.0015".
End Thrust:—Taken by thrust washer assembled between front face of crankcase and rear side of camshaft front flange, and by spring-loaded button in camshaft hub and thrust plate on gear cover. See that spring and button in place under cover.
Timing Gears:—Crankshaft gear cast-iron. Camshaft gear GE. or Continental Diamond Fibre Bakelite.
Camshaft Setting:—Mesh marked tooth of crankshaft gear between two marked teeth on camshaft gear.

VALVES:—

	Head Diameter	Stem Diameter	Length
All Valves	1⅜"	⅜"	5 11/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.0015-.003"
Exhaust	45°	11/32"	.003-.005"

Tappet Clearance—.006" Int., .008" Exh., engine hot.
Valve Guides:—2 9/16" long. Top 1 1/16" below top of block. Finish ream to size after installation.
Valve Springs:—Cadmium plated. Install spring seat and spring dampener on bottom of all springs.

	Spring Pressure	Spring Length
Valve Closed	44 lbs.	2"
Valve Open	102 lbs.	1 21/32"

Valve Lifters:—Roller shoe type, fitted in removable guides. *See Hudson Shop Notes for lifter removal.*
Valve Timing:—See camshaft setting above.
Intake Valves—Open 14° 40' BTDC. Close 60° ALDC.
Exhaust Valves—Open 50° BLDC. Close 18°44' ATDC.
These figures correct with .010" tappet clearance.
To Check Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0562" BTDC. when point on flywheel approximately 3.94 teeth before 'UDC.1-6/' mark lines up with pointer in hole in left front face of flywheel housing. Reset tappet clearance at .006" hot.
Motor Gauge—Weidenhoff Adapter #114, Rod #44.

LUBRICATION:—Duo-flow (pressure and positive splash) system.
Oil Pump:—Oscillating plunger type, gear driven by camshaft. Mounted on right side of crankcase.
Normal Oil Pressure—3 lbs. (no gauge).
Oil Pressure Regulator:—Located on right side of crankcase at rear. Opens at 3 lbs. Not adjustable.
Oil Pressure Indicator:—Teleflash Oil Pressure indicator. See article in Electrical Equipment Section.
Checking Oiling System:—*See Hudson Shop Notes.*
Crankcase Capacity:—5 qts. (refill), 6 qts. (dry).

COOLING SYSTEM:—**Water Pump.** Centrifugal, belt-driven, packless type.
See article in Mechanical Equipment Section for data.
Removal—With water drained and fan belt removed, disconnect water hoses at pump, remove mounting bolts and lift fan and pump assembly off.
Thermostat:—On 72 only. In water outlet on cyl. hd.
Setting—Start to open 150-155°F. Fully open 185°F.
Water Capacity:—13 quarts.

CLUTCH:—**Own make.** Single plate, cork insert type, operating in oil.
See article in Mechanical Equipment Section for data.
Driven Member—Thickness .203". Inside Diameter 5.375", Outside Diam. 8.625". Facing 90 cork inserts.
Automatic Clutch Control:—Optional equipment.
See article in Mechanical Equipment Section for data.
Adjustment:—Pedal free movement must be 1½". To adjust, remove clevis pin at lower end of connecting link on throw-out shaft lever, loosen locknut, turn clevis. On cars with Automatic Clutch control, check setting whenever clutch adjusted.
Clutch Oil Servicing:—*See Hudson Shop Notes for data.*
Removal:—Remove transmission (see Transmission Removal following), take out 16 clutch cover capscrews and remove clutch assembly from below.

TRANSMISSION:—**Own make.** Constant-mesh, helical gears with synchronizing unit (second and high speeds). Sliding spur gears (low and reverse).
Electric Hand:—Bendix type electro-pneumatic gear shift Optional Equipment.
See article in Mechanical Equipment Section for data.
Removal:—Remove Electric Hand and Automatic Clutch Control units and wiring from transmission first, if car so equipped. See separate articles in Mechanical Equipment Section for necessary adjustments on these units when reinstalling. Disconnect transmission side bumpers, interlock straps, speedometer cable and drive shaft at front universal. Take out bell housing-to-engine mounting bolts, pull transmission straight back.

UNIVERSAL JOINTS:—Spicer. 1271 (front), 1278 (rear). Needle bearing type.
See article in Mechanical Equipment Section for data.

REAR AXLE:—**Own make.** Semi-floating, spiral bevel gear type.
See article in Mechanical Equipment Section for data.
Ratio—4.11-1 Std., 4.56-1 Optl. 3.89-1, 3.56-1 Special.
Backlash—.0005-.003". Screw adjustment.
Removal:—Remove rear wheel and hub assembly (use screw type puller only), take out four nuts on bearing cap bolts, push bolts out through backing plate remove shims, pull wheel bearing and axle shaft, disconnect drive shaft at rear universal, remove 8 nuts from axle housing-to-carrier stud bolts, withdraw differential assembly.
Wheel Bearing Adjustment:—Controlled by shims under bearing cap. Measure endplay by dial indicator clamped to backing plate with plunger against end of axle shaft. To adjust, remove bearing caps (as directed above), add or remove shims equally at both wheels. **Endplay**—.004-.010".

SHOCK ABSORBERS:—**Monroe.** 637502 (front), 635703 (rear). Hydraulic, direct acting type.
See article in Mechanical Equipment Section for data.

STEERING:—**Steering Gear**—Gemmer Model 305. Worm and Roller type.
See article in Mechanical Equipment Section for data.
Front Suspension:—Conventional 'I' beam section front axle with Elliott type ends and semi-elliptic springs. Axle alignment maintained by torque arm at each end (71, 72—not used on 70).
See article in Mechanical Equipment Section for data.
Torque Arms—*See Hudson Special Shop Notes.*
Kingpin Inclination—7° crosswise. NOTE—Loose ball type thrust bearing used. See 1936 page for data.
Caster—1-2° and equal within ½° for both wheels. To adjust (71, 72), loosen capscrews at front of torque arm, insert shim between arm and axle at upper screw or remove shim at lower screw to decrease caster, remove shim at upper screw or insert shim at lower screw to increase caster. Shims .020" thick, change caster ½°. To adjust (70), install wedge shims between spring and spring seat.
Camber—1-1½°. No adjustment.
Toe In—⅛" measured 10" up from ground. Adjust by loosening clamp bolts and turning tie rod.
Steering Geometry—Inner wheel 20°. Outer 17¾°.

BRAKES:—**Service**—Bendix Hydraulic, Duo-servo, Single anchor type with Mechanical follow-up. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Drum—Alloy-steel. Diameter—10 1/16".
Lining—Moulded and woven type. Width 1¾". Thickness 7/32". Length 22⅛" per wheel.
Clearance—.010" heel and toe of each shoe.
Hand Brake:—See Service Brakes above.
Hill-Holder:—Optional on all models.
See article in Mechanical Equipment Section for data.

SERIAL NUMBER:—First number:—Business Models (80) 80101, (88) 88101; Deluxe (81) 81101; Super (82) 82101. On right front door hinge post.

ENGINE NUMBER:—First number same as Serial Number (above). On boss on left side of block near top front or on top of block between #1 and #2 exhaust manifold flanges.

ENGINE SPECIFICATIONS:—6 cyl. L head type.
Bore—3". **Stroke**—5". **Displacement**—212 cu. ins.
Rated Horsepower—21.6 A.M.A.

Developed Horsepower—	80, 81, 88	82
Std. 6.25-1	96 @ 3900	101 @ 4000
Optl. 7.0-1 'Super Power'	102 @ 3900	107 @ 4000

Compression Ratio & Pressure—Check at cranking speed, spark plugs removed, throttle wide open.

Std. 6.25-1 head	103 lbs. at 170 R.P.M.
Optl. 7.0-1 head	119 lbs. at 170 R.P.M.

Vacuum Reading—18-21" at 350 R.P.M. or 7 M.P.H.

PISTONS:—Own Lo-Ex aluminum alloy, 'T' slot, cam ground type. Use finished replacement pistons.
Weight—10.5 ozs. stripped. **Length**—3 3/16".
Removal—May be removed from above or below.
Clearance—.016" top, .002" skirt (see below).
Original Bore Size:—*See Hudson Shop Notes.*
Replacement Pistons:—*See Hudson Shop Notes.*
Fitting New Pistons:—3-4 lb. tension should be required to withdraw .0015" feeler ½" wide from between piston and cylinder wall on side opposite slot at right angles to pin bosses.
Installing Pistons:—Slot away from camshaft side.

PISTON RINGS:—Two compression, one oil ring above pin, 1 oil ring below pin. Rings positioned by pin in grooves.

Ring	Width	End Gap	Side Clearance
Compression	3/32"	.005-.010"	.001"
Oil (both)	3/16"	.005"	.001"

Replacement Rings:—*See Hudson Shop Notes.*

PISTON PIN:—Diameter—¾". **Length**—2 7/16".
Pin floats in piston and rod, held by locking rings. Pin hole in rod bronze-bushed. Pins furnished std., .002", .005", .010" oversize.
Pin Fit in Piston—.0003" clearance or hand push fit with piston heated to 200° F.
Pin Fit in Rod Bushing—.0003" clearance.

CONNECTING ROD:—Weight 30.3 oz. **Length** 8 3/16". *See Hudson Shop Notes for Connecting Rod change on late cars.*
Crankpin Journal Diameter—1 15/16".
Lower Bearing—Spun-babbitt. Rods exchanged. Finished bearings furnished standard and undersize (special order).
Clearance—.001". **Sideplay**—.006-.010".
Bearing Adjustment:—None (no shims). Replace rods. *See Hudson Shop Notes for connecting rod palnut (locknut) installation instructions.*
Installing Rods:—Offset. Install rods with widest half of bearing toward rear (#1, 2, 4), toward front (#3, 5, 6). Oil scoop on all rods toward camshaft.

CRANKSHAFT:—3 bearing, integral counterweights *See Hudson Shop Notes for Crankshaft and Vibration Dampener removal, Main Bearing Removal, Installation and Line-Reaming data.*
Journal Diameter—#1, 2 11/32", #2, 2⅜", #3, 2 13/32".
Bearing Type—Bronze-backed, babbitt-lined. Furnished std., and unfinished (1/32" extra stock—ream to desired undersize). **Clearance**—.001".
Bearing Adjustment:—Shims. *See Hudson Shop Notes.*
End Thrust:—Taken by center bearing. Replace bearing to adjust. Endplay .006-.012".

CAMSHAFT:—Three bearing. Gear driven.
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1½"
Bearing Clearance—.0025".
End Thrust:—Taken by thrust washer on front face of crankcase and by spring-loaded button in camshaft hub and thrust plate on gear cover. See that spring and button in place under cover.
Timing Gears:—Crankshaft gear cast-iron. Camshaft gear GE. or Continental Diamond Fibre Bakelite.
Camshaft Setting:—Mesh marked tooth of crankshaft gear between 2 marked teeth on camshaft gear.

VALVES:—Lighter valves (smaller stem diameter) used, than on previous models. New pilot size necessary for valve tools. *See Hudson Shop Notes for data.*

Head Diameter	Stem Diameter	Length
All valves 1⅜"	11/32"	5 11/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.0015-.003"
Exhaust	45°	11/32"	.003-.005"

Tappet Clearance—.006" Int., .008" Exh., engine hot.
Valve Guides: 2 9/16" long. Top 1 1/16" below top of block. Finish ream to size after installation.
Valve Springs:—Cadmium plated. Install spring seat and spring dampener on bottom of all springs.

	Spring Pressure	Spring Length
Valve Closed	44 lbs.	2"
Valve Open	102 lbs.	1 21/32"

Valve Lifters:—Roller shoe type, fitted in removable guides. *See Hudson Shop Notes for Lifter Removal.*
Valve Timing:—See camshaft setting above.
Intake Valves—Open 10°40' BTDC. Close 60° ALDC.
Exhaust Valves—Open 50° BLDC. Close 18°44' ATDC.
These figures correct with .010" tappet clearance.
To Check Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0562" BTDC. when point on flywheel approximately 3.94 teeth before 'UDC.1-6/' mark lines up with pointer in hole in left front face of flywheel housing. Reset tappet clearance at .006" hot.
Motor Gauge—Weidenhoff Adapter #114. Rod #44.

LUBRICATION:—Duo-flo (pressure & splash) system.
Oil Pump:—Oscillating plunger type, gear driven by camshaft. Mounted on right center of crankcase.
Normal Oil Pressure—3 lbs. (no gauge).
Oil Pressure Regulator:—Located on right side of crankcase at rear. Opens at 3 lbs. Not adjustable.
Oil Pressure Indicator:—Teleflash Oil Pressure indicator. See article in Electrical Equipment Section.
Checking Oiling System:—*See Hudson Shop Notes.*
Crankcase Capacity:—5 qts. (refill), 6 qts. (dry).
NOTE—Capacity decreased ½ qt. after car #43845.

COOLING SYSTEM:—Water Pump. Centrifugal, belt-driven, packless type.
See article in Mechanical Equipment Section for data.
Removal—With water drained and fan belt removed, disconnect water hoses at pump, remove mounting bolts and lift fan and pump assembly off.
Thermostat:—Std. on 82, optl. on others. In water outlet on cylinder head.
Setting—Start to open at 150-155°F. Fully open 185°F.
Water Capacity:—12½ quarts.

CLUTCH:—Own make. Single plate, cork insert type operating in oil. *See Mechanical Equip. Section.*
Adjustment:—Pedal free movement must be 1½". To adjust, remove clevis pin at lower end of connecting link on throw-out shaft lever, loosen locknut, turn clevis. On cars with Automatic Clutch control, check setting whenever clutch adjusted.
Driven Member—80 Utility coach, coupe and sedan, 81. Thickness .203". Inside Diameter 5.375". Outside Diameter 8.625". Facing 90 cork inserts. **All others**—Thickness .203". Inside Diam. 6.375". Outside Diameter 9.75". Facing 108 cork inserts.
Automatic Clutch Control:—Optional equipment. *See article in Mechanical Equipment Section for data.*
Clutch Oil Servicing:—*See Hudson Shop Notes.*
Removal:—Remove transmission (see Transmission Removal following) take out 16 clutch cover capscrews and remove clutch assembly from below.

TRANSMISSION:—Own make. Constant-mesh, helical gears with synchronizing unit (second and high speeds). Sliding spur gears (low and reverse).
Electric Hand:—Bendix type electro-pneumatic gear shift Optional Equipment.
See article in Mechanical Equipment Section for data.
Removal:—Remove Electric Hand and Automatic Clutch Control units and wiring from transmission first, if car model so equipped. See separate articles in Mechanical Equipment Section for necessary adjustments on these units when reinstalling. Disconnect transmission side bumpers, interlock straps, speedometer cable and drive shaft at front universal. Take out bell housing-to-engine mounting bolts, pull transmission straight back.

UNIVERSAL JOINTS:—Spicer. 1271 (front), 1278 (rear). Needle bearing type.
See article in Mechanical Equipment Section for data.

REAR AXLE:—Own make. Semi-floating, spiral bevel gear type.
See article in Mechanical Equipment Section for data.
Ratio—4 1/9-1, 4 5/9-1, 5 1/8-1.
Backlash—.0005-.003". Screw adjustment.
Removal:—Remove rear wheel and hub assembly (use screw type puller only), take out four nuts on bearing cap bolts, push bolts out through backing plate remove shims, pull wheel bearing and axle shaft, disconnect drive shaft at rear universal, remove 8 nuts from axle housing-to-carrier stud bolts, withdraw differential assembly.
Wheel Bearing Adjustment:—Controlled by shims under bearing cap. Measure endplay by dial indicator clamped to backing plate with plunger against end of axle shaft. To adjust, remove bearing caps (as directed above), add or remove shims equally at both wheels. **Endplay**—.004-.010".

SHOCK ABSORBERS:—Monroe. 156577 (front), 156578 (rear). Hydraulic, direct acting type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Gemmer Model 305. Worm and Roller type. *See Mechanical Equip. Section.*
Front Suspension:—Conventional 'I' beam section front axle with Elliott type ends and semi-elliptic springs. Axle alignment maintained by torque arm at each end (81, 82—not used on 80, 88).
Kingpin Inclination—7° crosswise. *See Hudson Shop Notes for Kingpin Thrust Bearing data.*
Caster—1-2° and equal within ½° for both wheels. To adjust (81, 82), loosen capscrews at front of torque arm, insert shim between arm and axle at upper screw or remove shim at lower screw to decrease caster, remove shim at upper screw or insert shim at lower screw to increase caster. Shims .020" thick, change caster ½°. To adjust (80, 88), install wedge shims between spring and spring seat.
Camber—1-1½°. No adjustment.
Toe In—⅛" measured 10" up from ground. Adjust by loosening clamp bolts and turning tie rod.
Steering Geometry—Inner wheel 20°. Outer 17¾°.

BRAKES:—Service—Bendix Hydraulic, Duo-servo, Single anchor type with Mechanical follow-up. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Drum—Alloy-steel. Diameter—10 1/16".
Lining—Moulded (primary), Woven (secondary). Width 1¾". Thickness 3/16". Lgth. 22⅛" per wheel.
Clearance—.010" heel and toe of each shoe.
Hand Brake:—See Service Brakes above.
Hill-Holder:—Optional on all models.
See article in Mechanical Equipment Section for data.

SERIAL NUMBER:—First number 1001 (1933), 13,820 (1934), 27,001 (1935), 42,002 (1936). On left frame rail near front spring rear shackle or on body sill at left front door opening.

ENGINE NUMBER:—Stamped on right front upper corner of cylinder block. 1st no. 42,000 ('36).

ENGINE:—Own Model 77. Four cylinder, 'L' head type.
Bore—3⅛". **Stroke—4⅜".**
Piston Displacement—134.2 cubic inches.
Rated Horsepower—15.63.
Developed Horsepower—48 at 3200 R.P.M.
Compression Ratio—5.13-1 ('33-35). 5.7-1 ('36).
Compression Pressure—83 lbs. at 120 R.P.M. ('33-35). 87 lbs. at 216 R.P.M. ('36).
Vacuum Reading—Gauge should show steady reading of 18-20" with engine idling.

NOTE—Cylinder bores are offset ⅛" from centerline of crankshaft toward valve side of engine.

Pistons:—Hard Grey Iron (cast-iron). Light weight type, relieved at pin bosses. Length, 3¾".
Weight—23-25 ozs. (without rings or pin).
Removal—Pistons and rods removed at top.
Clearance—Top .007-.008". Bottom .0025-.003".
Fitting New Pistons—Use .0025" feeler stock to check clearance. Pull required to withdraw feeler from between piston and cylinder wall must be 4 lbs. plus or minus 2 lbs.

Piston Rings:—Three compression rings, one oil control ring per piston, all above pin. Oil ring groove drilled radially with oil drain holes.

Ring	Width	End Gap	Wall Thickness
Comp. (Top)	3/32"	.010-.012"	.132"
Comp. (2,3)	3/32"	.007-.012"	.132"
Oil Cont.	3/16"	.007-.015"	.140"

NOTE—Wall thickness of .140" on all 1936 rings.

Piston Pin:—Diameter .875". Length 2.713". Pin floats in piston and rod. Retained by locking rings. Pins furnished .001" and .003" oversize.
Clearance in Piston—.0002-.0004". Hand press fit.
Clearance in Rod Bushing—.0004-.0006". Thumb press fit.

Connecting Rod:—Length 9 3/16" (center-to-center).
Lower Bearing Diameter—1 15/16".
Bearing Type—Spun babbitt-lined type.
Clearance—.001-.0025". Sideplay .006-.008".
Adjustment—None (no shims). Replace rods.
Installing Rods—Connecting rod lower bearings are offset. Install rods with short side of bearing toward nearest main bearing (short side forward on #1 and 3, toward rear on #2, 4). Oil hole in lower bearing upper half must be toward right (away from camshaft) on all rods.

Crankshaft:—Three main bearing type.
Journal Diameters—2 3/16" (all bearings).
Bearing Type—Interchangeable steel-backed, babbitt-lined type.
Clearance—.001-.0025".
Adjustment—None (no shims). Replace bearings. Do not file bearing caps.
End Thrust—Taken by #1 (front) main bearing. Endplay .004-.006". Adjustable by shims between crankshaft thrust washer and shaft.

Camshaft:—Four bearing. Non-adjustable chain drive.
Bearing Type—Removable bushing (front), machined in crankcase (all others).
Bearing Clearance—.002".
End Thrust—Taken by thrust plate behind camshaft sprocket and spring loaded plunger in forward end of camshaft bearing against thrust stud on chain case cover.

NOTE—When replacing chain case cover see that plunger and spring are in place in camshaft.
Timing Chain—Link Belt #33403-2. Width 1¼". Pitch ½". Length 23½" or 47 links.
Camshaft Setting—Sprockets are marked. With pistons #1 and 4 at TDC. marks should be adjacent and in line with a straightedge across the shaft centers. Remove camshaft sprocket to install chain.

Valves:—	Head Diameter	Stem Diameter	Length
Intake	1 17/32"	.372"	5 13/64" (5¾" over all)
Exhaust	1 15/32"	.371"	5 13/64" (5¾" over all)

	Seat Angle	Lift	Stem Clearance
Intake	45°	21/64"	.002-.004"
Exhaust	45°	21/64"	.003-.005"

NOTE—Hard alloy steel inserts are used for exhaust valve seats.
Tappet Clearance—.004" Int., .006" Exh. engine hot.
Valve Guides—Removable type installed with taper end up. Remove old guides from above and press in new guides until lower end extends ¾" below valve spring recess machined in block. Exhaust guide longer than intake guide.

Valve Springs—	Pressure	Length
Valve Closed	46½ lbs.	2¼"
Valve Open	85½ lbs.	1 15/16"

Valve Lifters—One piece mushroom type. Operate in guide holes reamed in block. Clearance in guides .0008". Serviced by reaming guide hole and installing lifters furnished .005" oversize.

Valve Timing

Intake Valves—Open at TDC. Close 45° ALDC.
Exhaust Valves—Open 40° BLDC. Close 5° ATDC.
To Check Valve Timing—Set tappet clearance #1 intake and exhaust valves at .010". Intake valve opens with piston on top dead center when flywheel mark 'T.C.I.O.1-4' lines up with pointed end of inspection hole cover plate screw (top of flywheel housing on left hand side). Exhaust valve closes with piston 5° or .0103" down on intake stroke when flywheel mark 'E.C.' lines up with indicator. Reset tappet clearance at .004" (intake), .006" (exhaust) with engine hot.
Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Lubrication:—Pressure. Gear type oil pump located at left of crankcase.
NOTE—When installing oil pump, turn engine over until 'IGN' mark on flywheel lines up with pointed end of inspection cover screw on left top side of flywheel housing with #1 piston on compression stroke. Rotate distributor shaft so that rotor is in #1 firing position, then mesh oil pump gear so that tongue-and-slot connection to distributor shaft is engaged without changing position of distributor shaft.
Normal Oil Pressure—30 lbs. at 30 M.P.H.
Oil Pressure Relief Valve—Located under plug on oil pump cover. Operates at 30 lbs. Adjustable by adding or removing shims in plug above spring.
Crankcase Capacity—4 quarts (refill).

CLUTCH:—Rockford-Borg & Beck Model 8-II. Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Clutch Facings—Molded type, 2 required, 5⅛" I.D., 7⅞" O.D., .125" thick.
Clutch Pedal Adjustment—Clutch pedal free movement should be ¾-1" (providing clearance of 1/16" between clutch release levers and clutch release bearing within housing). To adjust, loosen lock nut, turn turnbuckle on end of clutch lever link cable.
Removal:—Remove transmission (see Transmission Removal below for 1935-36 models), take out clutch mounting screws, lift assembly out.

TRANSMISSION:—Own Make. Sliding spur gear type (all speeds).
See article in Mechanical Equipment Section for data.
Removal (1935-36):—Remove front seat, cowl trim pads, accelerating pedal and bracket (on '36 cars accelerator pedal can be pulled out from rubber connection at lower end), and floor boards. Alignment bolts (engine-to-bell housing) should enter from front, if not, they must be reversed. Turn fan so two top blades form 'V', cover with cloth to prevent injury to radiator core. Attach lifting block in #4 spark plug hole. On 1935 cars, remove bolts from right hand torque arm and left hand rear engine abutment, raise rear of engine until bell housing clears cross shaft, remove engine-to-bell housing bolt nuts, lift transmission out from above. On 1936 cars, remove lower nuts from rear transmission mounting bolts, raise engine to allow removal of rubber mounting rings and mounting bracket-to-transmission capscrews, then continue to raise engine until bell housing clears brake cross shaft, remove engine-to-bell housing bolt nuts, lift transmission out from above.
NOTE—On 1936 cars, upper rebound rubber rings should be compressed to outside diameter of 1 11/16" with lower nuts drawn up tight. Adjust by upper nuts.

UNIVERSAL JOINTS:—'Detroit-Universal'. Series 200. Ball and trunnion type. Two used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—Own—Semi-floating, spiral bevel gear type, straddle mounted pinion, Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.3-1.
Backlash—.006-.012". Shim adjustment.
Removal:—Hoist rear of car, disconnect rear universal, brake cables, shock absorbers, remove spring U-bolts, disconnect rear spring shackles, pull assembly out from car.
Wheel Bearing Adjustment—Endplay controlled by shims between bearing retainer and backing plate. To adjust, remove wheel, hub assembly, oil seal and bearing retainer and add or remove shims.

SHOCK ABSORBERS:—Monroe—Single acting, hydraulic.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Saginaw Worm-and-Sector (1933-35). Lavine Worm-and-Block (1936).
See separate articles in Mechanical Equipment Section.
Front Suspension:—Conventionel 'I' beam section axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—7½° (crosswise).
Camber—2°. No adjustment.
Caster—1-2°. Adjust by inserting shims between spring and spring pad on axle.
Toe In—3/32". Adjust by loosening tie rod clamp bolts and rotating tie rod.
NOTE—Kingpin bushing diameter, .625". End thrust is taken by a taper roller bearing assembled between axle end and steering knuckle lower yoke. Tie rod ends are rubber bushed.

BRAKES:—Service—Bendix Mechanical, Duo-Servo, Single anchor. Hand lever applies 4 service brakes.
See article in Mechanical Equipment Section for data.
Drum Diameter—9".
Lining—Moulded type. Width 1¾". Thickness 3/16". Length 19 3/ 16" per wheel.
Clearance—.010" at heel and toe of each shoe.
Hand Brake:—See Service Brakes.

SERIAL NUMBER:—On frame front cross member at center and on right side of cowl under hood. First number 37-1001 ('37), 65,001 ('38).

ENGINE NUMBER:—Stamped on right front upper corner of cylinder block.

ENGINE SPECIFICATIONS:—4 cylinder, 'L' head.
Bore—3⅛". Stroke—4⅜".
Displacement—134.2 cubic inches.
Rated Horsepower—15.63 (AMA).
Developed Horsepower—48 at 3200 R.P.M.
Compression Ratio & Pressure—5.7-1 cast-iron head, no optl. Pressure 87 lbs. at 216 R.P.M.
Vacuum Reading—Gauge should show steady reading of 18½" with engine idling at 7 M.P.H.
NOTE—Cylinder bore offset ⅛" from center line of crankshaft toward valve side of engine.

PISTONS:—Full skirt, cast-iron, light weight type.
Weight—21-23 oz. (stripped). **Length—3¾".**
Removal—Pistons and rods removed from above.
Clearance—Top .016". Skirt .0025-.003".
Replacement Pistons:—Finished pistons furnished .003", .005", .010", .015", .020", .025", .030", .035", .040" oversize.
Fitting New Pistons:—Use .0025" feeler stock to check clearance. Pull required to withdraw feeler from between piston and cylinder wall must be 4 lbs. plus or minus 2 lbs.

PISTON RINGS:—Three compression, one oil control ring per piston, all above pin. Oil ring groove drilled radially with oil drain holes.

Ring	Width	End Gap	Wall Thickness
Comp (Top)	3/32"	.010"	.140"
Comp (#2, 3)	3/32"	.008-.013"	.140"
Oil Cont.	3/16"	.008-.013"	.098-.103"

NOTE—Wall thickness .140" for all 1937 rings.

PISTON PIN:—Diameter—.9375". Length—2.682".
Pin floats in piston and rod. Retained by locking rings. Pins furnished .001", .003" oversize.
Pin Fit in Piston—Hand press fit. Clearance .0002-.0004".
Pin Fit in Rod Bushing—Thumb press fit. .0004-.0006".

CONNECTING ROD:—Length 9 3/16". Weight 34 ozs.
Upper Bearing (Piston Pin Bushing)—Bronze.
Crankpin Journal Diameter—1 15/16".
Lower Bearing—Spun babbitt-lined type.
Clearance—.001". **Sideplay**—.004-.009".
Bearing Adjustment:—None (no shims). Replace rods.
Installing Rods:—Connecting rod lower bearings are offset. Install rods with short side of bearing toward nearest main bearing (short side forward on #1 and 3, toward rear on #2 and 4). Oil hole in lower bearing upper half must be toward right (away from camshaft) on all rods.

CRANKSHAFT:—Three main bearing type.
Journal Diameter—2.334" all bearings.
Bearing Type—Removable (slip-in) steel-backed, babbitt-lined. Bearings furnished .010" undersize.
Clearance—.001-.0025".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps.
End Thrust:—Taken by front (#1) main bearing. Endplay .004-.006". Adjustable by shims between crankshaft thrust washer and shaft.

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Bearing Type—Removable bushing (front), machined in crankcase (all others).
Bearing Clearance—.002".
End Thrust:—Taken by thrust plate behind camshaft sprocket and spring loaded plunger in forward end of camshaft bearing against thrust stud on chain case cover.
Timing Chain:—Link-Belt #33403-2. Width 1¼". Pitch ½". Length 23½" or 47 links.
Camshaft Setting:—Sprockets are marked. With pistons #1 and 4 at TDC. marks should be adjacent and in line with a straightedge across the shaft centers. Remove camshaft sprocket to install chain.

VALVES:—Head Diam. Stem Diam. Length
Intake.....1 17/32".....372".....5 13/64" (5¾" overall)
Exhaust ..1 15/32".....371".....5 13/64" (5¾" overall)

	Seat Angle	Lift	Stem Clearance
Intake	45°	21/64"	.002-.004"
Exhaust	45°	21/64"	.003-.005"

NOTE—Exhaust valve seat inserts used.
Tappet Clearance—.004" Int., .006" Exh., engine hot.
Valve Guides:—Removable type installed with taper end up. Remove old guides from above and press in new guides until lower end extends ¾" below valve spring recess machined in block. Exhaust guide longer than intake guide.

Valve Springs:—	Pressure	Length
Valve Closed	46½ lbs.	2¼"
Valve Open	85½ lbs.	1 15/16"

NOTE—Spring free length 2 11/16".
Valve Lifters:—One piece mushroom type. Operate in guide holes reamed in block. Clearance in guides .0008". Serviced by reaming guide hole and installing lifters furnished .005" oversize.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open at TDC. Close 45° ALDC.
Exhaust Valves—Open 40° BLDC. Close 5° ATDC.
To Check Valve Timing—Set tappet clearance #1 intake valve at .010". This valve should start to open with piston on top dead center when flywheel mark 'T.C.I.O.1-4' lines up with pointed end of inspection plate cover screw (top of flywheel housing, left hand side). Reset tappet clearance at .004" (hot).
Motor Gauge—Weidenhoff Adapter #104, #2 Rod.

LUBRICATION:—Pressure system. Gear type oil pump mounted on left hand outer crankcase wall.
NOTE—When installing oil pump, turn engine over until 'IGN' mark on flywheel lines up with pointed end of inspection cover screw on left top side of flywheel housing with #1 piston on compression stroke. Rotate distributor shaft so that rotor is in #1 firing position, then mesh oil pump gear so that tongue-and-slot connection to distributor shaft is engaged without changing position of distributor shaft.
Normal Oil Pressure:—30 lbs. at 30 M.P.H.
Oil Pressure Regulator:—Located under plug on oil pump cover. Operates at 30 lbs. Adjustable by adding or removing shims in plug above spring.
Oil Pressure Gauge:—King-Seeley Electric type, K-S Part No. 6275 (dash unit), 6425 (motor unit).
See article in Mechanical Equipment Section for data.
Crankcase Capacity—4 qts. (refill).

COOLING SYSTEM:—Water Pump. Centrifugal, belt-driven, with adjustable type packing.
See article in Mechanical Equipment Section for data.
Removal—With water drained and fan belt removed, remove pump mounting bolt nuts and pull fan and pump assembly out.
Thermostat:—None.
Water Capacity:—11 quarts.

CLUTCH:—Rockford Cover Assembly, Borg & Beck Driven Plate. Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Moulded, 2 required. I.D. 5⅛". O.D. 7⅞". Thickness ⅛".
Adjustment—Clutch pedal free movement should be ¾-1" (providing clearance of 1/16" between clutch release levers and clutch release bearing within housing). To adjust, loosen lock nut, turn turnbuckle on end of clutch lever link cable.
Removal:—Remove transmission (see Transmission Removal below), take out clutch mounting screws evenly, lift assembly out.

TRANSMISSION:—Warner—Model T84-C (pass. cars), T82-D ('38 trucks). Helical gears (second & high speeds), sliding spur (low and reverse). Synchronizer for second and high speeds.
See article in Mechanical Equipment Section for data.
Removal:—Remove front seat, cover door trim, gear shift lever (at retaining collar), disconnect accelerator pedal from rubber socket, remove toe boards, loosen radiator mounting bolts (at bottom) and brace rods (for fan clearance), disconnect propeller shaft at front, remove lower nuts from mounting bolts at rear of transmission, jack up rear of engine removing transmission rear mounting bracket, and raising until it clears frame cross member, remove housing to engine bolts (bolts should be driven in from front or engine side—holding motor plate in position). Lift out transmission from above.
NOTE—Upper snubbing rubber on mounting bolts should be compressed to ⅝" with lower nuts drawn up tight. Adjust to this thickness with upper nuts.

UNIVERSAL JOINTS:—'Detroit-Universal'—Series 200 (All '37 - early '38) ball & trunnion with plain bearings. Series 4100 (later '38) roller bearings.
See article in Mechanical Equipment Section for data.

REAR AXLE:—Own—Pass. cars and Economy Pickup.
Spicer 21-1—All other trucks. Semi-floating, spiral bevel gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.3-1 (own). 4.7-1, 5.1-1 (Spicer).
Backlash—.005-.010". Shim adjustment.
Removal:—Hoist rear of car, disconnect rear universal, brake cables, shock absorbers, remove spring U-bolts, disconnect rear spring shackles, pull assembly out from car.
Wheel Bearing Adjustment—Endplay controlled by shims between bearing retainer and backing plate. To adjust, remove wheel, hub assembly, oil seal and bearing retainer and add or remove shims.

SHOCK ABSORBERS:—Monroe. Front—152941 ('37), 635702 ('38). Rear—152942 ('37), 635703 ('38 pass.), 636450 ('38 pickup). Direct acting, hydraulic type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Gemmer Model 120. Worm-and-Sector type.
See article in Mechanical Equipment Section for data.
Front Suspension—Conventional 'I' beam section axle with Reverse-Elliot ends and semi-elliptic springs.
Kingpin Inclination—7½° crosswise.
Camber—2° or 21/32". No adjustment.
Caster—3°. Wedge shims bet. spring and axle.
Toe In—3/32". Adjust by loosening tie rod clamp bolts and rotating tie rod.
NOTE—Kingpin bushing diameter .750". End thrust taken by taper roller bearing assembled between axle end and steering knuckle lower yoke.

BRAKES:—Service—Bendix Mechanical, Duo-Servo., Single anchor type. Hand lever applies the service brakes.
See article in Mechanical Equipment Section for data.
Drum—Steel. Diameter—9".
Lining—Moulded type. Width 1¾". Thickness 3/16". Length 19 3/16" per wheel.
Clearance—.010" at heel and toe of each shoe.
Hand Brake:—See Service Brakes.

SERIAL NUMBER:—First number 91751 (see Note). Stamped on front center of front frame cross-member and on right side of cowl under engine hood. NOTE—Cars manufactured after beginning of fiscal year (Sept. 1, 1938), Serial No. 89001 and up, are 1939 cars.

ENGINE NUMBER:—First number 91751. Stamped on boss on right front upper corner of cylinder block.

ENGINE SPECIFICATIONS:— 4 cylinder, 'L' head type.
Bore—3⅛". **Stroke**—4⅜".
Displacement—134.2 cubic inches.
Rated Horsepower—15.63 (A. M. A.).
Developed Horsepower—48 HP. at 3200 R.P.M.
Compression Ratio—5.7-1 cast-iron hd.
Compression Pressure—87 lbs. at 217 R.P.M.
Vacuum Reading—Steady 18½" idling at 7 M.P.H.
NOTE—Cylinder bore offset ⅛" from center line of crankshaft toward valve side of engine.

PISTONS:—Full skirt, semi-steel, light weight type.
Weight—21-23 ozs. (stripped). **Length**—3¾".
Removal—Pistons and rods removed from above.
Clearance—Top .016". Skirt .0025-.003".
Replacement Pistons:—Finished pistons furnished Std. and .003", .005", .010", .015", .020", .025", .030" oversize.
Fitting New Pistons:—Use .0025" feeler stock ⅜" wide inserted between piston and cylinder wall to check clearance. Pull required to withdraw feeler must be 4 lbs. plus or minus 2 lbs.

PISTON RINGS:—Three compression, one oil control ring per piston, all above pin. Oil ring groove drilled for oil drainage.

Ring	Width	End Gap	Side Clearance
Compression	3/32"	.008-.013"	.0015"
Oil Control	3/16"	.008-.013"	.0015"

Wall Thickness—.130-.140" (Comp.), .098-.103" (oil).
Replacement Rings:—Furnished Std. and .003", .005", .010", .015", .020", .025", .030", .040" oversize.

PISTON PIN:—Diameter—15/16" (.9375"). **Length**—2.682". Pin floats in piston and rod. Retained by locking rings. Furnished .001", .003", .005" oversize.
Pin Fit in Piston—.0002-.0004" clearance or hand push fit with piston dry.
Pin Fit in Rod Bushing—.0004-.0006" clearance or thumb press fit.

CONNECTING ROD:—Weight 34 ozs. **Length** 9 3/16".
Upper Bearing (Piston Pin Bushing)—Bronze.
Crankpin Journal Diameter—1.9395" (1 15/16").
Lower Bearing—Spun-babbitt-lined type.
Clearance—.001-.0025". **Sideplay**—.005-.009".
Bearing Adjustment:—None (no shims). Replace or rebabbitt rods. Do not file rods or bearing caps. Rods furnished Standard and .010" undersize.
Installing Rods:—Lower bearings offset. Install rods with short side of bearing toward nearest main bearing (toward front of engine for #1 & 3, toward rear for #2 & 4) with oil squirt hole in rod toward right (away from camshaft) on all rods.

CRANKSHAFT:—Three main bearing type.
Journal Diameters—2.334" all bearings.
Bearing Type—Removable slip-in steel-backed, babbitt-lined type. Bearings furnished Standard and .010" undersize.
Clearance—.001-.0025".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file caps.
End Thrust:—Taken by #1 front bearing. Adjustable by adding or removing shims between crankshaft thrust washer and shaft. **Endplay**—.004-.006".

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Bearing Type—Removable bushing (front), machined in crankcase (all others).
Bearing Clearance—.002-.0035".
End Thrust:—Taken by thrust plate behind camshaft sprocket and spring-loaded plunger in forward end of camshaft bearing against thrust stud on cover.
Timing Chain:—Link-Belt #33403-2. Width 1¼". Pitch ½". Length 23½" or 47 links.
Camshaft Setting:—With #1 piston on top dead center, mesh chain so that timing marks on sprockets are adjacent and in line with a straightedge across the shaft centers.

VALVES:

	Head Diam.	Stem. Diam.	Length
Intake	1 17/32"	.372"	5 13/64" (5¾" overall)
Exhaust	1 15/32"	.371"	5 13/64" (5¾" overall)

	Seat Angle	Lift	Stem Clearance
Intake	45°	21/64"	.002-.004"
Exhaust	45°	21/64"	.003-.005"

NOTE—Exhaust valve seat inserts are used.
Tappet Clearance:—.004" Int., .006" Exh., engine warm. NOTE—Whenever valves ground or new valves installed, car manufacturer recommends .010" setting for all valves for at least 100 miles to allow valves to seat properly.
Valve Guides:—Removable. Installed with taper end up. Remove old guides from above and press in new guides until lower end extends ¾" below valve spring seat recess in block. Exhaust guide longer than intake guide.
Valve Springs:—Free length 2 11/16".

	Spring Pressure	Length
Valve Closed	46½ lbs.	2¼"
Valve Open	85½ lbs.	1 15/16"

Valve Lifters:—Mushroom type. Guide holes reamed directly in block. Serviced by reaming guide hole and installing lifters furnished .005", .010", .020" oversize. **Clearance**—.0007-.001".
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open TDC. Close 45° ALDC.
Exhaust Valves—Open 40° BLDC. Close 5° ATDC.
To Check Timing—Set tappet clearance #1 intake valve at .010" (cold). This valve should open with piston on top dead center when flywheel mark 'T.C. I.O.1-4' lines up with pointed end of inspection plate screw in inspection hole on left top face of flywheel housing (permissible variation ¼" either way from mark). Reset tappet clearance at .004" warm.

LUBRICATION:—Pressure system. Gear type oil pump mounted on outer left side of crankcase.
Oil Pump Installation Note—Turn engine over until 'IGN' mark on flywheel lines up with indicator (inspection hole in top left surface of flywheel housing) with #1 piston on compression stroke, turn distributor shaft so that rotor is at #1 segment in distributor cap, mesh oil pump gear so that distributor not disturbed when tongue-and-slot drive coupling engaged.
Normal Oil Pressure:—30 lbs. at 30 M.P.H.
Oil Pressure Regulator:—Located under plug on oil pump cover. Opens at 30 lbs. Adjustable by adding or removing shims within plug above spring.
Oil Pressure Gauge:—King-Seeley Electric. K-S No. 6275 (dash unit), No. 6425 (engine unit).
See article in Mechanical Equipment Section for data.
Crankcase Capacity:—4 quarts.

COOLING SYSTEM:—Capacity—11 quarts.
Water Pump:—Adjustable packing type.
See article in Mechanical Equipment Section for data.
Thermostat:—None used. Accessory thermostat (for installation in cylinder head outlet) available.
Temperature Gauge (Pass. Cars):—King-Seeley Electric. K-S No. 7205 (Engine Unit). Engine unit controls Signal Light on instrument panel.
Commercial Cars—King-Seeley Electric. K-S No. 6632 (dash unit), No. 5700 (engine unit).
See article in Mechanical Equipment Section for data.

CLUTCH:—Rockford Cover Assembly (with Borg & Beck Driven Plate). Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Moulded type, 2 required. Inside Diam. 5⅛". Outside Diam. 7⅞". Thickness ⅛".
Adjustment:—Pedal free movement must be ¾-1" (providing 1/16" clearance between release levers and release bearing). To adjust, loosen locknut, turn yoke on rear end of clutch control lever cable.
Removal:—Remove transmission (see Transmission Removal below) and flywheel bell housing, take out mounting screws in clutch cover evenly, lift out clutch cover assembly and driven plate.

TRANSMISSION:—Warner Model AS3-T84D. Constant-mesh, synchro-mesh, helical gears (Second and High), sliding spur gears (Low and Reverse).
See article in Mechanical Equipment Section for data.
Removal:—Remove front seat cushion and cover door trim; disconnect gear shift lever at retaining collar, and accelerator pedal from rubber socket, remove toeboards, loosen radiator mounting nuts and brace rod, disconnect propeller shaft at front universal, remove bell housing hand hole cover and unhook throw-out bearing retracting spring. Remove lower nuts on mounting bolts at rear of transmission, jack up rear of engine (see that fan blades do not damage radiator) to clear frame crossmember, remove transmission mounting bracket, remove bell housing bolts, pull transmission straight back.

UNIVERSAL JOINTS:—Detroit Series 4100. Needle bearing, ball-and-trunnion type. 2 used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—Own Model 48. Passenger car models.
Spicer Model 21-1. Truck models. semi-floating, spiral bevel gear type with Hotchkiss drive.
See articles in Mechanical Equipment Section for data.
Ratio—4.1-1 passenger cars. 4.7-1 Std. trucks. 5.1-1 Panel Delivery and Optional on other truck models.
Backlash—.004-.008" Shim adjustment.
Removal:—Hoist rear of car, disconnect drive shaft at rear universal, disconnect brake cables, shock absorbers, spring U bolts and rear shackles, pull assembly out.
Wheel Bearing Adjustment:—To adjust, remove wheel, hub assembly, oil seal, and bearing retainer. Remove shims between retainer and backing plate at both wheels equally. **Endplay**—.004-.006".

SHOCK ABSORBERS:—Monroe. Model 637509—frt., 637508—rear (Std. Control), 637645—frt., 637644—rear (H.D. Control). Direct acting hydraulic type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Gemmer Model 120. Worm-and-sector type.
See article in Mechanical Equipment Section for data.
Front Suspension:—Front axle Own Model 48. Conventional 'I' beam section with Reverse-Elliott ends.
Kingpin Inclination—7½° crosswise.
Camber—2° or 21/32". Not adjustable.
Caster—3°. Adjustable by using wedge shims between spring and spring pad on axle.
Toe In—1/16-⅛" Passenger cars. 3/32" Trucks. Adjust by turning tie rod.
Steering Geometry (Toe Out on Turns)—Inner wheel turned 23°15', outer wheel 20°.

BRAKES:—Service—Bendix Mechanical, duo-servo, single anchor. Hand lever applies all service brakes.
See article in Mechanical Equipment Section for data.
Drum—Steel—Diameter 9" (passenger cars and trucks). Alloy cast-iron—Diameter 11" (Panel).
Lining—Moulded type. Width 1¾". Thickness 3/16". Length per wheel 19 3/16" (passenger cars and trucks), 23 15/16" (panel).
Clearance—.010" at heel and toe of each shoe.
Braking Power—55% front, 45% rear.
Hand Brake:—See Service Brakes above.

SERIAL NUMBER:—First number #39-1001. Stamped on plate on right side of cowl under engine hood and on center of front frame cross-member.

ENGINE NUMBER:—First number 39-1001. Stamped on right front upper corner of engine block.

ENGINE:—Own Model 39. 4 cylinder, 'L' head type.
Bore—3⅛". Stroke—4⅜". Displ'mt.—234.2 cu. ins.
Rated Horsepower—15.63.
Developed Horsepower—61 at 3600 RPM. Std. Head.
Compression Ratio—6.35-1 (Std.), 6.81-1 (High Alt.), Cast-iron heads, 7.0-1 (Optl. HC.) aluminum head.
Compression Pressure—105 lbs. at 185 RPM. (Std. hd.).
Vacuum Reading—Steady 21-23" at 7 MPH. idling speed.
NOTE—Cylinders offset ⅛" from center-line of crankshaft toward camshaft side of engine.

PISTONS:—Aluminum alloy, 'T' slot, Cam Ground, Tin-plated type with narrow 'heat-dam' above top piston ring.
Weight—12 ozs. (stripped). **Length—3¾".**
Removal—Pistons and rods removed from above.
Clearance—.0025" skirt. See Fitting New Pistons.
Replacement Pistons:—Finished pistons furnished Std. and .002", .005", .010", .020", .030" oversize.
Fitting New Pistons:—Use .0025" feeler stock ¾" wide inserted between piston and cylinder wall on side opposite slot to check clearance. Pull required to withdraw feeler must be within 5 to 10 lbs.
Installing Pistons:—Slot toward left (valve) side.

PISTON RINGS:—Two compression, one oil control ring per piston, all above pin with narrow 'heat-dam' groove (no ring) above top ring. Oil ring groove drilled for oil drainage.

Ring	Width	End Gap	Side Clearance
Compr.	3/32"	.008-.013"	.002"
Oil Contr.	3/16"	.008-.013"	.002"

Wall Thickness—.130-.140" (Comp.), .098-.103" (oil).
NOTE—Install taper-face compression ring with mark 'TOP' up.
Replacement Rings:—Furnished Std. and .005", .010", .020", .030" oversize.

PISTON PIN:—Diameter .8117-.8121". **Length** 2 25/32". Pin locked in connecting rod by clampscrew.
Pin Fit in Piston—.0001-.0009" clearance or light push fit with piston at 60° F.
Replacement Pins:—Furnished Std. and .005" oversize.

CONNECTING ROD:—Weight 34 ozs. **Length** 9 3/16".
Crankpin Journal Diameter—1.9395" (1 15/16").
Lower Bearing—Spun babbitt-lined type.
Clearance—.001-.0025". **Sideplay**—.005-.009".
Bearing Adjustment:—None (no shims). Replace or rebabbitt rods. Do not file rods or bearing caps. Rods furnished Standard and .010" undersize.
Installing Rods:—Lower bearings offset. Install rods with short side of bearing toward nearest main bearing (toward front of engine for #1 and 3, toward rear for #2 and 4) with oil squirt hole in rod toward right (away from camshaft) on all rods.

CRANKSHAFT:—Three main bearing type.
Journal Diameters—2.334" all bearings.
Bearing Type—Removable slip-in steel-backed, babbitt-lined type. Bearings furnished Standard and .010" undersize.
Clearance—.001-.0025".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps.
End Thrust:—Taken by #1 front bearing. Adjustable by adding or removing shims between crankshaft thrust washer and shaft. **Endplay**—.004-.006".

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Bearing Type—Removable bushing (front), machined in crankcase (all others).
Bearing Clearance—.002-.0035".
End Thrust:—Taken by thrust plate behind camshaft sprocket and spring-loaded plunger in forward end of camshaft bearing against thrust stud on chain case cover. NOTE—Make certain that plunger and spring in place when replacing chain case cover.
Timing Chain:—Link Belt. Width 1¼". Pitch ½". Length 47 links or 23½".
Camshaft Setting:—With #1 piston on top dead center, mesh chain so that timing marks on sprockets are adjacent and in line with straightedge across shaft centers.

VALVES:—

	Head Diam.	Stem Diam.	Length
Intake	1 17/32"	.373"	5¾" (overall)
Exhaust	1 15/32"	.3725"	5¾" (overall)

	Seat Angle	Lift	Stem Clearance
Intake	45°	23/64"	.0015-.00325"
Exhaust	45°	23/64"	.002-.00375"

NOTE—Separate valve seat inserts not used.
Tappet Clearance:—.014" all valves, engine cold.
Valve Guides:—Removable. Installed with taper end up. Remove old guides from above and press in new guides until lower end extends ¾" below valve spring seat recess in block.
Valve Springs:—Free length 2.684". Cylindrical dampener installed within each spring at upper end.

	Spring Pressure	Length
Valve Closed	59.5 lbs.	2.165"
Valve Open	100 lbs.	1.814"

Valve Lifters:—Mushroom type. Guide holes reamed directly in block. Serviced by reaming guide hole and installing lifters furnished .005", .010", .020" oversize. **Clearance**—.0007-.001".
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 9° BTDC. Close 50° ALDC.
Exhaust Valves—Open 47° BLDC. Close 12° ATDC.
To Check Timing—Set tappet clearance #4 intake valve at .020" (cold). This valve should begin to open with piston 9° or .039" before top dead center when flywheel marked 'I.O.' lines up with pointed end of indicator screw in inspection hole in top left surface of flywheel housing (¼" variation of mark permissible). Reset tappet clearance at .014".

LUBRICATION:—Pressure type. Gear type oil pump mounted on outer left side of crankcase.
Oil Pump Installation Note—Turn engine over until 'TC.IGN' mark on flywheel lines up with indicator (inspection hole in top left surface of flywheel housing) with #1 piston on compression stroke, turn distributor shaft so that rotor is at #1 segment in distributor cap, mesh oil pump gear so that distributor not disturbed when tongue-and-slot drive coupling engaged.
Normal Oil Pressure:—30 lbs. at 30 M.P.H.
Oil Pressure Regulator:—Located under plug on oil pump cover. Opens at 30 lbs. Adjustable by adding or removing shims within plug above spring.
Oil Pressure Gauge:—King-Seeley Electric. K-S No. 7047 (dash unit), No. 6425 (engine unit).
See article in Mechanical Equipment Section for data.
Crankcase Capacity:—4 quarts.

COOLING SYSTEM:—Water Capacity—11¾ qts.
Water Pump:—New packless type with ball-bearing shaft.
See article in Mechanical Equipment Section for data.
Removal—Drain water, remove fan belt and fan blades, loosen radiator mounting nuts, take out mounting bolts and lift pump out.
Thermostat:—Harrison. In outlet elbow on head.
Setting—Starts to open 140-147°F. Fully open 170°F.
Temperature Gauge:—King-Seeley Electric. K-S No. 7041 (dash unit), No. 7000 (engine unit).
See article in Mechanical Equipment Section for data.

CLUTCH:—Long Model 8½CB-CS6 (with Borg & Beck or Long Driven Member). Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Molded type, 2 required. Inside Diam. 5⅛" (Borg & Beck), 6" (Long); Outside Diam. 7⅞" (Borg & Beck), 8½" (Long); Thickness .125" (all).
Adjustment:—Pedal free movement must be ¾-1" (providing 1/16" clearance between release levers and release bearing). To adjust, loosen locknut, turn clevis on rear end of clutch fork cable.
Removal:—Remove transmission (see Transmission Removal below) and flywheel bell housing, take out mounting screws on clutch cover rim, lift clutch assembly and driven plate out.

TRANSMISSION:—Warner Model AS3-T84D. Constant-mesh, synchro-mesh, helical gears (Second & High), sliding spur gear (Low & Reverse).
See article in Mechanical Equipment Section for data.
Removal:—Remove front seat cushion and cover door trim; disconnect gear shift lever at retaining collar, and accelerator pedal from rubber socket, remove toeboards, loosen radiator mounting nuts and brace rod, disconnect propeller shaft at front universal, remove bell housing hand hole cover and disconnect clutch throw-out bearing retracting spring. Remove lower nuts on mounting bolts at rear of transmission, jack up rear of engine (See that fan blades do not damage radiator) to clear frame cross-member, remove transmission mounting bracket, remove bell housing to transmission case bolts, pull transmission straight back and lift out.

UNIVERSAL JOINTS:—Detroit Series 4100. Needle bearing, ball-and-trunnion type. 2 used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—Own Model 39. Semi-floating, spiral bevel gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.3-1 Std., 4.55-1 Deluxe.
Backlash—.004-.008". Shim adjustment.
Removal:—Hoist rear of car, disconnect brake tube and cables, shock absorbers, spring U bolts and rear shackles, pull assembly out.
Wheel Bearing Adjustment:—To adjust, remove wheel, hub assembly, oil seal, and bearing retainer. Remove shims from between retainer and backing plate. **Endplay**—.004-.006" (total both shafts).

SHOCK ABSORBERS:—Monroe. Model 637509—frt., 637508—rear (Std. control), 637645—frt., 637644—rear (H.D. control). Direct acting, hydraulic type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Gemmer Model 120. Worm-and-sector type.
See article in Mechanical Equipment Section for data.
Front Suspension:—Front axle Own Model 39. Conventional 'I' beam section with Reverse-Elliott ends.
Kingpin Inclination—7½° crosswise.
Camber—2°. Not adjustable.
Caster—3°. Adjustable by using wedge shims between spring and spring pad on axle.
Toe In—1/16-⅛". Adjustable by loosening tie rod clamp bolts and turning tie rod.
Steering Geometry (Toe out on Turns)—Inner wheel turned 23°15', outer wheel 20°.

BRAKES:—Service—Wagner-Lockheed Hydraulic, Single Anchor type. Hand lever applies rear wheel service brakes.
See article in Mechanical Equipment Section for data.
Drums—Alloy cast-iron. Diameter 9".
Lining—Moulded type. Width 1¾", Thickness 3/16", Length per wheel 18".
Clearance—.010" toe, .006" heel for each shoe.
Braking Power—56% front, 44% rear.
Hand Brake:—See Service Brakes above.

1940 MECHANICAL CAR MODEL INDEX

IMPORTANT—Refer to "FIELD & PRODUCTION CHANGES, NEW TYPE UNITS, SPECIAL SERVICE NOTES" at front of 1940 Tune Up & Electrical pages.

GRAHAM SPECIAL SHOP NOTES (1940)

For all data see Graham Special Shop Notes in 'M' Section of manual (or 1938 Supplement).

HUPMOBILE SKYLARK MODEL R (1940)

For all data see Hupmobile Skylark Model R (1939) 'M' page.

LINCOLN V12 MODEL (1940)

For all data see Lincoln V12 model (1938) 'M' page.

HOOD LATCH NOTE:—Latch handles located in driver's compartment on extreme right and left sides and must be released before hood can be raised.

SERIAL NUMBER:—First number 65-343. Stamped on plate on left side of cowl under engine hood. On Export cars, Serial Number also stamped on left frame side rail below engine oil level gauge.

ENGINE NUMBER:—First number 65-501. Stamped on left side of crankcase above Starter Bendix.

ENGINE SPECIFICATIONS:—Own. Four cylinder, 'L' head type. Cylinders cast En-bloc and bolted to aluminum alloy crankcase which is integral with flywheel housing.
Bore—2.26". **Stroke**—3.125"
Displacement—50.144 cu. ins. **Rated HP**—8.17.
Developed Horsepower—22 at 3800 RPM.
Compression Ratio—7.4-1 Std. Cast Iron head.
Compression Pressure—135 lbs. at 200 RPM.
Vacuum Reading—Steady 18-20" idling at 7 MPH.

PISTONS:—Bohn Autothermic, aluminum alloy, steel strut, split skirt, cam ground type with tin-plate finish. **Length**—2.083".
Weight—5.125 ozs. (without rings or pin).
Removal—Pistons and rods removed from above.
Clearance—Top .0125-.017". Skirt .0005".
Replacement Pistons:—Pistons furnished in standard size and .003", .005", .010", .020", .030" oversize.
Fitting New Pistons:—Use .0025" feeler installed between pistons and cylinder wall on side opposite slot at right angles to piston pin. Pull required to withdraw feeler must be 7-12 lbs.
Installing Pistons:—Slot toward left hand side.

PISTON RINGS:—Two compression, one oil control ring per piston, all above pin. Oil ring groove drilled with oil drain holes.

Ring	Width	End Gap	Side Clearance
Compr.	.0925-.0935"	.010-.020"	.001-.0015"
Oil Contr.	.1235-.1240"	.010-.018"	.001-.0015"

Replacement Rings:—Furnished standard size and .003", .005", .010", .020", .030" oversize.

PISTON PIN:—Diameter—.6095". **Length**—1.9375". Pin is locked in connecting rod by clampscrew.
Pin Fit in Piston—Free to .0002" clearance. When correctly fitted and installed, 2 lbs. pressure at end of rod should be required to rock rod.
Replacement Pins:—Furnished .003", .005" oversize.

CONNECTING ROD:—Weight 11 ozs. **Length** 5.75".
Crankpin Journal Diameter—1.25".
Lower Bearing—Spun babbitt-lined type. No shims.
Clearance—.0008-.0022". **Sideplay**—.004-.009".
Bearing Adjustment:—None (no shims). Replace rods. Do not file rods or bearing caps.
Installing Rods:—Lower bearings offset. Install with wide half away from center of engine.

CRANKSHAFT:—Three bearing, counterweighted type.
Journal Diameters—#1—1.9975", #2 & 3—2.4975".
Bearing Type—Babbitt-lined bushings front (with integral retainer) and rear (with separate retainer). Center bearing conventional split type.
Clearance—.001-.003".
Bearing Adjustment:—None. Replace bearings. Crankcase should be heated to temperature of boiling water (212°) to remove and install bearings. To remove bearing retainers proceed as follows:
Front Bearing Removal—Remove timing gear cover, pull both timing gears, take out four capscrews in retainer flange, use gear puller to remove bearing.
Center Bearing Removal—Conventional split type.
Rear Bearing Removal—Remove transmission and Clutch (see Transmission and Clutch Sections for directions), remove flywheel by removing 4 bolts and prying centering flange off crankshaft carefully. Remove nuts on bolts in bearing retainer flange, screw capscrews in each of two tapped holes in retainer, turn screws up evenly to force retainer and bearing out.
Replacement Bearings:—.003", .006", .009" undersize.
End Thrust:—By rear bearing. **Endplay**—.004-.006".

CAMSHAFT:—Three bearing. Helical gear drive.
NOTE—Front camshaft bushing retained by setscrew in upper part of crankcase. Screw must be removed in order to remove bushing.
Bearing Type—Bronze Bushings. **Clearance**—.002".
Replacement Bearings:—Front bushing furnished finished to size. Other bushings must be reamed.
End Thrust:—By rear face of camshaft gear hub and front end of front camshaft bushing. When installing timing gears, install camshaft gear first, tighten nut securely with endplay removed and shaft free.
Timing Gears:—Cast iron helical gears.
Camshaft Setting:—Mesh marked crankshaft gear tooth between two marked teeth on camshaft gear.

VALVES:—Intake marked 'INL', exhaust 'EXH' under head.

	Head Diameter	Stem Diameter	Length
Intake Valves	1.125"	.279"	3.25"
Exhaust Valves	1.03125"	.279"	3.25"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	.257"	.0012-.0032"

Tappet Clearance:—.011" Int., .012" Exh. (hot 130°).
Valve Guides:—Pressed in block. Top of guide should be 1" below valve port. Finish ream new guides to inside diameter of .2807-.2817".
Valve Lifters:—Plunger type. Operate in individual guides in cylinder block. Guides removable from lower end after block removed from crankcase. Serviced by installing new lifter and guide assembly.
Lifter Clearance in Guide—.001".
Valve Springs:—Spring free length 1.6875".

	Spring Pressure	Spring Length
Valve Closed	28 lbs.	1¼"
Valve Open	44 lbs.	1"

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 19° BTDC. Close 50° ALDC.
Exhaust Valves—Open 57° BLDC. Close 12° ATDC.
To Check Timing—Check tappet clearance of #1 intake valve (.011" warm). This valve should open with piston 19° or .115" before top dead center when point on flywheel 1 5/32" before '/' (TDC) mark lines up with indicator on housing under pit cover.

LUBRICATION:—Pressure system. Gear type oil pump.
Oil Pump:—Gear type. In crankcase at rear of engine. To remove pump, remove cylinder block from crankcase, take off flat cover on crankcase over oil pump driving gear, pull this gear, remove woodruff key in shaft. Remove oil pan, take out two screws holding oil pump body to crankcase, withdraw pump. Install pump in same manner.
NOTE—Oil pump screen (on elbow on pump cover in crankcase should be cleaned at 10000 mile intervals (average conditions), 2000-3000 mile intervals (extremely dusty or dirty conditions).
Normal Oil Pressure:—30 lbs. at 50 MPH.
Oil Pressure Regulator:—Spring-loaded ball check valve type located on right hand side of crankcase above pump (in large plug). Not adjustable.
Crankcase Capacity:—6 pints or 3 quarts.

COOLING:—Circulation—Thermo-syphon (no pump).
Capacity—6 quarts.

CLUTCH:—Rockford Model UCLA-3-1748. Single plate, dry disc type.
See article in Mechanical Equipment Section.
Facings—Moulded type, 2 used. Inside Diam. 6.5". Outside Diam. 8.4375". Thickness .125". NOTE—Front face floats between driven disc and flywheel (after Motor No. 65-500), rear facing riveted to pressure plate (driven disc is not lined).
Adjustment—Clutch pedal free travel should be 1". Turn adjustable link for correct free travel.
Removal:—Disconnect drive shaft at front universal flange, remove flywheel housing top cover, take out screws in flywheel housing rear cover, remove rear cover and transmission as a unit. Take out screws in clutch cover around flywheel rim (turn all screws out evenly to relieve pressure), lift clutch out.
NOTE—Car manufacturer recommends that engine be removed for easier access to clutch.

TRANSMISSION:—Warner Model AS1-T84E. Constant mesh, synchro-mesh, helical gears (Second & High), sliding spur gears (Low & Reverse).
See article in Mechanical Equipment Section for data.
Removal:—Disconnect drive shaft at front universal flange, drop shaft, take off nuts on transmission mounting studs, pull transmission back.
NOTE—If transmission removed for work on clutch, take out rear flywheel cover screws and remove transmission and cover as an assembly.

UNIVERSAL JOINTS:—Detroit Series 4100. Roller bearing Ball and Trunnion type. 2 used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—Spicer Model 10. Semi-floating, sprial bevel gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—5.25-1. **Backlash**—.006-.008".
Removal:—Disconnect drive shaft at rear universal. Disconnect brake cables and shock absorber links. Free spring clips at axle housing (or disconnect spring shackles to remove springs with axle), remove axle assembly from beneath car.
Axle Shaft Removal—Remove wheel, take out four capscrews in bearing retainer flange, remove grease retainer, bearing shims, brake flange. Use axle shaft puller to remove shaft and bearing.
Wheel Bearing Adjustment:—Controlled by shims under bearing retainer at outer end of axle shaft. Remove wheel, take out capscrews in retainer, remove retainer to adjust. **Endplay**—.008".

SHOCK ABSORBERS (PASS. CARS):—Monroe. Front: Model 1415 (right), 1414 (left). Rear: Conv'tble Sedan 1422 (right), 1423 (left); Others Bantam No. 8899 (right), 8900 (left). Single acting, hydraulic type. ***See article in Mechanical Equipment Section.***

SHOCK ABSORBERS (STATION WAGON & COMM'L):—Own Make. Friction disc type. Same as used on previous models. ***See 1938 Bantam 'M' page for servicing data.***

STEERING:—Steering Gear. Ross S-12. Cam-and-Lever type. ***See article in Mechanical Equipment Section.***
Front Suspension:—Conventional 'I' beam section front axle with transverse spring. Axle positioned by torque arm at each end.
Kingpin Inclination—1°30' crosswise.
Caster—15°. Not adjustable.
Camber—1°15'. Not adjustable.
Toe In—.0625-.125". Adjust tie rod.
Steering Geometry (Toe-out on turns)—With outer wheel turned 20°, inner wheel should be turned 24°18'.

BRAKES:—Service—Own Make. Four wheel, mechanical type. Hand lever applies all four service brakes.
Drums—Steel. Diameter 8".
Lining—Moulded type. Width 1.125". Thickness .1718". Length 13" per wheel.
Clearance—Shoes are self-centralizing.
Hand Brake:—See Service Brakes above.

TORQUE WRENCH SPECIFICATIONS:—*See Torque Wrench article in Mechanical Equipment Section for tightening specifications for Cylinder Head, Main & Connecting Rod Bolts, etc.*

FRONT END ASSEMBLY:—Radiator, fenders, and headlamps mounted on front fender iron assembly and reinforcement plate extending under radiator shell, fender and headlamp with cross bar ahead of radiator core attached to fenders. Assembly held by one bolt in center of front frame cross-member and attached to body at hood side panels, front fenders and fender skirt.

Front Fender Removal—Fender forms hood side panel, headlamp shell and part of radiator shell. May be removed as follows: Disconnect headlamp wires at junction block and fresh air intake at dash. Remove radiator grille, lower front fender bolts at radiator lower panel and radiator pan, bolts and nuts at cowl (on Series 50, 70, remove trim pad at front door hinge pillar for access to nuts), bolts holding fender assembly to upper radiator shell panel and fender iron to mounting strap, lift fender out.

HOOD SIDE PANEL:—No separate hood side panels (part of fender). See Front Fender Removal above.

ENGINE ASSEMBLY:—**Removal.** Engine and transmission may be removed from car as follows: Remove hood and hood center hinge. Remove front end assembly (fenders and radiator) as a unit. Disconnect wires at junction boxes, radiator hose and other connecting parts. Remove battery, disconnect gear shift linkage, clutch linkage and fuel pump intake line. Take out screws attaching front of torque tube to transmission and bolts holding engine to engine mountings. **Do not loosen engine mountings on frame or complete realignment with rear axle will be required when engine installed.** Hoist engine and transmission assembly out of car.

Installation:—Lower engine and transmission carefully in place (engage torque tube connection without disturbing alignment). Tighten front engine support-to-mounting bolts and torque tube-to-transmission screws. Install transmission steady rest (use original number of shims at each end). Install rear engine support-to-mounting screws, raise rear of engine (with jack under transmission) until supports are clear of mountings at each side, then lower slowly until one support just rests on mounting and shim up opposite mounting to level engine supports. Install transmission steady rest brace rod (leave nuts at cross-member loose while tightening bolt at X-member, then tighten nuts at cross-member so that no tension placed on rod).

Alignment—To check alignment, roll car on level floor with front wheels set straight ahead. Rear wheel tracks should overlap front wheel tracks an equal amount on each side. To adjust engine alignment, shift rear engine mountings on frame and shim transmission steady rest mounting at each end so that universal ball joint is exactly in center of car.

PISTONS:—'Dome head' type same as 1939 (with dome cut back 1/32" from piston edge and land clearance of .023-.030" on 40, 50, .026-.033" on 60, 70, 80, 90 and top edge of skirt relieved at horizontal slot) except that narrower top compression ring used (now 3/32", was ⅛"). Top ring has increased bearing surface in ring groove to prevent ring and land failure. Ring grooved depth increased from .148" to .166" (40, 50), .162" to .179" (60, 70, 80, 90). Top ring wall thickness increased from .140" to .155" (40, 50), .155" to .172" (60, 70, 80, 90).

CYLINDER BORE SIZES:—Original production (new engine) bore size indicated on all engines by number and color of paint marks on lower crankcase flange, under gasket, in line with each cylinder (not uniform for all cylinders of one block). See table below for sizes and markings. On engines where engine number followed by dash, all cylinders are .010" oversize.

PISTONS (ORIGINAL & REPLACEMENT):—Pistons graded for size in .0003" steps and marked by one or two color marks below pin bosses within piston skirt. Paper sticker on replacement pistons indicates piston size and cylinder bore for which intended. Pistons fitted in .010" oversize blocks are all low limit .010" oversize (see Replacement Piston table). All replacement pistons furnished with pins fitted. See table below for piston size for all bore diameters.

Series 40, 50—Original Production

Piston Diameter 3 3/32", #1394812 (1940)

Piston & Engine Mark	Piston Diameter	Cylinder Diameter
1—Yellow	3.0892-3.0895"	3.0910-3.0913"
2—Yellow	3.0895-3.0898"	3.0913-3.0916"
1—Green	3.0898-3.0901"	3.0916-3.0919"
2—Green	3.0901-3.0904"	3.0919-3.0922"
1—White	3.0904-3.0907"	3.0922-3.0925"
2—White	3.0907-3.0910"	3.0925-3.0928"
1—Red	3.0910-3.0913"	3.0928-3.0931"
2—Red	3.0913-3.0916"	3.0931-3.0934"

Series 60, 70, 80, 90—Original Production

Piston Diameter 3 7/16", #1394823 (1940)

Piston & Engine Mark	Piston Diameter	Cylinder Diameter
1—Yellow	3.4340-3.4343"	3.4360-3.4363"
2—Yellow	3.4343-3.4346"	3.4363-3.4366"
1—Green	3.4346-3.4349"	3.4366-3.4369"
2—Green	3.4349-3.4352"	3.4369-3.4372"
1—White	3.4352-3.4355"	3.4372-3.4375"
2—White	3.4355-3.4358"	3.4375-3.4378"
1—Red	3.4358-3.4361"	3.4378-3.4381"
2—Red	3.4361-3.4364"	3.4381-3.4384"

Replacement Oversize Pistons

Pistons furnished in following oversizes, graded and marked in same manner as for previous cars. *See Buick Shop Note 'M' page in Manual (or 1938 Supplement) for size graduations and markings for these oversize pistons.*

Oversize	40, 50 — Part No.	60, 70, 80,90
.001"	1394813	1394824
.005"	1394814	1394825
.010"	1394815	1394826
.015"	1394816	1394827
.020"	1394821	1394828
.030"	1394822	1394829

REPLACEMENT PISTON RINGS:—Car manufacturer supplies oversize rings in sizes listed below and recommends that they be fitted to pistons as follows:

Ring Oversize	Piston Oversize
.010"	.005" to .010"
.020"	.011" to .020"
.030"	.021" to .030"

NOTE—Cylinder bores up to .005" max. taper can usually be serviced by installing Perfect Circle X-90 piston ring sets (supplied by car manufacturer).

Excessive Oil Consumption Note—When installing rings to correct this condition use a fine hone very lightly on all bores (just enough to dull glaze surface and not changing bore size). This will allow quicker break-in of new rings.

New Top Compression Ring—New service tool KMO-297-E (40, 50), KMO-297-D (60, 70, 80, 90) necessary for removing and replacing this ring.

REPLACEMENT MAIN BEARINGS:—Bearings are furnished (singly) or finished (sets only) as follows:

Unfinished—Have .012-.014" diameter extra babbitt stock and must be line-reamed to size.

Finished—Furnished in sets of 5 only which are finish-reamed as a set and require no reaming when installed (must not be used singly).

ROCKER ARMS:—Same as 1939. Rocker arms are mounted on tubular shaft and held against side of shaft brackets by spring installed on shaft between adjacent rocker arms. Shaft retained in brackets by pilot setscrew installed in top of #2 bracket. When installing rocker arms, make certain that lug on side of arm at adjusting screw end is toward bracket (all rocker arms Series 40, 50, intake rocker arms Series 60, 70, 80, 90). Exhaust rocker arms for Series 60, 70, 80, 90 are straight (no offset) and do not have reference lug.

Rocker Arm Clearance—.002-.004".

Rocker Arm Lubrication Connection:—Metering restriction for oil feed to hollow rocker arm shaft located in cylinder head and oil pipe fitted directly into top of #1 bracket. #1 and #2 brackets are same part and shaft pilot screw is self-tapping type.

OIL PUMP:—Slot in pump shaft engages tongue on end of distributor shaft. Distributor shaft only pinned to drive gear.

Drive Clearances—Drive shaft bearing .001-.0025". Drive gear backlash .003-.005".

Pump Gear Clearances—Idler gear bearing .001-.0025". Backlash .003-.006". End Clearance .0005-.004".

Relief Valve Clearance—.003-.006".

CLUTCH OVER-CENTER RETURN SPRINGS:—Used on all models. Similar in design to corresponding 1939 models. Connected between frame cross-member and equalizer shaft (40, 60), bracket and clutch pedal (50, 70, 80, 90).

Adjustment—Tighten nut under frame cross-member (40, 60), bracket mounting eyebolt (50, 70, 80, 90) by turning nut up to limit of threads so as to stretch spring as much as possible.

TRANSMISSION STEADY REST:—Transmission support at universal joint housing which is part of engine mounting. Consists of cross-member bolted to leg of 'X' member at each end and to universal joint housing at center. A positioning brace rod is connected between the steady rest and the lower center plate of the 'X' member.

Adjustment—Bolt holes in frame and support are slotted and shims installed at each of support for for centering. Make certain that shims in place when installing steady rest, tighten nuts on two center bolts up tight against spacer, adjust steady rest so that no upward tension placed on transmission, adjust brace rod so that it is tight with no tension placed on rod.

SERIES 60, 70 NOTE:—All data on Rear Axle, Shock Absorbers and Steering given below applies also to Series 60 and 70 cars.

SERIAL NUMBER:—First number 13596807 (Flint), 23601856 (California), 33611856 (Linden). Stamped on top right frame side rail at dash.

ENGINE NUMBER:—First number (40) 4—, (50) 5—3786214 (same number for both series). On boss on right side of crankcase to rear of fuel pump. NOTE—Dash (—) following engine number indicates engine equipped with .010" oversize pistons.

ENGINE SPECIFICATIONS:—Own 40, 50. 8 cylinder, 'I' head type. **Bore**—3 3/32". **Stroke**—4⅛".
Displacement—248 cu. ins. **Rated HP.**—30.63.
Developed Horsepower—107 at 3400 RPM.
Compression Ratio—6.1-1 Std. cast-iron head.
Compression Pressure—126 lbs at 1000 RPM., 112 lbs. at cranking speed (uniform within 6 lbs.).
Vacuum Reading—Steady 18-20" idling at 7-8 MPH.
See Buick Shop Notes for Engine Removal and Installation.

PISTONS:—Modified 'Dome Head', aluminum alloy, tri-slot, cam ground, anodized finished type.
See Buick Shop Notes for description and all Replacement Piston specifications and data. **Length**—4 9/32". **Weight**—14¼ ozs. (stripped), 20.16 (with rings & pin).
Removal—Pistons and rods removed from above. **Clearance**—.0021" (.0018-.0024") top of skirt.
Fitting New Pistons:—If micrometer used, check at points on each side of vertical slot at top of skirt, and at lower end of slot (light contact only). Clearance above correct for pistons at 70° F. If feeler gauge used, install ½" wide feeler between piston and cylinder wall on side opposite slot (piston inverted, pin parallel to crankshaft). Piston should pass on .0015" feeler, hold on .00225" feeler.
Installing Pistons:—Slot away from camshaft.

PISTON RINGS:—Two compression (new top ring), two oil control rings, all above pin (heat-dam groove above top ring). Oil ring grooves drilled for oil drains. NOTE—Install top compression ring with relief up, #2 with mark 'TOP' up.

Ring	Width	End Gap	Side Clearance
Compr. ①	3/32"	.010-.020"	.0015-.003"
Oil Control	3/16"	.010-.015"	.0015-.003"

①—Wall thickness Top .155", #2 .140".
Replacement Rings:—***See Buick Shop Notes.***

PISTON PIN:—Diameter—.8127". **Length**—2 11/16". Pin clamped in rod. Not furnished separately (all replacement pistons have pins installed).
Pin Fit in Piston—.0003-.0004" at 70° F. (easy finger push fit at room temperature).
NOTE—Use #25 wrench (5½") only on pin bolt.

CONNECTING ROD:—Length—7⅝". **Weight**—30¾ ozs. Maximum weight variation ⅛ ounce.
Crankpin Journal Diameter—2".
Lower Bearing—Spun babbitt-lined type.
Clearance—.0008-.0018". **Sideplay**—.005-.010".
Bearing Adjustment:—Shims. Do not file rods or caps.
Installing Rods:—Marks on rod and cap toward rear of engine, oil hole to camshaft. Align rod and cap. NOTE—Use special ground bolts on rod caps.

CRANKSHAFT:—5 bearing, 8 integral counterweights.
Journal Diameters—#1, 2 5/16"; #2, 2⅜"; #3, 2 7/16"; #4, 2½"; #5, 2 9/16".
Bearings—Steel-backed, babbitt-lined type.
See Buick Shop Notes for Replacement Bearing data.
Clearance—.0007-.0022".
Bearing Adjustment:—Shims. Do not file caps.
End Thrust:—Center (#3) bearing. **Endplay** .004-.008".

CAMSHAFT:—5 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 2 5/32"; #2, 2⅛"; #3, 2 3/32"; #4, 2 1/16"; #5, 1¾".
Bearing Type—Steel-backed, babbitt bushings.
Clearance—.0005-.0035". **Endplay**—.004-.008".
End Thrust:—Thrust plate between front bearing and camshaft sprocket.
Timing Chain:—Link-Belt. Width 1". Pitch .500". Length 24½" or 49 links. Initial slack ¼-⅜". 1" worn.
Camshaft Setting:—Mesh copper-plated washers on chain (10 links apart) with sprocket marks upward.

VALVES:—

	Head Diam.	Stem Diam.	Overall Length
Intake	1 17/32"	.3720"	5.1"
Exhaust	1 11/32"	.3715"	5.1"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.348"	.0015-.0035"
Exhaust	45°	.348"	.0021-.0039"

Series 50 Note—Cylinder head must be removed in order to take out #16 push rod.
Tappet Clearance:—.015" all valves—engine hot.
Valve Guides:—Press fit in head, installed with taper end up. Finish ream for correct clearance.
Valve Springs:—Double springs on all valves. Spring free length 1⅞" (inner), 2 5/16" (outer).

	Inner Spring Pressure	Inner Spring Length	Outer Spring Pressure	Outer Spring Length
Closed	15½-20½ lbs.	1 21/32"	26½-31½ lbs.	1 15/16"
Open	45-51 lbs.	1 5/16"	67-73 lbs.	1 19/32"

Valve Lifters:—Barrel type, cast-iron. Lifter guide holes reamed in block. **Clearance**—.0005-.0025".
Rocker Arms:—***See Buick Shop Notes for installation and fitting directions.***
Valve Timing:—See Camshaft Setting above.
Timing Points (Valve .004" Open)
Intake Valves—Open 13° BTDC. Close 68° ALDC.
Exhaust Valves—Open 55° BLDC. Close 22° ATDC.
Opening & Closing Points
Intake Valves—Open 26° BTDC. Close 81½° ALDC.
Exhaust Valves—Open 68° BLDC. Close 35° ATDC.
Valve Timing Check—With .015" tappet clearance, #2 or 7 exhaust valve should be .145" open (actual valve opening—use dial indicator) with #1 & 8 pistons at TDC and flywheel mark 'TDC/1-8' at indicator (inspection hole, right front face of housing).

LUBRICATION:—Pressure type (gear type oil pump in crankcase). ***See Buick Shop Notes for Oil Pump data.***
Normal Oil Pressure:—45 lbs. at 35 MPH.
Oil Pressure Regulator:—On pump. Opens at 45 lbs. Non-adjustable type.
Crankcase Capacity:—8 qts. (dry), 6 qts. (refill).

COOLING SYSTEM:—Capacity—13¼ quarts.
Water Pump:—Ball-bearing, packless type.
See article in Mechanical Equipment Section for data.
Thermostat:—Harrison. In cylinder head outlet.
Setting—Opens at 148-155° F. Fully open 173° F.
Temperature Gauge:—AC #1510906 Thermo gauge.
See article in Mechanical Equipment Section for data.

CLUTCH:—Own Make with Long 10CS-CT or Borg & Beck 'Borglite' driven member. Single plate, 'crown spring' type.
See article in Mechanical Equipment Section for data.
Facings—Spiral or chevron wound woven (Long), Spiral wound molded woven (B&B), 2 used. Inside Diam. 6½" (B&B), 6¾" (Long). Outside Diam. 10". .125" thick.
Adjustment:—Pedal free movement ¾-1" (adjusting clevis and locknut on link at clutch fork). Pedal toeboard clearance (underside) ⅞" (setscrew and locknut at lower end of pedal).
Removal:—Remove Rear Axle & Transmission (see below), take off clutch underpan, release return spring (back off nut on spring eyebolt on 50), disconnect linkage, remove yoke and release bearing retainer, mark clutch and flywheel (reassemble to marks), remove mounting screws in cover flange.
See Buick Shop Notes for 'Over-center' Return Spring installation and adjustment.

TRANSMISSION:—Own Make. All helical gear, constant-mesh, synchro-mesh (second and high), sliding gear (low and reverse) with new remote shift.
Transmission Control:—Buick 'Handi-shift' type.
See articles in Mechanical Equipment Section for data.
Removal:—Remove Rear Axle (see below), disconnect shifter rods at transmission, remove selector (lower) lever, rear transmission support (wire shims to ends of support for correct replacement) and steady rest rod, upper mounting bolts, install guide pins (J-851), remove lower bolts, pull transmission out.
NOTE—See Mechanical Equipment Section for shifter linkage adjustment when installing transmission.
Transmission Steady Rest—***See Buick Shop Notes for installation and adjustment instructions.***

UNIVERSAL JOINT:—Saginaw or Spicer 202-5. 1 used.
See article in Mechanical Equipment Section for data.

REAR AXLE (40, 50, 60, 70):—Own Make. Semi-floating, hypoid gear type with torque tube drive.
See article in Mechanical Equipment Section for data.
Ratio—4.4-1 (white) Std. 40, 50. 3.9-1 (red) Std. 60, 70, Optl. 40. 3.6-1 (blue) Optl. 60. Paint marks on outer ends of axle shaft flanges. **Backlash** .008-.010".
Removal:—Hoist rear of car; disconnect parking brake at equalizer, hydraulic brake line at fitting anchored to left channel iron-strut, lower end of shock absorber links, rear radius rod at axle end, lower end of chassis springs (tie springs to bumper for clearance). Disconnect torque tube at universal joint ball, remove axle assembly from beneath car. IMPORTANT—2 piece torque tube assembly used (flanged at rear end and bolted to carrier). **Torque tube should never be dismantled at rear end except for gasket replacement.** Furnished as complete assembly only.
Axle Shaft Removal:—***See Mechanical Equipment Section.*** NOTE—Right shaft is ¾" longer than left.
Wheel Bearing Adjustment—None.
Rear Suspension:—Coil springs, conventional axle.
See article in Mechanical Equipment Section for data.

SHOCK ABSORBERS (40, 50, 60, 70):—Delco. Front—Model 1948-A. **Rear**—2105-A, B. Double acting hydraulic. Parallel cylinder type used on rear.
See article in Mechanical Equipment Section for data.

STEERING (40, 50, 60, 70):—Steering Gear. Saginaw Worm-and-Double roller type.
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent, linked parallelogram type.
See article in Mechanical Equipment Section for data.
Kingpin Inclination—3½-4½° crosswise.
Camber—Negative ¼° to Pos. 1°. Not adjustable.
Caster—⅜° ± ⅜°. Adjustable.
Toe In—0-1/16". Adjust rods equally.
Steering Geometry (Toe-out on Turns)—Inner wheel turned 22° ± ¾°, outer wheel 20°.

BRAKES:—**Service**—Bendix hydraulic, duo-servo, single anchor type without eccentric adjustment. Hand lever applies rear wheel service brakes.
See article in Mechanical Equipment Section for data.
Drums—Centrifuse type. Diameter 12".
Lining—Woven—Ferodo BZ-10 (primary), Moulded Manhattan Raybestos #2320K (secondary). Width 1¾". Thickness 3/16". Length 9 15/16" (primary), 12¾" (secondary).
Clearance—.015" at both ends of secondary shoe (with primary shoe forced out against drum).
Braking Power—47% rear, 53% front.
Hand Brake:—See Service Brakes above.
NoRol:—Optl. *See Mechanical Equipment Section.*

SERIES 60, 70 NOTE:—For data on Rear Axle, Shock Absorbers and Steering, refer to preceding Series 40, 50 data. All other data listed below applies to Series 60 and 70.

SERIAL NUMBER:—First number 13596807 (Flint), 23601856 (California), 33611856 (Linden). Stamped on top right frame side rail at dash.

ENGINE NUMBER:—First number (60) 6—, (70) 7—, (80) 8—, (90) 9-381200 (same number all series). On boss on right side of crankcase to rear of fuel pump. NOTE—Dash (—) following engine number indicates engine equipped with .010" oversize pistons.

ENGINE SPECIFICATIONS:—Own 60, 70, 80, 90. 8 cylinder 'I' head type. **Bore** 3 7/16". **Stroke** 4 5/16". **Displacement**—320.2 cu. ins. **Rated HP.**—37.81. **Developed Horsepower**—141 at 3600 RPM. **Compression Ratio**—6.25-1 Std. cast-iron head. **Compression Pressure**—130 lbs. at 1000 RPM., 114 lbs. at cranking speed (uniform within 6 lbs.). **Vacuum Reading**—Steady 18-20" idling at 7-8 MPH. ***See Buick Shop Notes for Engine Removal and Installation instructions.***

PISTONS:—Modified 'Dome Head', aluminum alloy, tri-slot, cam ground, anodized finished type. ***See Buick Shop Notes for description and all Replacement Piston specifications and data.*** **Length** 4 7/16". **Weight**—17¼ ozs. (stripped), 24.96 (with rings and pin).

Removal—Pistons and rods removed from above. **Clearance**—.0023" (.0020-.0026") top of skirt.

Fitting New Pistons:—If micrometer used, check at points on each side of vertical slot at top of skirt, and at lower end of slot (light contact only). Clearance above correct for pistons at 70° F. If feeler gauge used, install ½" wide feeler between piston and cylinder wall on side opposite slot (piston inverted, pin parallel to crankshaft). Piston should pass on .0015" feeler and hold on .00225" feeler.

Installing Pistons:—Slot away from camshaft.

PISTON RINGS:—Two compression (new top ring), two oil control rings, all above pin (heat-dam groove above top ring). Oil ring grooves drilled for oil drains. NOTE—Install top compression ring with relief up, #2 with mark 'TOP' up.

Ring	Width	End Gap	Side Clearance
Compr. ①	3/32"	.010-.020"	.0015-.003"
Oil Control	3/16"	.010-.015"	.0015-.003"

①—Wall thickness Top .172", #2 .150".

Replacement Rings:—***See Buick Shop Notes.***

PISTON PIN:—Diameter—.8747". **Length**— 3 1/16". Pin clamped in rod. Not furnished separately (all replacement pistons have pin installed).

Pin Fit in Piston—.0003-.0004" at 70° F. (easy finger push fit at room temperature).

NOTE—Use #25 wrench (5½") only on pin bolt.

CONNECTING ROD:—Length 8¼". **Weight** 38 ozs. Maximum weight variation ⅛ ounce. **Crankpin Journal Diameter**—2¼". **Lower Bearing**—Spun babbitt-lined type. **Clearance**—.0008-.0018". **Sideplay**—.005-.010".

Bearing Adjustment:—Shims. Do not file rods or caps.

Installing Rods:—Marks on rod and cap toward rear of engine, oil hole to camshaft. Align rod and cap. NOTE—Use special ground bolts on rod caps.

CRANKSHAFT:—5 bearing, 8 integral counterweights. **Journal Diameters:**—#1, 2 9/16"; #2, 2⅝"; #3, 2 11/16"; #4, 2¾"; #5, 2 13/16". **Bearings**—Steel-backed, babbitt-lined type. ***See Buick Shop Notes for bearing replacement data.*** **Clearance**—.0007-.0022".

Bearing Adjustment:—Shims. Do not file caps.

End Thrust:—Center (#3) bearing. **Endplay** .004-.008".

CAMSHAFT:—5 bearing. Non-adjustable chain drive. **Journal Diameters**—#1, 2 5/32"; #2, 2⅛"; #3, 2 3/32"; #4, 2 1/16"; #5, 1¾". **Bearing Type**—Steel-backed, babbitt bushings. **Clearance**—.0005-.0035". **Endplay**—.004-.008".

End Thrust:—Thrust plate between front bearing and camshaft sprocket.

Timing Chain:—Link-Belt. Width 1". Pitch .500". Length 25" or 50 links. Initial slack ¼-⅜". 1" worn.

Camshaft Setting:—Mesh copper-plated washers on chain (10 links apart) with sprocket marks upward.

VALVES:—

	Head Diam.	Stem Diam.	Overall Length
Intake	1 25/32"	.3720"	5¼"
Exhaust	1 7/16"	.3715"	5¼"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.347"	.0015-.0035"
Exhaust	45°	.342"	.0021-.0039"

Series 70 Note—Cylinder head must be removed in order to take out #16 push rod.

Tappet Clearance:—.015" all valves—engine hot.

Valve Guides:—Press fit in head, installed with taper end up. Finish ream for correct clearance.

Valve Springs:—Double springs used on all valves. Spring free length 1⅞" (inner), 2 5/16" (outer).

	Inner Spring Pressure	Inner Spring Length	Outer Spring Pressure	Outer Spring Length
Closed	15½-20½ lbs.	1 21/32"	26½-31½ lbs.	1 15/16"
Open	45-51 lbs.	1 5/16"	67-73 lbs.	1 19/32"

Valve Lifters:—Barrel type, cast-iron. Lifter guide holes reamed in block. **Clearance**—.0005-.0025".

Rocker Arms:—***See Buick Shop Notes for installation and fitting directions.***

Valve Timing:—See Camshaft Setting above.

Timing Points (Valve .004" Open)

Intake Valves—Open 14° BTDC. Close 71° ALDC.
Exhaust Valves—Open 56° BLDC. Close 25° ATDC.

Opening & Closing Points

Intake Valves—Open 27° BTDC. Close 84½° ALDC.
Exhaust Valves—Open 69° BLDC. Close 38½° ATDC.

Valve Timing Check—With .015" tappet clearance, #2 or 7 exhaust valve should be .155" open (actual valve opening—use dial indicator) with #1 & 8 pistons on TDC and flywheel mark 'TDC/1-8' at indicator (inspection hole, right front face of housing).

LUBRICATION:—Pressure type (gear type oil pump in crankcase). ***See Buick Shop Notes for oil pump data.*** **Normal Oil Pressure**—45 lbs. at 35 MPH. **Oil Pressure Regulator**—On pump. Opens at 45 lbs. Non-adjustable type. **Crankcase Capacity**—10 qts. (dry), 8 qts. (refill).

COOLING SYSTEM:—Capacity—17 quarts.

Water Pump:—Ball-bearing, packless type. ***See article in Mechanical Equipment Section for data.*** **Removal**—Remove fan belt, pump mounting bolts, lift off pump and fan assembly.

Thermostat:—Harrison. In cylinder head water outlet. **Setting**—Opens at 148-155° F. Fully open 173°.

Temperature Gauge:—AC #1510906 Thermo gauge. ***See article in Mechanical Equipment Section for data.***

CLUTCH:—Own make with Borg & Beck 'Borglite' driven member. Single plate, dry disc type. ***See article in Mechanical Equipment Section for data.*** **Facings**—Spiral wound molded woven, grooved type. 2 used. Inside Diam. 6½". Outside D. 10½". ⅛" thick.

Adjustment:—Pedal free movement ¾-1" (adjusting clevis and locknut on link at clutch fork). Pedal toeboard clearance (underside) ⅞" (setscrew and locknut at lower end of pedal).

Removal:—Remove Rear Axle & Transmission (see below), take off clutch underpan, release return spring (back off nut on spring eyebolt on 70, 80, 90), disconnect linkage, remove yoke and release bearing retainer, mark clutch and flywheel (reassemble to these marks), remove mounting screws in cover flange. NOTE—Metal spacers may be used between release levers and cover to relieve spring tension. ***See Buick Shop Notes for 'Over-center' return spring installation and adjustment.***

TRANSMISSION:—Own Make. All helical gear, constant-mesh, synchro-mesh (second and high), sliding gear (low and reverse) with new remote shift.

Transmission Control:—Buick 'Handi-shift' type. ***See articles in Mechanical Equipment Section for data.***

Removal:—Remove Rear Axle (see below), disconnect shift linkage at transmission, remove rear transmission support (wire shims to ends of support for correct replacement) and steady rest rod, remove upper mounting bolts, install guide pins (J-851), remove lower mounting bolts, pull transmission out. ***NOTE—See Mechanical Equipment Section for shifter linkage adjustment when installing transmission.***

Transmission Steady Rest—***See Buick Shop Notes for installation and adjustment instructions.***

UNIVERSAL JOINT:—Saginaw or Spicer 202-3. 1 used. ***See article in Mechanical Equipment Section for data.***

REAR AXLE (80, 90):—Own Make. Semi-floating, hypoid gear type with torque tube drive. See Series 40, 50 (preceding page) for 60, 70 data. ***See article in Mechanical Equipment Section for data.*** **Ratio**—4.182-1 (80), 4.555-1 (90). **Backlash** .008-.010".

Removal:—Hoist rear of car; disconnect parking brake at equalizer, hydraulic brake line at fitting anchored to left channel iron-strut, lower end of shock absorber links, rear radius rod at axle end, lower end of chassis springs (wire springs to bumper for clearance). Disconnect torque tube at universal joint ball, remove axle assembly from beneath car.

Axle Shaft Removal:—***See Mechanical Equipment Section.*** NOTE—Right axle shaft 15/16" longer than left shaft.

Wheel Bearing Adjustment—None.

Rear Suspension:—Coil springs, conventional axle. ***See article in Mechanical Equipment Section for data.***

SHOCK ABSORBERS (80, 90):—Delco. Front—Model 1902-E, **F. Rear**—1751-R, S. Double acting, hydraulic. See Series 40, 50 (preceding page) for 60, 70 data. ***See article in Mechanical Equipment Section for data.***

STEERING (80, 90):—Steering Gear. Saginaw Worm-and-Double roller type. See Series 40, 50 page (preceding) for 60, 70 data. ***See article in Mechanical Equipment Section for data.***

Front Suspension:—Independent, linked parallelogram type with coil springs. **Kingpin Inclination**—4-5° crosswise. **Camber**—Negative ¼° to Pos. 1°. Not adjustable. **Caster**—0° ± ⅜°. Adjustable. **Toe In**—0-1/16". Adjust rods equally. **Steering Geometry (Toe-out on turns)**—Inner wheel turned 24° ± ¾°, outer wheel 20°.

BRAKES:—Service—Bendix hydraulic, duo-servo, single anchor type without eccentric adjustment. Hand brake applies rear wheel service brakes. ***See article in Mechanical Equipment Section for data.*** **Drums**—12" centrifuse (60,70). 14" cast-iron (80,90). **Lining**—Woven—Ferodo BZ-10 (primary), Moulded Manhattan Raybestos #2320K (secondary). Width 2¼" (60, 70), 2" (80, 90). Length—Primary 10" (60, 70), 12 1/16" (80, 90), Secondary 12 15/16" (60, 70), 14¾" (80, 90). **Clearance**—.015" at both ends of secondary shoe (with primary shoe forced out against drum). **Braking Power**—47% rear, 53% front.

Hand Brake:—See Service Brakes above.

NoRol:—Optl. ***See Mechanical Equipment Section.***

TORQUE WRENCH SPECIFICATIONS:—*See Torque Wrench article in Mechanical Equipment Section for tightening specifications for Cylinder Head, Main & Connecting Rod Bolts, etc.*

HOOD & SIDE PANEL REMOVAL:—Hood hinged at cowl and lifts from forward end. Tilt radiator ornament back to free latch, lift hood slightly, free safety catch under forward edge of hood, lift up. NOTE—1940 V8 Models equipped with automatic safety catch (released by radiator ornament).

Side Panels—Secured by a screw at each corner at top edge and by 3 screws (V8), by clips (V16) along lower edge. To remove, take out screws and lift panel off.

FRONT SHEET METAL ASSEMBLY:—Radiator, radiator grilles and front fenders all bolted together (may be removed or installed as a unit). One bolt in center of radiator support engages enlarged hole in frame front cross member (enlarged hole permits moving entire assembly fore-and-aft, shims under mounting bolt control height). Fender-to-body bolt holes also enlarged to permit shifting assembly.

Alignment—Assembly must be aligned in following order: 1) Install and center hood (proper clearance at cowl must also be secured). 2) Install fender and grille assembly (leaving bolts loose), align with hood and tighten bolts. 3) Adjust radiator tie rods and tighten for snug fit (check radiator shutter for free movement). NOTE—Do not attempt to change front end alignment by shifting tie rods (may cause radiator shutter frame misalignment).

RADIATOR REMOVAL (ALL SERIES):—To remove radiator core, drain cooling system, remove hoses and radiator tie rods, disconnect shutter rod at thermostat (V8). Remove air cleaner (V8), ignition coils (V16), generator, fan and inlet elbow on left fuel pump (V16). Disconnect headlamp wires at block on right fender and remove harness from radiator (V8). Take out radiator mounting screws at each side and lift out core.

CYLINDER HEAD GASKETS (V8 MODELS):—Care must be exercised to install proper gasket. Use of wrong gasket may cause sluggish engine performance. Part No. 1419114 (50, 52), 1419759 (60S, 62, 72, 75) stamped between inner bores.

Installation—Interchangeable between banks. Install large triangular hole on inner edge to rear.

CYLINDER HEAD IDENTIFICATION (V8 MODELS):—Cadillac 72, 75; La Salle 50, 52. Same cylinder head used on both (provides higher compression ratio on 72, 75). All production cylinder heads marked with piston displacement and compression ratio as follows: Right Hand Head 322-625 and 346-670, Left Hand Head—322-625 (La Salle 50, 52), 346-670 (Cadillac 72, 75). Replacement heads marked with both ratios (both right and left hand heads).

Cadillac 60S, 62. These heads have ratio of 6.25-1. Interchangeable between these models only.

CYLINDER HEAD INSTALLATION:—V8 Models. Two capscrews used at water outlet connection on each head have oversize head and are ½" longer. Must not be used in any other position (will damage head if installed in any other holes).

V16 Models. Install short capscrews along lower edge of head, coat all screws with white lead before installing (necessary to prevent leaks as screws enter water jacket). Tighten screws from center of head outward, retighten with engine warmed up.

LOWERING COMPRESSION RATIO (V8 MODELS):—Standard compression ratio may be lowered by installing two shims between cylinder head and block.

REPLACEMENT PISTONS (ALL MODELS):—Finished aluminum alloy, T-slot, cam ground pistons with anodized finish furnished for service in sizes (with piston skirt diameter limits) listed below.

CADILLAC V8 AND LA SALLE V8

Size	La Salle V8	Cadillac V8
Standard	3.3726-3.3746"	3.4979-3.4999"
.003" oversize	3.3761-3.3776"	3.5014-3.5029"
.005" oversize	3.3781-3.3796"	3.5034-3.5049"
.010" oversize	3.3831-3.3846"	3.5084-3.5099"
.015" oversize	3.3881-3.3896"	3.5135-3.5149"
.030" oversize	3.4031-3.4046"	3.5284-3.5299"

CADILLAC V16

Size	Cadillac V16
Standard	3.2483-3.2503"
.005" oversize	3.2538-3.2553"
.010" oversize	3.2588-3.2603"
.015" oversize	3.2638-3.2653"
.030" oversize	3.2788-3.2803"

PISTON PIN SERVICING (V8 MODELS):—Removal. Heat piston in boiling water to expand pin hole, push pin out by hand from ribbed boss end (one boss marked by raised rib on underside within piston). Do not use arbor press to remove pins.

Pin Bushing in Connecting Rod:—Split type. Press out old bushing in arbor press (use sudden jerk to start bushing). Use special tool kit No. HM-250 to install new bushings. Insert bushing with split at right angles to rod center-line, and oil hole lined up with oil hole in rod, press bushing into rod with special bushing replacer and arbor press. Finish bushing by pressing burnishing bar through bushing (use kerosene as lubricant) using 2 or 3 ton arbor press, check pin fit, repeat burnishing operation until correct clearance secured.

Installing Pin:—Heat piston in boiling water, coat pin with engine oil, press pin in by hand from side opposite ribbed boss.

PISTON PIN REMOVAL & INSTALLATION (V16):—Rod web split at pin hole with clampscrew below pin (pin hole not split open) and pin must be removed and installed as follows: With locking screw removed, use tool J-1167 to spread split end of connecting rod, then tap pin out of piston and rod with brass drift. Install in same manner.

CONNECTING RODS (V8 MODELS):—Rods are split at an angle at lower end to permit removal through top of block. Caps doweled in rod and held by special capscrews (unequal length) with lockwashers under head. Use new lockwashers (Part #1419129)

Connecting Rod Bearing Installation:—Bearing halves not interchangeable (upper half has oil holes for piston pin oil channel and spray hole for cylinder wall lubrication). When installing upper halves, oil holes must line up with drilled holes in rod.

MAIN BEARING SERVICING (ALL MODELS):—Removal. To remove bearing upper halves (without removing crankshaft), use cotterpin with head flattened to "T' shape inserted in crankshaft oil hole, rotate crankshaft in reverse direction to turn bearing shell out. Rotate new bearing shell in place in same manner (making sure locating lug on bearing shell in correct position to seat in groove in block).

Rear Main Bearing Oil Seal Installation:—With crankshaft out of engine (remove bearing shells to prevent damaging), install length of new packing making certain that it is inserted behind sheet metal retainer, drive packing up into place in crankcase with tool J-1177 (pound handle of tool with hammer to seat packing), cut off each end of packing flush with bearing edge before removing tool. Install packing in bearing cap in same manner

CAMSHAFT BEARING SERVICING (V8 MODELS):—Removal. To remove camshaft, remove radiator and engine front cover, transmission and flywheel housing, distributor and oil pump drive gear, valve lifter assemblies, timing chain and sprockets. Pull camshaft out, press old bushings out (use tool J-829).

Camshaft Bushing Installation:—Paint outside surface of bearings with white lead, install front bearing first, rear bearing second, center bearing last (in each case, pilot installing tool in other two bearings). Make certain that oil holes aligned.

CAMSHAFT SERVICING (V16 MODELS):—Camshaft must be removed for all service operations.

Removal & Installation:—Remove front end assembly (radiator & frt. fenders) as unit, disconnect the flexible pipes from gasoline lines to fuel pumps and jack up front of engine, remove crankshaft balancer and pulley, chain case cover, timing chain and camshaft sprocket, valves, valve lifters, vacuum pump and operating plunger. Install special camshaft tool J-1210 (attach by turning tool into tapped hole for sprocket screw), withdraw camshaft. When installing camshaft, make certain that front camshaft bearing is properly installed.

VALVE SERVICING (V8 MODELS):—Valves should be checked with gauge J-1055 for correct stem length when installed (grind off end of stem until gauge slides in place with valve in closed position).

NOTE—Valve lifter assemblies must be removed before valve springs can be compressed to remove spring keepers and free valves. Use tool J-827 to hold plungers down when re-installing lifters. Use tool J-257-X to compress valve springs for spring keeper removal and installation.

LUBRICATION SYSTEM SERVICING (V8 MODELS):—Clean all oil lines and channels in block before installing new main or connecting rod bearings. To clean channels in block, remove oil pump and take out plug at front end of crankcase oil header (left side at angle of crankcase and cylinder block). Use compressed air and shots of kerosene at plug hole to clean lines (if engine dismantled, take out plugs at line to each bearing, clean lines with wire brush). Clean oil hole at lower end of each rod.

Oil Pump Specifications:—Oil pump drive gear Backlash .008-.012", Endplay .001-.004" (new), .006" (worn). Drive shaft clearance in pump body .0010-.0025" (new), .005" (worn). Pump gear clearance in pump body .002-.004" (new), .006" (worn).

LUBRICATION SYSTEM SERVICING (V16 MODEL):—Clean oil passages in block in same manner as for V8 models. If auxiliary relief valve for hydraulic valve lifter lines removed (located at rear of left hand lifter passage) make certain that relief hole turned so that oil will flow against camshaft and not on oil pump gears when valve reinstalled. Do not disturb plugs in crankcase directly above each valve lifter oil passage.

Oil Pump Specifications—Same as V8 models above.

CLUTCH BALANCING (ALL MODELS):—Balance clutch after installation by running the engine (with rear wheels jacked up) at speeds of 24 to 30 MPH. (for V8), 32 to 38 MPH. (for V16) and checking vibration. Add ⅛" washers with 5/16" hole under mounting screw heads (start at point where clutch drilled for balance) until vibration gone.

Clutch Housing Removal (V16):—Clutch must be removed before housing can be taken off engine (housing will not clear clutch and flywheel).

Locking Pin Removal:—Replacement clutches furnished by car manufacturer equipped with a locking pin (or block) under each release lever. These 3 pins must be removed when clutch installed on car (pins released when cover tightened) to avoid damage when car operated (pins will drop into clutch housing).

ENGINE HOOD, SIDE PANEL REMOVAL & FRONT SHEET METAL ASSEMBLY ALIGNMENT:—*See Cadillac Shop Notes.*

SERIAL & ENGINE NUMBER:—1st number 6320001 (60S), 8320001 (62), 7320001 (72), 3320001 (75). On crankcase to rear of left cylinder block and on left frame side member opposite steering gear.

ENGINE SPECIFICATIONS:—**Own.** 8 cylinder, 90° Vee, L head type. Upper crankcase and cylinder blocks cast Enbloc. **Bore**—3½". **Stroke**—4½". **Displacement**—346 cu. ins. **Rated HP**—39.20. **Developed Horsepower**—135 (60S, 62), 140 (72, 75) at 3400 RPM. **Compression Ratio**—6.25-1 (Std. 60S, 62; Optl. 72, 75), 6.7-1 (Std., 72, 75; Optl. 60S, 62), 5.75-1 (Optl.). *See Cadillac Shop Notes for Head installation, head gasket data, and changing compression ratios.* **Compression Pressure**—155 lbs. (60S, 62), 170 lbs. (72, 75) at 1000 RPM or approximately 105-110 lbs. (60S, 62), 110-115 lbs. (72, 75) at cranking speed. **Vacuum Reading**—Steady 20-21" idling at 7-8 MPH.

PISTONS:—Lynite or Bohn Lo-Ex aluminum alloy, 'T' slot, Cam Ground type with Anodized finish (special hard oxide bearing surface). **Length**—4⅛". **Weight**—18.30 ozs. (stripped), 25.10 ozs. (complete). **Removal**—Pistons and rods removed from above. **Clearance**—Skirt .0020-.0025". See Fitting Pistons. **Replacement Pistons:**—*See Cadillac Shop Notes.* **Fitting New Pistons:**—Check piston diameter with micrometer gauge at right angles to pin hole just below lower ring groove and also ½" above lower edge. If feeler gauges (⅜-½" wide, 7-10" long) used, insert feeler next to T-slot. Piston should fall through bore of own weight on .002" feeler, and hold on .0025" feeler. NOTE—Cylinder bore out-of-round .0005" maximum, taper .0003". **Installing Pistons:**—T-slot to left, for all pistons.

PISTON RINGS:—2 compression, 2 oil control rings per piston, all above pin. Oil ring grooves drilled.

Ring	Width	End Gap	Side Clearance
Compr. (Top)	3/32"	.007-.012"	.0023-.0041"
Compr. (#2)	⅛"	.007-.012"	.0013-.0026"
Oil Control	5/32"	.007-.015"	.0013-.0026"

Replacem't Rings:—.003",.005",.010",.015",.030" oversize.

PISTON PIN:—**Diameter**—⅞. **Length**—3 1/16". Pin floats in piston and rod. Held by locking rings. *See Cadillac Shop Notes for pin servicing data.* **Pin Fit in Piston**—.0004" press fit (ribbed end), .0000" clearance or free fit at 70° F. (plain end). **Pin Fit in Rod Bushing**—.0002-.0008" clearance (new), .0018" (worn limit).

CONNECTING ROD:—**Weight** 37.472 ozs. **Length** 8¾". **Crankpin Journal Diameter**—2.4590-2.4595". **Lower Bearing**—Steel-backed, babbitt-lined type. **Clearance**—.0015-.0025" (new), .0045" Max. (worn). **Sideplay**—.008-.014". **Bearing Adjustment:**—None (no shims). Replace bearings. Do not file rod or caps. *See Cadillac Shop Notes for connecting rod and bearing installation data.* **Installing Rods:**—Numbers on rods and bearing caps on same side and installed in same numbered cylinders with marks down toward oil pan.

CRANKSHAFT:—3 bearing with 6 counterweights. *See Cadillac Shop Notes for main bearing servicing and rear main bearing oil seal renewal.* **Journal Diameters**—2½" all bearings. **Bearings**—Removable steel-backed, babbitt-lined. **Clearance**—.0015-.0025" (new), .005" Max. (worn). **Bearing Adjustment:**—None (no shims). Replace bearings. Do not file bearing caps. **End Thrust:**—Taken by center (#2) bearing. **Endplay**—.001-.005" (new), .010" Max. (worn).

CAMSHAFT:—3 bearing, non-adjustable chain drive. *See Cadillac Shop Notes for camshaft bushing data.* **Journal Diameters**—#1 and #2, 2.4071-2.4078"; #3, 2.0009-2.0016". **Bearing Type**—Steel-backed, babbitt bushings. **Clearance**—.0015-.0033" (new), .0045" Max. (worn). **End Thrust:**—Taken by thrust plate behind camshaft sprocket. No endplay should be permitted. **Timing Chain:**—Morse Type C #3682-R Side Guide type. Width 1¼". Pitch ⅜". Length 23¼" or 62 links. NOTE—Install chain 'endless' as an assembly with sprockets. Use Tool J-836 to pilot camshaft sprocket. **Camshaft Setting:**—Sprockets marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across shaft centers.

VALVES:—	Head Diameter	Stem Diameter	Length
Intake	1.876-1.886"	.3415-.3425"	5 33/64"
Exhaust	1.626-1.636"	.3405-.3415"	5 33/64"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.335"	.0012-.0032"
Exhaust	45°	.345"	.0022-.0042"

NOTE—Stem clearance worn limit .005" (all valves). Valve heads not slotted. *See Cadillac Shop Notes for valve servicing.* **Tappet Clearance:**—None (automatic take-up used). **Valve Guides:**—Press in block (long step end down). **Valve Lifters:**—Wilcox-Rich 'Zero-lash' type hydraulic lifters (Mushroom type) in removable brackets. *See article in Mechanical Equipment Section for data.* **Clearance**—.0010-.0024" (new), .0035" (worn).

Valve Springs:—Free length 2.210".

	Spring Pressure	Spring Length
Valve Closed	66 lbs.	1.926"
Valve Open	145 lbs.	1.581"

Valve Timing:—See Camshaft Setting above. **Intake Valves**—Open at TDC. Close 42° ALDC. **Exhaust Valves**—Open 52° BLDC. Close 10° ATDC. **Valve Timing Check**—#1 cylinder (front-left bank) intake valve should open with piston at TDC and mark 'C.1/6' on crankshaft pulley aligned with chain case cover pointer (on right side).

LUBRICATION:—Pressure type (gear type pump in crankcase). *See Cadillac Shop Notes for oil pump data.* **Normal Oil Pressure:**—15 lbs. idling, 25 lbs. at 30 MPH. **Oil Pressure Regulator:**—Opens at 30 lbs. On oil pump. Non-adjustable. **Crankcase Capacity**—7 quarts.

COOLING SYSTEM:—**Capacity**—24½ quarts. *See Cadillac Shop Notes for radiator core removal.* **Water Pump:**—Self-adjusting packing type. *See article in Mechanical Equipment Section for data.* **Thermostat:**—Mounted in radiator top tank, linked to radiator shutters by rod on forward side. **Setting**—(Std. Type) Starts to open 153-158° F., fully open at 175° F. (High Reading Type—use with Heaters) Starts to open 168-173° F. Fully open 190°. **Shutter Adjustment**—Adjust clevis on threaded end of rod to secure 1/16" tension (shutters closed). **Temperature Gauge:**—AC Electric. #1510773 (dash unit), #1510774 (engine unit). *See article in Mechanical Equipment Section for data.*

CLUTCH:—**Long Model 11CF-10½CI (60S, 62), 11CF-TI (72,75).** Semi-centrifugal, single plate, dry disc type. NOTE—Borg & Beck Model 11A6 (marked #945) Single plate, dry disc type with 'Borglite' driven member used on early cars. *See article in Mechanical Equipment Section for data.* **Facing (Long)**—Spiral or Chevron wound (spiral grooved) woven, 2 used. Inside Diam. 7". Outside Diam. 10½" (60S, 62), 11" (72, 75). Thickness .137". *See article in Mechanical Equipment Section for data.* **Pedal Adjustment:**—Pedal free travel ⅞-1⅛" (adjusting nut on connector link at clutch fork). **Removal:**—Remove transmission (see below), drop clutch housing pan, punch mark clutch cover, pressure plate and flywheel, remove 6 cover screws. NOTE—Install driven disc with oil guard (cover over dampener springs) to rear. *See Cadillac Shop Notes for clutch locking pin removal (on replacement clutches) and balancing data.*

TRANSMISSION:—**Own Make.** All helical gear, constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse) with remote shift. *See article in Mechanical Equipment Section for data.* **Transmission Control:**—Remote steering col. shift. *See article in Mechanical Equipment Section for data.* **Removal:**—Support engine with jack under rear end of oil pan (use wooden block to avoid damage to pan), remove propeller shaft (disconnect front and rear universals), free transmission extension at engine rear support, remove crossmember with engine rear support, disconnect speedometer cable, remove shifter rods from levers at transmission, support transmission at rear, take out mounting screws, pull straight back (plug clutch connection shaft bearing drain hole as soon as accessible to prevent lubricant loss), lower front end of transmission and remove.

UNIVERSAL JOINTS:—**Mechanics 3C.** Needle bearing. *See article in Mechanical Equipment Section for data.*

REAR AXLE:—**Own Make.** Hypoid gear, semi-floating type with Hotchkiss drive. NOTE—Manufacturer recommends Carrier Assembly serviced by factory. **Ratio**—3.92-1 (60S, 62), 4.31-1 (72), 4.58-1 (75). **Backlash**—.004-.010". Screw adjustment. **Removal:**—Disconnect rear universal, remove axle shafts (see below), and carrier flange capscrews. **Axle Shaft Removal:**—Remove wheel, axle shaft nut, dust seal from rim of drum, pull off hub and drum, disconnect brake line and remove backing plate. Pull shaft and bearing assembly (use Tool J-838). **Wheel Bearing Adjustment**—None.

SHOCK ABSORBERS:—**Delco. Front**—1946-G, H (except 75), 1951-C, D (75). **Rear**—1751-G, H (60S), V, W (62); 2007-N, P (72), 2010-C, D (75). Double acting, hydraulic. *See article in Mechanical Equipment Section for data.*

STEERING:—**Steering Gear**—Saginaw Worm-and-Double Roller type (All except 72), new Re-circulating Ball type (72). *See article in Mechanical Equipment Section for data.* **Front Suspension:**—Independent linked parallelogram type with coil springs. *See article in Mechanical Equipment Section for data.* **Kingpin Inclination**—5°6' (60S, 62), 5°1' (72, 75). **Caster**—Neg. 1¾° to Neg. 2¾° (60S, 62, 72), Neg. ½° to Neg. 1° (75). Equal within ½°. **Camber**—0 to Pos. ¾° (except 75), 0 to Pos. ½° (75). **Toe In**—1/32-3/32" (at rest). Adjusters at outer end of each rod (except 75), turn tie rods (75). **Steering Geometry (Toe-out on turns)**—Inner wheel turned 22¼-23¾° (except 75), 22¾-24¼° (75). Outer 20°.

BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type (eccentric on 75 only). Hand lever applies rear wheel service brakes. *See article in Mechanical Equipment Section for data.* **Drums**—Centrifuse. Diameter—11.995-12.005" (60S, 62, 72), 13.995-14.005" (75). **Lining**—Molded. Length—Primary 11 17/32" (60S, 62, 72), 13 21/32" (75); Secondary 12 31/32" (60S, 62, 72), 15 1/32" (75). Width—Front wheel 2¼". Rear 2" (60S, 62), 2½" (72), 2¼" (75). Thickness 3/16" (60S, 62, 72), ¼" (75). **Clearance**—.015" both ends of secondary shoe—with primary shoe forced out against drum (60S, 62, 72). .010" both ends of secondary shoe with primary just free of drag (75). **Hand Brake:**—See Service Brakes above.

ENGINE HOOD, SIDE PANEL REMOVAL & FRONT SHEET METAL ASSEMBLY ALIGNMENT:—*See Cadillac Shop Notes.*

SERIAL & ENGINE NUMBER:—1st number 5320001. On upper rear corner of left cylinder block and on left frame side bar opposite steering gear.

ENGINE SPECIFICATIONS:—16 cylinder, 135° Vee, 'L' head. Cylinder banks and crankcase cast integral. *See Cadillac Shop Notes for head installation data.*
Bore—3¼". Stroke 3¼".
Displacement—431 cu. ins. Rated HP.—67.60.
Developed Horsepower—185 HP. at 3600 R.P.M.
Compression Ratio—6.75-1 Std. 6.08-1 Optl.
Compression Pressure—180 lbs. at 1000 R.P.M. or approximately 110-115 lbs. at cranking speed.
Vacuum Reading—Steady 20-21" idling at 7-8 MPH.

PISTONS:—Lynite & Bohn Lo-Ex aluminum alloy, 'T' slot, cam ground type with anodized finish (special hard oxide bearing surface). **Length—3¾".**
Weight—15.28 ozs. (stripped), 21.136 ozs. (complete).
Removal—Pistons and rods removed from above.
Clearance—.0020-.0025" skirt. See Fitting Pistons.
Replacement Pistons:—*See Cadillac Shop Notes.*
Fitting New Pistons:—Check piston diameter with micrometer gauge at right angles to pin hole just below lower ring groove and also ½" above lower edge. If feeler gauges (⅜-½" wide, 7-10" long) used, insert feeler next to T-slot. Piston should fall through bore of own weight on .002" feeler and hold on .0025" feeler. NOTE—Cylinder bore out-of-round .0005" Max., taper .0003".
Installing Pistons:—Slot to left, for all pistons.

PISTON RINGS:—Two compression, one oil control ring per piston, all above pin.

Ring	Width	End Gap	Side Clearance
Comp. (Top)	3/32"	.007-.015"	.0030-.0043"
Comp. (#2)	⅛"	.007-.015"	.0013-.0026"
Oil Control	3/16"	.007-.015"	.0013-.0026"

Replacement Rings: .003",.005",.010",.015",.030" oversize.

PISTON PIN:—Diameter—13/16". Length—2 25/32".
Pin is locked in rod by locking screw. Oil grooves broached for full length of pin hole in piston.
See Cadillac Shop Notes for special pin removal and installation instructions.
Pin Fit in Piston—.0001-.0006" clearance (new), .0018" (worn).
Replacement Pins:—Undersizes not furnished.

CONNECTING ROD:—Weight 24.528 ozs. Length 6⅜".
Crankpin Journal Diameter—1.9988-1.9993".
Lower Bearing—Steel-backed, babbitt-lined.
Clearance—.0015-.0025" (new), .0045" (worn).
Sideplay—.008-.014".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file connecting rods or caps.
Installing Rods:—Numbers on rods and bearing caps on same side and installed in same numbered cylinders with marks down toward oil pan.

CRANKSHAFT:—9 bearing, integral counterweights.
See Cadillac Shop Notes for main bearing servicing and rear main bearing oil seal renewal.
Journal Diameters—2½ all bearings.
Bearings—Bronze-backed, babbitt-lined (center), steel-backed, babbitt-lined (all others).
Clearance—.0015-.0025" (new), .005" Max. (worn).
Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps. Upper halves can be rotated out without removing crankshaft.
End Thrust:—Taken by #5 (center) bearing.
Endplay—.001-.005" (new), .010" (worn).

CAMSHAFT:—5 bearing, non-adjustable chain drive.
See Cadillac Shop Notes for camshaft removal and installation instructions.
Bearing Type—Steel-backed, babbitt bushings.
Clearance—.0013-.0025" (new), .004" (worn).
End Thrust:—Taken by thrust plate flange at front bearing. **Endplay** .005-.015" (new), .020" (worn).
Timing Chain:—Morse Type C #3682-R. Width 1¼". Pitch ⅜". Length 23¼" or 62 links.
Camshaft Setting:—Sprockets marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1.495-1.505"	.3415-.3425"	5 19/32"
Exhaust	1.370-1.380"	.3405-.3415"	5 39/64"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.290"	.0010-.0030"
Exhaust	45°	.302"	.0020-.0040"

NOTE—Worn limit for stem clearance .005" (all valves). Valve heads not slotted.
Tappet Clearance:—None (automatic take-up used).
Valve Guides:—Pressed in block (taper end down).
Valve Lifters:—Wilcox-Rich 'Zero-lash' type hydraulic lifters. Barrel type operating in reamed holes.
See article in Mechanical Equipment Section for data.
NOTE—Two sizes of lifter used, must be re-installed in same guide hole from which removed. Large lifter stamped 'B' in oil groove. Large guide hole stamped 'B' beside hole. Valves must be removed first.
Lifter Clearance—.0015-.0025" (new), .0035" (worn).

Valve Springs:—Damper used at bottom. Free length 2.074".

	Spring Pressure	Length
Valve Closed	50 lbs.	1 25/32"
Valve Open	100 lbs.	1 15/32"

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 6° BTDC. Close 28° ALDC.
Exhaust Valves—Open 44° BLDC. Close 12° ATDC.
To Check Timing—#1 cylinder (front—left bank) intake valve should open with piston 6° or .0112" before top dead center with ignition mark 'IG/A' aligned with pointer on chain case cover. NOTE—Intake opening and ignition timing same point.

LUBRICATION:—Pressure system. Main oil header in left crankcase wall (feed from pump) for main, connecting rod, and camshaft bearings. Pipe from this header through filter feeds oil header above each line of valve lifters (non-adjustable auxiliary relief valve at rear of left line).
Oil Pump:—Helical gear type. In rear of crankcase.
Normal Oil Pressure:—15 lbs. idling, 25 lbs. at 30 MPH.
Oil Pressure Regulator:—Piston type built in oil pump. Opens at 30 lbs.
Crankcase Capacity:—11 quarts.

COOLING SYSTEM:—Capacity—30 quarts.
See Cadillac Shop Notes for radiator core removal.
Water Pump:—Packless type, sealed ball-bearing shaft (2 used—one pump for each bank, driven in tandem with fan pulley by double Vee belt).
See article in Mechanical Equipment Section for data.
Removal—Drain cooling system, back off belt adjustment, remove hose and pump mounting screws.
Belt Adjustment:—Loosen two mounting bolts on fan bracket, lift fan pulley and bracket assembly up (right bolt hole slotted, pivots on left bolt), until all slack removed from belt, tighten bolts.
NOTE—Replace belts together as matched sets.
Thermostat:—Harrison. In radiator top tank. Linked to radiator shutters by rod on forward side.
Setting—(Std. Type) Starts to open 153-158° F., fully open at 175° F. (High Reading Type—use with Heaters) Starts to open 168-173° F. Fully open 190° F.
Shutter Adjustment—Disconnect shutter rod at lever on front of radiator top tank, loosen locknut, turn clevis so that rod extends 1/16" past lever (provides slight tension with shutters closed).
Temperature Gauge:—AC Electric. #1510773 (dash unit), #1510774 (engine unit).
See article in Mechanical Equipment Section for data.

CLUTCH:—**Long Model 12CB-11½.** Single plate, dry disc type. No adjustment required.
See article in Mechanical Equipment Section for data.
Facings—Spiral or chevron wound woven (spirally grooved), 2 used. Inside Diam. 7". O.D. 11½". Thick. .137". NOTE—Install driven disc with oil guard (cover over dampener springs) to rear.
Adjustment:—Free movement of pedal should be ⅞-1⅛" (adjusting nut on connector link at fork).
Removal:—Remove transmission (see below), drop clutch housing pan, punch mark clutch cover, pressure plate, and flywheel (re-install to these marks), remove 12 cover screws (release tension evenly).
See Cadillac Shop Notes for clutch housing note, locking pin removal (replacement clutches) & balancing data.

TRANSMISSION:—**Own Make.** Constant-mesh, synchro-mesh, all helical gear type (sliding gear, low & reverse).
Transmission Control:—Remote steering col. shift.
See articles in Mechanical Equipment Section for data.
Removal:—Remove propeller shaft, free transmission extension at engine rear support, remove crossmember (with engine rear support), disconnect speedometer cable, remove shifter rods from levers at transmission, support transmission at rear, take out mounting screws, pull straight back (plug clutch connection shaft bearing drain hole as soon as accessible to prevent lubricant loss), lower front end of transmission and remove from car.

UNIVERSAL JOINTS:—**Mechanics Model 3C.** Needle bearing type. Two used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—**Own Make.** Hypoid gear, semi-floating type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
NOTE—Manufacturer recommends Differential Carrier Assembly be returned to factory for servicing.
Ratio—4.31-1. **Backlash**—.004-.010". Screw adj.
Removal:—Disconnect drive shaft at rear universal, remove axle shafts (see below), remove capscrews on carrier flange, pull carrier assembly out.
Axle Shaft Removal—Remove rear wheels, take off axle shaft nut, pull wheel hub and brake drum, disconnect brake line and remove backing plate. Pull shaft and bearing assembly out (use Tool J-838).
Wheel Bearing Adjustment—None.

SHOCK ABSORBERS:—**Delco Model 1951-C, D (front), 2010-C, D (rear).** Double acting, hydraulic type.

STEERING:—**Steering Gear**—Saginaw Worm-and-Double Roller type with offset steering column and universal joint connection (Mechanics type).
See articles in Mechanical Equipment Section for data.
Front Suspension:—Independent linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
Kingpin Inclination—5°1' crosswise.
Caster—Neg. ½° to Neg. 1°. Adjustable.
Camber—0° to Pos. ½°. Shim adjustment.
Toe In—1/32-3/32" (at rest), 0-1/16" (in motion).
Steering Geometry (Toe-out on turns)—Inner wheel turned 22¾-24¼°, outer wheel 20°.

BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type with eccentric adjustment and rigid wheel cylinders. Hand lever applies rear service brakes. *See Mechanical Equipment Section for data.*
Drums—Centrifuse. Diameter 13.995-14.005".
Lining—Moulded. Length per shoe 13 21/32" (primary), 15 1/32" (secondary). Width 2¼". ¼" thick.
Clearance—.010" at each end of secondary shoe.
Braking Power—43% rear, 57% front wheels.
Hand Brake:—See Service Brakes.

HOOD LOCK & HOOD ADJUSTMENT:—Hood is Alligator type with hood control knob located under left side of instrument panel. To open hood, pull out on control knob (hood will raise slightly), reach under front of hood opening, press up on safety catch tab, lift hood up.

Hood Alignment (At Cowl):—Raise hood, remove side panels (see below), release hood hinge springs, close and lock hood. Loosen hood hinge to cowl bolts, shift hood to secure uniform spacing between cowl and rear edge of hood, tighten hinge bolts and assemble springs, raise hood and install side panels. To center hood, remove counterbalancing springs, loosen hinge mounting screws and shift hood sideways.

(At Radiator Grille)—If distance between hood and grille greater at center than at sides, raise hood and place two thin pieces of wood between side panels and hood to support hood, place two pieces of wood between two bottom louvres of grille (one on each side of center molding—pieces must fit snugly between louvres), place short jack between lower radiator splash guard and frame front cross-member (with short piece of wood between jack and splash guard). Pump jack slowly until hood distance at center slightly less than at sides (will even up when jack released), release jack and check alignment. To center hood at front, loosen radiator support bolts at front cross-member and adjust radiator brace rods.

Hood Lock Adjustment:—Raise hood, loosen lockscrews on control cable adjusting sleeve (in slot on baffle at top of grille), push dash control knob all the way in, see that latch plate in locked position, move adjusting sleeve until it contacts lever on latch, then tighten lockscrew securely.

Side Panel Removal:—Raise hood, remove side panel attaching screws (on upper edge, screws located in bracket at rear end, at radiator shell, and in edge of grille—grille upper baffle can be removed, if necessary, for access to these screws), lift panel out.

Radiator Grille Removal:—Raise hood fully, remove bolts attaching hood latch lower plate to grille, remove baffle. Reach through opening between radiator and grille, remove screws attaching grille to fenders. Remove screws on each side attaching grille to hood front side panels, remove grille. NOTE—Lower baffle is riveted to grille. If baffle being replaced, bolts may be used instead of rivets.

FRONT END REMOVAL:—Front Fenders, Radiator, and Grille may be removed as a unit for work on front of engine or for Independent Suspension Unit removal as follows: Raise hood, loosen lockscrew at hood lock control cable adjusting sleeve and disconnect cable. Drain radiator and disconnect upper and lower hose connections. Remove bolts attaching radiator brace rod to top of radiator support. Disconnect headlamp wires from junction block on each side, remove wiring harness from clip at radiator. Remove bolts attaching fenders to body, frame, and running boards, remove nuts from 2 bolts attaching radiator support to front cross-member. Attach chain hoist under outside flange of radiator support, raise assembly until it clears chassis. Re-install assembly in same manner and align hood as directed above.

RADIATOR CORE REMOVAL:—To remove radiator core (without disturbing grille), drain radiator, remove lower hose connection, disconnect upper hose. Raise hood and remove side panels (see above), disconnect front end of radiator brace rods, loosen both sides of brace rod at dash and turn rod up to allow clearance for radiator core. Remove headlamp wiring harness from clip at each top corner of radiator core. Remove two bolts on each side which hold radiator core in shell, tilt top of core to rear to clear shell and lift out.

ENGINE REMOVAL:—Drain radiator and cylinder block, remove hood and side panels (see above). Remove Fenders, Radiator, and Grille as an assembly (see Front End Removal above). Disconnect generator leads and free wiring loom from support clip, remove battery and starting cables. Disconnect distributor low and high tension leads, take out ignition coil mounting screws, lay coil on cowl. Disconnect gas line at fuel pump, throttle and choke controls at carburetor, and accelerator rod at bellcrank. Disconnect exhaust pipe from manifold. Remove front floor mat and floor plate over transmission, disconnect vacuum and air lines at shift cylinder, disconnect piston rod lever from transmission (See Chevrolet Transmission Control article in Mechanical Equipment Section for directions and adjustment instructions when shift cylinder re-installed). Disconnect clutch pedal link and pull-back spring. Remove bolts in universal joint ball retainer, slide retainer and ball back on shaft, take out 4 screws holding universal trunnion bearings on front yoke, remove trunnion bearings. Remove 4 bolts from transmission rear support, remove front and side engine mounting bolts, remove bolts in starter cross-shaft. Remove third cylinder head bolt from rear on left side, install engine lifting eye bolt in this bolt hole, attach hoist and lift engine until clear of mountings, pull engine forward and lift to clear front cross-member, then roll chassis back until engine is free. When engine re-installed, adjust mountings and align engine hood as directed above.

ENGINE MOUNTINGS:—Adjustment—Tighten front engine mounting bolts (replace mountings if oil-soaked), tighten rear mounting bolts at transmission (studs must be tight in case), clearance between cross-member and 'U' section plate should be .005-.015" **(limits fore and aft engine movement)**, if clearance excessive, remove mounting and bend plate to obtain correct clearance. Tighten side engine mounting bracket bolts. Take out engine side mounting bolts, check clearance between mounting and bracket at each side, clearance must be 1/16" (if clearance excessive, use 3/8" plain washer to shim for proper clearance, if clearance less than 1/16", loosen bracket bolts and push mounting up or if necessary remove brackets and file holes with round file to give 1/16" clearance). Tension on side mountings must be equal at each side.

HARMONIC BALANCER:—Serviced as complete assembly only (component parts not serviced separately). **Removal**—Remove Front End Assembly as a unit first (see directions above). Use Chevrolet Harmonic Balancer Puller and Driver (consists of puller body, puller screw and pinned driver head), attach puller body to balancer by means of 2 cap-screws in two tapped holes in balancer, pull balancer by turning up puller screw.

Installation—Place driver in starting crank jaws of balancer, install puller body (as above), line up keyway in balancer and key in crankshaft, turn puller screw down to contact driver, then use puller screw as driver and drive balancer in place.

MAIN BEARINGS:—Installation—Front intermediate bearing shell marked 'I' in oil groove and must be used in #2 bearing cap. Front intermediate (#2) and Rear intermediate (#3) bearing caps must be installed with mark 'FRONT' (#2 cap) toward front, 'REAR' (#3 cap) toward rear.

Line-Boring—Bearings must be line-bored with .008" shims (four .002" shims) under each end of bearing caps. After line-boring, Rear intermediate (#3 bearing must be faced to provide proper endplay. Adjust as directed below.

Endplay Adjustment—Crankshaft endplay and oil slinger clearance controlled by rear intermediate (#3) bearing. When installing new bearings, this bearing should be machined on front flange just enough to clean up the face of the bearing flange. Then machine rear flange of bearing to obtain endplay of .004-.007" (measure with feeler gauge inserted between rear side of #3 bearing and crankshaft with shaft in extreme rear position.

CRANKSHAFT OIL SEALS:—Rear—New type rear main bearing cap used (mounted on four bolts and two locating dowels) with wick type oil seal installed in groove in cap and crankcase. Seal bears on outer rim of crankshaft flange (oil slinger and check valve in oil return hole in bearing cap have been discontinued). To install new seal in bearing cap, insert packing in groove and roll firmly in place with rounded tool (roll from both ends toward center). Use round block of wood (same diameter as crankshaft flange) to hold packing in place, cut both ends off evenly and flush with bearing cap face. Install upper half of seal in crankcase in same manner with engine out of car and crankshaft removed (see Engine Removal instructions above).

Front (Timing Gear Cover) Oil Seal—Spring-loaded leather type installed in pocket in timing gear cover. To install new seal, place seal on special Oil Seal Replacer J-995 with free end of leather toward end of tool, seat seal in cover with few light hammer blows on tool. NOTE—Timing gear cover must be centered on crankshaft when installed on engine to prevent balancer damaging oil seal. To install cover, coat seal with grease, install centering guide J-966 on crankshaft, install cover and tighten cover screws.

CAMSHAFT BEARINGS:—Installation. Oil groove extends 70° around bearing from oil hole. To insure proper alignment with oil hole in block, mark front of bore opposite oil hole. Align oil hole in bearing with mark (with groove toward bottom of engine away from oil hole in block), press bearings in place and stake to prevent movement. Finally line ream bushings.

TIMING GEARS:—Installation—With gears off, check Gear alignment (controlled by shims behind Crankcase Front End Plate). Using new Camshaft Thrust Plate, hold in place on End Plate (before assembling on camshaft). Lay straightedge across crankshaft shoulder and thrust plate. Add or remove shims to align these two surfaces. Set End Plate screws with punch. Camshaft gear is press fit on hub. Remove and install gear in arbor press with camshaft out of engine. Press gear on shaft until no perceptible clearance remains between gear and thrust plate but plate turns freely (clearance should be .003" Maximum). CAUTION—Press on gear hub only when installing gear on shaft (gear will be

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

damaged if pressure applied to rim). New thrust plate must be used whenever gear removed (plate damaged by gear removal sleeve).

VALVE GUIDE INSTALLATION:—Use special valve guide drivers J-1089 (Intake), J-1090 (Exhaust) to install guides. Drivers have stop-collars which correctly position guides so that distance from cylinder head to top of guide is 1 1/16" (Intake), 61/64" (Exhaust). After guides installed, rough ream to inside diameter of .341", then finish ream to .343" diameter.

ROCKER ARMS:—Two types of intake arms used. Install arms with slight angle toward front of engine for cylinders #1, 3, 5; angle toward rear for #2, 4, 6. All exhaust rocker arms straight. Replace worn rocker arms and worn shafts. Replacement arms furnished with finished bushings installed. Assemble rocker arm shafts with open end toward center of engine with steel baffle pressed in open end of rear rocker shaft vertical. Oil pipe connector is a brass sleeve which slips over end of each shaft and should be installed on shafts first and rocker assemblies then installed as a unit. CAUTION—Tighten rocker arm shaft support nuts to 25-30 ft. lb. tension only. Excessive tightening may distort shaft and cause rocker arms to bind.

OIL LEAD TO VALVE ROCKER ARMS:—Installation—New assembly must be used (nipple and pipe assembly Part No. 839186) whenever assembly removed from engine. To install proceed as follows: insert pipe in block, coat threads of nipple with white lead and screw in block (on right side), install nipple and sleeve nut on lower end of pipe (left side of block) and secure in place, then bend pipe in upward loop and connect to oil distributor, bend pipe on right side of engine to clear push rod cover and bend upper end so that it passes through hole in cylinder head, connect pipe to valve rocker shaft coupling. Fill cooling system, run engine and check all connections for oil and water leaks.

CHECKING OILING SYSTEM:—Oil Pan—Check whenever oil pan removed. Use Gauge No. J-969-3 to check oil nozzle height for connecting rod clearance (remove pan gasket, hook end of gauge over pan rail, position gauge in trough with word 'front' toward front of engine). Open end of nozzle must be directly below gauge. Use Gauge No. 969-2 to check oil trough height. Gauge stem should just touch edge of all troughs. Use Gauge No. J-969-1 to check nozzle aim (use water pressure, see that nozzle stream hits hole in target gauge). Use wrench J-793-2 to adjust nozzles. Recheck nozzle height.

NOTE—Oil pipes in pan have been redesigned and if 1939 type Target Gauge used to check 1940 oil pans, center extension on gauge must be cut off flush with lower edge of gauge (to clear oil manifold lead)—this will not affect gauge use on 1939 and previous models. Special nozzle J-793-3 should be used for water connection to oil manifold and pan should be tilted at 45° angle so that nozzles are not covered by water in troughs.

Conn cting Rod Dipper Height—Use Oil Trough Depth & Connector Rod Dipper Height Gauge J-969-2. Place gauge over connecting rod with two side pins on gauge resting on lower face of crankcase (pan gasket must be removed). End of dipper should just touch face of cross bar on gauge with rod in lowest position. If dipper does not touch gauge, it should be replaced; if dipper interferes with gauge, correct by bending dipper.

OIL DISTRIBUTOR:—New design located within recess in left side of engine block (under cover plate). Distributor valve mounted on plate which is clamped on block by cover so that entire valve assembly is within engine. Oil Distributor operates in same manner as units used on previous models.
CAUTION—Inner and outer gaskets used with valve assembly plate must not be interchanged—see assembly directions below.
Removal—To dismantle oil distributor, take out three screws in cover plate, remove cover plate, outer gasket, valve assembly plate, inner gasket.
Assembly—Install cork gasket with **two center holes** between valve assembly plate and block, and use cork gasket with **center cut out** between valve assembly plate and cover, tighten cover screws securely.

TAPPET CLEARANCE ADJUSTMENT:—Normalizing Engine—Tappet clearance changes while engine is warming up and should be adjusted only after engine has been 'normalized' as follows: Run engine at 600 RPM and check oil temperature with thermometer at overflow pipe on valve rocker shaft connector until no change noted in oil temperature for period of five minutes (oil temperature will become stabilized at some point between 150-225° F.). This normalizing period will be from 5 to 30 minutes depending on engine temperature when started. Tappet clearance should be adjusted only after oil temperature reaches point where no further change occurs during 5 minutes operation at 600 RPM.

REAR SPRING SEATS & SHACKLES (PASS. CARS):—Bracket welded on front of housing at each spring. Spring seat attached to bracket by means of rubber bushed bolt (spacer sleeve through which bolt passes, used to prevent collapse of bracket through tightening bolts with too great pressure). Rubber washers used between bracket and each end of spring seat. Spring seat attached to springs through conventional U-bolts. IMPORTANT—When reassembling spring seat to bracket (when installing rear axle), eye bolt nut must not be tightened until all other connections made and car weight resting on all 4 wheels.

Tight Shackle Pin Correction—If shackle pins tight or seized, remove pin and bushing assembly from rear spring hanger, enlarge eye in hanger approximately .005-.010" with a drift, install new pin and bushing assembly.

REAR SPRING SEATS (TRUCK MODELS):—Fitting. Whenever rear spring seats are adjusted, clearance between spring seat and rear axle housing must be checked as follows: Block up rear of car under frame side rails, drop rear of spring by disconnecting spring shackle, take out spring U-bolts, remove spring seats (lower spring cap secured by means of 2 screws). File face of each spring seat half evenly (place in bench vise) until spring seat gives slight drag when placed on housing and rotated. CAUTION—File both halves evenly.

AXLE SHAFT (PASSENGER CARS):—To Install. Assemble new oil deflector, gasket (coat with shellac or paint on both sides), line up extra hole (center of three closest together) with notch in hub flange in axle shaft (also oil pocket in oil deflector with this notch), insert six new bolts and peen into place in countersink around bolt holes in flange using special Peening Tool and Anvil so that these parts are riveted together. NOTE—Axle shafts are of unequal length, longer shaft used on right side.

Endplay Adjustment—When installing shaft, select correct spacer block (see below) so that when installed on pinion shaft between inner ends of axle shafts, shaft endplay will be from a Free Fit to .014" maximum clearance.

Axle Spacer (Pass. Cars)—Three spacer blocks furnished which give four sizes as follows: Narrow—1.0105", Medium—1.0195" and 1.0295", Wide—1.0345".

NOTE—These dimensions are taken across ground surfaces and spacers should be installed with ground surface toward axle shaft end. Medium spacer ground on all four sides and may be installed either way to secure the two different sizes.

AXLE SHAFT (½, ¾, ¾ TON SPEC.):—These shafts heavier construction but serviced in same manner as Pass. Car axles (above) except that Axle Spacers furnished in three sizes only as follows:

Axle Spacer (Trucks)—Narrow-1.1485", Wide-1.1575" and 1.1675" (ground on all four sides).

CAB-OVER-ENGINE MODELS

ENGINE COVER REMOVAL:—To take off engine cover proceed as follows: Remove seat cushion and seat back, take out 4 bolts on cover at gear shift lever and raise assembly to rear, remove floor mats on each side, remove engine cover screws (at rear and at front on each side). Lift engine cover out by raising forward end and pulling out towards front.

NOTE—Right floor pan has hand hole for access to engine oil stick, crankcase oil filler pipe, and for lubrication of distributor and starter.

Left Floor Pan Note—Whenever floor pan removed, disconnect accelerator linkage by passing wire through accelerator spring and pull it upward exposing cotter pin retainer, then pull cotter pin out.

FRONT COWLING REMOVAL:—Take out 6 retaining screws on each side (2 top screws nuts accessible through side ventilators—not used on late models), remove 2 screws at top of cowling and take off radiator filler cap. Lift cowling up and forward. When replacing cowling, rubber insulators at upper screws must be installed between cowling and dash at each side. NOTE—With cowling removed, radiator may be taken out allowing access to water pump, fan belt, harmonic balancer, generator and front engine mountings.

REMOTE CONTROL TYPE GEARSHIFT LEVER:—Removal—Disconnect gearshift lever from top of engine cover, loosen wire on clutch boot, raise boot above transmission cover tower. Remove nut from stub gearshift lever and raise reverse latch Bowden cable support onto top of lever. Use gearshift lever removing tool K-353 to remove lever assembly from transmission cover. When installing lever, see that end of reverse latch shift rod seats in upper part of 'U' shaped bracket at end of reverse latch Bowden cable and that retaining nuts are tight so that rod anchored in bracket.

ENGINE HOOD, SIDE PANEL & RADIATOR GRILLE:—New type Alligator hood with dash-controlled hood lock and safety latch. *See Chevrolet Shop Notes for Hood Lock Operation and Adjustment, Side Panel Removal, and Radiator Grille Removal.*

Front End Assembly Removal—Fenders and Radiator Grille may be removed as a unit for access to Front Suspension. *See Chevrolet Shop Notes for data.*

CAB-OVER-ENGINE & DUBL DUTI PANEL NOTE:—*See Chevrolet Shop Notes for Engine Cover Removal & Front Cowling Removal (for access to engine).*

FLEET MODEL NOTE:—Special Economy Engine available for all models. May be identified by special Tune Up Specification Plate on Push Rod Cover listing special settings. Special carburetor used has stop pin to limit throttle opening to ½ throttle.

SERIAL NUMBER:—First No. 1001 with model prefix as follows: KA (Special Deluxe), KB (Master 85), KH (Master Deluxe), KC (Half Ton), KD (¾ Ton), KE (¾ Ton Spec.), WA, WB (1½ Ton), WC (School Bus), WD, WE, WF (Cab-over-Engine Trucks). Stamped on right side of floor pan in front of front seat (KA, KB, KH), On plate on right side of cowl under engine hood (KC, KD, KE, WA, WB, WC), On plate on rear of dash (WD, WE, WF).

ENGINE NUMBER:—First No. 2697268 (Flint), B-105462 (Buffalo) with special prefix for each model as follows: Pass. Cars—None (Flint), B (Buffalo); Half Ton—K (Flint), KB (Buffalo); ¾ & ¾ Ton Special—AT (Flint), ATB (Buffalo); 1½ Ton—T (Flint), TB (Buffalo); 1½ Ton Cab-over-engine—H (Flint only), Dubl Duti Panel—E (Flint only). Stamped on right side of block to rear of distributor.

ENGINE SPECIFICATIONS:—**Own.** 6 cyl., 'I' head type. **Bore**—3½". **Stroke**—3¾".

Displacement—216.5 cu. ins. **Rated HP.**—29.4.

Developed Horsepower—85 at 3400 RPM (Pass. Cars), 78 at 3200 RPM (Trucks except Cab-over-Engine), 80 at 3100 RPM (Cab-over-Engine Trucks).

Compression Ratio—6.25-1 Std. cast-iron head.

Compression Pressure—112 lbs. at 65 RPM (cranking speed), 90 lbs. Min. and all cylinders even within 5-10 lbs. NOTE—Engine must be at normal operating temperature (idle at 600 RPM for 20 minutes).

Vacuum Reading—Steady 18-21" with engine idling.

Engine Removal & Mounting Adjustment:—*See Chevrolet Shop Notes for instructions.*

Cylinder Head Installation:—Use new gasket and install with mark 'This Side Up' upward. Use guide pins to align head.

PISTONS:—**Pass. Cars**—Cast gray iron, dome head, cam ground, tin-plated with slipper type skirt.

Trucks—Same as Pass. Cars except 1½ ozs. heavier and may be identified by small forged boss on lower center of each piston pin boss.

Weight—25.3 ozs. (Pass. Car), 26.9 ozs. (Trucks) with bushings installed. **Length**—4 11/64".

Removal—Pistons & rods removed from above.

Clearance—.0147-.0183" Top, .0017-.0023" Skirt.

Replacement Pistons:—Finished pistons with bushings and pins fitted furnished Standard and .003", .010", .020", .030", .040" oversize. NOTE—Hone cylinder for .003" oversize, rebore and hone for other sizes (rebore .002" less than piston oversize, finish by honing for piston clearance below). Bore taper and out-of-round must not exceed .001".

Fitting Pistons:—Use feeler gauge between piston and cylinder wall at right angles to pin bosses. Piston should pass through bore with light pressure on .002" feeler and lock on .003" feeler.

PISTON RINGS:—Two compression, one oil control ring per piston, all above pin. Oil ring groove drilled for oil drainage. NOTE—Compression rings have tapered face. Install with mark 'TOP' upward.

Ring	Width	End Gap	Side Clearance
Compr.	.1235-.1240"	.005-.015"	.0015-.0035"
Oil Cont.	.1860-.1865"	.005-.015"	.0015-.0035"

Check side clearance with .002" feeler. #1 ring very free, #2 ring just free, #3 ring light drag.

Replacement Rings:—Furnished Standard and .005", .010", .015", .020", .030", .040" oversize.

PISTON PIN:—**Diameter** .8645-.8650". **Length** 3.135-3.165". Pin locked in rod, piston bronze bushed. NOTE—New pistons fitted with bushings and pins.

Pin Fit in Piston—Thumb push fit (room temp.).

Replacement Pins:—Std. & .003", .005", .010" oversize.

CONNECTING ROD:—**Length** 6 13/16". **Weight** 28.3 ozs.

Crankpin Journal Diameters—2.311-2.312".

Lower Bearing—Spun babbitt- lined type.

Clearance—.001-.0025". **Sideplay**—.004-.012" (side clearance between rod and pin bosses .025").

Bearing Adjustment:—Solid shims. Remove shims equally at both sides to secure 'snap fit' (bearing tight to hand but should snap from one side to other with light tap of 8 oz. hammer), **then replace one .002" shim for clearance** (if unequal number, place extra shim on camshaft side). Rod should snap from side to side with one hand pressure with proper fit. NOTE—Palnuts used on rod bolts. Use new palnut, install with open side toward end of bolt, turn finger tight against rod nut, then tighten ½ turn additional.

Installing Rods:—Numbers on rods and caps must be together and installed in same numbered cylinder with numbers and pin clamp bolt toward camshaft side. Install oil dippers on rods with mouth toward camshaft side of engine. Check dipper heights. *See Chevrolet Shop Notes for instructions.*

CRANKSHAFT:—4 bearing, integral counterweights. NOTE—New type rear bearing oil seal (no slinger). *See Chevrolet Shop Notes for Oil Seal and Crankshaft Balancer servicing data.*

Journal Diameters—#1, 2.6835-2.6845"; #2, 2.7145-2.7155"; #3, 2.7455-2.7465"; #4, 2.7765-2.7775". NOTE—Journal taper or out-of-round limits .001", Run-out limits for #2 & #3 bearings .002".

Bearing Type—Steel-backed, babbitt-lined.

Clearance—.002-.004". *See Chevrolet Shop Notes for Main Bearing Line-boring and Installation data.*

Bearing Adjustment:—Solid shims. Remove shims until slight drag secured when shaft turned by hand, **then replace one .002" shim for clearance** (if unequal number of shims used, place extra shim on same side for all bearings).

End Thrust:—Taken by #3 bearing (adjusted by facing new bearings). **Endplay**—.004-.007".

CAMSHAFT:—Four bearing. Helical gear drive.

Journal Diameters—#1, 2.0282-2.0292"; #2, 1.9657-1.9667"; #3, 1.0932-1.0942"; #4, 1.8407-1.8417". NOTE—Journal out-of-round limits .001". Run-out limits .002" (straighten if excessive).

Bearing Type—Steel-backed, babbitt-lined bushings. *See Chevrolet Shop Notes for bearing installation and line-reaming instructions.*

Clearance—.002-.004".

End Thrust:—Taken by thrust plate behind camshaft gear (adjusted by changing gear position on shaft). **Endplay**—Free to .003" maximum.

Timing Gears:—Crankshaft gear Steel. Camshaft gear Bakelite & Fabric. Maximum gear run-out .003" crankshaft, .004" camshaft. NOTE—1940 crankshaft gear is new (for new Valve Timing). Do not install 1939 gear on 1940 models.

Backlash—.002-.005". *See Chevrolet Shop Notes for Timing Gear installation & camshaft endplay data.*

Camshaft Setting:—Gears punchmarked. Mesh marked tooth of crankshaft gear with marked space between teeth of camshaft gear.

VALVES:—	Head Diameter	Stem Diameter	Length
Intake	1 41/64"	.3407-.3417"	6 5/64"
Exhaust	1 15/32"	.3397-.3407"	4 13/16"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.2947"	.001-.003"
Exhaust	30°	.3118"	.002-.004"

Tappet Clearance:—.006-.008" Int., .013-.015" Exh. Hot (Engine 'normalized'). Use lower figure for ordinary service, higher figure for severe Truck operation. *See Chevrolet Shop Notes for adjustment data.*

Economy Engines—.010" Int., .016" Exh. Hot.

Valve Guides:—Pressed in head. *See Chevrolet Shop Notes for Installation & Reaming instructions.*

Valve Springs:—Free length 2 7/32". When checked with U15 Tester, spring pressure should be 125-133 lbs. at 1½".

	Pressure	Length
Valve Closed	49-56 lbs.	1 13/16"
Valve Open	121-133 lbs.	1½"

NOTE—Install springs with close-coil end toward cylinder head. Use round valve caps on Intake Valves, hexagonal caps on Exhaust Valves.

Valve Lifters:—New type with pushrod seat brazed on top. **Clearance**—.001" (free fit in guide holes).

Rocker Arm Assembly:—*See Chevrolet Shop Notes.*

Valve Timing:—See Camshaft Setting above. Valve Timing is not same as 1939 (New Crankshaft Gear).

Intake Valves—Open 3° BTDC. Close 35° ALDC.

Exhaust Valves—Open 46° BLDC. Close 5° ATDC.

To Check Timing—With #1 intake valve tappet clearance set at .006", valve should open with piston 3° or .0032" BTDC. with point on flywheel approximately 1.158 teeth before 'U/C' mark in line with indicator in hole in right front face of housing.

LUBRICATION:—Pressure and positive splash system. Same as 1939 except for redesigned oil pan, new Oil Distributor (in block), and new type Overflow Pipe Connector at rocker arm shafts. *See Chevrolet Shop Notes for Oil Distributor, and Rocker Arm Oil Lead and Overflow Pipe servicing.*

Oil Pump Installation—Assemble ground side of idler gear toward cover. Oil pump assembly mounted in crankcase by tapered setscrew. See that screw seated firmly in tapered hole in pump housing before tightening locknut.

Normal Oil Pressure:—15 lbs. at 40 MPH. (KA, KH, KC), 15 lbs. at 43 MPH. (KB), 25 lbs. at 36 MPH. (KD), 25 lbs. at 40 MPH. (KE), 15 lbs. at 30 MPH. (WC Bus), 15 lbs. at 32 MPH. (Other Trucks).

Oil Pressure Regulator:—Located on oil pump cover. Opens at 75 lbs. Non-adjustable type. Pressure normally controlled by Oil Distributor.

Oil Distributor:—*See Chevrolet Shop Notes for data.*

Checking Oiling System:—Should be checked whenever pan removed. *See Chevrolet Shop Notes for data.*

Crankcase Capacity:—5½ qts. dry, 5 qts. refill (all).

COOLING SYSTEM:—**Capacity**—14 qts. (except Cab-over-Engine), 16½ qts. (Cab-over-Engine).

See Chevrolet Shop Notes for Radiator Core Removal.

Water Pump:—Packless, ball-bearing type. NOTE—Pumps interchangeable on all models (except fan). *See article in Mechanical Equipment Section for data.*

Thermostat:—Harrison. In cylinder head outlet.

Setting—Starts to open at 142° F. (Std.), 150° (for Alcohol Anti-freeze). 160° F. (for Permanent Anti-freeze & Economy Engines).

CLUTCH:—**Own Make.** Diaphragm spring, single plate, dry disc type. NOTE—Clutch with 9" disc used on Pass. Cars & ½ Ton, 11" disc on all others. *See article in Mechanical Equipment Section for data.*

Facings—Moulded type, 2 used. Inside Diam. 6⅛"

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

(Pass. Cars & ½ Ton), 7" (Others). Outside Diam. 9⅛" (Pass. Cars & ½ Ton), 10¾" (Others). Thickness .135" (Pass. Cars & ½ Ton), .140" (Others).

Adjustment:—Pedal free travel must be ¾-1". To adjust, loosen checknut and turn adjusting nut on connecting link at clutch throwout fork.

Removal:—Remove Transmission and flywheel underpan (see Transmission Removal below), remove throwout bearing from fork, remove fork by prying fork off ball, remove fork mounting (use ⅞ & ¾" wrench). Install Clutch Pilot Tool K-411 (to support clutch), loosen all six cover bolts evenly, remove assembly from below. CAUTION—Do not allow pressure plate to hang on retracting springs (support by hand). When installing clutch, line up 'X' marks on cover and flywheel.

TRANSMISSION (KA, KB, KC, KD, KE, KH):—Own Make. Constant mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse), all helical gear type. NOTE—All transmissions similar except Pass. Car type has remote control shift mechanism in slide cover, Truck type has conventional shift lever and cover assembly and gears are carburized type. ***See article in Mechanical Equipment Section for data.***

Transmission Control (Pass. Cars):—Remote control steering column shift, vacuum-power type Std. ***See article in Mechanical Equipment Section for data and Gearshift Lever Flutter Service Note.***

Removal (KA, KB, KC, KH):—On Pass. Cars, remove floor mat and transmission cover in floor, disconnect and remove vacuum-power cylinder (see Chevrolet Transmission Control article in Mechanical Equipment Section for data and adjustment instructions when re-installed). On Half Ton, remove hand brake lever on transmission case (see Note for 4 Spd. Trans. below). Disconnect cables on brake cross-shaft at rear of transmission, remove cross-shaft. Disconnect and remove speedometer cable and driven gear assembly. Take out capscrews in universal joint ball collar, slide ball and collar back on shaft housing. Take out four capscrews holding universal joint needle bearing trunnions on front yoke, remove trunnions (use care not to lose needle bearings), push front end of propeller shaft down for clearance. Remove 4 bolts holding transmission rear mounting on frame cross-member, remove 2 top transmission mounting screws, install guide pins in these holes, remove flywheel underpan and lower mounting screws, slide transmission out.

Half Ton Note—When 4 Spd. Transmission used, take out 2 capscrews in master cylinder mounting bracket and remove frame cross-member so that propeller shaft can be dropped down for clearance.

Removal (KD, KE):—Same as other truck models

TRANSMISSION (WA, B, C, D, E, F):—Own Make. Four speed, sliding spur gear type (all speeds). NOTE—This transmission Optional on KC, KD, KE models. ***See article in Mechanical Equipment Section for data.***

Transmission Control (Cab-over-Engine):—Remote control type. ***See Chevrolet Shop Notes for data.***

Removal:—Remove floor boards, hand brake lever from transmission case, speedometer cable. Take out bolts in front universal ball retainer (on rear of transmission), slide retainer and ball back on shaft housing, remove universal joint trunnion lock rings, drive trunnions out of rear yoke to 'split' universal, slide yoke back on shaft. Remove two bolts mounting front shaft assembly on cross-member (at rear universal), lower assembly and pull front propeller shaft and rear universal assembly off drive shaft. Take out 2 top transmission mounting screws, install guide pins in these holes. Remove flywheel underpan, take out lower transmission mounting screws, slide transmission back

UNIVERSAL JOINTS:—Own Make. Needle bearing 'cross' type (all models). One used (Pass. Car & ½ Ton), Two used (others). ***See article in Mechanical Equipment Section.***

REAR AXLE (KA, KB, KC, KD, KE, KH):—Own Make. Semi-floating, hypoid gear type with Torque Tube drive. All axles similar in design except that KC, KD, KE Truck axles are heavier construction. ***See article in Mechanical Equipment Section for data.***

Ratio—4.11-1 (KA, KH), 3.73-1 (KB), 4.11-1 (½ Ton KC), 4.55-1 (¾ Ton KD, ¾ Ton Spec. KE). NOTE—Passenger car axles may be identified by prefix letter of part number stamped on top right side of differential housing as follows: 4 11-1—'B' or no letter, 3.73-1—'C' or 'CB' (Optl. on KA, KH).

Backlash—.005-.008" (all). Screw Adjustment.

Removal:—Raise rear end of car, remove rear wheels and brake drums, install clamps on wheel brake cylinders, disconnect hand brake cables and remove cables from cable clamps on frame, disconnect brake line at axle housing and shock absorber 'I' bolts at spring seats. Remove spring 'U' bolts, disconnect spring shackles and drop springs. Pull axle back to free front end of drive shaft, remove assembly from under car. ***See Chevrolet Shop Notes for Rear Spring Seat data & Correction for Binding Shackles.***

Axle Shaft Removal:—Wheel bolted directly on flange on outer end of shaft. Shaft retained by 'C' washer on inner end of differential case. To remove axle shaft, remove wheel, take out two machine screws in brake drum, remove drum, install clamp on brake cylinder. Take off axle housing cover, remove differential pinion shaft screw, pinion shaft and axle shaft spacer. Push axle shaft in, remove 'C' washer on inner end of shaft, pull shaft out. NOTE—Axle shafts unequal in length, use longer shaft on right side. Truck axle shafts are heavier construction. ***See Chevrolet Shop Notes for Axle Shaft Installation, Spacer data, and Endplay adjustment.***

REAR AXLE (WA, B, C, D, E, F):—Own Make. Full-floating, Hypoid gear type with Torque Tube drive. NOTE—WD model (107⅝"WB.) has Hotchkiss drive. ***See article in Mechanical Equipment Section for data.***

Ratio—5 43-1 Std. (except WC Bus—6.17-1), 6.17-1 Optl. NOTE—Axles identified by prefix letter on part number stamped on top right side of differential housing as follows: 5.43-1—'B' or no letter, 6.17-1—'H' or 'HB'.

Backlash—.005-.008". Screw adjustment.

Removal:—See Model WD Note below. On all other models, take out bolts in front universal joint ball retainer (back of transmission), slide retainer and ball back on shaft housing, remove universal trunnion bearing lock rings, drive trunnion bearings out of rear yoke to 'split' universal, slide yoke back on shaft. Remove two bolts mounting front propeller shaft on frame cross-member (at rear universal), lower assembly and pull front propeller shaft and rear universal assembly off rear drive shaft. Remove axle shafts (see below), take out differential carrier mounting bolts in axle housing, pull differential carrier & drive shaft forward to clear.

Model WD Note—Disconnect drive shaft by taking out four bolts in universal joint yoke, then remove carrier assembly as above. ***See Chevrolet Shop Notes for Rear Spring Seat data.***

Axle Shaft Removal:—Bend lock plate lugs away from capscrew heads, take out 8 capscrews in axle shaft flange, install two ½"x13 capscrews in tapped holes in flange (between regular screw holes), turn these screws up evenly to loosen shaft, withdraw shaft and aluminum gasket. NOTE—Use new aluminum gasket and lock when axle shaft installed.

Wheel Bearing Adjustment:—Remove axle shaft (above), locknut and adjusting nut lock (within wheel hub), use J-870 wrench and tighten adjusting nut tight, then back off 45°, see that wheel hub turns freely by hand, install lock and locknut, bending lock tangs in notches on both nuts.

REAR AXLE (TWO SPEED):—Optl. on all Trucks. ***See article in Mechanical Equipment Section for data.***

Ratio—5.64-1 (high), 8.22-1 (low).

Backlash—.006-.012".

Removal:—Same as regular truck axle (above) except that front propeller shaft should be disconnected from cross-member & rear universal should be 'split'.

Axle Shaft Removal & Wheel Bearing Adjustment:—Same as regular truck axle (above) except that axle shaft retained by studs with locking sleeves under nuts. Use 2 7/16" x 14 screws to loosen shaft.

SHOCK ABSORBERS:—Delco Hydraulic type. Parallel cylinder type front & rear (KA, KH), Direct acting type front, single acting rear (KB), Single acting front & rear (KC, KD, KE). Double acting type Optl. on others. ***See article in Mechanical Equipment Section.***

STEERING:—Steering Gear—Saginaw Worm-and-Roller (Pass.Cars), Worm-and-Sector type (Trucks). ***See article in Mechanical Equipment Section for data.***

Front Suspension (KA, KH):—Independent, parallelogram type with coil springs. ***See article in Mechanical Equipment Section for data.*** NOTE—Make checks with car weight on wheels and special gauges installed front & rear to level frame.

Kingpin Inclination—0° ± ½°. Adjustable.

Camber—Negative ¼° ± ½°. Adjustable.

Toe-In—0-1/16". Adjust left tie rod only.

Steering Geometry (toe-out on turns)—Outer wheel turned 20°, Inner 24° ± 2°. No adjustment.

Front Suspension (Others):—Conventional 'I' beam section front axle with Reverse-Elliott ends and semi-elliptic springs. NOTE—Kingpin bushings 'floating' type on KB, KC, KD, KE models.

Kingpin Inclination—7°10' (except Cab-over-Engine), 8° (Cab-over-Engine) ± 1° crosswise.

Caster—2¼° (KB), 1¾° (KC, KD, KE), 2¾° (WA, WB, WC), 3° (WD, WE, WF) ± ½°. Adjust by installing wedge shims between spring and axle (up to 2°), use tools for greater corrections.

Camber—1° ± ½°. Bend cold for minor corrections.

Toe-In—5/64-⅛". Adjust by turning tie rod.

Steering Geometry (toe-out on turns)—Outer wheel turned 20°, Inner 23° ± 2°. No adjustment.

BRAKES:—Service—Own Make. Hydraulic type. Hand lever applies rear service brakes. ***See article in Mechanical Equipment Section for data.***

Wheel Cylinders—Diameter 1¼" (front wheels—all), 1 3/16" (rear—KA, B, C, D, H), 1⅜" (rear—KE), 1½" (rear—others). Size stamped on wheel cylinder housing under adjusting cup lock spring.

Drums—Cast iron, steel web (except WA, B, C), Pressed steel (WA, B, C). Diameters 11" (all KA, B, C, D, front KE), 14" (rear KE, front WA, B, C, D, E, F), 16" (rear WA, B, C, D, E, F).

Lining—Moulded type on all models.

Model	Width	Thickness	Length
KA,B,C,D,H,KE(front)	1¾"	3/16"	22⅝"
KE (rear)	2"	17/64"	38½"
WA,B,C,D,E,F (front)	2"	17/64"	28⅞"
WA,B,C,D,E,F (rear)	3"	17/64"	35 13/16"

Clearance—Adjusting Cover backed off 4 Notches (KA, B, C, D, E, H all wheels), 5 Notches (WA, B, C, D, E, F front wheels), adjusting pinion shaft backed off ¾ turn (WA, B, C, D, E, F rear wheels) from slight drag position.

Braking Power—47½% Rear (KA, B, C, D, H), 54¾% Rear (KE), 59% Rear (WA, B, C, D, E, F).

Hand Brake:—See Service Brakes above.

TORQUE WRENCH SPECIFICATIONS:—*See Torque Wrench article in Mechanical Equipment Section for tightening specifications for Cylinder Head, Main & Connecting Rod Bolts, etc.*

ENGINE NUMBER LETTERING ('SPECIAL STANDARD BORE & BEARING SIZES):—Letters used with engine number (**not in circular pads**) denote following 'special standard' sizes: **'A'**—.020" larger standard cylinder bore. **'B'**—.010" smaller standard main and connecting rod bearings. **'AB'**—Cylinder bore, main and connecting bearings 'special standard'.

FRONT END ASSEMBLY (UNIT) REMOVAL:—For work on front of engine, remove radiator shell, radiator core, hood lower side panels and both fenders as a unit as follows: Remove hood, drain radiator, disconnect headlight wires at junction block on left fender upper shield, remove engine water inlet and outlet hoses, free fenders from body and running board and lift assembly off.

ORIGINAL PISTON AND CYLINDER BORE SIZES:—All original production new engine piston and bore sizes and markings are same as for corresponding 1939 car models. *See 1939 Chrysler Shop Notes for complete data.*

REPLACEMENT PISTONS:—Finished Pistons—Furnished in standard size and .003", .005", .010", .015", .020", .023", .025", .030", .040", .050", .060" oversize. **Semi-finished Pistons**—Furnished in two sizes: (1) for cylinder bores from standard to .023" oversize, (2) for bores .025-.050" oversize. Pistons are finished except for skirt (head and ring grooves finished). **Piston skirt must be cam ground** and not finished circular. IMPORTANT—Second group pistons (.025-.050") must not be used for oversizes below .025" due to piston head and ring grooves being finished to different size than first group.

ENGINE ASSEMBLY REMOVAL:—Remove Front End Assembly as a unit (see above). Remove front floor boards and propeller shaft (for cars equipped with two shafts, see removal directions under propeller shaft center bearing following). Disconnect: hand brake cable, starter cable, battery ground cable, speedometer cable and gear shifter rod and cable at transmission (on cars with overdrive, remove solenoid coil and disconnect wires and overdrive control cable), fuel pump flexible line at pump, exhaust pipe at manifold, throttle and choke controls, heat indicator tube and bulb at head, oil gauge line at flexible tube, starter cable at starter, coil wires and clutch pedal linkage. Remove front and rear engine support bolts, loosen engine side splash pans, attach hoist and lift engine out.

REAR ENGINE SUPPORTS (C26, 27):—Insulators on rear support may be replaced without removing floor boards as follows: Support engine at rear, remove rear engine support bolts and remove cross member bolts at frame. Then remove insulators.

CONNECTING ROD & MAIN BEARING UNDERSIZES:—Replacement bearings furnished in standard size and .002", .010", .012" undersizes. **Fit .002" bearings** for standard crankshafts that show slight wear. **Fit .010" bearings** to 'Special Standard' crankshafts (see Engine Number Lettering in 1st column). **Fit .012" bearings** to 'Special Standard' crankshafts that show slight wear.

REPLACEMENT MAIN BEARING CAPS:—Furnished for service where original cap damaged or broken. These replacement caps same as original caps except for stud holes being 1/64" larger and bearing cap length which is 1/16" shorter. These replacement caps must be fitted due to caps being reamed on master reamer at factory and not on engine (as original bearing caps).

Fitting—Replacement caps must be fitted to engine by filing or shimming to obtain proper bearing clearance. This is only necessary when replacement cap originally fitted to engine (caps should not be shimmed or filed to compensate for wear.

MAIN BEARINGS:—Removal (with engine in car)—Remove oil pan (see Oil Pan Removal following), oil suction pipe and screen assembly, crankshaft pulley shield (De Soto, Dodge & Plymouth) which is secured by 2 screws, main bearing cap-to-cylinder head oil lines, and main bearing caps (see Front Main Bearing Cap Removal below). Use puller No. C-305 to remove #1 and #5 caps on Chrysler 8. Upper bearing shells can then be removed without removing crankshaft by using an old bearing shell or Tool No. C-584 (inserted in oil hole in crankshaft). Turn crankshaft to rotate bearing out.

Front Main Bearing Cap Removal:—With oil pan removed, oil pan front gasket oil seal plate (not used on Chrysler 8) can be removed by taking out 2 screws on lower edge of timing chain cover (not necessary to remove cover) permitting access to front main bearing cap.

Fitting Bearings:—Use .002" feeler and check clearance in same manner as on previous models (see 1939 Chrysler Shop Notes for instructions).

CRANKSHAFT OIL SEALS:—Servicing—Car manufacturer recommends that new oil seals be installed if chain cover or rear bearing cap removed.

Front Oil Seal:—Leather oil seal mounted in timing chain cover. When installing seal, leather should be soft and pliable, soaked in thin oil for approximately thirty minutes, then rolled with smooth bar. Use Chain Case Cover Oil Seal Centering Tool C-522 installed behind crankshaft starting jaw (tighten jaw finger tight only) while tightening timing chain cover in place.

Rear Oil Seal:—Located at rear bearing. Consists of three separate seals as follows: 1—Bearing oil seal formed in two halves. Lower half mounted on rear of bearing cap and held by retainer screwed (3 screws with lockwashers) to rear face of cap. Upper half retained in same manner with retainer screwed in place on rear face of crankcase. 2—Bearing cap seal. Groove on each side of cap (immediately to rear of stud holes) fitted with seal. Seal assembled in groove with double-over end in toward bearing. 3—Bearing cap gaskets. L-shaped cap gaskets assembled around oil slinger groove (at rear of cap). Install gaskets (one on each side).

CAMSHAFT REMOVAL:—Remove Front End Assembly as a unit (see removal directions in first column). Remove cylinder head, fuel pump, oil pump, valve tappet cover plates, crankshaft pulley, front motor support (with front of engine jacked up), timing chain cover, camshaft sprocket and timing chain. If valves and valve springs are not to be removed, prop valves up by inserting wooden wedges at opposite sides under valve head. Raise tappets and hold in this position (use spring type clothes pins or similar tool to hold tappets up). Withdraw camshaft (rotate shaft while withdrawing to clear any obstructions).

Chrysler 8 Note—In addition to instructions listed above, two oil feeder lines in valve chamber must be removed and #4 piston must be on top dead center in order to remove camshaft.

EXHAUST VALVE SEAT INSERTS:—Refacing and Replacement Insert Installation. *All data same as for 1939 cars. See 1939 Chrysler Shop Notes for complete data. Inserts furnished Std. & .010" oversize. Use tool set C-387.*

OIL PAN REMOVAL:—Drain oil and replace drain plug. Remove clutch housing underpan (on six cylinder cars this prevents damage to oil pan gaskets on housing underpan dust seal. Remove oil level indicator and drop oil pan.

Installation:—With oil pan clean, install new oil pan gaskets. IMPORTANT—On six cylinder engines, oil pan end gaskets (front and rear) must protrude ¼" to ⅛" above oil pan. Side gaskets installed with ends resting on top of protruding end gaskets. With gaskets in this position, they will be properly compressed when oil pan screws are tightened.

OIL PUMP REMOVAL:—Turn engine over until distributor rotor in firing position for #1 cylinder (allow engine to remain in this position while pump off engine). Remove capscrew in pump body and remove oil pump.

Installation:—When installing oil pump where crankshaft has been moved while pump off engine, turn crankshaft until #1 cylinder is at firing position (both valves closed, piston on compression), set distributor rotor at #1 terminal and install pump. Then reset ignition timing (see 'T&E' page).

RADIATOR CORE REMOVAL:—Chrysler C25, De Soto S7, Dodge D14, D17. Drain cooling system. Remove hood, radiator inlet hose (at top tank), outlet house (at pump), fan blade assembly (by removing screws at pump flange and lifting blades off), and radiator core-to-support capscrews (three on each side). With core tilted to rear, lift up and remove.

Chrysler C26, C27:—Remove hood and and carburetor air cleaner. Remove water pump (see 1940 Chrysler C26, C27 'M' page for instructions). Remove water pump back plate and headlight wires from clips along top of radiator core, radiator outlet hose and elbow at bottom of core, and core-to-support capscrews and nuts. Tilt radiator core toward engine as far as possible and lift core out (car manufacturer recommends that two men lift core out of car so as to prevent core damage).

Plymouth P9, P10:—Remove hood and take off water pump (see 1940 Plymouth P9, P10 'M' page for instructions). Disconnect hose at radiator top tank. Unclip headlight wires along top of core and move wires so as to clear core. Remove radiator core-to-support capscrews at each side. Tilt radiator core back and lift out of car.

PROPELLER SHAFT CENTER BEARING REMOVAL AND INSTALLATION:—Used on all passenger car models with two propeller shafts. To remove, take out rear propeller shaft, disconnect front universal (at rear of transmission), remove center bearing-to-frame mounting screws, slide front propeller shaft (with bearing) out through frame opening in X-member. To install, reverse procedure.

HAND BRAKE ADJUSTMENT:—The hand brake assembly has been redesigned slightly so that adjustments can now be made from beneath car as follows: Fully release hand lever (cable length adjusted by means of clevis at lower end). Adjust anchor screw for .015-.020" band to drum clearance by bending back tab of anchor screw lock and turning screw (on lower right side of brake), then lock screw by bending tab against flat of screw. Loosen guide bolt locknut and adjust guide bolt adjusting nut for .015-.020" band to drum clearance (these two nuts located in front of release springs at left side), then tighten locknut. Turn large adjusting bolt nut (on lower end of bolt below springs) for .015-.020" band to drum clearance for upper half of band. Groove in upper end of this nut must contact ridge on band operating lever spacer above nut.

NOTE—Clearance between side of anchor bracket at center of band and anchor must not exceed .005"

FRONT END ASSEMBLY (UNIT) REMOVAL:—Should be removed as a unit for work on front of engine. *See Chrysler Shop Notes for directions.*

SERIAL NUMBER:—On right front door hinge post. First number: Detroit—7,625,001 (Royal), 6,955,201 (Windsor). Canada—9,714,601 (Royal).

ENGINE NUMBER:—First number C25-1001. Stamped on left side of block between #1 and #2 cylinders. *See Chrysler Shop Notes for engine number lettering ('Special Standard' bore and bearing sizes).*

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head type. **Bore**—3⅜". **Stroke**—4½".
Displacement—241.5 cu. ins. **Rated HP**—27.34.
Developed Horsepower—108 (Std. 6.5-1 hd.), 112 HP (Optl. 7.0-1 hd.—Std. 7 pass.) at 3600 RPM.
Compression Ratio and Pressure—As follows:

Ratio	Pressure at 1000 RPM	At 100 RPM
6.5-1 cast-iron hd.	140-150 lbs.	Approx. 115 lbs.
7.0-1 aluminum hd.	150-160 lbs.	Approx. 120 lbs.

Vacuum Reading—Steady 18-21" idling at 6 MPH. *See Chrysler Shop Notes for Engine Removal data.*

PISTONS:—Aluminum alloy, U-slot, cam ground, tin coated. **Length** 3⅞". **Weight** 17.5 ozs. (stripped).
Removal—Pistons and rods removed from above.
Clearance—Top .0115". Skirt .0000-.0010".
Original Bore & Piston Sizes, Replacement Pistons:—*See Chrysler Shop Notes for sizes and markings.*
Fitting New Pistons:—Check piston size with micrometer across large diameter at bottom of skirt. Insert .002" feeler between cylinder wall and piston (pin removed) on side opposite slot. With piston and block at 70° F, pull to withdraw feeler 5-7 lbs.
Installing Pistons—Slot away from camshaft.

PISTON RINGS:—4 rings, all above pin—#1 Compression (upper inner edge beveled), #2 Comp. (lower outer edge stepped), #3 & 4 (slotted oil rings).

Ring	Width	End Gap	Side Clearance
Comp. (Top)	⅛"	.007-.015"	.002-.004"
Comp. (#2)	⅛"	.007-.015"	.0015-.0035"
Oil Control	5/32"	.007-.015"	.001-.0025"

Replacement Rings:—Std. & .003", .005", .010", .015", .020", .023", .025", .030", .040", .050", .060" oversize.

PISTON PIN:—**Diameter**—55/64". **Length**—2⅞". Floating type. Pin hole in rod bronze bushed.
Pin Fit in Piston—Thumb push fit with piston heated to 130°F.
Pin Fit in Rod Bushing—Thumb push fit at 70°F.
Replacement Pins:—Std. & .003", .005", .008" oversize.

CONNECTING ROD:—**Weight**—33.9 ozs. (with bearings and bolts). **Length**—7⅞".
Crankpin Journal Diameter—2⅛".
Lower Bearing—Removable, precision type, steel-backed babbitt. *See Chrysler Shop Notes for undersizes.* **Clearance** .0005-.0025". **Sideplay** .0055-.0115".
Bearing Adjustment:—None (no shims). Install bearings with boss engaging groove in rod and cap.
Installing Rods:—Oil spit hole toward camshaft.

CRANKSHAFT:—4 bearings, 9 integral counterweights. *See Chrysler Shop Notes for Replacement Main Bearing Caps and Crankshaft Front and Rear Oil Seals.*
Journal Diameters—2½" all bearings.
Bearing Type—Removable, precision type steel-backed, babbitt-lined. **Clearance**—.001-.002".
Bearing Adjustment:—*See Chrysler Shop Notes for bearing removal, front main bearing cap removal, replacement bearing sizes and adjustment data.*
End Thrust:—Taken by flange faces on rear (#4) main bearing. **Endplay**—.003-.007".

CAMSHAFT:—4 bearing. Non-adjustable chain drive. *See Chrysler Shop Notes for camshaft removal.*
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1¼".
Bearing Type—Removable steel-backed, babbitt-lined bushings (except #4 machined in block).
Clearance—.001-.003" (#1), .0015-.0035" (all others).
End Thrust:—Taken by thrust plate behind camshaft sprocket hub. **Endplay**—.002-.006".
Timing Chain:—Morse Type 1883-N, No. 2661. Width 1". Pitch .500" (½"). Length 24" or 48 links.
Camshaft Setting:—Sprockets marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across shaft centers.

VALVES:

	Head Diameter	Stem Diameter	Length
Intake	1 21/32"	.340-.341"	4 25/32"
Exhaust	1 17/32"	.340-.341"	4 25/32"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	⅜"	.0015-.0035"

See Chrysler Shop Notes for Exh. valve seat insert data.
Tappet Clearance:—.008" Int., .010" Exh. (hot & idling). .002" additional exh. clearance desirable for sustained high speeds. NOTE—Tappet screws self-locking (no locknuts). Remove right front wheel, lower housing panel and pump shield for access.
Valve Guides:—Remove from above. Press new guides in (stepped end down) with upper end ⅞" below top of block, finish ream (Tool CM-83) to .3425-.3435".
Valve Springs:—Install with closely coiled ends to top.

Free length 2".	Spring Pressure	Length
Valve Closed	40-45 lbs.	1¾"
Valve Open	107-115 lbs.	1⅜"

Valve Lifters:—Mushroom type (remove from below). Stem diam. ⅝". Ream holes from above (pilot in valve stem guide). Oversizes .001", .008", .030", .060".
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 12° BTDC. Close 44° ALDC.
Exhaust Valves—Open 50° BLDC. Close 6° ATDC.
Valve Timing Check—With .014" (cold) tappet clearance #6 intake valve should open with #6 piston 12° or .063" BTDC with 12th graduation before DC mark on impulse neutralizer aligned with pointer on chain cover. Reset tappet cl. at .008" hot.

LUBRICATION:—Pressure (pump on right of engine). *See Chrysler Shop Notes for oil pump removal.*
Normal Oil Pressure:—30-45 lbs. @ 30 MPH, 15 idling.
Oil Pressure Relief Valve:—Under plug below starter. Opens at 40-45 lbs. To increase pressure use heavy (green), to decrease light (red), spring.
Crankcase Capacity:—5 quarts (refill).

COOLING SYSTEM:—**Capacity**—18 quarts. *See Chrysler Shop Notes for radiator core removal.*
Water Pump:—Packless type with belt drive. *See article in Mechanical Equipment Section for data.*
Removal—Drain water. Remove fan blade assembly, pulley, radiator outlet hose at pump, by-pass elbow (with small hose), pump mounting stud nuts, fan belt adjusting strap at generator, adjusting strap stud and lower pump stud from block.
Thermostat—Bishop & Babcock or Fulton. On head.
Setting—Starts to open 157-162°F. Fully open 183°F.

CLUTCH:—**Borg & Beck Model 10A7, 11A6 (Taxi) with 'Borglite' driven member.** #940 (10A7), #941 (11A6) stamped on cover. Single plate, dry disc type with spiral grooved facings, pressure plate oil baffle & pedal over-center return spring. *See article in Mechanical Equipment Section for data.*
Facings—Spiral wound moulded woven, 2 used. Inside Diam. 7" (10A7), 6½" (11A6), Outside Diam. 10" (10A7), 11" (11A6). Thickness ⅛" (all).
Adjustment:—Pedal should just clear toeboard (adjust stopscrew on lower end) and have 1" free movement (adjusting nut on link rod at clutch fork).
Removal:—Remove release fork pull-back spring, Transmission (see following) and housing underpan. Disconnect release fork from pivot and pull out as far as possible. Mark cover and flywheel, remove cover screws evenly, lower assembly out.

TRANSMISSION:—**Own Make.** All helical gear, constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse). Warner Model R7B overdrive with electrical 'kick-down' Optl. on Windsor. *See article in Mechanical Equipment Section for data.*
Transmission Control:—Steering column shift Std. *See article in Mechanical Equipment Section for data.*
Removal:—Remove propeller shaft (loosen comp. flange nut if transmission to be disassembled—see Chrysler Shop Notes for Propeller Shaft Center Bearing Removal on 7 pass.). Disconnect speedometer cable, battery ground cable, hand brake cable, and gear shift rod and cable at transmission. Remove mounting stud nuts and lockwashers. Pull unit back, lower and remove from under car.
Overdrive Transmission Removal—Same as above, plus the following: Remove hand brake assembly (U-joint flange, brake drum, band and support). Disconnect solenoid wires (remove coil) and overdrive cable at case. Remove 2 upper mounting studs (insert pilot studs) and withdraw assembly.

UNIVERSAL JOINTS:—**Detroit-Universal Series 7200.** *See article in Mechanical Equipment Section for data.*
Propeller Shaft Center Bearing:—Used on 7 passenger sedans. *See Chrysler Shop Notes for servicing.*

REAR AXLE:—**Own Make.** Semi-floating, Hypoid gear type with Hotchkiss drive. *See article in Mechanical Equipment Section for data.*
Ratio—3.9-1 (Std.), 4.3-1 (Windsor with OverDr.—Std. 7 pass.), 4.56-1 (7 pass. with Overdrive).
Backlash—.006-.010". Screw adjustment.
Removal:—Disconnect drive shaft at rear universal. Remove axle shafts (see below) and capscrews on carrier flange. Pull carrier assembly out.
Axle Shaft Removal—Remove wheel, hub, and drum assembly (use screw type hub puller—Tool C-319), block brake pedal, disconnect brake line at wheel cylinder, take off backing plate with oil seal, pull shaft and bearing (Tool C-158). NOTE—Use Tool C-358 to pull oil washer, C-201, 2 to install.
Wheel Bearing Adjustment:—Shims between backing plate and axle housing. With wheel and hub removed, check endplay with dial indicator. To adjust, remove backing plate (see above), add or remove shims (.010", .0125", .015" .030" thick) equally at both wheels. **Endplay**—.003-.008".

SHOCK ABSORBERS:—**Domestic**—Delco or Monroe Direct acting. **Export**—Delco Direct acting or Delco Adjustable direct acting (Spec. Equip. Dom. also). *See articles in Mechanical Equipment Section for data.*

STEERING:—**Steering Gear.** Gemmer Model 305 Worm-and-Roller type with 'Push-pull' adjustment. *See article in Mechanical Equipment Section for data.*
Front Suspension:—Independent, linked parallelogram type with coil springs. *See article in Mechanical Equipment Section for data.*
Kingpin Inclination—4¾° to 6°.
Camber—Pos. ¼°. Limits 0° to Pos. ¾°.
Caster—Neg. 1° to Pos. 1°. Not adjustable.
Toe In—1/16" (0-⅛"). Turn both rods equally.
Steering Geometry—Inner wheel 22°. Outer 20°.

BRAKES:—**Service.** Lockheed hydraulic, double anchor type. Hand lever applies independent shaft brake. *See article in Mechanical Equipment Section for data.*
Wheel Cylinders—Stepped or two-stage bore type.
Drums—Centrifuse type. Diameter—11".
Lining—Molded. Width 2". Thickness 13/64". Length (front shoe) 11 15/32", (rear shoe) 7 31/32".
Clearance—.012" toe, .006" heel, for each shoe.
Hand Brake:—On drum at rear of transmission.
Adjustment—*See Chrysler Shop Notes for data.*
Drum—Cast-iron type. Diameter—6".
Lining—Width 2". Thick. 5/32". Length 17 1/16".

FRONT END ASSEMBLY (UNIT) REMOVAL:—Should be removed as a unit for work on front of engine. *See Chrysler Shop Notes for directions.*

SERIAL NUMBER:—Stamped on plate on right front door hinge pillar post. First number for each model

Traveler	New Yorker	Saratoga	C-27
6,750,101	6,613,401	6,673,501	7,806,551

ENGINE NUMBER:—First number C-26: C26-1001, C27: C27-1001. Stamped on left side of cylinder block between #2 and #3 cylinders. *See Chrysler Shop Notes for Engine Number Lettering ('Special Standard' bore and bearing sizes).*

ENGINE SPECIFICATIONS:—8 cylinder, 'L' head type.

Bore—3¼". **Stroke**—4⅞".

Displacement—323.5 cu. ins. **Rated HP**—33.80.

Developed Horsepower—130 HP (C26—6.8-1 Cast-iron hd.), 137 HP (C27—6.8-1 Aluminum hd.), 143 HP (C26 & C27 with optl. 7.45-1 hd.) at 3400 RPM.

Compression Ratio and Pressure—As follows:

Ratio	Pressure at 1000 RPM	At 100 RPM
6.8-1 hd. (see Note)	150-160 lbs.	Approx. 118 lbs.
7.45-1 aluminum hd.	160-170 lbs.	Approx. 124 lbs.

NOTE—Cast-iron head (C26), Aluminum (C27).

Vacuum Reading—Steady 18-21" idling at 6 MPH. *See Chrysler Shop Notes for engine removal instruct'ns.*

PISTONS:—Aluminum alloy, U-slot, cam ground, tin coated type. **Length**—3⅞".

Weight—16.33 ozs. (stripped).

Removal—Pistons and rods removed from above.

Clearance—Top .011". Skirt .0000-.0010". See Fitting New Pistons (following).

Original Bore & Piston Sizes, Replacement Pistons:—*See Chrysler Shop Notes for sizes and markings.*

Fitting New Pistons:—Check piston size with micrometer at bottom of skirt with gauge at right angles to pin bosses. Insert .002" feeler between cylinder wall and piston (with pin removed) opposite piston slot. Pull to withdraw feeler should be 5 to 7 lbs. Cylinders should be reconditioned when taper exceeds .0015" or out-of-round .002". Reconditioned cylinder bores should be within limits of .0005".

Installing Pistons:—Slot away from camshaft.

PISTON RINGS:—4 rings, all above pin—#1 Compression (upper inner edge beveled), #2 Comp. (lower outer edge stepped), #3 & 4 (slotted oil rings). NOTE—Compression rings are coated type.

Ring	Width	End Gap	Side Clearance
Comp. (top)	⅛"	.007-.015"	.002-.0035"
Comp. (#2)	⅛"	.007-.015"	.0015-.003"
Oil Control	5/32"	.007-.015"	.001-.0025"

Replacement Rings:—Std. & .003", .005", .010", .015", .020", .023", .025", .030", .040", .050", .060" oversize.

PISTON PIN:—**Diameter**—55/64". **Length**—2¾". Pin floats in piston and rod. Held by retaining ring at each end. Pin hole in rod bronze bushed.

Pin Fit in Piston—Thumb push fit with piston heated to 130°F.

Pin Fit in Rod Bushing—Thumb push fit at room temperature.

Replacement Pins:—Std. & .003", .005", .008" oversize.

CONNECTING ROD:—**Weight**—34.3 ozs. (with bearings and bolts). **Length**—9".
Crankpin Journal Diameter—2 3/16".

Lower Bearing—Removable, precision type, steel-backed, babbitt-lined. *See Chrysler Shop Notes for undersizes.*

Clearance—.001-.003". **Sideplay**—.006-.011".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps. Install new bearings with boss engaging groove in rod and cap.

Installing Rods:—Lower bearings are offset. Install rods with widest portion of bearing toward the rear on #1, #3, #5, and #7; toward the front on #2, #4, #6 and #8. Oil hole in upper bearing half must be toward camshaft side of engine on all rods.

CRANKSHAFT:—5 bearing type with 8 integral counterweights. Impulse neutralizer mounted on front end. *See Chrysler Shop Notes for Replacement Main Bearing Caps and Crankshaft Front and Rear Oil Seals.*

Journal Diameters—2 45/64" all bearings.

Bearing Type—Removable, precision type, steel-backed, babbitt-lined.

Clearance—.001-.002".

Bearing Adjustment:—*See Chrysler Shop Notes for Bearing removal, front main bearing cap removal, replacement bearing sizes and adjustment data.*

End Thrust:—Taken by flange faces on rear (#5) main bearing. **Endplay**—.003-.007".

CAMSHAFT:—6 bearing. Non-adjustable chain drive. *See Chrysler Shop Notes for camshaft removal.*

Journal Diameters—#1, 2 1/16"; #2, 2 1/32"; #3, 2"; #4, 1 31/32"; #5, 1 15/16"; #6, 1⅜".

Bearing Type—Removable steel-backed, babbitt-lined bushings (except #6 machined in crankcase).

Clearance—.001-.003" (#1), .0015-.0035" (all others). NOTE—Replacement bushings furnished finish reamed (reaming, scraping or burnishing not required).

End Thrust:—Taken by thrust plate assembled behind camshaft sprocket hub. **Endplay**—.002-.006".

Timing Chain:—Whitney #668983 center link guide type. Width 1¼". Pitch .500" (½"). Length 47 links or 23½".

Camshaft Setting:—Sprockets marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 17/32"	.340-.341"	5⅞"
Exhaust	1 11/32"	.340-.341"	5⅞"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	⅜"	.0015-.0035"

See Chrysler Shop Notes for Exh. valve seat insert data.

Tappet Clearance:—.008" Intake, .010" Exhaust (with engine hot and running). .002" additional exhaust clearance desireable for sustained high speeds. NOTE—Tappet screws are self-locking type (no locknuts used). Remove right front wheel, lower housing panel and fuel pump shield for access to valves.

Valve Guides:—Remove from above. Press new guides in place with upper end 13/16" (Intake), 1" (Exhaust) below top of cylinder block. Install with taper end up (Intake), down (Exhaust) and ream (with Tool CM-83) to inside diameter of .3425-.3435". Counterbore exhaust guide at top to diameter of .365-.375" and ⅜" deep after installed in block.

Valve Springs:—Install with closely coiled ends at top. Free length 2 25/64".

	Spring Pressure	Length
Valve Closed	52-58 lbs.	2 1/32"
Valve Open	129-137 lbs.	1 21/32"

Valve Lifters:—Mushroom type (remove from below with oil pan, camshaft and valves out of engine). Stem diameter ⅝". Ream guide holes from above (with reamer piloted in valve guide to insure alignment of lifter). Lifters furnished for service in Std. & .001", .008", .030", .060" oversize.
Clearance in block—.000-.001".

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 6° BTDC. Close 50° ALDC.
Exhaust Valves—Open 44° BLDC. Close 12° ATDC. Above figures correct with tappet clearance of .011" Intake, .014" Exhaust (cold).
Valve Timing Check—With .011" (cold) tappet clearance #8 intake valve should open with #8 piston 6° or .0170" BTDC with 6th graduation before DC mark on impulse neutralizer aligned with pointer on chain cover. Reset tappet clearance to .006" (hot and idling).
NOTE—Car manufacturer recommends use of Timing Indicator (Tool C-435) inserted in timing hole in cylinder head over #8 piston (measures piston travel).
Motor Gauge—Weidenhoff Adapter #103, Rod #12.

LUBRICATION:—Pressure system with gear type oil pump mounted on right side of crankcase. *See Chrysler Shop Notes for oil pump removal and installation.*

Normal Oil Pressure:—30-45 lbs. at car speed of 30 MPH. 15 lbs. at idling speed.

Oil Pressure Relief Valve:—Located under plug on lower left side of crankcase. Adjustable. To adjust, remove cap, withdraw locking wire, turn slotted plug clockwise to increase pressure, or counter-clockwise to decrease pressure. Valve opens at 40-45 lbs.

Crankcase Capacity:—6 quarts (refill).

COOLING SYSTEM:—**Capacity**—24 quarts. *See Chrysler Shop Notes for radiator core removal.*

Water Pump:—Packless type with sealed ball-bearing shaft (factory lubricated). *See article in Mechanical Equipment Section for data.*
Removal—Drain cooling system, loosen fan shroud-to-radiator core cap screws, remove fan belt, cylinder head water outlet elbow (with radiator inlet hose and water pump by-pass hose and elbow). Disconnect pump inlet hose and take out pump-to-back plate screws. Remove nut from stud in front lower right hand side of pump (pull pump forward and use stud pliers between pump and back plate to remove this stud). Lift out water pump, fan and shroud. NOTE—Back-plate assembled between pump and cylinder block (not removed with water pump).

Thermostat:—Bishop & Babcock or Fulton. In cylinder head outlet elbow. Install with bellows down.
Setting—Starts to open at 150° F. to 155° F. Fully open at 176° F.

Temperature Gauge:—Motometer (Auto-Lite) Vapor tension type. A-L Part No. H-9355. *See article in Mechanical Equipment Section for data.*

Drain Valves:—Two drain valves used. One drain valve in center of radiator lower tank at front. Cylinder block drain valve on lower edge of water jacket on left side of engine.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

CLUTCH (C26 WITHOUT FLUID DRIVE):—Borg & Beck Model 11A6 with 'Borglite' driven member. #941 stamped on cover. Single plate, dry disc type with spiral grooved facings, pressure plate oil baffle and pedal over-center return spring.
See article in Mechanical Equipment Section for data.
Facings—Spiral wound moulded woven, 2 used. Inside Diam. 6½". Outside Diam. 11". Thickness ⅛".

Adjustment:—Clutch pedal should just clear underside of toeboard. To adjust, loosen locknut and turn stopscrew located to rear of pedal arm above shaft. Free movement of pedal should be 1". To adjust, turn clutch release fork adjusting nut on connector link at clutch release fork.

Removal:—Remove clutch release fork pull-back spring. Remove transmission (see Transmission Removal following) and clutch underpan. Disconnect release fork from pivot and pull out as far as possible. Punch mark cover and flywheel (assemble to these marks when re-installing clutch assembly to maintain balance). Remove clutch cover screws (release spring tension evenly by turning each screw out a few turns at a time). Assembly can then be lowered out through pan opening.

CLUTCH (C26 WITH FLUID DRIVE AND C27):—Borg & Beck Model 10A6 with 'Borglite' driven member. #939 stamped on cover. Single plate, dry disc type with spiral grooved facings, pressure plate oil baffle and pedal over-center return spring. Clutch assembly mounted on clutch driving plate at rear of fluid drive unit. NOTE—No spring dampener used on clutch driven member.
See article in Mechanical Equipment Section for data.

Adjustment:—Same as for C26 above.

Removal:—Remove floor board, clutch release fork pull-back spring and cotter pin and clevis from end of release fork rod. Pull release fork out of housing. Remove transmission (see Transmission Removal following) and clutch housing underpan (jack up rear of engine enough to allow pan to clear frame cross member). Punch mark clutch cover and clutch driving plate (assemble to these marks when re-installing clutch assembly to maintain balance). Remove clutch cover-to-driving plate screws (release spring tension evenly by turning each screw out a few turns at a time). Clutch assembly and driven member can then be lowered out through pan opening.

FLUID DRIVE (STD. ON C27, OPTL. ON C26):—Consists of fluid coupling assembled to rear of engine in place of conventional flywheel.
See article in Mechanical Equipment Section for data.

Removal:—Remove clutch (see removal instructions above for C26 with Fluid Drive and C27). If fluid drive to be disassembled, turn unit over until one filler plug is at bottom center, remove plug with 1⅛" socket wrench and allow unit to drain. Remove fluid drive-to-crankshaft stud nuts freeing assembly. Then pull fluid drive and clutch driving plate assembly to rear and lower assembly out through pan opening.

TRANSMISSION:—Own Make. All helical gear type, constant-mesh, synchro-mesh (second and high), sliding gear (low and reverse). Warner Model R7B overdrive with electrical 'kick-down' control standard on C27, optional on C26 (New Yorker and Saratoga—not available on Traveler).
See articles in Mechanical Equipment Section for data.

Transmission Control:—Remote control, steering column mounted mechanical shift.
See article in Mechanical Equipment Section for data.

Removal (C26):—Remove propeller shaft by disconnecting front and rear universal joints. Loosen companion flange nut if transmission to be disassembled. Disconnect speedometer cable, battery ground cable, hand brake cable, and gear shift rod and cable at transmission. Remove transmission-to-clutch housing mounting stud nuts and washers. Pull transmission back, down and out of car. NOTE—Use pilot studs inserted in place of two upper mounting studs when installing transmission to avoid springing clutch driven member.
Overdrive Transmission Removal (C26)—Same as for standard transmission above, plus the following: Remove hand brake assembly (universal joint flange, brake drum, brake band and support). Disconnect solenoid wires (remove coil) and overdrive control cable clevis at lever on overdrive case. Remove two upper mounting studs (insert pilot studs) and withdraw transmission and overdrive as an assembly.

Removal (C27):—Remove floor boards. Disconnect battery ground cable at transmission. Remove rear propeller shaft, four front companion flange nuts, four frame-to-center bearing mounting screws, slide bearing and front shaft back through frame X-member opening (if spacer used between frame and bearing mounting, replace spacer when re-installing). Remove universal joint flange and brake drum from shaft, and clevis pin from brake cable. Take off brake assembly from overdrive case. Disconnect solenoid wires and remove coil. Disconnect speedometer and gear shifter rod and cable at transmission. Remove transmission-to-clutch housing mounting stud nuts, two upper mounting studs (install two nuts on end of stud and turn stud out) and replace with pilot studs. Withdraw transmission and overdrive as an assembly.

UNIVERSAL JOINTS:—Detroit-Universal Series 7300. Cross type with roller bearings. Two used on C26. Three used with Center bearing on C27.
See article in Mechanical Equipment Section for data.

Propeller Shaft Center Bearing (C27):—*See Chrysler Shop Notes for removal and installation data.*

REAR AXLE (C26):—Own Make. Semi-floating, hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—3.91-1 (standard). 4.1-1 (special). 4.3-1 or 4.89-1 (with overdrive and fluid drive).
Backlash—.006-.010". Screw adjustment.

Removal:—Drain differential, remove both axle shafts (see below) and universal flange bolts at rear universal and lower propeller shaft. Take out carrier-to-axle housing capscrews (nuts used on C27) and lift out differential gear carrier assembly.

Axle Shaft Removal—Remove wheel, hub, and drum assembly (use screw type hub puller—Tool C-319 for C26, C-476 for C27). Block brake pedal, disconnect brake line at wheel cylinder, take off oil seal and backing plate and pull axle shaft and bearing with Tool C-158. NOTE—Use Tool C-358 to pull axle shaft oil seal washer and drift C-201 or C-202 to install washer.

Wheel Bearing Adjustment:—Adjusting shims located between flanged ends of axle housing and brake backing plate. Remove wheel and hub assembly (see above). Check endplay with dial indicator (make sure that brake bolts are tight and tap end of axle shaft so that bearing cups are seated). To adjust, remove oil seal and backing plate, add or remove shims equally at both ends of axle housing until endplay is correct. **Endplay**—.003-.008". NOTE—Adjusting shims furnished .010", .0125", .015" and .030" thick.

REAR AXLE (C-27):—Own Make. New type, semi-floating, hypoid gear type with Hotchkiss drive. New barrel type differential with adjustable type drive gear thrust pad.
See article in Mechanical Equipment Section for data.
Ratio—4.55-1.
All other data same as for C26 Rear Axle above.

SHOCK ABSORBERS:—Delco or Monroe. Direct acting, hydraulic types. Delco Models 1130 and 1134 are adjustable type.

Car Model	Make	Front	Rear
C23 (Standard)	Delco	1000-C	1001-T
C23 (Standard)	Monroe	854568	854570
C23 (Spec. Equip.)	Delco	1134-E	1130-W
C23 (Export)	Delco	1002-C	1003-T
C24 (Standard)	Delco	1134-E	1130-W

See articles in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Gemmer Model 335 Worm-and-Roller type with 'push-pull' adjustment.
See article in Mechanical Equipment Section for data.

Front Suspension:—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
Specifications below apply with car weight on wheels and no passenger load.
Kingpin Inclination—4¾° to 6°.
Camber—Positive ¼° (desired). Limits 0° to Positive ¾°. Adjustable.
Caster—Negative 1° to Positive 1°. Not adjustable.
Toe In—1/16" (desired). Limits 0" to ⅛". Adjust by loosening clamp bolts on ends of both tie rods and turning rods equally, tighten clamp bolts. NOTE—Clamp bolt on left end of long tie rod should be turned below tie rod to give clearance for extreme turns.
Steering Geometry (toe-out on turns)—Inner wheel turned 21°30'. Outer wheel turned 20°.

BRAKES:—Service—(Front Wheels): New Lockheed hydraulic, Two-Cylinder type (front shoe anchored at bottom and actuated by top cylinder, rear shoe anchored at top and actuated by bottom cylinder). **(Rear Wheels):** Lockheed hydraulic, double anchor type (same as 1939 except for redesigned wheel cylinder). Hand lever applies independent propeller shaft brake.
See articles in Mechanical Equipment Section for data.
Wheel Cylinders—New straight cut bore type with new piston assembly (no spring) used on both front and rear brakes. Cylinder bore diameter 1⅛".
Drums—Centrifuse type. Diameter—12".
Lining—Molded. Width 2". Thickness 13/64". Length—Rear wheel rear shoe 9⅝", all other shoes 12 9/16".
Clearance—Toe (wheel cylinder end) .007" for all shoes. Heel (anchor bolt end) .006" for all shoes except rear wheel rear shoes—.007" rear wheel rear shoes only.
Braking Power—61% front wheels, 39% rear wheels.

Hand Brake:—On drum at rear of transmission.
Adjustment—*See Chrysler Shop Notes.*
Drum—Cast-iron. Diameter—7".
Lining—Width 2½". Thickness 5/32". Length 20⅛".

Power Brake Unit (C27):—Bendix Internal Valve type.
See article in Mechanical Equipment Section for data.

ENGINE REMOVAL NOTE:—Engine removal from chassis required for all service work. *See Crosley Special Shop Notes for removal directions.*

SERIAL NUMBER:—First number 390-10000. Stamped on front face of cowl below battery shelf (in engine compartment).

ENGINE NUMBER:—First number C-10000. Stamped on top center of engine block at rear of carburetor.

ENGINE SPECIFICATIONS:—Waukesha. Two cylinder, 'L' head, horizontal opposed, air-cooled type with shrouded cylinders and air circulating fan built in flywheel.

Bore—3". **Stroke**—2¾". **Rated Horsepower**—7.2.

Displacement—38.87 cubic inches.

Developed Horsepower—13.5 at 4000 R.P.M.

Compression Ratio—5.5-1.

Compression Pressure—90 lbs. at cranking speed.

Vacuum Reading—No means of connecting gauge.

PISTONS:—Electric furnace cast iron. Matched for equal weight within ⅛ oz.

Weight—18.5 ozs. (with pin). **Length** 2⅝".

Removal—Pistons & rods removed from above with engine out of chassis. *See Crosley Special Shop Notes for engine removal instructions.*

Clearance—.004-.0055". See Fitting Pistons.

Fitting New Pistons:—Use feeler gauges installed between piston and cylinder wall at right angles to pin hole. Piston should pass through bore on .004" feeler and lock on .0055" feeler.

Replacement Pistons:—Finished pistons furnished Standard and .010", .020", .040" oversize.

PISTON RINGS:—Two compression, one oil control ring per piston, all above pin.

Ring	Width	End Gap	Side Clearance
Compr. #1	⅛"	.010-.015"	.002-.0035"
Compr. #2	⅛"	.010-.015"	.0015-.003"
Oil Contr.	3/16"	.010-.018"	.001-.0025"

NOTE—Install oil ring with scraper edge down.

Replacement Rings:—Furnished Standard and .010", .020", .040" oversize.

PISTON PIN:—Diameter ⅝". Pin floats in piston and rod, held by locking ring at each end.

Pin Fit in Piston—.0002" clearance or thumb push fit at normal temperature.

Pin Fit in Rod Bushing—.0003" clearance. Ream new bushings with ⅝" reamer for this clearance.

Replacement Pins:—Std. and .005", .010" oversize.

CONNECTING ROD:—Weight 12.5 ozs. **Length** 4⅝".

Lower Bearing—Removable steel-backed, babbitt lined type.

Crankpin Journal Diameters—1½".

Clearance—.0025". **Sideplay**—.008".

Adjustment:—None (no shims). Replace bearings. Do not file bearing caps.

Replacement Bearings:—Furnished Std. and .003" undersize. Install bearings with locating lugs fitted in notches in rod and cap. NOTE—Bearings can be renewed through pan opening without removing engine from chassis.

CRANKSHAFT:—Two bearing, counterweighted type. *See Crosley Special Shop Notes for Engine Removal directions for main bearing and crankshaft oil seal servicing.*

Journal Diameters—Front 1⅝". Rear 2¼".

Bearing Type—Steel-backed, babbitt-lined bushings (not split). Front bearing mounted in timing gear housing cover.

Clearance—.001-.003" (frt.), .0015-.003" (rear).

Adjustment:—None. Replace bearings. *See Crosley Special Shop Notes for Crankshaft Removal directions.*

End Thrust:—Taken by rear bearing. Adjustable by replacing fiber thrust washer. **Endplay**—.003-.005".

CAMSHAFT:—Proferal (alloy iron). Two bearing, gear driven.

Bearing Type—Removable bushing in rear cover (front), machined in crankcase (rear).

Clearance—.001-.003".

Endplay—.006-.009". Controlled by timing gear.

See Crosley Special Shop Notes for Camshaft Removal and front bushing servicing data.

Timing Gears:—Allowable runout .001". To renew gears, remove camshaft (see Crosley Shop Notes for data), use puller to remove old gears.

Camshaft Setting:—Mesh gears so that 'C' mark on camshaft gear and punchmark on crankshaft gear line up (install gears with these marks forward).

VALVES:—

	Head Diameter	Stem Diameter
Intake	1⅜"	5/16"
Exhaust	1 5/32"	5/16"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.300"	.002-.003"
Exhaust	45°	.300"	.003-.004"

Tappet Clearance—.006-.0065" Intake, .007-.0075" Exhaust, Cold. Not adjustable. NOTE—After grinding valves, check tappet clearance with feeler gauge. Grind off end of valve stem if clearance less than minimum above.

Valve Springs:—Free length 1 27/32".

	Pressure	Length
Valve Closed	20 lbs.	1½"
Valve Open	41 lbs.	1 15/64"

Valve Guides:—Guides can be removed and renewed with engine out of car and dismantled (See Shop Notes for engine removal directions). Ream new guides with 5/16" reamer for correct stem clearance (above).

Valve Lifters:—Mushroom type. Remove from below with camshaft out of engine (see Shop Notes for Camshaft removal directions).

Lifter Clearance—.0005-.0015".

Valve Timing:—See Camshaft Setting above.

Intake Valves—Open 20° BTDC. Close 60° ALDC.

Exhaust Valves—Open 60° BLDC. Close 20° ATDC.

To Check Valve Timing—Intake valve should open when point on flywheel 5.5 teeth before TDC mark (half round notch on rim of flywheel) lines up with small ribcast on top center of crankcase. Exhaust closing point is 5.5 teeth past TDC point.

LUBRICATION:—Pressure to crankshaft, connecting rod and camshaft bearings.

Oil Pump:—Rotary vane type mounted on timing gear cover and driven directly from camshaft.

Removal—Take out 4 screws mounting pump on timing gear cover, remove pump. Serviced by replacement. Use new gasket when installing pump.

Normal Oil Pressure:—30-45 lbs. with warm oil.

Oil Pressure Regulator:—On timing gear case cover. Adjustable by varying valve spring tension (increase tension to increase oil pressure).

Crankcase Capacity—2 quarts.

COOLING:—Air-cooled by suction fan built in flywheel which draws air past cylinder barrel and head fins through ducts formed by shroud bolted over cylinders.

Cooling Fan Capacity—700 cu. ft. of air per minute at 3600 R.P.M.

CLUTCH:—Rockford. Single plate dry disc type.

See article in Mechanical Equipment Section for data.

Facings—Not furnished separately (each facing consists of 4 segments).

Adjustment:—Clutch pedal free travel should be 1.5". To adjust, loosen locknut and turn clevis on connector cable at lower end of throw-out yoke.

Removal:—Remove transmission (see Transmission Removal below) and rear axle as an assembly (do not disconnect drive shaft at rear of transmission case as for transmission removal only). Disconnect clevis at bottom of clutch yoke, remove throw-out bearing from top of yoke, take out six capscrews mounting clutch lever brackets on flywheel, remove clutch assembly.

TRANSMISSION:—Warner Model AS1-T92. Sliding spur gear type (all speeds).

See article in Mechanical Equipment Section for data.

Removal:—Hoist rear of car to remove weight from springs, disconnect springs at rear axle, disconnect brake cables and conduits at backing plates, shock absorber links, exhaust pipe and muffler at torque tube. Block up rear of engine, disconnect speedometer cable and clutch cable clamp on bottom of transmission case, take off control housing and remove shift lever assembly. Take out capscrews in torque tube flange on rear face of transmission case, pull rear axle and propeller shaft assembly to rear **being careful not to lose spring and two washers on shaft at rear of speedometer gear.** Take out four capscrews mounting transmission on flywheel housing, pull transmission straight back and remove.

UNIVERSAL JOINTS:—None used.

REAR AXLE:—Spicer (Salisbury) Model 11. Semi-floating spiral bevel gear type with Torque Tube drive.

See article in Mechanical Equipment Section for data.

Ratio—5.14-1 or 5.57-1.

Backlash—.004-.008". Shim adjustment.

Removal:—Disconnect shock absorber links, brake cables and conduits at backing plate. Hoist rear end of car to remove weight from springs, disconnect springs at axle. Free exhaust pipe and muffler from torque tube, block up rear end of transmission (supported by torque tube). Take out capscrews in torque tube flange on rear of transmission case, pull torque tube and rear axle assembly to rear and remove **being careful not to lose spring and two washers on front end of propeller shaft at rear of speedometer gear.**

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Axle Shaft Removal—Remove hub cap, wheel, axle nut, pull hub (use puller No. 202318). Disconnect brake cable and conduit on backing plate, take out four capscrews and remove backing plate being careful not to lose bearing adjusting shims (between backing plate and axle housing flange). Pull axle and bearing out.

Wheel Bearing Adjustment:—Check endplay with dial indicator. Adjust by removing backing plate (see Axle Shaft Removal above) and adding or removing shims between backing plate and axle housing.

Endplay—.002-.007" between shaft and thrust block (total for both shafts).

TORQUE TUBE & PROPELLER SHAFT ASSEMBLY:—Spicer No. 98-1107X. Shaft is supported by bearing at center of torque tube and has splined joint at each end to engage transmission mainshaft (front), rear axle pinion shaft (rear). Torque tube has flanged ends which bolt directly to transmission case and rear axle housing.

Propeller Shaft Removal—Remove rear axle and torque tube as a unit (see Rear Axle Removal above), withdraw propeller shaft through forward end of torque tube.

CAUTION—When installing assembly in car make certain that spring and washers assembled on forward end of propeller shaft (necessary to prevent endplay in shaft).

SHOCK ABSORBERS:—Delco Model 1201G, H (front), 1201J, K (rear). Single acting, hydraulic type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Ross Model S-12. Cam-and-Lever type.
See article in Mechanical Equipment Section for data.

Front Suspension:—Conventional 'I' beam section front axle with reverse Elliott ends and semi-elliptic springs.

Kingpin Inclination—6°30' crosswise.

Camber—2°. No adjustment provided.

Caster—9°. No adjustment provided.

Toe In—3/64-1/16". Adjust in usual manner by loosening tie rod clamp bolts and turning rod.

BRAKES:—Service—Hawley. Four wheel, mechanical type with 'floating' lining. Hand lever applies all four service brakes.
See article in Mechanical Equipment Section for data.

Drum Diameter—6".

Lining—Width 1". Thickness 5/32". Length 18⅜" per wheel. NOTE—Lining furnished in correct length to fit loosely around shoe assembly with 1/16-⅛" gap at ends (not riveted on shoes).

Clearance—Just clear of drag.

Hand Brake:—See Service Brakes above.

CROSLEY SPECIAL SHOP NOTES

ENGINE REMOVAL (FOR SERVICING):—Engine should be removed from chassis for all major service work as follows: Disconnect battery ground cable, distributor cables, choke and throttle connections, oil gauge tube line at engine. Close shut-off valve at gasoline tank, disconnect gas line at sediment bulb. Remove exhaust pipe (connecting manifold and muffler), accelerator bracket, generator, starting motor (accessible by removing plate in driver's compartment). Disconnect clutch cable bracket on transmission case, clutch cable clevis at clutch yoke, speedometer cable at transmission. Block up front end of car and remove front axle assembly and wheels. Drain oil, remove oil pan and oil suction tube (pan retained by Phillips type screws). Remove hold-down bolts in front motor support, block engine and transmission up, take out capscrews mounting transmission on flywheel housing, pull engine forward. Take out capscrews mounting torque tube on rear face of transmission case, remove transmission. Lower engine to floor, raise front end of car, remove engine from below.
Installation—Install engine in same manner. Check ignition timing if distributor disturbed.

PISTON & CONNECTING ROD REMOVAL:—With engine removed from chassis (above), take out 7 Phillips screws in each shroud, remove shrouds from cylinders. Remove cylinder heads and oil pan (pan retained by 9 Phillips screws). Take out connecting rod bearing cap screws, push piston and rod assembly out through cylinder barrel.

CAMSHAFT REMOVAL:—With engine removed from chassis (above), remove intake and exhaust manifold assembly, cylinder shrouds (retained by 7 Phillips screws in each shroud), cylinder heads, and oil pan (retained by 9 Phillips screws). Remove connecting rod and piston assemblies, gear housing cover (with oil pump), and valve cover. Block up valves by placing 5/16"x¾" capscrew between crankcase and spring washer on each valve, pull camshaft and timing gear assembly out through front of crankcase.

CRANKSHAFT REMOVAL:—For Main Bearing & Crankshaft Oil Seal Servicing. With engine removed from chassis (above), dismantle engine and remove camshaft (see Camshaft Removal above). Take out 4 capscrews mounting flywheel on crankshaft flange, pull flywheel. Pull crankshaft out through front end of crankcase by hand.

Main Bearing Renewal—Drive old bearings out (rear bearing in crankcase, front bearing in gear housing cover), drive new bearing bushings in place. Bearings are precision type and need not be reamed.

Oil Seal Renewal—Drive old oil seals out of crankcase (rear), gear housing cover (front) with drift pin. Use mandril or hardwood block to drive new seals in place. CAUTION—When installing crankshaft use care not to damage leather oil seals.

CAMSHAFT BUSHING RENEWAL:—Take out 8 capscrews in gear housing cover and Phillips screws in oil pan which enter gear cover, remove gear cover. Drive or press camshaft bushing out of timing gear cover and install new bushing in same manner.

NOTE—Rear camshaft bushing is integral with crankcase and cannot be serviced.

FRONT WHEEL & AXLE ASSEMBLY REMOVAL: For Engine Removal from chassis. Raise front end of car until front wheels clear floor, disconnect brake cables at levers on backing plates and cable conduit from backing plate clamps. Disconnect drag link at pitman arm, disconnect shock absorber links at axle. Remove front spring 'U' bolts at axle. Hoist front end of car and roll wheel and axle assembly out from under car.

FRONT END ASSEMBLY (UNIT) REMOVAL:—Should be removed as a unit for work on front of engine. *See Chrysler Shop Notes for directions.*

SERIAL NUMBER:—On right front door hinge post. First number. Detroit—5,688,001 (Custom), 6,064,301 (Deluxe), 5,096,701 (Taxi). Canada—9,393,281.

ENGINE NUMBER:—First number S-7-1001. Stamped on left side of block between #1 and #2 cylinders *See Chrysler Shop Notes for engine number lettering ('Special Standard' bore and bearing sizes).*

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head type. **Bore**—3⅜". **Stroke**—4¼".
Displacement—228 1 cu. ins **Rated HP**—27 34.
Developed Horsepower—100 HP (Std. 6 5-1 head), 105 HP (Optl. 7 0-1 hd—Std. 7 pass.) at 3600 RPM.
Compression Ratio and Pressure—As follows:

Ratio	Pressure at 1000 RPM	At 100 RPM
6 5-1 cast-iron hd	145-155 lbs.	Approx. 115 lbs.
7.0-1 aluminum hd.	150-160 lbs	Approx 120 lbs.

Vacuum Reading—Steady 18-21" idling at 6 MPH *See Chrysler Shop Notes for Engine Removal data.*

PISTONS:—Aluminum alloy, U-slot, cam ground, tin coated. **Length** 3⅞". **Weight** 17 5 ozs (stripped).
Removal—Pistons and rods removed from above
Clearance—Top .0115". Skirt .0000-.0010".
Original Bore & Piston Sizes, Replacement Pistons:—*See Chrysler Shop Notes for sizes and markings.*
Fitting New Pistons:—Check piston size with micrometer across large diameter at bottom of skirt Insert .002" feeler between cylinder wall and piston (pin removed) on side opposite slot With piston and block at 70° F, pull to withdraw feeler 5-7 lbs
Installing Pistons—Slot away from camshaft

PISTON RINGS:—4 rings, all above pin—#1 Compression (upper inner edge beveled), #2 Comp. (lower outer edge stepped), #3 & 4 (slotted oil rings)

Ring	Width	End Gap	Side Clearance
Comp (Top)	⅛"	.007-.015"	.002-.004"
Comp (#2)	⅛"	.007-.015"	.0015-.0035"
Oil Control	5/32"	.007-.015"	.001-.0025"

Replacement Rings:—Std & .003", .005", .010", .015", .020", .023", .025", .030", .040", .050", .060" oversize

PISTON PIN:—**Diameter**—.55/64" **Length**—2⅞" Floating type Pin hole in rod bronze bushed
Pin Fit in Piston—Thumb push fit with piston heated to 130°F
Pin Fit in Rod Bushing—Thumb push fit at 70°F
Replacement Pins:—Std & .003", .005", .008" oversize.

CONNECTING ROD:—**Weight**—35 2 ozs (with bearings and bolts). **Length**—8".
Crankpin Journal Diameter—2⅛"
Lower Bearing—Removable, precision type, steel-backed babbitt *See Chrysler Shop Notes for undersizes.* **Clearance** .0005-.0025" **Sideplay** .0055-.0115".
Bearing Adjustment:—None (no shims) Install bearings with boss engaging groove in rod and cap
Installing Rods:—Oil spit hole toward camshaft

CRANKSHAFT:—4 bearing type with 7 counterweights *See Chrysler Shop Notes for replacement Main Bearing Caps and Crankshaft Front and Rear Oil Seals.*
Journal Diameters—2½" all bearings
Bearing Type—Removable, precision type steel-backed, babbitt-lined **Clearance**—.001-.002".
Bearing Adjustment:—*See Chrysler Shop Notes for bearing removal, front main bearing cap removal, replacement bearing sizes and adjustment data.*
End Thrust:—Taken by flange faces on rear (#4) main bearing **Endplay**—.003-.007"

CAMSHAFT:—4 bearing Non-adjustable chain drive *See Chrysler Shop Notes for camshaft removal.*
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1¼".
Bearing Type—Removable steel-backed, babbitt-lined bushings (except #4 machined in block).
Clearance—.001-.003" (#1), .0015-.0035" (all others).
End Thrust:—Taken by thrust plate behind camshaft sprocket hub. **Endplay**—.002-.006".
Timing Chain:—Morse Type 1883-N, No. 2661. Width 1". Pitch .500" (½"). Length 24" or 48 links.
Camshaft Setting:—Sprockets marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across shaft centers.

VALVES:

	Head Diameter	Stem Diameter	Length
Intake	1 21/32"	.340-.341"	4 25/32"
Exhaust	1 17/32"	.340-.341"	4 25/32"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	⅜"	.0015-.0035"

See Chrysler Shop Notes for Exh. valve seat insert data.
Tappet Clearance:—.008" Int., .010" Exh. (hot & idling). .002" additional exh. clearance desirable for sustained high speeds. NOTE—Tappet screws self-locking (no locknuts). Remove right front wheel, lower housing panel and pump shield for access.
Valve Guides:—Remove from above. Press new guides in (stepped end down) with upper end ⅞" below top of block, finish ream (Tool CM-83) to .3425-.3435".
Valve Springs:—Install with closely coiled ends to top.

	Spring Pressure	Length
Free length 2".		
Valve Closed	40-45 lbs.	1¾"
Valve Open	107-115 lbs.	1⅜"

Valve Lifters:—Mushroom type (remove from below). Stem diam. ⅝". Ream holes from above (pilot in valve stem guide). Oversizes .001", 008", .030", .060".
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 12° BTDC Close 44° ALDC.
Exhaust Valves—Open 50° BLDC. Close 6° ATDC.
Valve Timing Check—With .014" (cold) tappet clearance #6 intake valve should open with #6 piston 12° or .059" BTDC with 12th graduation before DC mark on impulse neutralizer aligned with pointer on chain cover. Reset tappet cl. at .008" hot.

LUBRICATION:—Pressure (pump on right of engine). *See Chrysler Shop Notes for oil pump removal.*
Normal Oil Pressure:—30-45 lbs. @ 30 MPH, 15 idling.
Oil Pressure Relief Valve:—Under plug below starter Opens at 40-45 lbs. To increase pressure use heavy (green), to decrease light (red), spring.
Crankcase Capacity:—5 quarts (refill).

COOLING SYSTEM:—**Capacity**—17 quarts. *See Chrysler Shop Notes for radiator core removal.*
Water Pump:—Packless type with belt drive. *See article in Mechanical Equipment Section for data.*
Removal—Drain water Remove fan blade assembly, pulley, radiator outlet hose at pump, by-pass elbow (with small hose), pump mounting stud nuts, fan belt adjusting strap at generator, adjusting strap stud and lower pump stud from block.
Thermostat—Bishop & Babcock or Fulton. On head.
Setting—Starts to open 157-162°F. Fully open 183°F.

CLUTCH:—**Borg & Beck Model 10A7, 11A6 (Taxi) with 'Borglite' driven member.** #938 (10A7), #931 (11A6) stamped on cover. Single plate, dry disc type with spiral grooved facings, pressure plate oil baffle & pedal over-center return spring. *See article in Mechanical Equipment Section for data.*
Facings—Spiral wound moulded woven, 2 used. Inside Diam 7" (10A7), 6½" (11A6), Outside Diam. 10" (10A7), 11" (11A6) Thickness ⅛" (all).
Adjustment:—Pedal should just clear toeboard (adjust stopscrew on lower end) and have 1" free movement (adjusting nut on link rod at clutch fork).
Removal:—Remove release fork pull-back spring, Transmission (see following) and housing underpan. Disconnect release fork from pivot and pull out as far as possible. Mark cover and flywheel, remove cover screws evenly, lower assembly out.

TRANSMISSION:—**Own Make.** All helical gear, constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse). Warner Model R7B overdrive with electrical 'kick-down' control optl. *See article in Mechanical Equipment Section for data.*
Transmission Control:—Steering column shift Std. *See article in Mechanical Equipment Section for data.*
Removal:—Remove propeller shaft (loosen comp. flange nut if transmission to be disassembled—see Chrysler Shop Notes for Propeller Shaft Center Bearing Removal on 7 pass). Disconnect speedometer cable, battery ground cable, hand brake cable, and gear shift rod and cable at transmission. Remove mounting stud nuts and lockwashers. Pull unit back, lower and remove from under car.
Overdrive Transmission Removal—Same as above, plus the following: Remove hand brake assembly (U-joint flange, brake drum, band and support). Disconnect solenoid wires (remove coil) and overdrive cable at case. Remove 2 upper mounting studs (insert pilot studs) and withdraw assembly.

UNIVERSAL JOINTS:—**Detroit-Universal Series 7200.** Cross type. NOTE—Series 4200 Ball & Trunnion Type used also. *See Mechanical Equipment Section.*
Propeller Shaft Center Bearing:—Used on 7 passenger sedans. *See Chrysler Shop Notes for servicing.*

REAR AXLE:—**Own Make.** Semi-floating, Hypoid gear type with Hotchkiss drive. *See article in Mechanical Equipment Section for data.*
Ratio—4 1-1 (Std. 5 pass.). 4 3-1 (5 pass with overdrive—Std. 7 pass). 4 56-1 (7 pass. with Overdrive).
Backlash—.006-.010". Screw adjustment.
Removal:—Disconnect drive shaft at rear universal. Remove axle shafts (see below) and capscrews on carrier flange. Pull carrier assembly out.
Axle Shaft Removal—Remove wheel, hub, and drum assembly (use screw type hub puller—Tool C-319), block brake pedal, disconnect brake line at wheel cylinder, take off backing plate with oil seal, pull shaft and bearing (Tool C-158). NOTE—Use Tool C-358 to pull oil washer, C-201, 2 to install.
Wheel Bearing Adjustment:—Shims between backing plate and axle housing. With wheel and hub removed, check endplay with dial indicator To adjust, remove backing plate, add or remove shims equally at both wheels. **Endplay**—.003-.008".

SHOCK ABSORBERS:—**Domestic**—Delco Direct Acting.
Export—Delco Direct Acting or Delco Adjustable Direct acting (Special Equip Dom also). *See article in Mechanical Equipment Section for data.*

STEERING:—**Steering Gear.** Gemmer Model 305 Worm-and-Roller type with 'Push-pull' adjustment. *See article in Mechanical Equipment Section for data.*
Front Suspension:—Independent, linked parallelogram type with coil springs. *See article in Mechanical Equipment Section for data.*
Kingpin Inclination—4¾° to 6°
Camber—Pos. ¼°. Limits 0° to Pos ¾°.
Caster—Neg. 1° to Pos. 1° Not adjustable
Toe In—1/16" (0-⅛") Turn both rods equally
Steering Geometry—Inner wheel 22°. Outer 20°.

BRAKES:—**Service.** Lockheed hydraulic, double anchor type. Hand lever applies independent shaft brake. *See article in Mechanical Equipment Section for data.*
Wheel Cylinders—Stepped or two-stage bore type.
Drums—Centrifuse type Diameter—11".
Lining—Molded Width 2". Thickness 13/64". Length (front shoe) 11 15/32", (rear shoe) 7 31/32".
Clearance—.012" toe, .006" heel, for each shoe.
Hand Brake:—On drum at rear of transmission.
Adjustment—*See Chrysler Shop Notes for data.*
Drum—Cast-iron type Diameter—6"
Lining—Width 2". Thick. 5/32". Length 17 1/16".

FRONT END ASSEMBLY (UNIT) REMOVAL:—Should be removed as a unit for work on front of engine. ***See Chrysler Shop Notes for directions.***

SERIAL NUMBER:—On right front door hinge post.

	Detroit	Canada
D14 Deluxe	30,216,001	9,420,231
D17 Special	4,349,001	9,494,721

ENGINE NUMBER:—First number D-14-1001. Stamped on left side of block between #1 and #2 cylinders. ***See Chrysler Shop Notes for Engine Number Lettering ('Special Standard' bore and bearing sizes).***

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head type. **Bore**—3¼". **Stroke**—4⅜".
Displacement—217.8 cu. ins. **Rated HP**—25.35.
Developed Horsepower—87 HP at 3600 RPM.
Compression Ratio—6.5-1 cast-iron head. No optl.
Compression Pressure—140-150 lbs. at 1000 RPM or approximately 113 lbs. at cranking speed.
Vacuum Reading—Steady 18-21" idling at 6 MPH. ***See Chrysler Shop Notes for engine removal instructions.***

PISTONS:—Aluminum alloy, cam ground, split skirt, steel strut, tin coated type. **Length**—3 11/16". **Weight**—15.2 ozs. (stripped).
Removal—Pistons and rods removed from above.
Clearance—Top .011". Skirt .00025-.00075".
Original Bore & Piston Sizes, Replacement Pistons:—***See Chrysler Shop Notes for sizes and markings.***
Fitting New Pistons:—Check piston size with micrometer gauge on skirt across piston pin support ribs. Insert .002" feeler between cylinder wall and piston on side opposite slot. With piston and block at 70°F pull to withdraw feeler should be 10-16 lbs.
Installing Pistons:—Slot away from camshaft.

PISTON RINGS:—4 rings, all above pin—#1 Compression (upper inner edge stepped), #2 Comp. (lower outer edge stepped), #3 and 4 (slotted oil rings).

Ring	Width	End Gap	Side Clearance
Comp. (Top)	⅛"	.007-.015"	.002-.004"
Comp. (#2)	⅛"	.007-.015"	.0015-.0035"
Oil Control	5/32"	.007-.015"	.001-.0025"

Replacement Rings:—Std. & .003", .005", .010", .015", .020", .023", .025", .030", .040", .050", .060" oversize.

PISTON PIN:—**Diameter**—55/64". **Length**—2¾". Floating type. Pin hole in rod bronze bushed.
Pit Fit in Piston—Thumb push fit with piston heated to 160°F.
Pin Fit in Rod Bushing—Thumb push fit at 70°F.
Replacement Pins:—Std. & .003", .005", .008" oversize.

CONNECTING ROD:—**Weight**—30.4 ozs. (with bearings and bolts). **Length**—7 15/16".
Crankpin Journal Diameter—2 1/16".
Lower Bearing—Removable, precision type, steel & bronze backed, babbitt. ***See Chrysler Shop Notes for undersizes.***
Clearance—.0005-.0025". **Sideplay**—.0055-.0115".
Bearing Adjustment:—None (no shims). Install bearings with boss engaging groove in rod and cap.
Installing Rods:—Wide portion of bearing to rear (#1, 3, 5), to front (#2, 4, 6). Oil hole to camshaft.

CRANKSHAFT:—4 bearing type with 7 counterweights. ***See Chrysler Shop Notes for Replacement Main Bearing Caps and Crankshaft Front and Rear Oil Seals.***
Journal Diameters—2½" all bearings.
Bearings—Removable, precision type, babbitt (#4 steel-backed—others bronze & steel backed).
Clearance—.001-.002".
Bearing Adjustment:—***See Chrysler Shop Notes for bearing removal, front main bearing cap removal, replacement bearing sizes and adjustment data.***
End Thrust:—Taken by flange faces on rear (#4) main bearing. **Endplay**—.003-.007".

CAMSHAFT:—4 bearing. Non-adjustable chain drive. ***See Chrysler Shop Notes for camshaft removal.***
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1¼".
Bearing Type—Removable steel-backed, babbitt-lined bushings (except #4 machined in block).
Clearance—.001-.003" (#1), .0015-.0035" (all others).
End Thrust:—Taken by thrust plate behind camshaft sprocket hub. **Endplay**—.002-.006".
Timing Chain:—Morse Type 1883-N, No. 2661. Width 1". Pitch .500" (½"). Length 24" or 48 links.
Camshaft Setting:—Sprockets marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
All valves	1 15/32"	.340-.341"	4 25/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	5/16"	.001-.003"
Exhaust	45°	5/16"	.003-.005"

See Chrysler Shop Notes for Exh. valve seat insert data.
Tappet Clearance:—.006" Int., .008" Exh. (hot & idling). .002" addt'l exh. clearance desirable for sustained high speeds. NOTE—Tappet screws self-locking (no locknuts). Remove right front wheel, lower housing panel and pump shield for access.
Valve Guides:—Remove from above. Press new guides in (stepped end down) with upper end ⅞" below top of block, then finish ream (Tool CM-83) to .342-.343" Intake, .344-.345" Exhaust.
Valve Springs:—Install with closely coiled ends to top.

	Free length 2 3/32".	Spring Pressure	Length
Valve Closed		34-38 lbs.	1¾"
Valve Open		77-83 lbs.	1 7/16"

Valve Lifters:—Mushroom type (remove from below). Stem diam. ⅝". Ream holes from above (pilot in valve stem guide). Oversizes .001", .008", .030", .060". **Clearance in Block**—.000-.001".
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 6° ATDC. Close 46° ALDC.
Exhaust Valves—Open 42° BLDC. Close 8° ATDC.
Valve Timing Check—With .011" (cold) tappet clearance, #6 intake valve should open with #6 piston 6° or .0153" ATDC with 6th graduation after DC mark on impulse neutralizer in line with pointer. Reset tappet clearance at .006" (hot and idling).

LUBRICATION:—Pressure (pump on right of engine). ***See Chrysler Shop Notes for oil pump removal.***
Normal Oil Pressure:—30-45 lbs. @ 30 MPH, 15 idling.
Oil Pressure Relief Valve:—Under plug below starter. Opens at 40-45 lbs. To increase pressure use heavy (green)spring, to decrease use light (red) spring.
Crankcase Capacity:—5 quarts (refill).

COOLING SYSTEM:—**Capacity**—15 quarts. ***See Chrysler Shop Notes for radiator core removal.***
Water Pump:—Packless type with belt drive. ***See article in Mechanical Equipment Section for data.***
Removal—Drain water. Remove fan blade assembly, pulley, radiator outlet hose at pump, by-pass elbow (with small hose), pump mounting stud nuts, fan belt adjusting strap at generator, and belt adjusting strap stud from block. Pull pump off.
Thermostat—Bishop & Babcock or Fulton. On head **Setting**—Starts to open 157-162°F. Fully open 183°F.

CLUTCH:—**Borg & Beck Model 10A7, 11A6 (Taxi) with 'Borglite' driven member.** #928 (10A7), #931 (11A6) stamped on cover. Single plate, dry disc type with spiral grooved facings, pressure plate oil baffle & pedal over-center return spring. ***See article in Mechanical Equipment Section for data.***
Facings—Spiral wound moulded woven, 2 used. Inside Diam. 7" (10A7), 6½" (11A6). Outside Diam. 10" (10A7), 11" (11A6). Thickness ⅛" (all).
Adjustment:—Pedal should just clear toeboard (adjust stopscrew on lower end) and have 1" free movement (adjusting nut on link rod at clutch fork).
Removal:—Remove release fork pull-back spring, Transmission (see following) and housing underpan. Disconnect release fork from pivot and pull out as far as possible. Mark cover and flywheel, remove clutch cover screws evenly, lower assembly out.

TRANSMISSION:—**Own Make.** All helical gear, constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse) with remote shift. ***See article in Mechanical Equipment Section for data.***
Transmission Control:—Steering column shift Std. ***See article in Mechanical Equipment Section for data.***
Removal:—Remove propeller shaft (loosen comp. flange nut if transmission to be disassembled—See Chrysler Shop Notes for Propeller Shaft Center Bearing Removal on 7 pass.). Disconnect speedometer cable, battery ground cable, hand brake cable, and gear shift rod and cable at transmission. Remove mounting stud nuts and lockwashers. Pull unit back, lower and remove from car.

UNIVERSAL JOINTS:—**Detroit-Universal Series 4200 (3 & 5 pass.), Series 7200 (7 pass.).** Roller bearings with ball & trunnion (4200), cross type (7200). ***See articles in Mechanical Equipment Section for data.***
Propeller Shaft Center Bearing:—Used on 7 passenger sedans. ***See Chrysler Shop Notes for servicing.***

REAR AXLE:—**Own Make.** Semi-floating, hypoid gear type with Hotchkiss drive. ***See article in Mechanical Equpiment Section for data.***
Ratio—3.9-1 (Coupe), 4.1-1 (5 pass.), 4.3-1 (7 pass.).
Backlash—.006-.010". Screw adjustment.
Removal:—Disconnect drive shaft at rear universal. Remove axle shafts (see below) and capscrews on carrier flange. Pull carrier assembly out.
Axle Shaft Removal—Remove wheel,hub, and drum assembly (use screw type hub puller—Tool C-319), block brake pedal, disconnect brake line at wheel cylinder, take off backing plate with oil seal, pull shaft and bearing (Tool C-158). NOTE—Use Tool C-358 to pull oil washer, C-201, 2 to install.
Wheel Bearing Adjustment:—Shims between backing plate and axle housing. With wheel and hub removed, check endplay with dial indicator. To adjust, remove backing plate, add or remove shims at both wheels equally. **Endplay**—.003-.008".

SHOCK ABSORBERS:—**Domestic**—Delco Direct Acting. **Export**—Delco Direct Acting or Delco Adjustable Direct Acting (Special Equip. Dom. also). ***See article in Mechanical Equipment Section for data.***

STEERING:—**Steering Gear**—Chrysler (Gemmer design Model 300) standard. Gemmer Model 305 'push-pull' adjustment (7 pass.). Worm-and-roller types. ***See articles in Mechanical Equipment Section for data.***
Front Suspension:—Independent, linked parallelogram type with coil springs. ***See article in Mechanical Equipment Section for data.***
Kingpin Inclination—4¾° to 6°.
Camber—Pos. ¼°. Limits 0° to Pos. ¾°.
Caster—Neg. 1° to Pos. 1°. Not adjustable.
Toe In—1/16" (0-⅛"). Turn both rods equally.
Steering Geometry—Outer wheel 20°, Inner 22°.

BRAKES:—**Service.** Lockheed hydraulic, double anchor type. Hand brake applies independent shaft brake. ***See article in Mechanical Equipment Section for data.***
Wheel Cylinders—Stepped or two-stage bore type.
Drums—Cast-iron. Diameter—11".
Lining—Molded. Width 2". Thickness 13/64". Length (front shoe) 11 15/32", (rear shoe) 7 31/32".
Clearance—.012" toe, .006" heel, for each shoe.
Hand Brake:—On drum at rear of transmission.
Adjustment—***See Chrysler Shop Notes for data.***
Drum—Cast-iron. Diameter—6".
Lining—Width 2". Thick. 5/32". Length 17 1/16".

MERCURY NOTE:—All '95' Engine data below applies to Mercury as well as Ford models with '95' Engine.

GRILLE REMOVAL (FORD DELUXE):—Made up of right and left sections but can be removed as an assembly. To remove, raise hood, take out one screw at top of grille at each side, light baffle-to-fender brace bolt at top, 6 grille-to-side louvre bolts (accessible between core and grille), 1 grille-to-side louvre bolt at each side at bottom (accessible by reaching under grille). Pull assembly out at top, lift off.

OIL PAN REMOVAL:—To remove oil pan, disconnect radius rods at rear end, remove oil level indicator and tube, attach hoist to front bumper bars and raise front end of car, push radius rods down and install block between bolt and cross-member. Remove oil pan screws, maneuver pan off.

CYLINDER SLEEVES:—Replaceable dry type hardened cylinder sleeves use on part production for 1940 Ford '60', '85' and Mercury Engines. Engines with sleeves can be identifed by letters 'HS' stamped on top of block beside inner front corner of left cylinder hd.

Servicing:—To recondition engines with cylinder sleeves, sleeves should be replaced. Car manufacturer recommends use of KRW #6055A Sleeve Puller and Replacer (sleeves should not be pressed in with arbor press). **Sleeves furnished in standard size and should be fitted with new standard size pistons only.**

Fitting Pistons on Sleeve Equipped Engines:—Special gauge thicknesses used (not same as for engines without sleeves). Use .50" wide feeler inserted between cylinder wall and piston at right angles to pin. Pull to withdraw feeler should be 7-12 lbs. (60 Eng.), 6-10 lbs. (85 & 95 Eng.). Feeler thicknesses as follows:

'60' Engine with steel pistons—.0025".
'85' Engine with steel pistons—.003".
'95' Engine with steel pistons—.003".

NOTE—If aluminum pistons used on '85' and '95' Engines, feeler thickness should be .0025".

REPLACEMENT PISTONS ('60' ENGINES):—Steel-alloy pistons only used on these models. Finished pistons furnished in following sizes:

Part No.	Piston Sizes
52-6110-A	Standard
52-6110-B	.0025" Oversize
52-6110-C	.005" Oversize
52-6110-D	.015" Oversize
52-6110-E	.030" Oversize
52-6110-F	.045" Oversize

REPLACEMENT PISTONS ('85'&'95' ENGINES):—Steel alloy pistons used on passenger cars and trucks (except '95' Trucks which are equipped with aluminum pistons). Finished pistons furnished in following sizes:

Steel Alloy Pistons

'85' — Part No. — '95' (except Truck)	Piston Sizes
91-A-6110-A	Standard
91-A-6110-B	.0025" Oversize

NOTE—For .005" to .060" oversize pistons on '85' Engines use Aluminum Pistons listed below.

Aluminum Pistons

'85' — Part No. — '95' Truck	Piston Sizes
———— 99-T-6110-A	Standard
———— 99-T-6110-B	.0025" Oversize
91-A-6110-C 99-T-6110-C	.005" Oversize
91-A-6110-D 99-T-6110-D	.015" Oversize
91-A-6110-E 99-T-6110-E	.030" Oversize
91-A-6110-F 99-T-6110-F	.045" Oversize
91-A-6110-G 99-T-6110-G	.060" Oversize

NOTE—Aluminum pistons not fitted to same clearance as steel pistons. When installing aluminum pistons, use .002" feeler (.0025" feeler for engines with sleeves) with 6-10 lb. pull on feeler.

CONNECTING ROD BEARING SERVICING:—Bearings float between connecting rods and crankpin. Special Replacement bearings furnished oversize on outer diameter (for oversize rods) and undersize on inner diameter (undersize crankpins) as follows:

'60' Engine

Part No.	Connecting Rod Oversize	Crankpin Undersize
92-A-6211-A	Std.	Std.
92-A-6211-B	Std.	.003"
92-A-6211-C	Std.	.010"
92-A-6211-D	.004"	.003"
92-A-6211-E	.008"	.010"
92-A-6211-F	.008"	.003"
92-A-6211-G	.004"	.010"
92-A-6211-H	.004"	Std.
92-A-6211-J	.008"	Std.
92-A-6211-K	Std.	.0015"
92-A-6211-L	Std.	.020"

'60' Note—These bearings used only with new 1940 Connecting Rod 92A-6200, and new Crankshaft 022A-6303 (crankshaft has larger crankpins and main bearing journals). These new bearings do not have end flanges.

'85' & '95' Engines

Part Numbers 85 Eng.	95 Eng.	Con. Rod Oversize	Crankpin Undersize
81-A-6211-A	99-A-6211-A	Std.	Std.
81-A-6211-D	99-A-6211-B	.004"	.003"
81-A-6211-E	99-A-6211-C	.008"	.010"
81-A-6211-F	99-A-6211-D	.008"	.003"
81-A-6211-G	99-A-6211-E	.004"	.010"
————	99-A-6211-F	Std.	.015"
81-A-6211-J	99-A-6211-G	.004"	Std.
81-A-6211-K	99-A-6211-H	.008"	Std.
81-A-6211-L	99-A-6211-L	Std.	.0015"
————	99-A-6211-M	Std.	.020"

CRANKSHAFT BEARINGS:—Replacement bearings furnished in Standard Size and Undersizes as shown below. In addition, Rear Main Bearings (flanged on both ends—take crankshaft end thrust) furnished in special lengths as follows:

'60' Engine

Part Numbers Frt. & Center	Rear	Size
92-A-6333-A	92-A-6331-A	Standard
92-A-6333-B	92-A-6331-B	.005" Undersize
92-A-6333-C	92-A-6331-C	.010" Undersize
————	92-A-6331-D①	Standard
————	92-A-6331-E①	.005" Undersize
————	92-A-6331-F①	.010" Undersize
92-A-6333-D	92-A-6331-G②	.015" Undersize
92-A-6333-E	92-A-6331-H	.020" Undersize

①—.015" Oversize in length.
②—.010" Undersize in length.

'60' Note—These bearings used only with new 1940 Crankshaft 022A-6303 (has larger bearing journals).

'85' & '95' Engines

Part Numbers Frt. & Center	Rear	Size
81-A-6333-A	81-A-6331-A	Standard
81-A-6333-B	81-A-6331-B	.005" Undersize
81-A-6333-C	81-A-6331-C	.010" Undersize
————	81-A-6331-D①	Standard
————	81-A-6331-E①	.005" Undersize
————	81-A-6331-F①	.010" Undersize
81-A-6333-D	81-A-6331-G	.015" Undersize
81-A-6333-E②	81-A-6331-H②	Standard

①—.015" Oversize in length.
②—O.D. .015" Oversize. .010" Undersize in length.

PISTON PIN FITTING:—Steel Pistons. Pins can be removed and installed without heating pistons. Pins, pistons, and rod bushings held to close limits so no fitting required. Check clearance as follows:
Pin Fit in Piston—With piston and pin at same temperature and clean, pin should drop through pin hole in piston (clearance .0007" maximum).
Pin Fit in Rod Bushing—With pin installed, hold pin so that rod hangs vertically, then rotate pin. Lower end of rod should move upward through arc of ½" max. before dropping back to vertical.

Aluminum Pistons:—Pistons must be heated by immersion in boiling water for one minute, or on special piston heater to a temperature not to exceed 200°F. for pin removal and installation. Pins, pistons, and rod bushings held to close limits so that no fitting required. Check clearances as follows:
Pin Fit in Piston—Pin should be hard hand push fit in piston with piston at room temperature.
Pin Fit in Rod Bushing—Same as for steel pistons

TIMING GEARS (FORD 85, 95 & MERCURY):—New type aluminum alloy Camshaft Gear used for partial production on 1940 Engines. Can be replaced without removing camshaft as follows:

Camshaft Gear (Aluminum Alloy Type):—Gear is bolted on camshaft hub flange by four offset cap-screws. To remove gear, remove screw in front end of crankshaft, pull fan and pulley assembly (use puller 6312-A), remove timing gear cover. Bend back lockplate tangs, take out four camshaft gear mounting screws, remove gear. When replacing gear, make certain that marks on camshaft and crankshaft gears are lined up and see that lockplate tangs are bent up against flats on mounting screws. Use 6312-B Pulley Replacer tool to install pulley and fan assembly.

NOTE—Camshaft gear mounting screw holes offset so gear can only be installed in correct position.

VALVE SERVICING (ALL FORD AND MERCURY ENGINES):—Complete valve assembly (valve, spring, guide) should be removed as follows:

Valve Assembly Removal:—Use special bar type lifter V-78 (All Fords and Mercury) inserting the end of lifter through valve spring coils to engage flanged lower end of guides, pull guide down slightly, withdraw 'C' type guide retainer, lift valve assembly out through top of block.

Valve Assembly Dismantling:—Use special bench fixture V-130 (85 Valves), S-214 (60 Valves). Consists of special press by which valve spring can be compressed to free spring retainer (fixture has stop which prevents excessive valve spring compression).

Valve Grinding and Tappet Clearance Note for all V8 Models):—To perform these operations with minimum amount of hand cranking, note which valves are fully open (first column in table below), grind or check valves listed on same line of table—then turn shaft 'til next 'valve open' point reached.

Valves Open	Valves to Grind
1. 4X & 1N	3X, 8N, 6N, 7X, 3N, 2X
2. 3X & 8N	1X, 7N, 5X, 2N, 4X, 1N
3. 1X & 7N	8X, 5N, 6X, 4N
OR	
1. 8X & 5N	1X, 7N, 6N, 7X, 3N, 2X
2. 6N & 7X	5X, 2N, 4X, 1N, 8X, 5N
3. 5X & 2N	6X, 4N, 3X, 8N

NOTE—'X' Exhaust Valve. 'N' Intake Valve.

Tappet Clearance Checking (All Models):—Use special two-step feeler to check clearance with valve lifter on heel of cam (see above). First .0125" step should be 'go', second .0135" 'no go'.

Exhaust Valve Seat Insert Grinding Note:—Seat inserts are exceedingly hard (high-tungsten, chrome-alloy steel). Manufacturer recommends eccentric-grinding equipment be used to reface these inserts.

ENGINE HOOD NOTE:—To raise hood, pull out on latch handle on front of hood at center, press in on button in upper edge of grille (under handle) to release secondary (safety) catch.

OIL PAN REMOVAL:—*See Ford Shop Notes for data.*

SERIAL & ENGINE NUMBER:—Stamped on top of clutch housing and on left frame side member in front of dash bracket.

ENGINE SPECIFICATIONS:—**Own '60'.** 8 Cylinder, 90° Vee, L head. Both banks & crankcase cast enbloc. **Bore**—2.6". **Stroke**—3.2". **Displacement**—136 cu. ins. **Rated Horsepower**—21.6.
Developed Horsepower—60 at 3500 R.P.M.
Compression Ratio—6.6-1 Std. No Optl. ratios.
Compression Pressure—158 lbs. at 2800 R.P.M. max., or 105 lbs. at cranking speed of 100 R.P.M.
Vacuum Reading—18-20" steady at 5-7 M.P.H.

CYLINDER SLEEVES:—Hardened, dry type cylinder sleeves used on engines marked 'HS' on cylinder block just above upper front corner of left cylinder head.
Servicing:—*See Ford Shop Notes for complete data.*

PISTONS:—Steel alloy, light wgt., cam-ground. Recondition cylinders for finished replacement pistons.
Weight—226-231 grams (without rings or pin).
Removal—Pistons and rods removed from above.
Clearance—See Fitting New Pistons.
Replacement Pistons:—*See Ford Shop Notes for data.*
Fitting New Pistons:—Use .002" feeler (.0025" feeler for engines with sleeves), .50" wide, inserted between piston and cylinder wall at right angles to pin. Pull to withdraw feeler—7-12 lbs.

PISTON RINGS:—Two compression, one oil ring, all above pin. Oil ring groove drilled with drain holes.
NOTE—Expander used with #2 Compr. and oil ring.

Ring	Width	End Gap	Side Clearance
Compr. #1	.092-.0925"	.012-.017"	.0025-.003"
Compr. #2	.092-.0925"	.012-.017"	.002-.0025"
Oil Cont.	.1535-.154"	.012-.017"	.0015-.002"

Replacement Rings:—Furnished (sets in cartons only) Std. and .005", .015", .030", .045" oversize.

PISTON PIN:—**Diameter** .6876-.6879". **Length** 2.368". Floating type (locking rings in piston at each end). Pin hole in connecting rod bronze-bushed.
Pin Fit in Piston—.0004" clearance.
Pin Fit in Rod Bushing—.0001" clearance. *See Ford Shop Notes for Pin Fitting Directions.*
Replacement Pins:—Std. & .002" over- & under-size.

CONNECTING ROD:—**Length** 6.125". **Weight** 295 grams.
Crankpin Journal Diameter—1.699" (connecting rod diameter on crankpin 1.800").
Bearing Type—Steel-backed, special-alloy lined. Bearing floats in both rods (side-by-side mounting) with bearing surface on both inner and outer face.
Bearing Dimensions—Length 1.403", .09995" thick. These bearings do not have end flanges.
Clearance—.0005-.002" (total diametrical).
Sideplay—.010-.022" (total).
Bearing Adjustment:—None (no shims). Do not file.
Replacement Bearings:—*See Ford Shop Notes for special bearings for Oversize Rods & Undersize Crankpins.*
Installing Rods:—Marks on rods and caps must be together and installed in same numbered cylinder with marks pointing down toward oil pan.

CRANKSHAFT:—New 3 bearing type with larger main and connecting rod journals and integral counterweights.
Journal Diameters—2.099" (all bearings).
Bearing Type—Steel-backed, special-alloy lined.
Clearance—.001-.003" (or slight drag with .002" feeler assembled in bearing for clearance check).
Bearing Adjustment:—None (no shims). Do not file.
End Thrust:—Taken by rear bearing. Adjust by replacing bearing. **Endplay**—.002-.005".
Replacement Bearings:—*See Ford Shop Notes for Undersizes and special long bearings.*

CAMSHAFT:—Three bearings. Helical gear drive.
Bearing Diameters—1.498" (all bearings).
Bearings—Steel-backed, babbitt-lined bushings.
Clearance—.002".
End Thrust:—Taken by gear hub and cover plate. Adjusted by replacing coverplate. **Endplay**—.005-.015".
Timing Gears:—Cast alloy steel (crankshaft), Bakelized Fabric (Camshaft). **Backlash**—.004" max.
Camshaft Setting:—Mesh '0' marked tooth of crankshaft gear with '/' marked space on camshaft gear (this mark must line up with mark on gear hub).

VALVES:—

	Head Diameter	Stem Diameter	Length
All Valves	1.281"	.2795"	4.375"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	.251"	.0015-.0035"

See Ford Shop Notes for Valve Servicing data.
NOTE—Inserts used for exhaust valves only.
Tappet Clearance:—.0125-.0135". No adjustment.
Valve Guides:—Split type retained by 'C' washer and valve spring. *See Ford Shop Notes for servicing data.*
Valve Lifters:—Barrel type in reamed holes in block. **Diameter**—.8295". **Clearance**—.0005-.001".

Valve Springs:—	Pressure	Length
Valve Closed	26-30 lbs.	2.05"
Valve Open	48-52 lbs.	1.80"

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 9½° BTDC. Close 54½° ALDC.
Exhaust Valves—Open 57½° BLDC. Close 6½° ATDC
To Check Valve Timing—No flywheel marks provided. If dead center point established for any cylinder on flywheel, intake valve for this cylinder should open approximately 3.22 flywheel teeth before this point with the piston .027" BTDC.
Motor Gauge—Weidenhoff Adapter #114. Rod #40.

LUBRICATION:—Pressure. Gear type oil pump mounted on front main bearing cap in crankcase.
Normal Oil Pressure:—30 lbs. at 2000 R.P.M.
Oil Pressure Regulator:—Under plug above front camshaft bearing. Opens at 30 lbs. Not adjustable.
Oil Pressure Gauge:—King-Seeley Electric. Ford No. 01A-9273-A (dash unit), No. 48-9278 (engine unit). *See article in Mechanical Equipment Section for data.*
Crankcase Capacity:—4 qts.

COOLING SYSTEM:—**Capacity**—13 quarts (all).
Water Pump:—Packless 2 used (1 for each bank). *See article in Mechanical Equipment Section for data.*
Removal—Slack off belt adjustment, unscrew large mounting nut behind pulley, pull pump out.
Thermostat:—In each cylinder head outlet (2 used). **Setting**—Starts to open at 145°F. Fully open 180°.
Temperature Gauge:—King-Seeley Electric. Ford No. 01A-10883A (dash unit), 99A-10884 (engine unit). *See article in Mechanical Equipment Section for data.*

CLUTCH:—**Long Model 9CF-CS.** Semi-centrifugal, single plate, dry disc type. *See article in Mechanical Equipment Section for data.*
Facings—Moulded type, 2 required. Inside Diam. 5.76". Outside Diam. 9". Thickness .137".
Adjustment:—Pedal free movement should be 1.0-1.25". To adjust, remove clevis pin at end of connector rod, adjust clevis on rod.
Removal:—Slide rear axle and transmission to rear as a unit to expose clutch (see Transmission Removal (below), take out mounting screws in cover.

TRANSMISSION:—**Own Make.** Constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse), all helical gears (pass. car), second & high only (comm.). *See article in Mechanical Equipment Section for data.*
Transmision Control (022A):—Remote steering column mounted, mechanical shift. *See article in Mechanical Equipment Section for data.*
Removal:—To remove, disconnect hand brake cable, hydraulic brake line at torque tube connection (bleed lines when re-connected), speedometer cable, shock absorber links. Disconnect rear spring at center frame connection. Take out universal joint ball housing screws, slide rear axle assembly back to disengage drive shaft at splined joint. Support engine at rear, take out rear engine mounting bolts, clutch housing screws, pull trans'm straight back.
NOTE—Disconnect gear shifter rods from levers at transmission on passenger cars.

UNIVERSAL JOINT:—**Spicer Model 202-7.** Steel bushing type. Single joint at rear of transmission case. *See article in Mechanical Equipment Section for data.*

REAR AXLE:—**Own Make.** ¾ floating, Spiral bevel gear type with Torque Tube drive. *See article in Mechanical Equipment Section for data.*
Ratio 4.44-1 Std., 4.55-1 Comm. **Backlash** .012" max.
Removal:—Disconnect hand brake cables, hydraulic brake line at torque tube connection (bleed lines when re-connected), speedometer cable, shock absorber links. Disconnect rear spring at center frame connection. Take out universal joint ball housing mounting screws, pull axle assembly to rear to disengage drive shaft at splined joint.
Axle Shaft Removal—Axle must be dismantled and shaft removed through differential housing at inner end. *See Ford Axle article in Mechanical Equipment Section for data.*

SHOCK ABSORBERS:—**Houde (Houdaille).** Type BBDM (Front), BBDX (Rear). **Ford Nos.**—**Front 022A** 01A-18045A (right), 6A (left) arms stamped 10. **022C** 01A-18045B (right), 6B (left). **Rear All** 01A-18080A (right), 1A (left). Double acting, hydraulic, adjustable type. *See article in Mechanical Equipment Section for data.*

STEERING:—**Steering Gear**—Gemmer Model 305 Worm-and-Roller type with 'push-pull' adjustment. *See article in Mechanical Equipment Section for data.*
Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott ends and transverse spring. Axle positioned by radius rods.
Kingpin Inclination—8° crosswise (all models).
Caster—9° Max., 4½° Min. (all models). Must be equal within ½°. Axle may be bent cold to correct caster if proper tools (wedges and blocks to prevent crushing axle flange) are used.
Camber—1° Max., ¼° Min. (all models). Must be equal within ¼°, right wheel must not exceed left. Adjust as for caster (see caster data above).
Toe In—1/16". Set at 1-10 ratio to Camber. Adjust by loosening clamp bolts and turning tie rod.
Steering Geometry (Toe out on turns)—Outer wheel turned 20°. Inner 23⅓°. Allowable variation ½°.

BRAKES:—**Service**—Lockheed Hydraulic, double anchor, non-energizing type. Hand lever applies rear wheel service brakes. *See article in Mechanical Equipment Section for data.*
Wheel Cylinders—Stepped or two-stage bore type: Front Wheel—Front cylinder 1.25". Rear 1.00". Rear Wheel—Front cylinder 1.125". Rear 1.00".
Drums—Cast iron. Diameter 12".
Lining—Woven type (forward shoe—all wheels), Moulded type (rear shoe—all wheels). Width 1.75". Thickness .20". Length per shoe 13.18" (forward shoe—all wheels), 10.1" (rear shoe—all wheels).
Clearance—Least possible amount without drag.
Hand Brake:—See Service Brakes above.

ENGINE HOOD NOTE:—To raise hood, pull out on latch handle on front of hood at center, press in on button in upper edge of grille (under handle) to release secondary (safety) catch.

GRILLE & OIL PAN REMOVAL:—*See Ford Shop Notes.*

SERIAL & ENGINE NUMBER:—Stamped on top of clutch housing and on left frame member in front of dash bracket.

ENGINE SPECIFICATIONS (01A, C):—**Own 85, 8 cyl., 90°** Vee, L head. Both banks & crankcase cast Enbloc.
Bore—3.062". **Stroke**—3.75".
Rated Horsepower—30. **Displacement** 221 cu. ins.
Developed Horsepower—85 at 3800 R.P.M.
Compression Ratio—6.20-1 (Pass. Cars, Comm. ¾&1 Ton), 5.9-1 (Other Trucks). Cast iron head.
Compression Pressure—140 lbs. (6.20-1 hd.), 130 lbs. (5.9-1 hd.) at 2400 RPM maximum. 100 lbs. at cranking speed of 100 RPM.
Vacuum Reading—Steady 18-20" at 5-7 MPH.

ENGINE SPECIFICATIONS (09C):—**Own 95.** See Mercury 'M' page for complete 95 Engine data.

CYLINDER SLEEVES:—Hardened, dry type cylinder sleeves used on engines marked 'HS' on cylinder block beside inner front corner of left cylinder head.
Servicing:—*See Ford Shop Notes for complete data.*

PISTONS:—Steel alloy, light wgt., cam ground type. Recondition for finished replacement pistons.
Weight—333-337 grams (without rings or pin).
Removal—Pistons and rods removed from above.
Clearance—See Fitting New Pistons.
Replacement Pistons:—*See Ford Shop Notes for data.*
Fitting New Pistons:—Use .0025" feeler (.003" feeler for engines with sleeves), .50" wide, inserted between piston and cylinder wall at right angles to pin. Pull to withdraw feeler—6-10 lbs. NOTE—If aluminum pistons fitted, use .002" feeler (.0025" feeler for engines with sleeves) with 6-10 lbs. pull.

PISTON RINGS:—Two compression, one slotted oil ring, all above pin (drain holes in oil ring groove).
NOTE—Expander used with #2 Compr. and oil ring.

Ring	Width	End Gap	Side Clearance
Compr. #1	.0915-.0920"	.012-.017"	.0025-.003"
Compr. #2	.0915-.0920"	.012-.017"	.002-.0025"
Oil Contr.	.1535-.1540"	.012-.017"	.0015-.002"

Replacement Rings:—Furnished (sets in cartons only) Std. and .005", .015", .030", .045", .060" oversize.

PISTON PIN:—**Diameter**—.7501-.7504". **Length**—2.850" (steel pistons), 2.780" (aluminum pistons). Floating type. Pin hole in rod bronze-bushed.
Pin Fit in Piston:—.0005" clearance (steel pistons), +.0001" to —.0001" (aluminum pistons).
Pin Fit in Rod Bushing—.0001" clearance. *See Ford Shop Notes for Pin Fitting directions.*
Replacement Pins:—Std. & .002" over- & under-size.

CONNECTING ROD:—**Length** 7.002". **Weight** 476 grams.
Crankpin Journal Diameter—1.999" (connecting rod diameter on crankpin—2.220").
Bearing Type—Steel-backed, special-alloy lined. Bearing floats in both rods (side-by-side mounting) with bearing surface on inner and outer faces.
Bearing Dimensions—Length 1.747". Thickness .1095". These bearings do not have end flanges.
Clearance—.0005-.002" (total diametrical).
Sideplay—.010-.022" (total).
Bearing Adjustment:—None (no shims). Do not file.
Replacement Bearings:—*See Ford Shop Notes for special bearings for oversize rods and undersize crankpins.*
Installing Rods:—Marks on rods and caps must be together and installed in same numbered cylinder with marks pointing down toward oil pan.

CRANKSHAFT:—3 bearing. Integral counterweights.
Journal Diameters—2.499" (all bearings).
Bearing Type—Steel-backed, special-alloy lined.
Clearance—.001-.003" (or slight drag with .002" feeler assembled in bearing for clearance check).
Bearing Adjustment:—None (no shims). Do not file.
End Thrust:—Taken by rear main bearing. Adjust by replacing bearing. **Endplay**—.002-.006".
Replacement Bearings:—*See Ford Shop Notes for Undersizes and special long main bearings.*

CAMSHAFT:—Three bearing. Helical gear drive.
NOTE—New Camshaft Gear used. See Timing Gears.
Bearing Diameters—1.797" (all bearings).
Bearings—Steel-backed, babbitt-lined bushings.
Clearance—.002".
End Thrust:—Taken by gear hub and cover plate. Adjusted by replacing coverplate. **Endplay**—.005-.015".
Timing Gears:—Cast alloy iron (crankshaft), Bakelized Fabric—pressed on shaft, or Aluminum Alloy—bolted on shaft (camshaft). **Backlash**—.004" max.
See Ford Shop Notes for Timing Gear Replacement.
Camshaft Setting:—Mesh '0' marked tooth of crankshaft gear with '/' marked space on camshaft gear (this mark must be in line with mark on hub).

VALVES:—

	Head Diameter	Stem Diameter	Length
All Valves	1.537"	.3115"	4.750-4.751"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	.292"	.0015-.0035"

See Ford Shop Notes for Valve Servicing data.
NOTE—Seat inserts used for all valves.
Tappet Clearance:—.0125-.0135". No adjustment.
Valve Guides:—Split type retained by 'C' washer and valve spring. *See Ford Shop Notes for servicing data.*
Valve Lifters:—Barrel type in reamed holes in block. **Diameter**—.9995". **Clearance**—.0005-.001".

Valve Springs:	Pressure	Length
Valve Closed	37-40 lbs.	2.13"
Valve Open	76-80 lbs.	1.84"

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open at TDC. Close 44° ALDC.
Exhaust Valves—Open 48° BLDC. Close 6° ATDC.
To Check Valve Timing—No flywheel marks provided. Intake valve opens with piston at TDC.

LUBRICATION:—Pressure. Gear type oil pump mounted in crankcase at rear of engine.
Normal Oil Pressure:—30 lbs. at 2000 R.P.M.
Oil Pressure Regulator:—Under plug above front camshaft bearing. Opens at 30 lbs. Not adjustable.
Oil Pressure Gauge:—King-Seeley Electric. Ford Nos: Dash Unit—01A-9273A (Std.), 01A-9273B (Deluxe). Engine Unit—Ford No. 48-9278 (all models).
See article in Mechanical Equipment Section for data.
Crankcase Capacity:—5 qts.

COOLING SYSTEM:—**Capacity** 22 qts. (Passenger Cars, & Trucks except Cab-over-Engine), 23 qts. (Cab-over-Engine), 20 qts. (Commercial).
Water Pump:—Packless type, 2 used (1 for each bank). *See Mechanical Equipment Section for data.*
Removal—Slack off drive belt, support engine at forward end, remove front engine mounting bolts, take out mounting screws in pump body.
Thermostat:—In each cylinder head outlet (2 used).
Setting—Start to open at 145°F. Fully open 180°.
Temperature Gauge:—King-Seeley Electric. Ford No. Dash Unit—01A-10883A (Std), 01A-10883B (Deluxe). Engine Unit—99A-10884 (all models).
See article in Mechanical Equipment Section for data.

CLUTCH:—**Long Model 9CF-CS.** Semi-centrifugal, single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Molded type, 2 required. Inside Diam. 5.76". Outside Diam. 9". Thickness .137".
Adjustment:—Pedal free movement should be 1.0-1.25". To adjust, remove clevis pin at end of connector rod, adjust clevis on rod.
Removal:—Slide rear axle and transmission to rear as a unit to expose clutch (see Transmission Removal below), take out mounting screws in cover.

TRANSMISSION:—**Own Make.** Constant-mesh, synchro-mesh (Second & High), sliding gear (low & reverse), all helical gear type. NOTE—Four speed spur gear type optional on Commercial.
See articles in Mechanical Equipment Section for data.
Transmission Control (01A):—Steering col. shift Std.
See article in Mechanical Equipment Section for data.
Removal:—Disconnect rear shock absorbers, hand brake cables, hydraulic brake line at torque tube connection (bleed lines when re-connected), speedometer cable. Disconnect rear spring at center frame connection, take out universal joint ball housing screws, slide rear axle assembly back to disengage drive shaft at splined joint. Support engine at rear, take out rear engine mounting bolts and clutch housing screws, pull trans'm straight back. NOTE—Disconnect gear shifter rods from levers at transmission on passenger cars.

UNIVERSAL JOINT:—**Spicer 202-6 (Std.), 202-8 (01C, 09C with 4 spd. trans.).** Steel bushing type. 1 used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—**Own Make.** ¾ floating, Spiral Bevel gear type with Torque Tube drive.
See article in Mechanical Equipment Section for data.
Ratio—3.78-1 Std.; 3.54-1, 4.11-1 Optl.
Backlash—.012" max.
Optional Axle:—Columbia Two-speed type.
See article in Mechanical Equipment Section for data.
Removal:—Disconnect rear shock absorbers, hand brake cables, hydraulic brake line at torque tube connection (bleed lines when re-connected), speedometer cable. Disconnect rear spring at center frame connection, take out universal joint ball housing screws, pull axle assembly to rear to disengage splined joint, remove axle assembly.
Axle Shaft Removal—*See Ford Axle article in Mechanical Equipment Section for data.*

SHOCK ABSORBERS:—**Houde (Houdaille).** Type BBDM (frt.), BBDX (rear). **Ford Nos.—Front 01A** 01A-18045A (right), 6A (left) arms stamped 10. **01C, 09C** 01A-18045B (right), 6B (left). **Rear All** 01A-18080A (right), 1A (left). Double acting, hydraulic, adjustable. *See article in Mechanical Equipment Section.*

STEERING:—**Steering Gear**—Gemmer Model 305 Worm-and-Roller type with 'push-pull' adjustment.
See article in Mechanical Equipment Section for data.
Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott ends and transverse front spring. Axle positioned by radius rods.
Kingpin Inclination—8° crosswise.
Caster—9° Max., 4½° Min. Must be equal within ½°. Axle may be bent cold to correct caster if proper tools (to prevent axle flange damage) used.
Camber—1° Max., ¼° Min. Must be equal within ¼° and right wheel must not exceed left. Adjust as for Caster (see Caster adjustment above).
Toe In—1/16". Set at 1-10 ratio to Camber. Adjust by loosening tie rod clamp bolts and turning tie rod.
Steering Geometry—Inner wheel 23⅓°. Outer 20°.

BRAKES:—**Service.** Lockheed hydraulic, double anchor type. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Drums—Cast iron. Diameter 12".
Wheel Cylinders—Stepped or two-stage bore type: Front Wheel—Front cylinder 1.25". Rear 1.00". Rear Wheel—Front cylinder 1.125". Rear 1.00".
Lining—Woven (forward shoes), Molded (rear shoes). Width 1.75". Thickness .20". Length per shoe 13.18" (forward shoes), 10.1" (rear shoes).
Clearance—Least possible amount without drag.
Hand Brake:—See Service Brakes above.

MODEL DESIGNATION:—Models, Engine Type, and Wheelbases for all trucks are as follows:

¾ Tonner

Model	Engine	Wheelbase
01D	85	122"
02D	60	122"
09D	95	122"

1 Tonner

01Y	85	122"
02Y	60	122"
09Y	95	122"

Cab-Over-Engine Models

011W	85	101"
01W	85	134"
018W	85	158"
091W	95	101"
09W	95	134"
098W	95	158"

Other Models

01T, U	85	134"
018T	85	158"
014T (School Bus)	85	194"
09T, U	95	134"
098T	95	158"
094 (School Bus)	95	194"

SERIAL & ENGINE NUMBER:—Stamped on top of clutch housing.

ENGINE SPECIFICATIONS & SERVICE DATA:—*See Ford '60', Ford '85', and Mercury (for '95' Engine) 'M' pages for complete data.* All data (Cylinder Sleeves, Pistons, Pins, Rings, Connecting Rods, Main Bearings, Camshaft, Valves, Lubrication and Cooling System) same as for passenger cars except as noted.

CLUTCH:—Long Model 9CF-CS (02D, 02Y), 11CF-CI (all others). Semi-centrifugal, single plate, dry disc type. *See article in Mechanical Equipment Section.*

Facings—Molded type, 2 required. Inside Diam. 5.76" (9CF), 6.5" (11CF). Outside Diam. 9" (9CF), 11" (11CF). Thickness .137" (all).

Adjustment:—Pedal free movement should be 1.5-1.75". To adjust, remove clevis pin at end of connector rod, adjust clevis on rod.

Removal:—Remove transmission (see Transmission Removal below). Take out mounting screws in clutch cover flange.

TRANSMISSION (3 SPD.):—Own Make. Std. on ¾ & 1 Tonner. Constant-mesh, synchro-mesh (Second & High), helical gears (Second & High), sliding spur gears (Low & Reverse). 4 Spd. Trans. Optl. *See article in Mechanical Equipment Section for data.*

Removal:—Remove 4 front companion flange bolt nuts at front universal. Take out 2 bolt nuts at coupling shaft center support (all except 101" WB. Cab-Over-Engine). Lower propeller shaft assembly to floor. Support engine at rear end, take out rear engine mounting bolts and clutch housing mounting screws. Pull transmission straight back and remove.

TRANSMISSION (4 SPD.):—Own Make. Std. on all models except ¾ & 1 Tonner. Sliding spur gear type. *See article in Mechanical Equipment Section for data.*

Removal:—Same as for 3 Spd. transmission above.

UNIVERSAL JOINTS:—Spicer. Needle bearing types.

Spicer Model Nos.

Wheelbase	Front	Center	Rear
101"	1351-17	None	1358-104
122"	1318-103	1311-102	1318-103
134 & 158"	1358-4	1351-107	1358-104
194"	1358-5	1351-107	1358-105

See article in Mechanical Equipment Section for data.

Coupling Shaft Bearing:—With the change from Torque Tube Drive to Hotchkiss Drive a new type cushion mounted Coupling Shaft Ball Bearing bolted to underside of intermediate frame cross member is now used. Bearing is mounted on end of coupling shaft in a sleeve with a felt retainer sleeve on each end and a bearing baffle over the front end. Bearing is retained by center universal companion flange. Bearing and sleeve assembly mounted in center support which is bolted to underside of frame cross member.

REAR AXLE (STD.):—Own Make. Full-floating, Spiral Bevel gear type with straddle-mounted pinion and new Hotchkiss drive. *See article in Mechanical Equipment Section for data.*

Ratio—¾ & 1 Tonner: 4.857-1 (Std. 85), 6.67-1 (Std. 60), 4.11-1 (Optl.). Other Trucks: 6.67-1 (Std.), 5.14-1 stamped with SS or 5.83-1 (Optl.).

Backlash—.004-.016".

Removal:—Split rear universal joint by taking out 2 U bolts and nuts. Lower propeller shaft. Disconnect hand brake cables at equalizer (¾ & 1 Tonner) and flexible hydraulic brake line at rear axle (bleed lines when re-connected). Disconnect rear springs (semi-elliptic type) and withdraw axle assembly from beneath truck.

Axle Shaft Removal—Take out two screws (except ¾ & 1 Tonner) and remove hub cap, remove nuts on 8 hub studs which hold axle shaft flange in place, turn the two special screws (in tapped holes in flange) up evenly to break flange loose from wheel hub, **back these screws out,** strike axle shaft flange at center to loosen centering cones on studs, remove cones, pull axle shaft out (wheel not disturbed).

Wheel Bearing Adjustment—Remove axle shaft (above), use special bearing adjusting wrench and remove bearing locknut (outer nut), nut retainer, and grease retainer (except ¾ & 1 Tonner). Adjust inner bearing adjusting nut by turning up until tight and then backing off ⅛ turn, install grease retainer, bearing nut retainer, outer bearing locknut, turn locknut up tight.

NOTE—When installing axle shaft, make certain that gasket in place under shaft flange, cones in place on studs and that two loosening screws backed off sufficiently so that stud nuts can be tightened securely. Turn the two loosening screws in just enough to prevent loosening in service.

REAR AXLE (OPTL.):—Two-speed type. *See article in Mechanical Equipment Section for data.*

Ratio—5.83-1 (Direct), 8.11-1 (2nd speed).

Backlash—.006-.020".

Removal:—Same as for standard axle (above) except that control linkage must also be disconnected.

SHOCK ABSORBERS:—Houde (Houdaille). Double acting, hydraulic, adjustable. Used on front end only. *See article in Mechanical Equipment Section for data.*

STEERING:—Steering Gear—Gemmer Model 305 Worm-and-Roller type with 'Push-pull' adjustment. *See article in Mechanical Equipment Section for data.*

Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott ends and new semi-elliptic springs.

Kingpin Inclination—7° crosswise.

Caster—3½° Max., 1° Min. Must be equal within ½°. NOTE—Caster angle controlled by wedge shims inserted between axle pads and springs. To increase caster, insert taper wedge shims equally at both sides (make certain that spring tie bolts extend through wedge anchoring spring to axle).

Camber—1° Max., ¼° Min. Must be equal within ¼° and right wheel must not exceed left wheel. NOTE—Axle may be bent cold to correct Camber provided that proper tools (wedges and blocks to prevent crushing axle flange) used.

Toe In—1/16". Set at 1-10 ratio to Camber. Toe-in increases with load on trucks and should be set with truck empty. Adjust by loosening clamp bolts and turning tie rod.

Steering Geometry (Toe out on Turns)—Outer wheel turned 20°. Inner wheel 23° (¾ & 1 Tonner), 23¾° (101" WB.), 22⅔° (134" WB.), 22¼° (158" WB.). Allowable variation ½°.

BRAKES:—Service. Lockheed, hydraulic, double anchor type. Hand lever applies rear wheel service brakes (¾ & 1 Ton), independent shaft brake (all others). *See article in Mechanical Equipment Section for data.*

Drums—Cast-iron. Diameter: ¾ Ton (12" front & rear). 1 Ton (12" front, 14" rear). Other Trucks (14" front, 15" rear).

Wheel Cylinders—Stepped type used on ¾ Ton (front & rear wheels), 1 Ton (front). Sizes as follows:

	Front Wheel Front	Front Wheel Rear	Rear Wheel Front	Rear Wheel Rear
¾ Ton	1.25"-1.00"		1.25"-1.00"	
1 Ton	1.25"-1.00"		1.375"-1.375"	
All Others	1.375"-1.375"		1.50"-1.50"	

Lining—Forward shoes (Woven—all wheels ¾ Ton, front wheel 1 Ton. Molded—All Others). Rear shoes (Molded—All Models).

	Width	Thickness	Length per Shoe Forward	Length per Shoe Rear
¾ Ton (all)	1.75"	.20"	13.18"	10.1"
1 Ton (front)	1.75"	.20"	13.18"	10.1"
1 Ton (rear)	2.00"	.268"	15.53"	10.75"
Others (front)	3.50"	.268"	15.53"	10.75"
Others (rear)	3.50"	.33"	16.64"	11.52"

Clearance—Least possible amount without drag.

Hand Brake (¾ & 1 Ton):—See Service Brakes above.

Hand Brake (Others):—On drum at rear of transmission.

Adjustment—Fully release hand brake lever. Flat on cam should rest on ear of band (if not, remove pin in lower end of hand lever). Turn anchor screw (on left side) in to give .010" clearance between drum and band, replace locking wire. Loosen lock nut and turn bracket adjusting screw (on right side) to give .010" clearance for lower half of band, tighten lock nut. Tighten adjusting rod nut (on right side) to give .010" clearance for upper half of band (slotted side of nut up). Adjust brake rod clevis so that pin enters clevis and hand brake lever with flat of cam on ear of band and lever in fully released position.

Drum Diameter—7.81".

Lining—Woven. Width 2.5". Thickness 0.250".

SERIAL NUMBER:—First No. 505001 (107), 605001 (108), 700001 (109). Stamped on plate inside right rear door (Sedans), or on seat frame (Coupes).

ENGINE NUMBER:—First No. 515001 (107), 615001 (108), 710001 (109). Stamped on plate at right side of crankcase and on Serial No. Plate.

ENGINE SPECIFICATIONS:—Six cylinder, 'L' head. Engines same for both models except that Supercharger installed on Models 107 & 109 only.
Bore—3¼". Stroke 4⅜". Displacement 217.8 cu. ins.
Rated Horsepower—25.35 A.M.A.
Developed Horsepower—93 at 3800 RPM (108), 120 at 4000 RPM (107 & 109 Supercharged).
Compression Ratio—Cast iron. 6.65-1 Std., 7.0-1 & 7.25-1 Optl. (all models).
Compression Pressure—125 lbs. (108), 130 lbs. (107 & 109) at cranking speed (Std. Hd.).
Vacuum Reading—15-17" idling at 5-7 M.P.H.

PISTONS:—Bohn autothermic, aluminum alloy, cam ground, plated type with special cylinder wall lubrication system. *See 1938 Graham Shop Notes.*
Weight—14⅛ ozs. (stripped). Length—3⅝".
Removal—Pistons and rods removed from above.
Clearance—Top .024". Skirt .0025".
Replacement Pistons:—Finished pistons (with pins fitted) furnished in oversizes of 3.247" to 3.252" (in .001" steps), 3.252" to 3.274" (in .002" steps) and 3.277". NOTE—Piston size stamped on head.
Fitting New Pistons:—Use .0025" feeler ½" wide inserted between piston and cylinder wall at right angles to pin. Pull required to withdraw feeler must be 10-15 lbs. at all points in cylinder.
Installing Pistons:—Install pistons with four vertical grooves on skirt toward camshaft (right side).

PISTON RINGS:—Two compression, two oil control rings per piston, all above pin.

Ring	Width	End Gap	Side Clearance
Compr.	3/32"	.007-.015"	.0015" Min.
Oil Cont.	5/32"	.007-.015"	.0015" Min.

Replacement Rings & Installation Directions:—*See Graham 1938 Shop Notes for data.*

PISTON PIN:—Diameter 13/16". Length 2 13/16". Pin locked in rod by clampscrew.
Pin Fit in Piston—.0005" clearance (hand push fit).
Replacement Pins:—Furnished Std. and .002", .005", .010" oversize (new pistons have fitted pins).

CONNECTING ROD:—Length 7". Bearing caps dowelled on rods and held by capscrews in blind tapped holes
Crankpin Journal Diameters—2 1/16".
Lower Bearing—Removable steel-backed, cadmium-silver-lined type (not grooved, no oil spray hole).
Clearance—.0008-.0021". Sideplay—.004-.006".
Bearing Adjustment:—None (no shims). Replace bearings. New bearings should be tight with .002" feeler 1" long installed under cap (cap can be sanded on face plate to secure this fit). Install new bearings with tang engaging groove in rod and cap.
Installing Rods:—Lower Bearings offset. Install rod with widest half of bearing toward rear (#1, 3, 5), toward front (#2, 4, 6). Head of piston pin clampscrew should be toward camshaft on all rods.

CRANKSHAFT:—4 bearing, integral counterweights with Lanchester type Vibration dampener.
Journal Diameters—2⅜" all bearings.
Bearing Type (Front)—Cadmium-silver lined bushing inserted in hole in crankcase from forward end with bushing flange doweled to crankcase.
Bearing Type (Others)—Conventional removable steel-backed, cadmium-silver lined type.
Clearance (all Bearings)—.0008-.0021".
Bearing Adjustment & Replacement:—*See Graham 1938 Shop Notes for Crankshaft Bearing data.*
End Thrust:—Taken by front bearing. Adjusted by adding or removing shims furnished .002", .008" thick. **Endplay—.004-.006".**

CAMSHAFT:—4 Bearing. Non-adjustable Chain Drive.
Journal Diameters—#1, 1⅞"; #2, 1 13/16"; #3, 1¾"; #4, 1¼". Bearing Type—Bronze bushings.
End Thrust:—Taken by spring-loaded plunger in forward end of camshaft.
Timing Chain:—Link-Belt No. 336. Width 1". Pitch .500". Length 23" or 46 links.
Camshaft Setting:—Sprockets are marked. With #1 and #6 pistons on top dead center and marks on both sprockets on upper left side, mesh chain so there are exactly 9 links or 10 pins (inclusive of pins meshed opposite marks) between marks.

VALVES:—	Head Diameter	Stem Diameter	Length
Intake	1 33/64"	.341"	4 61/64"
Exhaust	1 21/64"	.341"	4 61/64"

	Seat Angle	Lift	Stem Clearance
Intake	30°	5/16"	.002-.003"
Exhaust	45°	5/16"	.002-.003"

Tappet Clearance:—.010" all valves, engine hot.
Valve Guides:—Pressed in block. Ream after installation for correct clearance.
Valve Springs:—Spring free length 2".

	Spring Pressure	Length
Valve Closed	44 lbs.	1 21/32"
Valve Open	98 lbs.	1 11/32"

Valve Lifters:—Cylindrical type. Diameter 1". Operate in guide holes 1 21/32" long finished in block.
Lifter Clearance in Guide—.0005-.0015".
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 8.5° BTDC. Close 54.5° ALDC.
Exhaust Valves—Open 41° BLDC. Close 11° ATDC.
To Check Timing—Set tappet clearance #6 exhaust valve at .012". This valve should close when flywheel mark 'EC-1' lines up with indicator under cover on right front face of flywheel housing. Reset tappet clearance at .010" with engine hot.

SUPERCHARGER:—107 & 109 Only. Centrifugal type. Carburetor mounted directly on top of case (Supercharger blower between carburetor and engine).
See article in Mechanical Equipment Section for data.
Supercharger Removal & Drive Data:—*See Graham 1938 Shop Notes for data.*

LUBRICATION:—Pressure system. Gear type oil pump located in crankcase.
Normal Oil Pressure:—45 lbs. at 30 M.P.H.
Oil Pressure Regulator:—Located on right side of crankcase at rear of engine number plate. Opens at 50 lbs. Adjusted by adding or removing washers between spring and plunger.
Oil Pressure Gauge:—King-Seeley Electric type.
See article in Mechanical Equipment Section for data.
Crankcase Capacity:—5 quarts (refill).

COOLING SYSTEM:—Capacity—14 quarts (108), 15 quarts (107), 16 quarts (109).
Water Pump:—Packless type, sealed ball bearing shaft.
See article in Mechanical Equipment Section for data.
Removal—Remove fan belt, pump mounting bolts, and remove fan and pump as an assembly.
Thermostat:—Detroit Lubricator. In cyl. head outlet.
Setting—Starts to open 150° F. Fully open 180° F.
Temperature Gauge:—King-Seeley Electric type.
See article in Mechanical Equipment Section for data.

CLUTCH:—Long Model 9½CF-CS. Semi-centrifugal, single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Chevron or Spiral wound Moulded type, 2 required. I.D. 6". O.D. 9½". Thickness .125".
Adjustment—Free movement of clutch pedal must be about 1¼". To adjust, loosen lock nut above pivot block at pedal, turn adjusting nut below pivot block on connector rod until proper clearance obtained.
Removal:—Remove Transmission (See Transmission below), take off clutch housing underpan, take out clutch mounting screws in cover flange (turning all screws out evenly, remove clutch from below.

TRANSMISSION:—Warner. Horizontal type (shift lever and cover on side of case). All helical gear type.
See article in Mechanical Equipment Section for data.
Overdrive Transmission:—Warner Model AS9-T88 with electrical 'kick-down' control. Optl. on 107&108.
See article in Mechanical Equipment Section for data.
Transmission Control:—Own remote control type.
See article in Mechanical Equipment Section for data.
Removal:—Disconnect hand brake and clutch linkage, disconnect propeller shaft at front universal, support engine at rear, remove rear engine mounting cross-member, take out transmission mounting bolts, pull transmission straight back and remove. NOTE—On cars with remote gear shift, disconnect shifter rods at side of transmission case.

UNIVERSAL JOINTS:—(107 & 108)—Detroit Universal Model 4200 Ball-and-trunnion type. **(109)**—Spicer. Needle bearing type, 2 used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—Spicer Model 41-2. Semi-floating, Hypoid Gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.27-1 (107 & 108), 4.09-1 (109) Std. 4.55-1 Optl. (all models).
Backlash—.004-.008" Shim adjustment.
Removal:—Hoist rear of car, disconnect propeller shaft at rear universal, brake line, and shock absorbers, remove spring U-bolts, disconnect rear spring shackles, withdraw axle assembly.
Wheel Bearing Adjustment—Shims provided between flanged end of axle housing and brake backing plate. To adjust, remove wheel, hub, and drum assembly. Remove shims. **Endplay .002-.007".**

SHOCK ABSORBERS:—Delco or Gabriel. Direct acting, hydraulic type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Ross Model T-14 Cam-and-Twin Lever type (107 & 108), Gemmer Model 305 Worm-and-Roller type (109).
See article in Mechanical Equipment Section for data.
Front Suspension:—Spicer, conventional 'I' beam section front axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—7½° crosswise.
Caster—3½°. Adjusted by inserting wedge shims between spring and spring pad on axle.
Camber—1°.
Toe In—⅛". Adjust in usual manner by changing length of tie rod.

BRAKES:—Service—'Graham-Lockheed' hydraulic type. Hand lever applies independent shaft brake. (107 & 108), rear wheel service brakes (109).
See article in Mechanical Equipment Section for data.
Drum—11" Centrifuse type (107 & 108), 10" Cast Iron (109).
Lining—Moulded Type. Width 1¾" (107 & 108), 2" (109). Thickness ¼". Length per wheel 23" (107 & 108).
Clearance—.006" heel, .010" toe, for each shoe.
Hand Brake (107 & 108):—At rear of transmission.
Adjustment—*See Graham 1938 Shop Notes for data.*
Drum Diameter—6".
Lining—Width 2". Thickness 5/32". Length 18 9/16".
Hand Brake (109):—See Service Brakes above.
NoRol:—Optl. *See article in Mechanical Equipment Section.*

TORQUE WRENCH SPECIFICATIONS:—*See Torque Wrench article in Mechanical Equipment Section for tightening specifications for Cylinder Head, Main & Connecting Rod Bolts, etc.*

ENGINE HOOD (BONNET) LOCK:—Alligator type hood (hinged at front) with integral side panels and instrument panel lock. To raise hood, push forward on lock handle located under edge of instrument panel to left of steering column, lift rear of hood.

Hood Removal—Unlock and raise hood. Remove bonnet-to-bonnet support bolts, bonnet lamp wire terminals from connectors and bonnet-to-bonnet hinge bolts (3 at each side). Lift bonnet straight up and remove.

Hood Alignment—Hood hinge U-shaped (cross bar with up right arm at each end). Cross bar fitted with adjustable bracket at each end which are held to frame bracket by 2 screws. Frame brackets bolted to frame. Hinge positioning washers located at end of cross bar and secured by cotter pin. Fender position (at front end) controlled by brace secured to frame with adjusting nut and lock nut at fender brace (under hood in front of radiator core). Radiator louvre assembly position controlled fender-to-louvre bolts. Hood adjustment secured as follows: 1) Frame Bracket Bolts—for slight fore-and-aft and side wise movement 2) Hinge Bracket Screws—for full fore-and-aft movement and slight sidewise movement. 3) Fender Brace Rod—for full sidewise movement of front end of fender. 4) Louvre Panel-to-Fender Bolts (beneath fender)—for fitting front edge of hood (panel should be pushed forward as far as possible).

Radiator Louvre Panel Removal—Remove panel-to-fender bolts from under fender. Remove front bumper bolt and and loosen rear bolt permitting bumper assembly to be lowered. Remove center front screw from under panel and lift panel off.

FRONT FENDER REMOVAL:—Unlock and raise hood. Disconnect headlamp wires at junction block, unclip wires from fender and dash and push headlamp cables through hole in fender (remove battery if left fender to be removed). Remove fender bolts at following points: running board, brace rod top nut, louvre panel, fender cross member (with spacers), brace to cross member screw, core baffle to fender screws (right fender only), radiator lower tank shield screws, hood support screws, apron support to inspection cover screw, and horn bracket to frame screws. Lift fender off.

Right Front Fender Inspection Hole Plate Removal—This plate replaces fender dust shield (now welded to fender) used on 1939 models for access to valve tappets, fuel pump, and oil pump. To remove, unlock and raise hood, remove horn mounting bolts and push horns forward (in engine compartment). Raise front end of car, remove right front wheel and 12 cap screws along the top, bottom and front edge of plate (under fender).

RADIATOR CORE REMOVAL:—Drain radiator and remove upper and lower hoses. Disconnect radiator stay rod bolts at radiator and remove 2 radiator mounting bolts. Lift core out of car.

ENGINE ASSEMBLY REMOVAL:—All engines can be removed as follows: Remove bonnet (see Hood Removal), front seat cushion, accelerator pedal, front floor mat, transmission hole cover, clutch housing to engine bolts, engine ground strap, radiator core (see Radiator Core Removal), radiator stay rods and horns. Disconnect generator, starter, temperature gauge, and oil check valve wires and remove wiring harness from clips on left side of engine. Disconnect flexible fuel pump feed line and remove fuel line to carburetor. Disconnect throttle linkage leading from accelerator cross shaft and remove cross shaft (pull shaft toward spring and slip shaft out of opposite bracket). Disconnect windshield wiper hose at manifold. Remove spark plug wires and bracket, distributor cap, carburetor and air cleaner. Disconnect exhaust pipe at manifold. Remove front engine support bolts and nuts. Hoist engine out of car (use Tool J-917 attached to engine) move engine forward carefully to disconnect from transmission mainshaft. Finally, remove distributor, generator, fuel pump and clutch.

Installation—Reverse procedure listed above and note following point. Wrap a piece of soft wire around clutch throwout bearing oil seal with ends of wire extending up through clutch housing, lower engine in place (use care not to damage clutch driving plate assembly when engaging transmission mainshaft), pull wire out (this will prevent edge of seal from curling over).

ENGINE FRONT SUPPORT REMOVAL:—Drain cooling system. Remove generator, fan belt, radiator outlet hose and raise front end of car. Remove radiator lower tank shield, vibration dampener (see Vibration Dampener Removal) and timing gears (see Timing Gear Removal). Block up front end of engine and remove front engine mounting bolts and nuts. Take out engine support bolt and locks and remove plate.

Installation:—Reverse procedure listed above and note the following points: Clean front face of cylinder block thoroughly and use new gaskets. When replacing engine mounting bolts, tighten nuts until upper and lower plates are against spacer.

CRANKSHAFT SIZE CODE:—Cars equipped with .010" undersize main bearing pins and connecting rod pins identified by marks stamped on left front corner of cylinder block on bottom face beside oil reservoir gasket (visible without removing oil reservoir) as follows:

MU—.010" undersize main bearing pins.

PU—.010" undersize connecting rod pins.

PMU—.010" undersize main and connecting rod pins.

NOTE—These pins require .010" undersize bearings.

ORIGINAL BORE SIZE:—Original production (new engine) bore size indicated by code mark stamped on lower edge of valve chamber opposite cylinders. See table below for size and code marks.

Code Mark	Cylinder Diameter	Code Mark	Cylinder Diameter
A	3.000"	AO	3.010"
B	3.0005"	BO	3.0105"
C	3.001"	CO	3.011"
D	3.0015"	DO	3.0115"
E	3.002"	EO	3.012"

Note—Recondition cylinders to size for which replacement pistons and rings available (see below).

REPLACEMENT PISTONS:—Standard and oversize pistons marked by letter stamped on head and furnished for **cylinder diameter** sizes listed below. See Replacement Rings (following) for ring sizes.

Piston Mark	Piston Size	Cylinder Size
B	2.9985"	3.000" & 3.0005"
D	2.9995"	3.001" & 3.0015"
F	3.0005"	3.002" & 3.0025"
J	3.0025"	3.004"
L	3.0035"	3.005"
BO	3.0085"	3.010" & 3.0105"
DO	3.0095"	3.011" & 3.0115"
FO	3.0105"	3.012" & 3.0125"
LO	3.0135"	3.015"
BB	3.0185"	3.020"
DD	3.0195"	3.021"
FF	3.0205"	3.022"

Piston Markings—Code marks stamped on head of piston as follows: Letter indicates bore size for which piston to be used (see above). One number above the other indicates weight (lower number indicates ounces, top number ¼ ounces). Original factory pistons carry two additional marks (one mark indicates cylinder in which piston installed and other mark indicates cylinder block number). NOTE—All pistons in one engine should be of same weight (carry same weight marks on head).

REPLACEMENT RINGS:—Use standard or oversize rings for replacement pistons listed above. Ring size and pistons for which each ring size applies listed in table below.

Ring Size	Piston Mark	Ring Size	Piston Mark
3.000"	B, D, F	3.010"	BO, DO, FO
3.003"	J	3.015"	LO
3.005"	L	3.020"	BB, DD, FF

Note—If rings filed, keep clearance at pin uniform with end gap (.005" minimum).

PISTON PIN SERVICING:—When replacing pins car manufacturer recommends that oversize piston pins be fitted to the piston boss and new piston pin bushings be installed in rod. NOTE—Piston pin bosses are diamond-bored and should not be reamed.

Replacement Piston Pins—Furnished in standard size and .002", .005", .010" oversize.

Fitting Pins—Pins should be a hand press fit in piston with piston heated to 200°F. (heat in boiling water or electric furnace—do not use torch or direct heat) Replace pin bushing in rod and ream or burnish to .0003" greater diameter than pin (giving desired .0003" clearance on pin). To check pin fit in rod bushing, hold piston with rod in horizontal position, rod should just turn on pin of own weight. CAUTION—Do not ream piston pin bosses in piston.

CONNECTING ROD PALNUTS:—Palnut (locknut) used in place of cotter pin for locking connecting rod bolt nuts. Consists of single thread tempered steel with turned up edges.

Installation—After tightening bolt nuts (see Tightening Specifications in Mechanical Equipment Section), install palnut with smooth face toward nut, turn palnut on finger tight, then lock in place with wrench an additional ¼-⅓ turn. NOTE—Car manufacturer recommends use of new palnuts whenever rods reassembled.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

VIBRATION DAMPENER REMOVAL:—Dampener can be removed from beneath car without removing radiator core or louvre panel as follows: Remove radiator louvre panel center moulding. Remove bumper front bolts and loosen rear bolts and lower bumper. Remove fan belt, unscrew crankshaft starting jaw, place dampener puller (Tool J-676-B) jaw over dampener and puller screw through starting crank hole. Turn screw and pulling dampener off shaft and remove from under car.

CRANKSHAFT REMOVAL:—Remove engine (see Engine Assembly Removal), timing gear cover, oil pan and disconnect connecting rods. Remove main bearing caps (use Tool J-377 for front and rear caps). Lift crankshaft out with flywheel and crankshaft gear.

Installation:—Reverse procedure listed above for removal and note following points. Front and rear oil seal grooves in caps and case must be cleaned of all old packing. After caps secured in place (see Tightening Specifications in Mechanical Equipment Section), drive new packing in grooves using Tool J-932 (install in horizontal groove first on front cap). See Connecting Rod Palnut data above for rod installation. See Timing Gear Installation (following).

MAIN BEARINGS:—Adjustment—Laminated shims provided on top of caps. Remove caps (use Puller J-377 for front and rear caps) and remove shims until clearance is .001". See Crankshaft Installation for bearing cap installation data.

Replacement Bearings:—Finished bearings (with attaching screws) furnished standard and .010" undersize (see Crankpin Size Code for original bearing sizes). Unfinished bearings furnished with 1/32" extra stock and must be line-reamed (see below).

Removal:—Bearing shells are removable type and are held in case and caps by screws. To replace bearings, crankshaft must be removed (see Crankshaft Removal above). With shaft out of engine, take out screws securing shells in cap and case.

Installation:—With crankshaft removed, secure bearings shells in case and cap with machine screws. If unfinished bearings installed, line-ream as directed below. Install crankshaft (see Crankshaft Installation). Add or remove shims on bearing caps until .001" clearance obtained. Tighten bearing cap stud nuts (see Tightening Specifications in Mechanical Equipment Section).

Line-Reaming Main Bearings:—Where unfinished bearings used for replacement, bearings must be line-reamed to size as follows: Install bearings in caps and case, place .021" shim pack between case and caps, tighten cap stud nuts. Line-ream bearings. Thrust flange on center bearing must then be faced for .006-.012" endplay. After line-reaming bearings, adjust for proper clearance as directed above for installation.

CAMSHAFT REMOVAL:—Remove bonnet (see Hood Removal), radiator (see Radiator Core Removal), radiator louvre panel assembly, vibration dampener (see Vibration Dampener Removal), fan blades, fan belt, timing gear cover, camshaft gear (3 bolts), valve chamber cover, cylinder head, valves, tappets, oil pump, fuel pump and distributor (on Six cylinder cars, remove distributor shaft and support assembly). Loosen front engine support and raise front end of engine until camshaft clears radiator tank lower shield. Withdraw camshaft with thrust button and spring.

Camshaft Bearing Removal:—Remove camshaft as directed above. Remove oil pan and bearings. See Rear Camshaft Bearing Installation for Six Cylinder Engines following.

Replacement Camshaft Bearings:—Finished bearings available which are reamed sufficiently oversize to provide correct running fit when installed in engine without reaming or scraping. Standard bearings with added wall thickness provided for installations where reaming equipment to be used. These bearings should be line reamed to give .001" clearance.

Rear Camshaft Bearing Installation (Six Cylinder only):—Due to new location of distributor at top rear of cylinder block, distributor gear is now cut in rear bearing journal with a specal cut-out machined in camshaft rear bushing for the distributor support shaft gear. Whenever rear bearing replaced, this cut-out must be made in bearing after installing in engine as follows: With distributor drive shaft and support assembly off engine, remove drive shaft and insert hole saw (1⅛" hole saw mounted on end of ½" cold rolled stock of sufficient length to extend through support) in place in support. Cut bearing (use nut on end of shaft and turn saw with ratchet wrench) using light pressure to give a clean cut. NOTE—Place oil soaked rag under bearing to catch chips (avoiding necessity of removing crankshaft). Remove support and use extreme care to remove all bearing chips and cuttings.

TIMING GEAR REMOVAL:—Drain cooling system. Remove fan belt, radiator outlet hose, vibration dampener (see Vibration Dampener Removal), timing gear cover bolts, cover, cover gasket and vibration dampener spacer. Turn engine over until timing marks (2 teeth mark on camshaft gear, 1 tooth mark on crankshaft gear) coincide. Remove camshaft gear (retained by 3 capscrews and lock wire). Remove crankshaft gear using Puller Tool J-471.

Installation:—Reverse procedure listed above. Replace crankshaft gear with Tool J-483. Mesh timing gear marks as noted above.

Replacement Camshaft Gear:—A special .008" oversize camshaft gear (marked with daub of yellow paint on front face of gear) available for service. Gear backlash .002-.003" (Six), .004-.005" (Eight).

VALVE LIFTER REMOVAL:—Tappets (lifters) may be removed without removing cylinder head as follows: Remove Right Front Fender Inspection Hole Plate (see instructions under Front Fender Removal), remove valve cover plates (right side of engine below intake manifold), valve spring seat retainer, spring seat, dampener, and spring, tappet adjusting screw (replace with short screw with thin head), tappet guide clamp screw and clamp. Lift out tappet and guide assembly. NOTE—This method recommended where a few tappets to be replaced. For removal of all lifters, remove cylinder head and valves.

CHECKING OILING SYSTEM:—See that oil lines securely in place and not bent or damaged. Drop oil reservoir and clean thoroughly every six months. When installing oil reservoir, check flapper valve on rear main bearing oil return tube (soldered in rear of reservoir). Valve must work freely and should be slightly open with reservoir level. Holes in gaskets between crankcase and oil dipper tray and between tray and reservoir must align with oil return tube (tube registers with hole in bearing).

OIL SUCTION PIPE SEAL:—Synthetic rubber suction pipe oil seal fitted in counter-bore in cylinder block flange at point where suction pipe passes through oil pan flange. Seal fitted around pipe and oil pan gasket widened at this point. Seal compressed by pan when pan screws tightened. NOTE—Use new seal whenever pan installed.

CLUTCH OIL:—Servicing—Hudsonite (oil) in clutch must be renewed every 5000 miles. Turn engine over until hexagonal drain plug on front face of flywheel is visible in timing inspection hole on left side of motor rear support above starting motor. Remove drain plug (using special wrench J-472), turn engine over ⅓ revolution until star on flywheel is at inspection hole, allow engine to stand in this position one minute to drain old oil, turn engine over until filler plug is again at inspection hole, insert ⅓ pint Hudsonite (use J-485 gun) replace plug.
Capacity & Oil—⅓ pt. Hudsonite Clutch Compound.

ENGINE HOOD (BONNET) LOCK & FENDER PLATE REMOVAL:—*See Hudson Shop Notes.*

SERIAL NUMBER:—First number 40101. Stamped on plate on right front door hinge pillar post.

ENGINE NUMBER:—Same as Serial No. On top of cylinder block between #1 and 2 exhaust flanges.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head type.
Bore—3". **Stroke**—4⅛".
Displacement—175 cu. ins. **Rated HP**—21.6.
Developed Horsepower—92 at 4000 RPM.
Compression Ratio—7.0-1 cast-iron head.
Compression Pressure—125 lbs. at 125 RPM.
Vacuum Reading—Steady 18-21" idling at 7 MPH.

PISTONS:—Own Lo-Ex aluminum alloy, 'T' slot, cam ground type. Use finished replacement pistons.
Weight—10.5 ozs. (stripped). **Length**—3 3/16".
Removal—Pistons and rods removed from above.
Clearance—Top .016". Skirt .001-.002".
Original Bore Sizes & Replacement Pistons:—*See Hudson Shop Notes for complete data.*
Fitting New Pistons:—Use .0015" feeler ½" wide inserted between piston and cylinder wall on side opposite slot at right angles to pin. Pull to withdraw feeler must be within 3-4 lbs.
Installing Pistons:—Slot away from camshaft.

PISTON RINGS:—2 compression, 2 oil rings (1 above pin, 1 below pin). Rings positioned by pin in groove.

Ring	Width	End Gap	Side Clearance
Compression	3/32"	.009-.011"	.001"
Oil Cont. (#1)	3/16"	.009-.011"	.001"
Oil Cont. (#2)	5/32"	.009-.011"	.001"

Replacement Rings:—*See Hudson Shop Notes for data.*

PISTON PIN:—**Diameter**—¾". **Length**—2 7/16".
Floating Type. Retained by locking rings. *See Hudson Shop Notes for Pin Servicing data.*
Pin Fit in Piston—.0003" clearance (hand push fit) with piston heated to 200°F.
Pin Fit in Rod Bushing—.0003" clearance.
Replacement Pins:—Std., .002", .005", .010" oversize.

CONNECTING ROD:—**Weight**—30¾". **Length**—8⅝".
Crankpin Journal Diameter 1 15/16".
Lower Bearing—'Bermax' alloy spun type. Exchange rods furnished Std. & .010" undersize. *See Crankshaft Size Code in Hudson Shop Notes for bearing sizes.*
Clearance—.001". **Sideplay**—.006-.010".
Bearing Adjustment:—None (no shims). Replace rods. *See Hudson Shop Notes for Palnut (locknut) data.*
Installing Rods:—Offset. Install rods with widest half of bearing toward rear (#1, 2, 4), toward front (#3, 5, 6). Oil scoop on all rods toward camshaft.

CRANKSHAFT:—3 bearing, integral counterweights. *See Hudson Shop Notes for Crankshaft and Vibration Dampener Removal, Main Bearing Removal, Installation, Replacement Bearings and Line-reaming data.*
Journal Diameters—#1, 2 11/32"; #2, 2⅜"; #3, 2 13/32". **Clearance**—.001".
Bearings—Bronze-backed, 'Bermax' alloy type. *See Crankshaft Size Code Note in Hudson Shop Notes for original bearing sizes.*
Bearing Adjustment:—Shims. *See Hudson Shop Notes.*
End Thrust:—Taken by center bearing. Replace bearing if endplay excessive. **Endplay**—.006-.012".

CAMSHAFT:—3 bearing, gear driven. *See Hudson Shop Notes for Camshaft Removal & Bearing Installation.*
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1 9/16".
Bearings—Babbitt type. **Clearance**—.0025".
End Thrust:—Thrust washer between camshaft flange and crankcase. Spring loaded button in camshaft hub bears against thrust plate on gear cover.
Timing Gears:—Crankshaft gear cast-iron. Camshaft gear GE or Continental Diamond Fibre Bakelite.
Camshaft Setting:—Mesh marked crankshaft gear tooth between two marked teeth on camshaft gear.

VALVES:—

	Head Diameter	Stem Diameter	Length
All valves	1⅜"	11/32"	5 11/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.0025"
Exhaust	45°	11/32"	.004"

Tappet Clearance:—.006" Int., .008" Exh., hot & idling. *See Hudson Shop Notes for Fender Plate Removal.*
Valve Guides:—2 9/16" long. Install with top 1 1/16" below top of block and finish ream to size.
Valve Springs:—Free length 2 17/64". See that dampener installed on bottom of spring with open side toward cylinder.

	Spring Pressure	Length
Valve Closed	40 lbs.	2"
Valve Open	80 lbs.	1 21/32"

NOTE—Replace if pressure below 34 lbs. at 2".
Valve Lifters:—Roller shoe type, fitted in removable guides. *See Hudson Shop Notes for lifter removal.*
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 10°40' BTDC. Close 60° ALDC.
Exhaust Valves—Open 50° BLDC. Close 18°44' ATDC. These figures correct with .010" tappet clearance.
Valve Timing Check—With .010" tappet clearance #1 intake valve should open with piston 10°40' or .0041" BTDC. when point on flywheel approx. 3.95 teeth before 'UDC.1-6/' lines up with indicator in inspection hole above starter. Reset tappet clearance at .006" hot.

LUBRICATION:—Duo-flo (pressure & positive splash).
Oil Pump:—Oscillating plunger type, gear driven by camshaft. Mounted on right side of crankcase.
Normal Oil Pressure—3 lbs. (no gauge).
Oil Pressure Regulator:—Located on right side of crankcase at rear. Opens at 3 lbs. Not adjustable.
Oil Pressure Indicator:—Teleflash Oil Pressure indicator. *See article in Electrical Equipment Section.*
Checking Oiling System:—*See Hudson Shop Notes.*
Crankcase Capacity:—4½ qts. (refill), 5½ (dry). NOTE—Whenever pan installed, place 1½ qts. in upper tray, then 4 qts. through filler.

COOLING SYSTEM:—**Capacity**—13 quarts. *See Hudson Shop Notes for radiator core removal.*
Water Pump:—Centrifugal, belt driven, packless type. *See article in Mechanical Equipment Section for data.*
Thermostat:—Fulton. In cylinder head water outlet.
Setting—Starts to open 150-155°F. Fully open 185°.
Temperature Gauge:—King-Seeley Electric K-S Nos. Dash Unit—8120 (early—white lines), 7755 (later—white diamonds). Engine Unit—7000. NOTE—Gauge inoperative with ignition Off (reads 'H'). *See article in Mechanical Equipment Section for data.*

CLUTCH:—**Own make.** Single plate, cork insert type operating in oil. **Overdrive Cars**—equipped with heavier clutch housing and larger (10") clutch. *See article in Mechanical Equipment Section for data.*
Driven Member—Cork insert type. Inside Diam. 5⅜" Outside Diam. 9". Facing 90 cork inserts .077" thick. See next page for Overdrive Car data.
Pedal Adjustment:—1½" free travel. Adjust yoke on lower end of pedal connector link. Check Automatic Clutch Control & Hill-holder (if used).
Clutch Oil Servicing:—*See Hudson Shop Notes.*
Removal:—Remove transmission (see below), drain clutch oil, take out mounting screws in clutch cover rim, remove clutch assembly from below.
Automatic Clutch Control:—Electric type. Optl. *See article in Mechanical Equipment Section for data.*

TRANSMISSION:—**Own Make.** Constant-mesh, helical gears (Second & High), sliding spur gears (Low & Reverse) with steering column gear shift.
Overdrive:—Warner Model AS13-R6 with electrical 'Kick-down' control optional.
Transmission Control:—Hudson 'Handy-Shift' type. *See separate articles in Mechanical Equipment Section.*
Removal:—Remove front seat cushion and push seat back, remove accelerator pedal. Remove floor mat and transmission hole cover. Disconnect front universal joint. Remove clutch pedal return spring, assist spring, and cross-shaft. Release transmission side bumpers and rods, disconnect handy-shift controls at transmission, remove speedometer cable. Raise front end of car, remove lower flywheel guard and engine rear mounting bolts, raise rear end of engine off frame. Remove clutch housing-to-engine mounting bolts, pull transmission back and lift out. NOTE—Transmission can be taken out without disturbing clutch housing by taking out transmission-to-clutch housing bolts.
Overdrive Transmission Removal—Same as Std. Transmission (above) except overdrive solenoid wires and control cable must also be disconnected.
Installation Note—Wrap one strand of soft wire around throw-out bearing oil seal to prevent leather curling over when transmission installed. Remove wire after transmission installed.

UNIVERSAL JOINTS:—**Spicer.** Front—1261-101 (Std.), 1271-101 (with Ovdr.). Rear—1268-101 (Std.), 1278-101 (with Ovdr.). Needle bearing type. *See article in Mechanical Equipment Section for data.*

REAR AXLE:—**Own Make.** Semi-floating spiral bevel gear type with Hotchkiss drive. *See article in Mechanical Equipment Section for data.*
Ratio—4 5/9-1 (Std., Optl. on Ovdr), 4⅞-1 (Std. on Ovdr., Optl. reg. trans), 4 1/9-1 (optl. all).
Backlash—.0005-.003". Screw adjustment.
Removal:—Disconnect drive shaft at rear universal. Remove axle shafts (see below) and capscrews on carrier flange. Pull carrier assembly out.
Axle Shaft Removal:—Remove wheel and hub (use screw type puller only), remove 4 nuts on bearing cap bolts, push bolts out of backing plate, remove cap (without disturbing brake link), remove shims, pull axle shaft and wheel bearing. Do not drag shaft on oil seals.
Wheel Bearing Adjustment:—Controlled by shims under bearing cap. To adjust, remove bearing cap (see Removal directions above), add or remove shims equally at both wheels. **Endplay**—.002-.004".

SHOCK ABSORBERS:—**Monroe. Front**—160101 (Std.), 160102 (Heavy springs). **Rear**—160107 (Std.), 160108 (Heavy springs). Direct acting, hydraulic. *See article in Mechanical Equipment Section for data.*

STEERING:—**Steering Gear.** Gemmer Model 305 Worm-and-Roller type with 'push-pull' adjustment and new type Center Point Steering linkage. *See article in Mechanical Equipment Section for data.*
Front Suspension:—Independent, linked parallelogram type with coil springs and Autopoise Control. *See article in Mechanical Equipment Section for data.*
Kingpin Inclination—4°36' crosswise.
Caster—0° (Neg. ¼° to Pos. ¼°). Adjustable.
Camber—Positive ¼° to Pos. ¾°. Adjustable.
Toe In—0-1/16". Loosen clamp at outer end of each tube (adjust tubes equally).
Steering Geometry—Inner wheel 24°. Outer 20°50'.

BRAKES (40T,40P):—**Service**—Bendix hydraulic, Double Anchor, duo-servo type with Mechanical Follow-up. Hand lever applies rear service brakes. *See article in Mechanical Equipment Section for data.*
Drums—Alloy steel. Diameter—9 1/16".
Lining—Moulded (primary), woven (secondary). Width 1¾". Thickness 7/32". Length per wheel 19".
Clearance—.010" at heel and toe of each shoe.
Hand Brake:—See Service Brakes above.
Hill-Holder:—Optl. *See Mechanical Equipment Section.*

BRAKES (40 BUSINESS CARS):—Same as Model 41.
See next page for data.

ENGINE HOOD (BONNET) LOCK & FENDER PLATE REMOVAL:—*See Hudson Shop Notes.*

SERIAL NUMBER:—First No. 41101 (41), 43101 (43), 48101 (48). On right front door hinge post.

ENGINE NUMBER:—Same as Serial No. On top of cylinder block between #1 and 2 exhaust flanges.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head type. **Bore**—3". **Stroke**—5". **Displacement**—212 cubic inches. **Rated HP** 21.6. **Developed Horsepower**—102 (41,43), 98 (48) at 4000 RPM. **Compression Ratio**—6.50-1 cast-iron head. **Compression Pressure**—120 lbs. at 125 RPM. **Vacuum Reading**—Steady 18-21" idling at 7 MPH.

PISTONS:—Own Lo-Ex aluminum alloy, 'T' slot, cam ground type. Use finished replacement pistons. **Weight**—10.5 ozs. (stripped). **Length**—3 3/16". **Removal**—Pistons and rods removed from above. **Clearance**—Top .016". Skirt .001-.002". **Original Bore Sizes & Replacement Pistons:**—*See Hudson Shop Notes for complete data.* **Fitting New Pistons:**—Use .0015" feeler ½" wide inserted between piston and cylinder wall on side opposite slot at right angles to pin. Pull to withdraw feeler must be within 3-4 lbs. **Installing Pistons:**—Slot away from camshaft.

PISTON RINGS:—2 compression, 2 oil rings (1 above pin, 1 below pin). Rings positioned by pin in groove.

Ring	Width	End Gap	Side Clearance
Compression	3/32"	.009-.011"	.001"
Oil Cont. (#1)	3/16"	.009-.011"	.001"
Oil Cont. (#2)	5/32"	.009-.011"	.001"

Replacement Rings:—*See Hudson Shop Notes for data.*

PISTON PIN:—**Diameter**—¾". **Length**—2 7/16". Floating Type. Retained by locking rings. *See Hudson Shop Notes for Pin Servicing data.* **Pin Fit in Piston**—.0003" clearance (hand push fit) with piston heated to 200°F. **Pin Fit in Rod Bushing**—.0003" clearance. **Replacement Pins:**—Std., .002", .005", .010" oversize.

CONNECTING ROD:—**Weight** 30 ozs. **Length** 8 3/16". **Upper Bearing (Piston Pin Bushing)**—Bronze. **Crankpin Journal Diameter** 1 15/16". **Lower Bearing**—'Bermax' alloy spun type. Exchange rods furnished Std. & .010" undersize. *See Crankshaft Size Code in Hudson Shop Notes for bearing sizes.* **Clearance**—.001". **Sideplay**—.006-.010". **Bearing Adjustment:**—None (no shims). Replace rods. *See Hudson Shop Notes for Palnut (locknut) data.* **Installing Rods:**—Offset. Install rods with widest half of bearing toward rear (#1, 2, 4), toward front (#3, 5, 6). Oil scoop on all rods toward camshaft.

CRANKSHAFT:—3 bearing, integral counterweights. *See Hudson Shop Notes for Crankshaft and Vibration Dampener Removal, Main Bearing Removal, Installation, Replacement Bearings and Line-reaming data.* **Journal Diameters**—#1, 2 11/32"; #2, 2⅜"; #3, 2 13/32". **Clearance**—.001". **Bearings**—Bronze-backed, 'Bermax' alloy type. *See Crankshaft Size Code Note in Hudson Shop Notes for original bearing sizes.* **Bearing Adjustment:**—Shims. *See Hudson Shop Notes.* **End Thrust:**—Taken by center bearing. Replace bearing if endplay excessive. **Endplay**—.006-.012".

CAMSHAFT:—3 bearing, gear driven. *See Hudson Shop Notes for Camshaft Removal & Bearing Installation.* **Journal Diameters**—#1, 2"; #2, 1 31/32"; #3, 1 9/16". **Bearings**—Babbitt type. **Clearance**—.0025". **End Thrust:**—Thrust washer between camshaft flange and crankcase. Spring loaded button in camshaft hub bears against thrust plate on gear cover. **Timing Gears:**—Crankshaft gear cast-iron. Camshaft gear GE or Continental Diamond Fibre Bakelite. **Camshaft Setting:**—Mesh marked crankshaft gear tooth between two marked teeth on camshaft gear.

VALVES:—

	Head Diameter	Stem Diameter	Length
All valves	1⅜"	11/32"	5 11/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.0025"
Exhaust	45°	11/32"	.004"

Tappet Clearance:—.006" Int., .008" Exh., hot & idling. *See Hudson Shop Notes for Fender Plate Removal.* **Valve Guides:**—2 9/16" long. Install with top 1 1/16" below top of block and finish ream to size. **Valve Springs:**—Free length 2 17/64". See that dampener installed on bottom of spring with open side toward cylinder.

	Spring Pressure	Length
Valve Closed	40 lbs.	2"
Valve Open	80 lbs.	1 21/32"

NOTE—Replace if pressure below 34 lbs. at 2". **Valve Lifters:**—Roller shoe type, fitted in removable guides. *See Hudson Shop Notes for lifter removal.* **Valve Timing:**—See Camshaft Setting above. **Intake Valves**—Open 10°40' BTDC. Close 60° ALDC. **Exhaust Valves**—Open 50° BLDC. Close 18°44'ATDC. These figures correct with .010" tappet clearance. **Valve Timing Check**—With .010" tappet clearance #1 intake valve should open with piston 10°40' or .0562" BTDC when a point on the flywheel approx. 3.94 teeth before 'UDC.1-6/' lines up with indicator in inspection hole above starter. Reset tappet clearance at .006" hot.

LUBRICATION:—Duo-flo (pressure & positive splash). **Oil Pump:**—Oscillating plunger type, gear driven by camshaft. Mounted on right side of crankcase. **Normal Oil Pressure**—3 lbs. (no gauge). **Oil Pressure Regulator:**—Located on right side of crankcase at rear. Opens at 3 lbs. Not adjustable. **Oil Pressure Indicator:**—Teleflash Oil Pressure indicator. *See article in Electrical Equipment Section.* **Checking Oiling System:**—*See Hudson Shop Notes.* **Crankcase Capacity:**—4½ qts. (refill), 5½ (dry). NOTE—Whenever pan installed, place 1½ qts. in upper tray, then 4 qts. through filler.

COOLING SYSTEM:—**Capacity**—13 quarts. *See Hudson Shop Notes for radiator core removal.* **Water Pump:**—Centrifugal, belt driven, packless type. *See article in Mechanical Equipment Section for data.* **Thermostat:**—Fulton. In cylinder head water outlet. **Setting**—Starts to open 150-155°F. Fully open 185°. **Temperature Gauge:**—King-Seeley Electric K-S Nos. Dash Unit—8120 (early—white lines), 7755 (later—white diamonds). Engine Unit—7000. NOTE—Gauge inoperative with ignition Off (reads 'H'). *See article in Mechanical Equipment Section for data.*

CLUTCH:—**Own make.** Single plate, cork insert type operating in oil. **Overdrive Cars**—equipped with heavier clutch housing and larger redesigned disc *See article in Mechanical Equipment Section for data.* **Driven Member**—Cork insert type. Inside Diam. 5⅜" (41), 6½" (43, 48). Outside Diam. 9" (41), 10" (43, 48). Facing 90 (41), 108 (43, 48) cork inserts .077" thick. NOTE—43 type used on 40, 41 with Overdrive. **Pedal Adjustment:**—1½" free travel. Adjust yoke on lower end of pedal connector link. Check Automatic Clutch Control & Hill-holder (if used). **Clutch Oil Servicing:**—*See Hudson Shop Notes.* **Removal:**—Remove transmission (see below), drain clutch oil, take out mounting screws in clutch cover rim, remove clutch assembly from below. **Automatic Clutch Control:**—Electric type. Optl. *See article in Mechanical Equipment Section for data.*

TRANSMISSION:—**Own Make.** Constant-mesh, helical gears (Second & High), sliding spur gears (Low & Reverse) with steering column gear shift. **Overdrive:**—Warner Model AS13-R6 with electrical 'Kick-down' control optional. **Transmission Control:**—Hudson 'Handy-Shift' type. *See separate articles in Mechanical Equipment Section.* **Removal:**—Remove front seat cushion and push seat back, remove accelerator pedal. Remove floor mat and transmission hole cover. Disconnect front universal joint. Remove clutch pedal return spring, assist spring, and cross-shaft. Release transmission side bumpers and rods, disconnect handy-shift controls at transmission, remove speedometer cable. Raise front end of car, remove lower flywheel guard and engine rear mounting bolts, raise rear end of engine off frame. Remove clutch housing-to-engine mounting bolts, pull transmission back and lift out. NOTE—Transmission can be taken out without disturbing clutch housing by taking out transmission-to-clutch housing bolts. **Overdrive Transmission Removal**—Same as Std. Transmission (above) except overdrive solenoid wires and control cable must also be disconnected. **Installation Note**—Wrap one strand of soft wire around throw-out bearing oil seal to prevent leather curling over when transmission installed. Remove wire after transmission installed.

UNIVERSAL JOINTS:—**Spicer**—1271-101 (front), 1278-101 (rear). Needle bearing type. *See article in Mechanical Equipment Section for data.*

REAR AXLE:—**Own Make.** Semi-floating spiral bevel gear type with Hotchkiss drive. *See article in Mechanical Equipment Section for data.* **Ratio**—4 1/9-1 (Std., Optl. on Overdrive), 4 5/9-1 (Std. on Overdrive, Optl. reg. transmission). **Backlash**—.0005-.003". Screw adjustment. **Removal:**—Disconnect drive shaft at rear universal. Remove axle shafts (see below) and capscrews on carrier flange. Pull carrier assembly out. **Axle Shaft Removal & Wheel Bearing Adjustment**—Same as on Model 40—see preceding page.

SHOCK ABSORBERS:—Direct acting, hydraulic types.

Car Model	Make	Front	Rear
41, 48 (std. springs)	Monroe	160101	160107
41, 48 (hvy. springs)	Monroe	160102	160108
43 (Dom. & Exp.)	Delco	1007-C	1008-S

See separate articles in Mechanical Equipment Section.

STEERING:—**Steering Gear.** Gemmer Model 305 Worm-and-Roller type with 'push-pull' adjustment and new type Center Point Steering linkage. *See article in Mechanical Equipment Section for data.* **Front Suspension:**—Independent, linked parallelogram type with coil springs and Autopoise Control. *See article in Mechanical Equipment Section for data.* **Kingpin Inclination**—4°36' crosswise. **Caster**—0° (Neg. ¼° to Pos. ¼°). Adjustable. **Camber**—Positive ¼° to Pos. ¾°. Adjustable. **Toe In**—0-1/16". Loosen clamp at outer end of each tube (adjust tubes equally). **Steering Geometry**—Inner wheel 24°. Outer 20°50'.

BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type with eccentric adjustment. Mechanical follow-up (pedal linked to hand brake cables) provided. Hand lever applies rear service brakes. *See articles in Mechanical Equipment Section for data.* **Drums**—Alloy steel. Diam. 10 1/16" (41,48), 11 1/16" (43). **Lining**—Moulded (primary), woven (secondary). Thickness 7/32". Width 1¾". Length per wheel 22⅛". 41,48), 23 15/16" (43). **Clearance**—.010" at heel and toe of each shoe. **Hand Brake:**—See Service Brakes above. **Hill-Holder:**—Optl. *See Mechanical Equipment Section.*

ENGINE HOOD (BONNET) LOCK & FENDER PLATE REMOVAL:—*See Hudson Shop Notes.*

SERIAL NUMBER:—1st number 44101 (44), 47101 (47). On plate on right front door hinge pillar post.

ENGINE NUMBER:—Same as Serial No. On top of cylinder block between #1 and 2 exhaust flanges.

ENGINE SPECIFICATIONS:—8 cylinder, 'L' head type.
Bore—3". **Stroke**—4½".
Displacement—254 cubic inches. **Rated HP**—28.8.
Developed Horsepower—128 at 4200 RPM.
Compression Ratio—6.50-1 cast-iron head.
Compression Pressure—119 lbs. at 125 RPM.
Vacuum Reading—Steady 18-21" idling at 7 MPH.

PISTONS:—Own Lo-Ex aluminum alloy, 'T' slot, cam ground type. Use finished replacement pistons.
Weight—10.5 ozs. (stripped). **Length**—3 3/16".
Removal—Piston and rod assemblies may be removed from above or below.
Clearance—Top .016". Skirt .001-.002".
Original Bore Sizes & Replacement Pistons:—*See Hudson Shop Notes for complete data.*
Fitting New Pistons:—Use .0015" feeler ½" wide inserted between piston and cylinder wall on side opposite slot at right angles to pin. Pull to withdraw feeler must be within 3-4 lbs.
Installing Pistons:—Slot away from camshaft.

PISTON RINGS:—2 compression, 2 oil rings (1 above pin, 1 below pin). Rings positioned by pin in groove.

Ring	Width	End Gap	Side Clearance
Compression	3/32"	.009-.011"	.001"
Oil Cont. (#1)	3/16"	.009-.011"	.001"
Oil Cont. (#2)	5/32"	.009-.011"	.001"

Replacement Rings:—*See Hudson Shop Notes for data.*

PISTON PIN:—**Diameter**—¾". **Length**—2 7/16". Floating Type. Retained by locking rings. *See Hudson Shop Notes for Pin Servicing data.*
Pin Fit in Piston—.0003" clearance (hand push fit) with piston heated to 200°F.
Pin Fit in Rod Bushing—.0003" clearance.
Replacement Pins:—Std., .002", .005", .010" oversize.

CONNECTING ROD:—**Weight** 30 ozs. **Length** 8 3/16".
Upper Bearing (Piston Pin Bushing)—Bronze.
Crankpin Journal Diameter 1 15/16".
Lower Bearing—'Bermax' alloy spun type. Exchange rods furnished Std. & .010" undersize. *See Crankshaft Size Code in Hudson Shop Notes for bearing sizes.*
Clearance—.001". **Sideplay**—.006-.010".
Bearing Adjustment:—None (no shims). Replace rods. *See Hudson Shop Notes for Palnut (locknut) data.*
Installing Rods:—Offset. Install rods with widest half of bearing toward rear (#1, 3, 5, 7), toward front (#2, 4, 6, 8). Oil scoop on all rods toward camshaft.

CRANKSHAFT:—5 bearing, integral counterweights. *See Hudson Shop Notes for Crankshaft and Vibration Dampener Removal, Main Bearing Removal, Installation, Replacement Bearings and Line-reaming data.*
Journal Diameters—#1, 2 9/32"; #2, 2 5/16"; #3, 2 11/32"; #4, 2⅜"; #5, 2 13/32".
Bearings—Bronze-backed, 'Bohnolloy' type. *See Crankshaft Size Code Note in Hudson Shop Notes for original bearing sizes.*
Clearance—.001".
Bearing Adjustment:—Shims. *See Hudson Shop Notes.*
End Thrust:—Taken by center bearing. Replace bearing if endplay excessive. **Endplay**—.006-.012".

CAMSHAFT:—5 bearing, gear driven. *See Hudson Shop Notes for Camshaft Removal.*
Journal Diameters—#1, 2.029"; #2, 1.998"; #3, 1.966"; #4, 1.935"; #5, 1.498".
Bearings—Babbitt type. **Clearance**—.0025".
End Thrust:—Thrust washer between camshaft flange and crankcase. Spring loaded button in camshaft hub bears against thrust plate on gear cover.
Timing Gears:—Crankshaft gear cast-iron. Camshaft gear GE or Continental Diamond Fibre Bakelite.
Camshaft Setting:—Mesh marked crankshaft gear tooth between two marked teeth on camshaft gear.

VALVES:

	Head Diameter	Stem Diameter	Length
Intake	1½"	11/32"	5 3/32"
Exhaust	1⅜"	11/32"	5 3/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.0025"
Exhaust	45°	11/32"	.004"

Tappet Clearance:—.006" Int., .008" Exh., hot & idling. *See Hudson Shop Notes for Fender Plate Removal.*
Valve Guides:—2 9/16" long. Install with top 15/16" below top of block and finish ream to size.
Valve Springs:—Free length 2 17/64". See that dampener installed on bottom of spring with open side toward cylinder.

	Spring Pressure	Length
Valve Closed	40 lbs.	2"
Valve Open	80 lbs.	1 21/32"

NOTE—Replace if pressure below 34 lbs. at 2".
Valve Lifters:—Roller shoe type, fitted in removable guides. *See Hudson Shop Notes for lifter removal.*
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 10°40' BTDC. Close 60° ALDC.
Exhaust Valves—Open 50° BLDC. Close 18°44' ATDC.
These figures correct with .010" tappet clearance.
Valve Timing Check—With .010" tappet clearance #1 intake valve should open with piston 10°40' or .0494" BTDC when a point on the flywheel approx. 3.97 teeth before 'UDC.1-8/' mark lines up with indicator in inspection hole above starter. Reset tappet clearance at .006" hot and idling.

LUBRICATION:—Duo-flo (pressure & positive splash).
Oil Pump:—Oscillating plunger type, gear driven by camshaft. Mounted on right side of crankcase.
Normal Oil Pressure—3 lbs. (no gauge).
Oil Pressure Regulator:—Located on right side of crankcase at rear. Opens at 3 lbs. Not adjustable.
Oil Pressure Indicator:—Teleflash Oil Pressure indicator. *See article in Electrical Equipment Section.*
Checking Oiling System:—*See Hudson Shop Notes.*
Crankcase Capacity:—7 qts. (refill). NOTE—Install 2 qts. add'tl oil in upper tray when pan installed.

COOLING SYSTEM:—**Capacity**—18 quarts. *See Hudson Shop Notes for radiator core removal.*
Water Pump:—Centrifugal, belt driven, packless type. *See article in Mechanical Equipment Section for data.*
Thermostat:—Fulton. In cylinder head water outlet.
Setting—Starts to open 150-155°F. Fully open 185°.
Temperature Gauge:—King-Seeley Electric K-S Nos. Dash Unit—8120 (early—white lines), 7755 (later—white diamonds). Engine Unit—7000. NOTE—Gauge inoperative with ignition Off (reads 'H'). *See article in Mechanical Equipment Section for data.*

CLUTCH:—**Own make.** Single plate, cork insert type operating in oil. **Overdrive Cars**—equipped with heavier clutch housing and larger redesigned disc assembly and hub section. *See article in Mechanical Equipment Section for data.*
Driven Member—Cork insert type. Inside Diam. 6½". Outside Diam. 10". Facing 108 corks .077" thick.
Pedal Adjustment:—1½" free travel. Adjust yoke on lower end of pedal connector link. Check Automatic Clutch Control & Hill-holder (if used).
Clutch Oil Servicing:—*See Hudson Shop Notes.*
Removal:—Remove transmission (see below), drain clutch oil, take out mounting screws in clutch cover rim, remove clutch assembly from below.
Automatic Clutch Control:—Electric type. Optl. *See article in Mechanical Equipment Section for data.*

TRANSMISSION:—**Own Make.** Constant-mesh, helical gears (Second & High), sliding spur gears (Low & Reverse) with steering column gear shift.
Overdrive:—Warner Model AS13-R6 with electrical 'Kick-down' control optional.
Transmission Control:—Hudson 'Handy-Shift' type. *See separate articles in Mechanical Equipment Section.*
Removal:—Remove front seat cushion and push seat back, remove accelerator pedal. Remove floor mat and transmission hole cover. Disconnect front universal joint. Remove clutch pedal return spring, assist spring, and cross-shaft. Release transmission side bumpers and rods, disconnect handy-shift controls at transmission, remove speedometer cable. Raise front end of car, remove lower flywheel guard and engine rear mounting bolts, raise rear end of engine off frame. Remove clutch housing-to-engine mounting bolts, pull transmission back and lift out. NOTE—Transmission can be taken out without disturbing clutch housing by taking out transmission-to-clutch housing bolts.
Overdrive Transmission Removal—Same as Std. Transmission (above) except overdrive solenoid wires and control cable must also be disconnected.
Installation Note—Wrap one strand of soft wire around throw-out bearing oil seal to prevent leather curling over when transmission installed. Remove wire after transmission installed.

UNIVERSAL JOINTS:—**Spicer.** Front—1271-101 (except 47 without Ovdr.), 1281-101 (47 Std.). Rear—1278-101. Needle bearing. *See article in Mechanical Equipment Section.*

REAR AXLE:—**Own Make.** Semi-floating spiral bevel gear type with Hotchkiss drive. *See article in Mechanical Equipment Section for data.*
Ratio—4 1/9-1 (Std., Optl. on Overdrive), 4 5/9-1 (Std. on Ovdr., Optl. on reg. transmission).
Backlash—.0005-.003". Screw adjustment.
Removal:—Disconnect drive shaft at rear universal. Remove axle shafts (see below) and capscrews on carrier flange. Pull carrier assembly out.
Axle Shaft Removal:—Remove wheel and hub (use screw type puller only), remove 4 nuts on bearing cap bolts, push bolts out of backing plate, remove cap (without disturbing brake link), remove shims, pull axle shaft and wheel bearing. Do not drag shaft on oil seals.
Wheel Bearing Adjustment:—Controlled by shims under bearing cap. To adjust, remove bearing cap (see Removal directions above), add or remove shims equally at both wheels. **Endplay**—.002-.004".

SHOCK ABSORBERS:—**Delco.** Model 1007-C (front), 1008-S (rear) for Domestic & Export. Direct, hydraulic. *See article in Mechanical Equipment Section.*

STEERING:—**Steering Gear.** Gemmer Model 335. Worm-and-Roller type with 'push-pull' adjustment and new type Center Point Steering linkage. *See article in Mechanical Equipment Section for data.*
Front Suspension:—Independent, linked parallelogram type with coil springs and Autopoise Control. *See article in Mechanical Equipment Section for data.*
Kingpin Inclination—4°36' crosswise.
Caster—0° (Neg. ¼° to Pos. ¼°). Adjustable.
Camber—Positive ¼° to Pos. ¾°. Adjustable.
Toe In—0-1/16". Loosen clamp at outer end of each tube (adjust tubes equally).
Steering Geometry—Inner wheel 24°. Outer 20°50'.

BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type with eccentric adjustment. Mechanical follow-up (pedal linked to hand brake cables) provided. Hand lever applies rear service brakes. *See articles in Mechanical Equipment Section for data.*
Drums—Alloy steel. Diameter—11 1/16".
Lining—Moulded (primary), woven (secondary). Thick. 7/32". Width 1¾". Length per whl. 23 15/16".
Clearance—.010" at heel and toe of each shoe.
Hand Brake:—See Service Brakes above.
Hill-Holder:—Optl. *See Mechanical Equipment Section.*

ENGINE HOOD, SIDE PANEL REMOVAL & FRONT SHEET METAL ASSEMBLY ALIGNMENT:—*See Cadillac Shop Notes.*

SERIAL & ENGINE NUMBER:—1st number 2320001 (50), 4320001 (52). On crankcase to rear of left cylinder block & on frame opposite steering gear.

ENGINE SPECIFICATIONS:—Own. 8 cylinder, 90° Vee, 'L' head type. Upper crankcase and cylinder blocks cast Enbloc. **Bore**—3⅜". **Stroke**—4½". **Displacement**—322 cu. ins. **Rated HP** 36.45. **Developed Horsepower**—130 at 3400 RPM. **Compression Ratio**—6.25-1 Std. 5.75-1 Optl. *See Cadillac Shop Notes for Head installation, head gasket data, and changing compression ratios.* **Compression Pressure**—155 lbs. at 1000 RPM or approx. 105-110 lbs. at cranking speed (Std. head). **Vacuum Reading**—Steady 20-21" idling at 7-8 MPH.

PISTONS:—Lynite or Bohn Lo-Ex aluminum alloy, 'T' slot, Cam Ground type with Anodized finish (special hard oxide bearing surface). **Length**—4⅛". **Weight**—16.88 ozs. (stripped), 25.12 ozs. (complete). **Removal**—Pistons and rods removed from above. **Clearance**—Skirt .0020-.0025". See Fitting Pistons.
Replacement Pistons:—*See Cadillac Shop Notes.*
Fitting New Pistons:—Check piston diameter with micrometer gauge at right angles to pin hole just below lower ring groove and also ½" above lower edge. If feeler gauges (¼-½" wide, 7-10" long) used, insert feeler next to T-slot. Piston should fall through bore of own weight on .002" feeler, and hold on .0025" feeler. NOTE—Cylinder bore out-of-round .0005" maximum, taper .0003".
Installing Pistons:—T-slot to left, for all pistons.

PISTON RINGS:—2 compression, 2 oil control rings per piston, all above pin. Oil ring grooves drilled for oil drains.

Ring	Width	End Gap	Side Clearance
Compr. (Top)	3/32"	.007-.012"	.0023-.0041"
Compr. (#2)	⅛"	.007-.012"	.0013-.0026"
Oil Control	5/32"	.007-.015"	.0013-.0026"

Replacem't Rings:—.003",.005",.010",.015",.030" oversize.

PISTON PIN:—**Diameter**—⅞". **Length**—2 15/16". Pin floats in piston and rod. Held by locking rings. *See Cadillac Shop Notes for special pin removal and installation instructions.* **Pin Fit in Piston**—.0004" press fit (ribbed end), .0000" clearance or free fit at 70° F. (plain end). **Pin Fit in Rod Bushing**—.0002-.0008" clearance (new), .0018" (worn limit).

CONNECTING ROD:—**Weight** 37.472 ozs. **Length** 8¾". **Crankpin Journal Diameter**—2.4590-2.4595". **Lower Bearing**—Steel-backed, babbitt-lined type. **Clearance**—.0015-.0025" (new), .0045" Max. (worn). **Sideplay**—.008-.014".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rod or caps. *See Cadillac Shop Notes for connecting rod and bearing installation data.*
Installing Rods:—Numbers on rods and bearing caps on same side and installed in same numbered cylinders with marks down toward oil pan.

CRANKSHAFT:—3 bearing with 6 counterweights. *See Cadillac Shop Notes for main bearing servicing and rear main bearing oil seal renewal.* **Journal Diameters**—2½" all bearings. **Bearings**—Removable steel-backed, babbitt-lined. **Clearance**—.0015-.0025" (new), .005" Max. (worn).
Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps.
End Thrust:—Taken by center (#2) bearing. **Endplay**—.001-.005" (new), .010" Max. (worn).

CAMSHAFT:—3 bearing, non-adjustable chain drive. *See Cadillac Shop Notes for camshaft bushing data.* **Journal Diameters**—#1 and #2, 2.4071-2.4078"; #3, 2.0009-2.0016". **Bearing Type**—Steel-backed, babbitt bushings. **Clearance**—.0015-.0033" (new), .0045" Max. (worn).
End Thrust:—Taken by thrust plate behind camshaft sprocket. No endplay should be permitted.
Timing Chain:—Morse. Type C #3682-R Side Guide type. Width 1¼". Pitch ⅜". Length 23¼" or 62 links. NOTE—Install chain 'endless' as an assembly with sprockets. Use Tool J-836 to pilot camshaft sprocket.
Camshaft Setting:—Sprockets marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1.876-1.886"	.3415-.3425"	5 33/64"
Exhaust	1.626-1.636"	.3405-.3415"	5 33/64"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.335"	.0012-.0032"
Exhaust	45°	.345"	.0022-.0042"

NOTE—Stem clearance worn limit .005" (all valves). Valve heads not slotted. *See Cadillac Shop Notes for valve servicing.*
Tappet Clearance:—None (automatic take-up used).
Valve Guides:—Press in block (long step end down).
Valve Lifters:—Wilcox-Rich 'Zero-lash' type hydraulic lifters (Mushroom type) in removable brackets. *See article in Mechanical Equipment Section for data.* **Clearance**—.0010-.0024" (new), .0035" (worn).
Valve Springs:—Free length 2.210".

	Spring Pressure	Spring Length
Valve Closed	66 lbs.	1.926"
Valve Open	145 lbs.	1.581"

Valve Timing:—See Camshaft Setting above. **Intake Valves**—Open at TDC. Close 42° ALDC. **Exhaust Valves**—Open 52° BLDC. Close 10° ATDC. **Valve Timing Check**—#1 cylinder (front-left bank) intake valve should open with piston at TDC and mark 'C.1/6' on crankshaft pulley aligned with chain case cover pointer (on right side).

LUBRICATION:—Pressure type (gear type pump in crankcase). *See Cadillac Shop Notes for oil pump data.*
Normal Oil Pressure:—15 lbs. idling, 25 lbs. at 30 MPH.
Oil Pressure Regulator:—Opens at 30 lbs. On oil pump. Non-adjustable type.
Crankcase Capacity:—7 quarts.

COOLING SYSTEM:—**Capacity**—25 quarts. *See Cadillac Shop Notes for radiator core removal.*
Water Pump:—Self-adjusting packing type. *See article in Mechanical Equipment Section for data.* **Removal**—Drain water, remove pump belt, hose and pump mounting screws. Lift pump out.
Thermostat:—Mounted in radiator top tank, linked to radiator shutters by rod on forward side. **Setting**—(Std. Type) Starts to open 153-158° F., fully open at 175° F. (High Reading Type—use with Heaters) Starts to open 168-173° F. Fully open 190°. **Shutter Adjustment**—Adjust clevis on threaded end of rod to secure 1/16" tension on thermostat with shutters closed.
Temperature Gauge:—AC Electric. #1510773 (dash unit), #1510774 (engine unit). *See article in Mechanical Equipment Section for data.*

CLUTCH:—**Long Model 10CF-TI.** Semi-centrifugal, single plate, dry disc type. NOTE—Borg & Beck Model 11A6 (marked #946) Single plate, dry disc type with 'Borglite' driven member used on early cars. *See article in Mechanical Equipment Section for data.* **Facings (Long)**—Spiral or chevron wound woven (spiral grooved). Inside Diam. 6¾". Outside Diam. 10". Thickness .137".
Pedal Adjustment:—Pedal free travel ⅞-1⅛" (adjusting nut on connector link at clutch fork).
Removal:—Remove transmission (see below), drop clutch housing pan, punch mark clutch cover, pressure plate, and flywheel (re-install to these marks), remove 6 cover screws (release tension evenly). NOTE—Install driven disc with oil guard (cover over dampener springs) to rear. *See Cadillac Shop Notes for clutch locking pin removal (on replacement clutches) and balancing data.*

TRANSMISSION:—**Own Make.** All helical gear, constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse) with remote shift. *See article in Mechanical Equipment Section for data.*
Transmission Control:—Remote steering col. shift. *See article in Mechanical Equipment Section for data.*
Removal:—Support engine with jack under rear end of oil pan (use wooden block to avoid damage to pan), remove propeller shaft (disconnect front and rear universals), free transmission extension at engine rear support, remove crossmember with engine rear support, disconnect speedometer cable, remove shifter rods from levers at transmission, support transmission at rear, take out mounting screws, pull straight back (plug clutch connection shaft bearing drain hole as soon as accessible to prevent lubricant loss), lower front end of transmission and remove.

UNIVERSAL JOINTS:—**Mechanics 3C.** Needle bearing. *See article in Mechanical Equipment Section for data.*

REAR AXLE:—**Own Make.** Hypoid gear, semi-floating type with Hotchkiss drive. *See article in Mechanical Equipment Section for data.* NOTE—Manufacturer recommends Carrier assembly be serviced by factory. **Ratio**—3.92-1. **Backlash**—.004-.010". Screw adjustment.
Removal:—Disconnect rear universal, remove axle shafts (see below), carrier flange capscrews and carrier.
Axle Shaft Removal:—Remove wheel, axle shaft nut, dust seal from rim of drum, pull off hub and drum, disconnect brake line and remove backing plate. Pull shaft and bearing assembly (use Tool J-838). **Wheel Bearing Adjustment**—None.

SHOCK ABSORBERS:—**Delco.** 1946-G, H (front), 1751-V, W (rear). Double acting, hydraulic type. *See article in Mechanical Equipment Section for data.*

STEERING:—**Steering Gear**—Saginaw Worm-and-Double Roller type. *See article in Mechanical Equipment Section for data.*
Front Suspension:—Independent linked parallelegram type with coil springs. *See article in Mechanical Equipment Section for data.* **Kingpin Inclination**—5°6' crosswise. **Caster**—Negative 1¾° to Neg. 2¾°. Adjustable. **Camber**—0° to Positive ¾°. Adjustable. **Toe In**—1/32-3/32" (at rest). Adjusters at outer end of each tie rod. Adjust equally. **Steering Geometry (Toe-out on Turns)**—Inner wheel turned 22¼-23¾°. Outer wheel 20°.

BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type without eccentric adjustment. Hand lever applies rear wheel service brakes. *See article in Mechanical Equipment Section for data.* **Drums**—Centrifuse. Diameter—11.995-12.0005". Drum out-of-round .007", Turn down limit .030" cut. **Lining**—Molded. Length—Primary 11 17/32", Secondary 12 31/32". Width 2" (50,52), 2¼" (50 Com'l front), 2½" (50 Com'l rear). Thickness 3/16". **Clearance**—.015" at both ends of secondary shoe with primary shoe forced out against drum. **Braking Power**—45½% front wheels, 54½% rear.
Hand Brake:—See Service Brakes above.

TORQUE WRENCH SPECIFICATIONS:—*See Torque Wrench article in Mechanical Equipment Section for tightening specifications for Cylinder Head, Main & Connecting Rod Bolts, etc.*

RECONDITIONED ENGINES & CYLINDER BLOCKS:

Engines—Reconditioned engines (with Heads and oil pan furnished in one size only (Part No. 06H-6012).

Cylinder Blocks—Cylinder blocks with fitted pistons furnished as follows:

Part No.	Size
06H-6014-A	Std.
06H-6014-B	.015" Oversize
06H-6014-C	.030" Oversize

REPLACEMENT PISTONS:—Finished pistons are furnished in Standard Size & Oversizes as listed below with each size graded in steps as follows:

Standard Pistons

Part No.	Size
06H-6110-B2	2.8732-2.8735"
06H-6110-B4	2.8743-2.8746"
06H-6110-B6	2.8755-2.8758"
06H-6110-B8	2.8767-2.8770"

.015" Oversize

06H-6110-C2	2.8882-2.8885"
06H-6110-C4	2.8893-2.8896"

.030" Oversize

06H-6110-D2	2.9032-2.9035"
06H-6110-D4	2.9043-2.9046"

PISTON RINGS:—Piston Rings (and Expanders for #2 Compression Ring & Oil Ring) are furnished in Sets in Cartons and singly in following sizes:

Sets in Cartons

Part No.	Size
06H-6149-A	Standard
06H-6149-B	.015" Oversize
06H-6149-C	.030" Oversize

Single Rings & Expanders

Part No.	Type	Size
06H-6150-B①	Upper Compr.	Standard
06H-6150-C①	Upper Compr.	.015" Oversize
06H-6150-D①	Upper Compr.	.030" Oversize
06H-6152-C	Lower Compr.	Standard
06H-6152-D	Lower Compr.	.015" Oversize
06H-6152-E	Lower Compr.	.030" Oversize
06H-6153-C	Oil Control	Standard
06H-6153-D	Oil Control	.015" Oversize
06H-6153-E	Oil Control	.030" Oversize

①—No expanders used.

PISTON PIN FITTING:—Steel Pistons. Pins can be removed and installed without heating pistons. Pins, pistons, and rod bushings held to close limits so that no fitting required. Clearances can be checked as follows:

Pin Fit in Piston—With piston and pin at same temperature and clean, pin should drop through pin hole in piston (total clearance not to exceed .0007").

Pin Fit in Rod Bushing—With pin installed, hold pin so that rod hangs vertically, then rotate pin. Lower end of rod should move upward through arc not greater than ½" before dropping back to vertical position.

TIMING GEARS:—Camshaft Gear—New type aluminum alloy camshaft gear is bolted on camshaft hub flange by four offset capscrews and can be replaced without removing camshaft from engine. To remove gear, remove screw in front end of crankshaft, pull fan and dampener assembly (use Puller 6130-A), remove timing gear cover. Bend back lockplate tangs and take out four camshaft gear mounting screws, remove gear. When replacing gear, make certain that marks on camshaft gear and crankshaft gear are lined up and see that lockplate tangs are bent up against flats on mounting screws. Use 6360-B Dampener Replacer tool to install dampener assembly.

NOTE—Camshaft gear mounting screw holes are offset so that gear can only be installed in correct position.

Crankshaft Gear—To replace crankshaft gear, pull fan and dampener assembly (see Camshaft Gear Removal above), use 6306-C puller to remove crankshaft gear, 6306-D Gear Replacer to install gear.

VALVE SERVICING:—Complete valve assembly (valve, spring, guide) should be removed from the engine and dismantled on the bench as follows:

Valve Assembly Removal—Use special bar type lifter, VZ-185, inserting end of lifter through spring coils to engage flanged lower end of guide, pull guide down slightly to release retaining 'C' washer, pull 'C' washer out, lift valve assembly out through top of block.

Valve Assembly Dismantling—Use special bench fixture to compress valve spring so that spring retainer can be removed, then remove spring, separate guide halves and remove valve. Re-assemble valves in same manner.

Valve Installation Note—Intake valve guides have relief groove cut on one edge of each guide half. Install guides with this relief groove up.

Valve Seat Insert Grinding:—Manufacturer recommends use of eccentric grinding equipment to reface seat inserts (inserts are high-tungsten, chrome-alloy steel and are exceedingly hard).

Hydraulic Valve Lifter Servicing:—When lifters removed they should be installed dry (will fill with oil and become quiet more rapidly than if installed with oil film between plunger and cylinder which will trap air in unit). Whenever lifters removed from engine, service as follows:

Lifter Installation—Remove plunger from lifter body, wash out all oil, dry with air, re-install plunger in lifter body and install in engine.

CAUTION—Plunger is selective fit in lifter body and must not be interchanged. Make certain that each plunger re-installed in same lifter from which removed.

Lifter Clearance—Clearance between plunger and valve stem must be .030-.070" with no oil in unit and plunger and spring fully compressed. To check this clearance, see that lifter is on heel of cam, use screwdriver to fully depress plunger in lifter body, check clearance with feeler gauge.

See article in Mechanical Equipment Section for complete Wilcox-Rich 'Zero-lash' hydraulic lifter servicing data.

ENGINE HOOD NOTE:—Turn radiator ornament counter-clockwise to free latch, lift hood up at front.

SERIAL & ENGINE NUMBER:—Stamped on top of clutch housing and on left side of front frame cross-member.

ENGINE SPECIFICATIONS:—**Own Model 06H.** 12 cylinder 75° Vee, L head type. Both blocks and crankcase cast enbloc.
Bore—2.875". **Stroke**—3.75".
Rated Horsepower—39.6. **Displ'mt.**—292 cu. ins.
Developed Horsepower—120 at 3500 RPM.
Compression Ratio—7.2-1 Std. aluminum head.
Compression Pressure—154 lbs. at 1000 RPM. or 110 lbs. at cranking speed of 100 R.P.M.
Vacuum Reading—18-20" steady idling at 5 M.P.H.

PISTONS:—Steey alloy, light weight, cam-ground, with slipper type skirt. Recondition cylinders for finished replacement pistons.
Weight—360 grams (without rings or pin).
Removal—Pistons and rods removed from above.
Clearance—See Fitting New Pistons.
Replacement Pistons:—*See Lincoln-Zephyr Shop Notes for replacement piston and reconditioned block data.*
Fitting New Pistons:—Use .002" feeler, .50" wide, inserted between piston and cylinder wall at right angle to pin. Pull to withdraw feeler—3-6 lbs.

PISTON RINGS:—Two compression, one oil ring, all above pin. Oil ring groove drilled with drain holes. NOTE—Expander used with #2 Compr. and oil ring. Install this #2 Compr. ring with mark 'TOP' up.

Ring	Width	End Gap	Side Clearance
Compr. #1	.093-.0935"	.008-.013"	.0025-.003"
Compr. #2	.093-.0935"	.008-.013"	.002-.0025"
Oil Contr.	.1845-.185"	.008-.013"	.0015-.002"

Replacement Rings:—*See Lincoln-Zephyr Shop Notes for complete Ring and Expander size data.*

PISTON PIN:—**Diameter** .7501-.7504". **Length** 2.607". Floating type (locking ring in piston at each end). Pin hole in connecting rod bronze-bushed.
Pin Fit in Piston—.0005" clearance.
Pin Fit in Rod—.0001" clearance.
See Lincoln-Zephyr Shop Notes for pin fitting data.

CONNECTING ROD:—**Length** 7.40". **Weight** 638 grams.
Crankpin Journal Diameter—2.126".
Bearing Type—Steel-backed, copper-lead lined bearing halves clamped in each rod.
Clearance—.001". **Sideplay**—.002-.006".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps. NOTE—Engage tang on bearing in groove in rod and cap. See that long and short bearing cap bolts installed on correct side of rod (rod split at an angle, bolts are unequal length).
Replacement Bearings:—Furnished Std. and .0015", .020", .040" undersize.
Installing Rods:—Marks on rods and caps must be together and installed in same numbered cylinder with marks pointing down toward oil pan.

CRANKSHAFT:—Four bearing with integral counterweights. NOTE—Crankshafts furnished Std. and .020", .040" undersize.
Journal Diameters—2.401" (all bearings).
Bearing Type—Steel-backed, copper-lead lined.
Clearance—.001" (or slight drag with .002" feeler assembled in bearing for clearance check).
Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps. NOTE—See that tang on bearing engages groove in block and bearing cap.
Replacement Bearings:—Furnished Std. and .0015", .020", .040" undersize.
End Thrust:—Taken by rear main bearing. To adjust, replace bearing. **Endplay**—.002-.006".

CAMSHAFT:—Four bearing. Helical gear drive.
NOTE—New bolted-on type Aluminum Alloy camshaft timing gear used (formerly pressed on shaft).
Journal Diameters—1.797" (all bearings).
Bearing Type—Steel-backed, babbitt-lined bushings pressed in block. **Clearance**—.002".
End Thrust:—Taken by gear hub and coverplate. Adjusted by replacing coverplate. **Endplay**—.005-.015".
Timing Gears:—Cast alloy iron (Crankshaft), New Aluminum Alloy—bolted on shaft (Camshaft).
Backlash—.004" Max.
See Lincoln-Zephyr Shop Notes for Timing Gear data.
Camshaft Setting:—Mesh marked tooth of crankshaft gear with space marked by line on camshaft gear (this line must be in line with mark on hub). NOTE—Cap screw holes in camshaft gear and shaft are unevenly spaced insuring correct gear position.

VALVES:—

	Head Diameter	Stem Diameter	Length
All Valves	1.537"	.3115"	4.750-4.751"
	Seat Angle	**Lift**	**Stem Clearance**
All Valves	45°	.292"	.0015-.0035"

NOTE—Valve Seat Inserts used for exhaust valves.
See Lincoln-Zephyr Shop Notes for Valve Servicing data.
Tappet Clearance:—None (hydraulic type lifters).
Valve Guides:—Cast iron, split type. Retained by 'C' washer and valve spring. *See Lincoln-Zephyr Shop Notes.*
Valve Lifters:—Barrel type, hydraulic tappet take-up (Wilcox-Rich Zero-lash type). Diameter .9995".
See article in Mechanical Equipment Section for data.

Valve Springs:—	Pressure	Length
Valve Closed	51-57 lbs.	2.13"
Valve Open	111-121 lbs.	1.84"

Valve Timing:—See Camshaft Setting above.
Int. Valves—Open 10.42° BTDC. Close 35.58° ALDC.
Exh. Valves—Open 50.92° BLDC. Close 8.08° ATDC.
To Check Timing—No flywheel marks provided. If dead center position for any cylinder established on flywheel, intake valve for this cylinder should open approx. 3.24 teeth before this point with piston .0389" before top dead center.
Motor Gauge—Weidenhoff Adapter #114. Rod #40.

LUBRICATION:—Pressure type with gear type oil pump in crankcase at rear of engine.
Normal Oil Pressure—40-45 lbs. at 2000 R.P.M.
Oil Pressure Regulator:—Above crankshaft bearing between cylinder banks at front end of engine. Opens at 50 lbs. Not adjustable.
Oil Pressure Gauge:—King-Seeley Electric. Ford No. Dash Unit—06H-9273-A (except Contl.), 06H-9273-B (Contl.). Engine Unit—No. 48-9278 (all models).
See article in Mechanical Equipment Section for data.
Crankcase Capacity:—5 qts.

COOLING SYSTEM:—**Capacity**—27 quarts.
Water Pump:—Packless type, 2 used (1 for each bank).
See article in Mechanical Equipment Section for data.
Removal—Slack off drive belt, disconnect hose couplings, take out mounting screws on pump.
Thermostat:—In outlet hose for each bank (2 used).
Setting—Starts to open at 145°F. Fully open 180°F.
Temperature Gauge:—King-Seeley Electric. Ford No. Dash Unit—06H-10883-A (except Contl.), 06H-10883-B (Contl.). Engine Unit—No. 99A-10884 (all).
See article in Mechanical Equipment Section for data.

CLUTCH:—**Long Model 10CF-TI.** Semi-centrifugal, single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Molded type, chevron or spiral wound, 2 required. Inside Diam. 6". Outside Diam. 10". Thickness .140".
Adjustment:—Pedal free movement must be 1.5-2.0". To adjust, loosen locknuts, turn clevis on connector link.
Removal:—Slide transmission and rear axle to rear as a unit to expose clutch (see Transmission Removal below), take out mounting screws in clutch cover.

TRANSMISSION:—**Own Model.** All helical gear, constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse).
Transmission Control (06H):—Steering col. shift Std.
See article in Mechanical Equipment Section for data.
Removal:—Disconnect hand brake cable, hydraulic brake line at torque tube connection (bleed lines when re-connected), speedometer cable, shock absorber links. Disconnect rear spring at center frame connection. Take off universal joint ball housing bolts, slide axle assembly to rear. Disconnect shifter rods from levers at transmission. Support engine at rear, take out rear engine mounting bolts, remove clutch housing mounting screws, pull transmission straight back.

UNIVERSAL JOINT:—**Spicer Model 2102-1.** Needle bearing type. Single joint at rear of transmission.
See article in Mechanical Equipment Section for data.

REAR AXLE:—**Own Model.** ¾ floating, Hypoid Gear type with Torque Tube drive.
See article in Mechanical Equipment Section for data.
Ratio—4.44-1. **Backlash**—.002-.004".
Optl. Axle:—Columbia Two-speed type.
See article in Mechanical Equipment Section for data.
Removal:—Disconnect hand brake cable, hydraulic brake line at torque tube connection (bleed lines when re-connected), speedometer cable, shock absorber links. Disconnect rear spring at center frame connection, take out universal joint ball housing bolts, pull axle assembly to free shaft at joint.
Axle Shaft Removal—*See Lincoln-Zephyr Axle article in Mechanical Equipment Section for data.*

SHOCK ABSORBERS:—**Houde (Houdaille).** Type BBCM (Front), BBCX (Rear). **L-Z Part Nos.**—**Front** 96H-18045B or 06H-18045 (right), 96H-18046B or 06H-18046 (left). **Rear** 96H-18080 or 06H-18080 (right), 96H-18081 or 06H-18081 (left). Double acting, hydraulic, adjustable type.
See article in Mechanical Equipment Section for data.

STEERING:—**Steering Gear**—Gemmer Model 330. Worm-and-roller type with push-pull adjustments.
See article in Mechanical Equipment Section for data.
Front Suspension:—Conventional I-beam section axle with Reverse-Elliott ends and transverse spring. Axle positioned by radius rods and strut rod (anti-sway bar).
Kingpin Inclination—4° crosswise.
Caster—3° Min., 5° Max. Must be equal for both wheels within ½°. No adjustment.
Camber—¼° Min., ¾° Max. Must be equal for both wheels within ¼°, right wheel must not exceed left. No adjustment.
Toe In—1/16". Set at 1-10 ratio to Camber. To adjust, loosen clamp bolts, turn tie rod.
Steering Geometry (Toe out on turns)—Inner wheel turned 23°, outer 20°. Allowable variation ½°.

BRAKES:—**Service**—Bendix Hydraulic, duo-servo, single anchor type without eccentric adjustment. Hand lever applies all four service brakes.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Diameter 1.125" (front), 1.00" (rear). Not interchangeable from one wheel to another.
Drums—Diameter 12".
Lining—Molded (primary or forward shoe), Woven (secondary shoe). Width 1.75". Thickness .21", Length per shoe 11.95".
Clearance—.010" at each end of each shoe.
Hand Brake:—See Service Brakes above.

FORD TRUCK NOTE:—All Mercury Engine data below applies to Ford Truck Models with '95' Engine as well as Mercury models.

ENGINE HOOD NOTE:—To raise hood, pull out on latch handle on front of hood at center, press in on button in upper edge of grille (under handle) to release secondary (safety) catch.

OIL PAN REMOVAL:—*See Ford Shop Notes for data.*

SERIAL & ENGINE NUMBER:—Stamped on top of clutch housing and on left frame member in front of dash bracket.

ENGINE SPECIFICATIONS:—Own 95. 8 Cylinder, 90° Vee, L head. Both banks & crankcase cast enbloc. **Bore**—3.187". **Stroke**—3.75".
Rated Horsepower—32.5. **Displacement**—239 cu. ins.
Developed Horsepower—95 at 3600 RPM.
Compression Ratio—6.30-1 (Pass. Cars, Ford Comm.), 5.9-1 (Ford Trucks). Cast-iron heads.
Compression Pressure—145 lbs. (6.30-1 hd.), 134 lbs. (5.9-1 head) at 2400 RPM maximum. 100 lbs. at cranking speed of 100 RPM.
Vacuum Reading—Steady 18-20" at 5 MPH.

CYLINDER SLEEVES:—Hardened, dry type cylinder sleeves used on engines marked 'HS' on cylinder block just above upper front corner of left cylinder head.

Servicing:—*See Ford Shop Notes for complete data.*

PISTONS:—Steel alloy, light weight, cam ground type (Mercury), Aluminum alloy, T-slot type (Ford Trucks). Recondition engine for finished replacement pistons.
Weight—Without rings or pin, 358-362 grams (Mercury), 364-368 grams (Ford Truck).
Removal—Pistons and rods removed from above.
Clearance—See Fitting New Pistons.
Replacement Pistons:—*See Ford Shop Notes for data.*
Fitting New Pistons:—Use .0025" feeler (.003" feeler for engines with sleeves), .50" wide, inserted between piston and cylinder wall at right angles to pin. Pull to withdraw feeler—6-10 lbs. NOTE—If aluminum pistons fitted, use .002" feeler (.0025" feeler for engines with sleeves) with 6-10 lbs. pull.

PISTON RINGS:—Two compression, one slotted oil ring, all above pin (drain holes in oil ring groove).
NOTE—Expander used with #2 Compr. and oil ring.

Ring	Width	End Gap	Side Clearance
Compr. #1	.0915-.0920"	.012-.017"	.0025-.003"
Compr. #2	.0915-.0920"	.012-.017"	.002-.0025"
Oil Contr.	.1535-.1540"	.012-.017"	.0015-.002"

Replacement Rings:—Furnished (sets in carton only) Std. and .005", .015", .030", .045", .060" oversize.

PISTON PIN:—Diameter .7501-.7504". **Length** 2.975". Floating type (locking ring in piston at each end). Pin hole in connecting rod bronze-bushed.
Pin Fit in Piston—.0005" clearance.
Pin Fit in Rod Bushing—.0001" clearance. *See Ford Shop Notes for Pin Fitting directions.*

CONNECTING ROD:—Length 7.002". **Weight** 488 grams.
Crankpin Journal Diameter—2.139" (connecting rod diameter on crankpin—2.360").
Bearing Type—Steel-backed, special-alloy lined. Bearing floats in both rods (side-by-side mounting) with bearing surface on both inner and outer face.
Bearing Dimensions—Length 1.747". Thickness .1095". These bearings do not have end flanges.
Clearance—.0005-.002" (total diametrical).
Sideplay—.010-.022" (total).
Bearing Adjustment:—None (no shims). Do not file.
Replacement Bearings:—*See Ford Shop Notes for special bearings for oversize rods and undersize crankpins.*
Installing Rods:—Marks on rods and caps must be together and installed in same numbered cylinder with marks pointing down toward oil pan.

CRANKSHAFT:—3 bearing. Integral counterweights.
Journal Diameters—2.499" (all bearings).
Bearing Type—Steel-backed, special-alloy lined.
Clearance—.001-.003" (or slight drag with .002" feeler assembled in bearing for clearance check).
Bearing Adjustment:—None (no shims). Do not file.
End Thrust:—Taken by rear main bearing. Adjust by replacing bearing. **Endplay**—.002-.006".
Replacement Bearings:—*See Ford Shop Notes for Undersizes and special long main bearings.*

CAMSHAFT:—3 bearing. Helical gear drive (2 types of camshaft gears used—Bakelized Fabric pressed on shaft or new Aluminum Alloy type bolted on shaft).
Bearing Diameters—1.797" (all bearings).
Bearings—Steel-backed, babbitt-lined bushings.
Clearance—.002".
End Thrust:—Taken by gear hub and cover plate. Adjusted by replacing coverplate. **Endplay**—.005-.015".
Timing Gears:—Cast alloy iron (crankshaft), Bakelized Fabric—pressed on shaft, or Aluminum Alloy—bolted on shaft (camshaft). **Backlash**—.004" max. *See Ford Shop Notes for Timing Gear Replacement.*
Camshaft Setting:—Mesh '0' marked tooth of crankshaft gear with '/' marked space on camshaft gear (this mark must be in line with mark on hub).

VALVES:—

	Head Diameter	Stem Diameter	Length
All Valves	1.537"	3115"	4.750-4.751"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	.292"	.0015-.0035"

See Ford Shop Notes for Valve Servicing data.
NOTE—Seat inserts used for all valves.
Tappet Clearance:—.0125-.0135". No adjustment.
Valve Guides:—Split type retained by 'C' washer and valve springs. *See Ford Shop Notes for servicing data.*
Valve Lifters:—Barrel type in reamed holes in block. **Diameter**—.9995". **Clearance**—.0005-.001".

Valve Springs:	Pressure	Length
Valve Closed	37-40 lbs.	2.13"
Valve Open	76-80 lbs.	1.84"

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open at TDC. Close 44° ALDC.
Exhaust Valves—Open 48° BLDC. Close 6° ATDC.
To Check Valve Timing—No flywheel marks provided. Intake valve opens with piston at TDC.

LUBRICATION:—Pressure. Gear type oil pump mounted in crankcase at rear of engine.
Normal Oil Pressure:—30 lbs. at 2000 R.P.M.
Oil Pressure Regulator:—Under plug above front camshaft bearing. Opens at 30 lbs. Not adjustable.
Oil Pressure Gauge:—King-Seeley Electric. Ford No. 09A-9273 (Dash Unit), No. 48-9278 (Engine Unit). *See article in Mechanical Equipment Section for data.*
Crankcase Capacity:—5 qts.

COOLING SYSTEM:—Capacity 22 qts.
Water Pump:—Packless type, 2 used (1 for each bank). *See article in Mechanical Equipment Section for data.*
Removal—Slack off drive belt, support engine at forward end, remove front engine mounting bolts, take out mounting screws in pump body.
Thermostat:—In each cylinder head outlet (2 used). **Setting**—Starts to open at 145°F. Fully open 180°.
Temperature Gauge:—King-Seeley Electric. Ford No. 09A-10883 (Dash Unit), No. 99A-10884 (Eng. Unit). *See article in Mechanical Equipment Section for data.*
NOTE—Gauge reads 212° (hot) when turned off.

CLUTCH:—Long Model 9CF-CS. Single, plate, dry disc, semi-centrifugal type. *See article in Mechanical Equipment Section for data.*
Facings—Moulded type, 2 required. Inside Diam. 5.76". Outside Diameter 9". Thickness .137".
Adjustment:—Pedal free movement must be 1.0-1.25". To adjust, remove pin at throw-out shaft lever end of connecting link, turn clevis on link rod.
Removal:—Slide rear axle and transmission to rear as a unit to expose clutch (See Transmission Removal (below), take out mounting screws in cover.

TRANSMISSION:—Own Make. Constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse), all helical gear type.
Transmission Control:—Remote steering col. shift. *See article in Mechanical Equipment Section for data.*
Removal:—Disconnect rear shock absorbers, hand brake cables, hydraulic brake line (at torque tube connection—bleed lines when re-connected), speedometer cable, shock absorber links. Disconnect rear spring at center frame connection. Take out universal joint ball housing screws, slide rear axle assembly back to disengage drive shaft at splined joint. Support engine at rear, take out rear engine mounting bolts, remove clutch housing screws, pull transmission straight back.
NOTE—Disconnect gear shifter rods from levers at transmission.

UNIVERSAL JOINT:—**Spicer Model 202-6.** Steel bushing type. Single joint at rear of transmission case. *See article in Mechanical Equipment Section for data.*

REAR AXLE—Own make. ¾ floating, Spiral Bevel gear type with Torque Tube drive. *See article in Mechanical Equipment Section for data.*
Ratio—3.54-1 Std., 3.78-1 Optl.
Backlash—.010" max.
Optional Axle:—Columbia Two-speed type. *See article in Mechanical Equipment Section for data.*
Removal:—Disconnect rear shock absorbers, hand brake cables, hydraulic brake line (at torque tube connection—bleed lines when re-connected), speedometer cable, shock absorber links. Disconnect rear spring at center frame connection. Take out universal joint ball housing screws, pull axle assembly to rear to disengage drive shaft at splined joint.
Axle Shaft Removal—*See Mercury Axle article in Mechanical Equipment Section for data.*

SHOCK ABSORBERS:—Houde (Houdaille). Type BBDM (frt.), BBCX (rear). **Ford Nos.—Front** 01A-18045B (right), 01A-18046B (left). **Rear** 09A-18080A (right), 09A-18081A (left). Hydraulic, double acting, adjustable. *See data in Mechanical Equipment Section.*

STEERING:—Steering Gear—Gemmer Model 305 Worm-and-Roller type with 'push-pull' adjustment. *See article in Mechanical Equipment Section for data.*
Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott ends and transverse spring. Axle positioned by radius rods.
Kingpin Inclination—8° crosswise.
Caster—9° Max., 4½° Min. Must be equal within ½°. Axle may be bent cold to correct caster if proper tools (wedges and blocks to prevent crushing axle flange) are used.
Camber—1° Max., ¼° Min. Must be equal within ¼°, right wheel must not exceed left. Adjust in same manner as for caster (see caster data above).
Toe In—1/16". Set at 1-10 ratio to Camber. Adjust by loosening clamp bolts and turning tie rod.
Steering Geometry (Toe Out on Turns)—Outer wheel turned 20°, Inner wheel 23⅓°. No adjustment.

BRAKES:—**Service.** Lockheed hydraulic, double anchor type. Hand lever applies rear service brakes. *See article in Mechanical Equipment Section for data.*
Drum—Cast iron. Diameter 12".
Wheel Cylinders—Stepped type as follows:
Front Wheel....1.25"-1.00". Rear Wheel....1.125"-1.00".
Lining—Woven (forward shoes), Molded (rear shoes). Width 1.75". Thickness .20". Length per shoe 13.18" (forward shoes), 10.1" (rear shoes).
Clearance—Least possible amount without drag.
Hand Brake:—See Service Brakes above.

TORQUE WRENCH SPECIFICATIONS:—*See Torque Wrench article in Mechanical Equipment Section for tightening specifications for Cylinder Head, Main & Connecting Rod Bolts, etc.*

HOOD LOCK:—Engine hood hinged at cowl and lifts from forward end. To raise hood, turn latch handle located on lower edge of radiator grille at center and release safety catch (under hood) at upper edge of grille.

FRONT END ASSEMBLY REMOVAL:—Radiator core, grille and front fenders can be removed as an assembly for work on front of engine, if necessary, by loosening fenders, core, and side shields.

ENGINE CODE NOTE:—Car manufacturer stamps each engine with a three letter code as a means of identifying original cylinder bore, main bearing, and crankpin and connecting rod bearing sizes. This three letter code stamped on Engine Number Plate on left front top corner of engine block. Each letter indicates engine sizes as follows:

Original Cylinder Bore Size—First letter.

Main Bearing Size—Second letter.

Crankpin & Connecting Rod Bearing Size—Third letter.

Letters indicate following sizes:

'A'.....Standard	'D'.....015" Oversize
'B'.....010" Undersize	'E'.....020" Oversize
'C'.....010" Oversize	

REPLACEMENT PISTONS:—Nash finished replacement pistons furnished in the following sizes:

Standard	.010" Oversize
.001" Oversize	.012" Oversize
.002" Oversize	.015" Oversize
.003" Oversize	.020" Oversize
.005" Oversize	

Semi-finished Pistons—Furnished in one size only —.050" Oversize. These pistons must be finished on suitable machine equipment.

Installation Note—Pistons must be installed with slot in skirt away from camshaft and trademark on inside of piston toward front of engine. Pin bosses in piston offset toward camshaft.

REPLACEMENT PISTON RINGS:—Nash replacement piston rings furnished in the following three sizes: 1—Standard. 2—.010" Oversize. 3—.020" Oversize.

Installation—Car manufacturer recommends that these Sealed Power Spring Type Rings be used as follows:

Standard—For standard up to and including .010" Oversize pistons.

.010" Oversize—For .011" Oversize up to and including .020" Oversize pistons.

.020" Oversize—For .021" Oversize up to and including .030" Oversize pistons.

NOTE—When installing rings, check to following specifications: End Gap—.010-.020" for compression rings; .010-.018" for oil control rings. Side Clearance in ring groove—#1 Compression .002-.0025", #2 Compression .0015-.003". #3 Oil Control .0015-.0025". #4 Oil Control .001-.0025".

VIBRATION DAMPENER:—Rubber cushioned vibration dampener mounted on forward end of crankshaft. Dampener is drilled for lubrication. Car manufacturer recommends that 2 brass filler plugs in outside diameter of dampener flywheel be removed and filled with light engine oil at 3000 mile intervals.

FITTING CONNECTING ROD BEARINGS:—Check crankpin for out-of-round or wear. To check bearing fit, remove connecting rod bearing cap on bearing to be checked and loosen remaining connecting rod bearing caps. Use a .002" shim ½" wide and ½" long. Place shim across bearing and install cap. Tighten bearing cap (with shim in place). Check bearing fit by moving connecting rod on crankpin. If rod moves with heavy drag, bearing fit is correct. Remove bearing cap, take out shim, re-install cap loosely. Repeat fitting operation on remaining connecting rods. After all rod bearings checked, tighten caps securely.

MAIN BEARINGS:—Removal—Main bearing shell upper half can be removed without removing crankshaft by removing bearing cap and inserting suitable tool or pin in oil hole in crankshaft and rotating bearing shell out by turning shaft.

Installation:—Bearing shell upper half can be installed by reversing Removal instructions above. Remove any sharp edges on bearing shell before installing. Tang on shell should seat in notch on block and cap.

Fitting:—Before fitting bearings, journals must be checked for out-of-round or wear. To check bearing fit, remove bearing cap on bearing to be checked and loosen all other main bearing caps. Use a .002" shim ½" wide and ½" long. Place shim across bearing and install bearing cap. Tighten bearing cap (with shim in place). Test bearing fit by rocking crankshaft by hand. **Do not rock crankshaft more than 1" in either direction** or bearing may be damaged by shim. If crankshaft turns with a heavy drag, bearing clearance is correct. Remove bearing cap, take out shim, replace bearing cap loosely and repeat test for remaining bearings. After all bearings checked tighten caps securely. NOTE—On Nash-Lafayette, oil pump is retained by the main bearing capscrew.

CAMSHAFT REMOVAL:—For camshaft removal or camshaft bearing replacement, remove as follows: Remove radiator, grille, and hood side panel for access to engine. Remove fan belt, vibration dampener, timing chain cover, timing chain, distributor and fuel pump. On Ambassador Eight, take off the oil pump and pump driveshaft. Remove front camshaft bearing (takes camshaft end thrust), raise valve lifters to clear camshaft journals and withdraw camshaft from front of engine. NOTE—When re-assembling oil pump and pump driveshaft on Ambassador Eight, slot in end of pump driveshaft (for distributor coupling) should be across the engine.

Crankshaft Sprocket Installation:—Sprocket should be heated for installation on crankshaft. When re-assembling timing chain make certain that sprocket marks are adjacent and in line with a straightedge across the crankshaft and camshaft centers. NOTE—Sprocket should be heated to 212° F. (temperature of boiling water).

HOOD LOCK & ENGINE CODE NOTE:—*See Nash Shop Notes.*

SERIAL NUMBER:—First number R-340000. Stamped on plate on right frame side member under hood.

SERVICE SERIAL NUMBER:—First number N6-31500. On 'Caution Plate' on left front door hinge post.

ENGINE NUMBER:—First number E-339500. On engine block on left side at front. NOTE—Engine number is 500 less than Serial Number on same car.

ENGINE SPECIFICATIONS:—6 cylinder, valve-in-head, Twin Ignition type. NOTE—'Iso-thermal' fuel intake system used (intake manifold cast in cylinder head—water cooled for temperature control).
Bore—3⅜". **Stroke**—4⅜".
Displacement—234.8 cu. ins. **Rated HP**—27.34.
Developed Horsepower—105 at 3400 RPM.
Compression Ratio—6.0-1 cast-iron head.
Compression Pressure—125 lbs. at 350 RPM. or approx. 100-105 lbs. at cranking speed (160 RPM).
Vacuum Reading—18-20" steady idling at 7-8 MPH.

PISTONS:—Nelson-Bohnalite, aluminum alloy, Invar strut, tin plated, split skirt type.
Original Bore Size:—*See Engine Code Note in Nash Shop Notes for complete data.*
Weight—19¼ ozs. (stripped). **Length**—3⅞".
Removal—Pistons and rods removed from above.
Clearance—Top .027-.030". Skirt .001-.002".
Replacement Pistons:—*See Nash Shop Notes for data.*
Fitting New Pistons:—Insert .002" feeler between piston and cylinder wall on side opposite slot. Pull to withdraw feeler should be 10 lbs.
Installing Pistons:—Pin offset toward camshaft. Slot toward left (trademark within piston toward front).

PISTON RINGS:—Two compression, two oil control rings per piston, all above pin. Oil ring grooves drilled for oil drain holes.

Ring	Width	End Gap	Side Clearance
Compr. #1	.124"	.010-.020"	.002-.0025"
Compr. #2	.124"	.010-.020"	.0015-.003"
Oil Contr. #3	.1550"	.010-.018"	.0015-.0025"
Oil Contr. #4	.1550"	.010-.018"	.001-.0025"

NOTE—Wall thickness .145" (for all rings).
Replacement Rings:—*See Nash Shop Notes for data.*

PISTON PIN:—**Diameter**—.8745". **Length**—2.804".
Floating type. Pin retained by locking ring at each end. Pin hole in piston offset to camshaft.
Pin Fit in Piston—Light push fit (piston at 200°F.).
Pin Fit in Rod Bushing—Select fit to .0001" or light push fit at normal temperature.
Replacement Pins:—.001, .003", .005" oversize.

CONNECTING ROD:—**Length**—8¾". **Weight**—36¼ ozs.
Upper Bearing (Piston Pin Bushing)—Bronze.
Crankpin Journal Diameter—2.002".
Lower Bearing—Removable steel-backed, babbitt-lined type. No shims. *See Engine Code Note in Nash Shop Notes for original bearing sizes.*
Clearance—.0015-.0025". **Sideplay**—.008-.012".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps. Tangs on bearing shells should be installed on opposite sides of rod.
Replacement Bearings:—.002", .010" undersize.
Installing Rods:—Oil split hole toward camshaft.

CRANKSHAFT:—7 bearings, 4 counterweights.
See Nash Shop Notes for vibration dampener data.
Journal Diameters—2 31/64" all bearings.
Bearings—Interchangeable steel-backed, babbitt-lined type. No shims. **Clearance**—.002".
See Engine Code Note in Nash Shop Notes for original main bearing sizes.
Bearing Adjustment:—None (no shims). *See Nash Shop Notes for removing, installing and fitting bearings.*
Replacement Bearings:—.002", .010" Undersize.
End Thrust:—Center (#4) bearing. Replace bearing to take up excessive endplay. **Endplay**—.004".

CAMSHAFT:—Non-adjustable double-roller chain drive.
See Nash Shop Notes for camshaft removal.
Bearings—Steel-backed, babbitt bushings.
Bearing Clearance—.002".
End Thrust:—Taken by front bearing. Replace bearing to take up excessive endplay.
Endplay—.003" (new), .005" max. (worn).
Timing Chain:—Whitney No. 49205 or Diamond. Width 9/16". Pitch ⅜". Length 60 links or 22½".
Camshaft Setting:—Sprockets marked. Mesh chain with sprocket marks adjacent and in line with a straightedge across the shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1¾"	.3725"	5 17/32"
Exhaust	1 19/32"	.3725"	5 17/32"

	Seat angle	Lift	Side Clearance
All Valves	45°	11/32"	.002-.004"

Tappet Clearance:—.015" all valves—engine warm and idling.
Valve Guides:—Press fit. Press in head to shoulder on guide and ream for correct clearance. Replacement guides furnished .002" undersize.
Valve Springs:—Double springs on all valves.
Free Length—1 21/32" (inner), 2" (outer).

	Inner Spring Pressure	Inner Spring Length	Outer Spring Pressure	Outer Spring Length
Closed	21 lbs.	1⅜"	38 lbs.	1 11/16"
Open	51 lbs.	1 1/32"	95 lbs.	1 11/32"

Valve Lifters:—Mushroom type. Lifter guide holes reamed in block. Remove from below (camshaft out).
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 24½° BTDC. Close 70½° ALDC.
Exhaust Valves—Open 49½° BLDC. Close 5° ATDC.
Valve Timing Check—With regular tappet clearance of .015", exhaust valve should close with piston 5° or .0104" after top dead center.
Motor Gauge—Weidenhoff Adapter #113, Rod #37.

LUBRICATION:—Pressure system (gear type oil pump in crankcase. NOTE—Install pump with distributor drive slot turned crosswise of car.
Normal Oil Pressure:—30 lbs. at 20 MPH.
Oil Pressure Relief Valve:—On oil pump cover. Opens at 30 lbs. Turn adjusting screw in to increase.
Oil Pressure Gauge:—King-Seeley Electric. K-S No. 7665 (dash unit), 6125 (engine unit).
See article in Mechanical Equipment Section for data.
Crankcase Capacity:—6 qts. (dry or refill).

COOLING SYSTEM:—**Cap.** 16 qts. (17 with heater).
Water Pump:—Centrifugal, adjustable packing type.
See article in Mechanical Equipment Section for data.
Removal—Drain radiator, disconnect hose and drive coupling, take out mounting screws in pump flange.
Thermostat:—Dole. In water outlet on cyl. head.
Setting—Starts to open at 160° F.
Temperature Gauge:—King-Seeley Electric. K-S No. 7670 (dash unit), 7000 (engine unit). NOTE—Gauge inoperative with ignition Off (reads '212').
See article in Mechanical Equipment Section for data.

CLUTCH:—**Borg & Beck Model 10A7.** Single plate, dry disc type. See Production Change following.
Production Change—Clutch assembly changed from #934 (same as 1939) to #950 (with 'Borglite' driven member) after Dec. 15, 1939. Assembly no. stamped on cover. *See article in Mechanical Equipment Section.*
Facings—Spiral wound moulded woven, 2 used. Inside Diam. 6" (934), 7" (950). Outside Diam. 10". Thickness .125". NOTE—Install plate with mark 'flywheel side' forward (damper toward trans).
Pedal Adjustment:—Free travel ½-1" (adjusting nuts on lower end of pedal connector link). Check NoRol
Removal:—Remove transmission (see below). Disconnect clutch pedal linkage. Support engine at rear, disconnect rear engine mountings. Remove clutch housing and pan. Punch mark flywheel, cover, and pressure plate (re-assemble to these marks). Take out mounting screws in cover flange.

TRANSMISSION:—**Own Make.** All helical gear, constant-mesh (all speeds), synchro-mesh (second & high) with remote type steering column shift.
See article in Mechanical Equipment Section for data.
Cruising Gear (Overdrive):—Warner Model AS12-R6 with electrical 'kick-down' control optl.
See article in Mechanical Equipment Section for data.
Transmission Control:—Steering col. mechanical shift.
See article in Mechanical Equipment Section for data.
Removal:—Disconnect shift rods, speedometer cable, overdrive control and wires (if used), and driveshaft. Remove two upper mounting studs and install pilot studs (to support transmission and avoid bending clutch plate). Remove remaining mounting stud nuts, remove transmission from below. NOTE—When removing transmission from car, do not remove inspection hole plate in car floor.

UNIVERSAL JOINTS:—**Mechanics Type 2C.** Roller bearing type. 2 used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—**Own Make.** Semi-floating, hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.1-1 Std., 4 4/9-1 Optl.
Backlash—.005-.007". Shim adjustment.
Removal:—Hoist rear of car, remove axle shafts (see below). Free axle from springs by disconnecting U-bolts and rear shackles and withdraw from car.
Axle Shaft Removal:—Remove wheel and drum. Disconnect brake line and cable. Remove backing plate mounting bolt nuts, oil seal retainer, brake backing plate, bearing adjusting shims and withdraw shaft and bearing (do not drag shaft on oil seal).
Wheel Bearing Adjustment—Shims at flanged end of housing. To adjust, remove backing plate, add or remove shims (equally at both ends of axle).
Endplay—.003-.006".

SHOCK ABSORBERS:—**Delco. Front**—Model 1947-C, **D. Rear**—Model 1006-DD, 1006-EE (heavy springs), 1723-N, P (heavy springs—Export). Double acting, hydraulic. Direct acting on rear (except 1723).
See articles in Mechanical Equipment Section for data.

STEERING:—**Steering Gear.** Gemmer Model 305. Worm-and-Roller type with 'push-pull' adjustment. New type steering linkage with idler arm on right frame side member. *See Mechanical Equip. Section for data.*
Front Suspension:—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
IMPORTANT—Insert 2" blocks (Tool J886) between upper support arm and frame flange (at each side) to level frame when checking specifications.
Kingpin Inclination—4½° crosswise.
Caster—0° to Negative ½°. Adjustable.
Camber—Pos. ¼° to Pos. ¾°. Adjustable.
Toe In—1/32-3/32". Adjust tie rod tube for each wheel equally.
Steering Geometry (Toe-out on Turns)—Inner wheel turned 21½°, Outer wheel 20°.

BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type without eccentric adjustment. Hand lever applies rear wheel service brakes.
See article in Mechanical Equipment Section for data.
Drums—Cast-iron. Diameter—10".
Lining—Moulded. Width 2". Thickness 3/16". Length per wheel 22".
Clearance—.015" at each end of secondary shoe with primary shoe forced out against drum.
Braking Power—53% front wheels, 47% rear.
Hand Brake:—See Service Brakes above.
NoRol:—Optl. *See Mechanical Equipment Section.*

HOOD LOCK & ENGINE CODE NOTE:—*See Nash Shop Notes.*

SERIAL NUMBER:—First number B-106300. Stamped on right frame side member under hood.

SERVICE SERIAL NUMBER:—First number N8-13500. On 'Caution Plate' on left front door hinge post.

ENGINE NUMBER:—First number B-105800. On engine block on left side at front. NOTE—Engine number is 500 less than Serial Number on same car.

ENGINE SPECIFICATIONS:—8 cylinder, valve-in-head, Twin Ignition type. NOTE—'Iso-thermal' fuel intake system used (intake manifold cast in cylinder head—water cooled for temperature control).
Bore—3⅛". **Stroke**—4¼".
Displacement—260.8 cu. ins. **Rated HP**—31.25.
Developed Horsepower—115 at 3400 RPM.
Compression Ratio—6.0-1 cast-iron head.
Compression Pressure—110 lbs. at 350 RPM. or approx. 100 lbs. at cranking speed (160 RPM).

PISTONS:—Nelson-Bohnalite, aluminum alloy, Invar strut, tin plated, split skirt type.
Original Bore Size:—*See Engine Code Note in Nash Shop Notes for complete data.*
Weight—16 ozs. (stripped). **Length**—3 11/16".
Removal—Pistons and rods removed from below.
Clearance—Top .018-.022". Skirt .001-.002".
Replacement Pistons:—*See Nash Shop Notes for data.*
Fitting New Pistons:—Insert .002" feeler between piston and cylinder wall on side opposite slot. Pull to withdraw feeler should be 10 lbs.
Installing Pistons:—Pin offset toward camshaft. Slot toward left (trademark within piston toward front).

PISTON RINGS:—Two compression, two oil control rings per piston, all above pin. Oil ring grooves drilled for oil drain holes.

Ring	Width	End Gap	Side Clearance
Compr. #1	.124"	.010-.020"	.002-.0025"
Compr. #2	.124"	.010-.020"	.0015-.003"
Oil Contr. #3	.1240"	.010-.018"	.0015-.0025"
Oil Contr. #4	.1865"	.010-.018"	.001-.0025"

NOTE—Wall thickness .130" compression, .140" oil ring.
Replacement Rings:—*See Nash Shop Notes for data.*

PISTON PIN:—**Diameter**—.8747". **Length**—2.574". Floating type. Pin retained by locking ring at each end. Pin hole in piston offset to camshaft.
Pin Fit in Piston—Light push fit (piston at 200°F.).
Pin Fit in Rod Bushing—Select fit to .0001" or light push fit at normal temperature.
Replacement Pins:—.001", .003", .005" oversize.

CONNECTING ROD:—**Length**—8¾". **Weight**—34 ozs.
Upper Bearing (Piston Pin Bushing)—Bronze.
Crankpin Journal Diameter—2.0015".
Lower Bearing—Removable steel-backed, babbitt-lined type. No shims. *See Engine Code Note in Nash Shop Notes for original bearing sizes.*
Clearance—.0015-.0025". **Sideplay**—.008-.012".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps. Tangs on bearing shells should be installed on opposite sides of rod.
Replacement Bearings:—.002", .010" undersize.
Installing Rods:—Oil split hole toward camshaft.

CRANKSHAFT:—9 bearing. No counterweights.
See Nash Shop Notes for vibration dampener data.
Journal Diameters—2 31/64" all bearings.
Bearings—Interchangeable steel-backed, babbitt-lined type. No shims. **Clearance**—.002".
See Engine Code Note in Nash Shop Notes for original main bearing sizes.
Bearing Adjustment:—None (no shims). *See Nash Shop Notes for removing, installing and fitting bearings.*
Replacement Bearings:—.002", .010" Undersize.
End Thrust:—Center (#5) bearing. Replace bearing to take up excessive endplay. **Endplay**—.004".

CAMSHAFT:—Non-adjustable double-roller chain drive.
See Nash Shop Notes for camshaft removal.
Bearings—Steel-backed, babbitt bushings.
Bearing Clearance—.002".
End Thrust:—Taken by front bearing. Replace bearing to take up excessive endplay.
Endplay—.003" (new), .005" Max. (worn).
Timing Chain:—Diamond. Width 9/16". Pitch ⅜". Length 62 links or 23¼".
Camshaft Setting:—Sprockets marked. Mesh chain with sprocket marks adjacent and in line with a straightedge across the shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 21/32"	.3725"	5½"
Exhaust	1 15/32"	.3725"	5½"

	Seat angle	Lift	Side Clearance
All Valves	45°	11/32"	.002-.004"

Tappet Clearance:—.015" all valves—engine warm and idling.
Valve Guides:—Press fit. Press in head to shoulder on guide and ream for correct clearance. Replacement guides furnished .002" undersize.
Valve Springs:—Double springs on all valves.
Free Length—1 21/32" (inner), 2" (outer).

	Inner Spring Pressure	Inner Spring Length	Outer Spring Pressure	Outer Spring Length
Closed	21 lbs.	1⅜"	38 lbs.	1 11/16"
Open	51 lbs.	1 1/32"	95 lbs.	1 11/32"

Valve Lifters:—Mushroom type. Lifter guide holes reamed in block. Remove from below (camshaft out).
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 20° BTDC. Close 74° ALDC.
Exhaust Valves—Open 45° BLDC. Close 10° ATDC.
Valve Timing Check—With regular tappet clearance of .015" Exhaust valve should close with piston 10° or .0400" after top dead center.
Motor Gauge—Weidenhoff Adapter #113, Rod #37.

LUBRICATION:—Pressure system (gear type oil pump in crankcase). NOTE—Slot in pump shaft should be assembled across engine when pump installed.
Normal Oil Pressure:—30 lbs. at 20 MPH.
Oil Pressure Relief Valve:—On oil pump cover. Opens at 30 lbs. Turn adjusting screw in to increase.
Oil Pressure Gauge:—King-Seeley Electric. K-S No. 7665 (dash unit), 6125 (engine unit).
See article in Mechanical Equipment Section for data.
Crankcase Capacity:—7 qts. (dry or refill).

COOLING SYSTEM:—**Capacity.** 17 qts. (add 1 qt. for heater).
Water Pump:—Centrifugal, adjustable packing type.
See article in Mechanical Equipment Section for data.
Removal—Drain radiator, disconnect hose and drive coupling, take out mounting screws in pump flange.
Thermostat:—Dole. In water outlet on cyl. head.
Setting—Starts to open at 160° F.
Temperature Gauge:—King-Seeley Electric. K-S No. 7670 (dash unit), 7000 (engine unit). NOTE—Gauge inoperative with ignition Off (reads '212').
See article in Mechanical Equipment Section for data.

CLUTCH:—**Borg & Beck Model 10A7.** Single plate, dry disc type. See Production Change following.
Production Change—Clutch assembly changed from #919 (same as 1939) to #949 (with 'Borglite' driven member) after Feb. 1, 1940. Assembly No. stamped on cover. *See article in Mechanical Equipment Section.*
Facings—Spiral wound molded woven, 2 used. Inside Diam. 6" (919), 6½" (949). Outside Diam. 10". Thickness .125". NOTE—Install plate with mark 'flywheel side' forward (damper toward trans).
Pedal Adjustment:—Free travel ½-1" (adjusting nuts on lower end of pedal connector link). Check NoRol
Removal:—Remove transmission (see below). Disconnect clutch pedal linkage. Support engine at rear, disconnect rear engine mountings. Remove clutch housing and pan. Punch mark flywheel, cover, and pressure plate (re-assemble to these marks). Take out mounting screws in cover flange.

TRANSMISSION:—**Own Make.** All helical gear, constant-mesh (all speeds), synchro-mesh (second & high) with remote type steering column shift.
See article in Mechanical Equipment Section for data.
Cruising Gear (Overdrive):—Warner Model AS12-R6 with electrical 'kick-down' control optl.
See article in Mechanical Equipment Section for data.
Transmission Control:—Steering col. mechanical shift.
See article in Mechanical Equipment Section for data.
Removal:—Disconnect shift rods, speedometer cable, overdrive control and wires (if used), and driveshaft. Remove two upper mounting studs and install pilot studs (to support transmission and avoid bending clutch plate). Remove remaining mounting stud nuts, remove transmission from below. NOTE—When removing transmission from car, do not remove inspection hole plate in car floor.

UNIVERSAL JOINTS:—**Mechanics Type 3C.** Roller bearing type. 2 used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—**Own Make.** Semi-floating, hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.1-1 Std., 4 4/9-1 Optl.
Backlash—.005-.007". Shim adjustment.
Removal:—Hoist rear of car, remove axle shafts (see below). Free axle from springs by disconnecting U-bolts and rear shackles and withdraw from car.
Axle Shaft Removal:—Remove wheel and drum. Disconnect brake line and cable. Remove backing plate mounting bolt nuts, oil seal retainer, brake backing plate, bearing adjusting shims and withdraw shaft and bearing (do not drag shaft on oil seal).
Wheel Bearing Adjustment—Shims at flanged end of housing. To adjust, remove backing plate, add or remove shims (equally at both ends of axle).
Endplay—.003-.006".

SHOCK ABSORBERS:—**Delco. Front**—Model 1947-C, D. **Rear**—Model 1006-DD, 1006-EE (heavy springs), 1723-N, P (heavy springs—Export). Double acting, hydraulic. Direct acting on rear (except 1723).
See articles in Mechanical Equipment Section for data.

STEERING:—**Steering Gear.** Gemmer Model 335. Worm-and-Roller type with 'push-pull' adjustment. New type steering linkage with idler arm on right frame side member. *See Mechanical Equip. Section for data.*
Front Suspension:—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
IMPORTANT—Insert 2" blocks (Tool J886) between upper support arm and frame flange (at each side) to level frame when checking specifications.
Kingpin Inclination—4½° crosswise.
Caster—0° to Negative ½°. Adjustable.
Camber—Pos. ¼° to Pos. ¾°. Adjustable.
Toe In—1/32-3/32". Adjust tie rod tube for each wheel equally.
Steering Geometry (Toe-out on Turns)—Inner wheel turned 21½°, Outer wheel 20°.

BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type with eccentric adjustment. Hand lever applies rear wheel service brakes.
See article in Mechanical Equipment Section for data.
Drums—Cast-iron. Diameter 11 1/16".
Lining—Moulded. Width 2¼". Thickness 3/16". Length per wheel 24".
Clearance—.010" at heel and toe of each shoe.
Braking Power—53% front wheels, 47% rear.
Hand Brakes:—See Service Brakes above.
NoRol:—Optl. *See Mechanical Equipment Section.*

HOOD LOCK & ENGINE CODE NOTE:—*See Nash Shop Notes.*

SERIAL NUMBER:—First number H-57000. Stamped on plate on right frame side member under hood.

SERVICE SERIAL NUMBER:—First number LH-57000. On 'Caution Plate' on left front door hinge post.

ENGINE NUMBER:—First number HE-56500. On boss on upper left hand side of engine above front water jacket cover plate. NOTE—Engine No. is 500 less than Serial Number on same car.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head type. Cylinders cast Enbloc. NOTE—'Iso-thermal' fuel intake system used (intake manifold cast in block water cooled for temperature control).

Bore—3⅜". **Stroke**—4⅜".

Displacement—234.8 cu. ins. **Rated HP**—27.34.

Developed Horsepower—99 at 3400 RPM.

Compression Ratio—6.3-1 cast-iron head.

Compression Pressure—110 lbs. at cranking speed of 160 RPM.

Vacuum Reading—18-20" steady idling at 7-8 MPH.

PISTONS:—Nelson-Bohnalite, aluminum alloy, Invar strut, tin plated, split skirt type.

Original Bore Size:—*See Engine Code Note in Nash Shop Notes for complete data.*

Weight—19¼ ozs. (stripped). **Length**—3⅞".

Removal—Pistons and rods removed from above.

Clearance—Top .027-.030". Skirt .001-.002".

Replacement Pistons:—*See Nash Shop Notes for data.*

Fitting New Pistons:—Insert .002" feeler between piston and cylinder wall on side opposite slot. Pull to withdraw feeler should be 10 lbs.

Installing Pistons:—Pin offset toward camshaft. Slot toward left (trademark within piston toward front).

PISTON RINGS:—Two compression, two oil control rings per piston, all above pin. Oil ring grooves drilled for oil drain holes.

Ring	Width	End Gap	Side Clearance
Compr. #1	.124"	.010-.020"	.002-.0025"
Compr. #2	.124"	.010-.020"	.0015-.003"
Oil Contr. #3	.1550"	.010-.018"	.0015-.0025"
Oil Contr. #4	.1550"	.010-.018"	.001-.0025"

NOTE—Wall thickness .145" (for all rings).

Replacement Rings:—*See Nash Shop Notes for data.*

PISTON PIN:—**Diameter**—.8745". **Length**—2.804". Floating type. Pin retained by locking ring at each end. Pin hole in piston offset to camshaft.

Pin Fit in Piston—Light push fit (piston at 200°F.).

Pin Fit in Rod Bushing—Select fit to .0001" or light push fit at normal temperature.

Replacement Pins:—.001, .003", .005" oversize.

CONNECTING ROD:—**Length**—8¾". **Weight**—36¼ ozs.

Upper Bearing (Piston Pin Bushing)—Bronze.

Crankpin Journal Diameter—2.002".

Lower Bearing—Removable steel-backed, babbitt-lined type. No shims. *See Engine Code Note in Nash Shop Notes for original bearing sizes.*

Clearance—.0015-.0025". **Sideplay**—.008-.012".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps. Tangs on bearing shells should be installed on opposite sides of rod.

Replacement Bearings:—.002", .010" undersize.

Installing Rods:—Oil split hole toward camshaft.

CRANKSHAFT:—7 bearings, 4 counterweights.

See Nash Shop Notes for vibration dampener data.

Journal Diameters—2 31/64" all bearings.

Bearings—Interchangeable steel-backed, babbitt-lined type. No shims. **Clearance**—.002".

See Engine Code Note in Nash Shop Notes for original main bearing sizes.

Bearing Adjustment:—None (no shims). *See Nash Shop Notes for removing, installing and fitting bearings.*

Replacement Bearings:—.002", .010" Undersize.

End Thrust:—Center (#4) bearing. Replace bearing to take up excessive endplay. **Endplay**—.004".

CAMSHAFT:—6 bearing. Non-adjustable chain drive.

See Nash Shop Notes for camshaft removal.

Bearings—Steel-backed, babbitt bushings.

Bearing Clearance—.002".

End Thrust:—Taken by front bearing. Replace bearing to take up excessive endplay.

Endplay—.003" (new), .005" Max. (worn).

Timing Chain:—Whitney No. 49205 or Diamond. Pitch ⅜". Width 9/16". Length 60 links or 22½".

Camshaft Setting:—Sprockets marked. Mesh chain with sprocket marks adjacent and in line with a straightedge across the shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 21/32"	3407"	5 55/64"
Exhaust	1 17/32"	3407"	5 55/64"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	5/16"	.002-.004"

Tappet Clearance:—.015" all valves—engine warm and idling. NOTE—For high speed driving .018" max. setting may be used. Remove right front fender shield for access to valve covers.

Valve Guides:—Press fit in block. Press guides in place 1¼"(intake), ¾"(exhaust) below top of block. Ream to correct clearance. Replacement guides furnished .002" undersize.

Valve Springs:—Free length 2½".

	Spring Pressure	Spring Length
Valve Closed	70 lbs.	2"
Valve Open	115 lbs.	1 11/16"

Valve Lifters:—Mushroom type. Lifter guide holes reamed in block. Remove from below (camshaft out).

Valve Timing:—See Camshaft Setting above.

Intake Valves—Open 21½° BTDC. Close 71° ALDC.

Exhaust Valves—Open 71° BLDC. Close 36½° ATDC.

Valve Timing Check—With regular tappet clearance of .015", Intake valve should open with piston 21½° or .1891" BTDC., and Exhaust valve close with piston 36½° or .5118" ATDC.

LUBRICATION:—Pressure system (gear type oil pump in crankcase).

Normal Oil Pressure:—30 lbs. at 20 MPH.

Oil Pressure Relief Valve:—On oil pump cover. Opens at 30 lbs. Turn adjusting screw in to increase.

Oil Pressure Gauge:—King-Seeley Electric. K-S No. 7665 (dash unit), 6125 (engine unit).

See article in Mechanical Equipment Section for data.

Crankcase Capacity:—6 qts. (dry or refill).

COOLING SYSTEM:—**Cap.** 18 qts. (19 with heater).

Water Pump:—Centrifugal, adjustable packing type.

See article in Mechanical Equipment Section for data.

Removal—Drain radiator, disconnect hose and drive coupling, take out mounting screws in pump flange.

Thermostat:—Dole. In water outlet on cyl. head.

Setting—Starts to open at 160° F.

Temperature Gauge:—King-Seeley Electric. K-S No. 7670 (dash unit), 7000 (engine unit). NOTE—Gauge inoperative with ignition Off (reads '212').

See article in Mechanical Equipment Section for data.

CLUTCH:—**Borg & Beck Model 9A6 (early), 9A7 (later).** Single plate, dry disc type.

Production Change—9A6 (#932) used on first cars, 9A7 (#937 & #951 with 'Borglite' driven member) used after Dec. 15, 1939. Assembly No. stamped on cover.

See article in Mechanical Equipment Section for data.

Facings—Spiral wound molded woven, 2 used. Inside Diam. 5⅝" (932), 6" (951). Outside Diam. 9¼". Thickness .125". NOTE—Install plate with mark 'flywheel side' forward (damper toward trans).

Pedal Adjustment:—Free travel ½-1" (adjusting nuts on lower end of pedal connector link). Check NoRol

Removal:—Remove transmission (see below). Disconnect clutch pedal linkage. Support engine at rear, disconnect rear engine mountings. Remove clutch housing and pan. Punch mark flywheel, cover, and pressure plate (re-assemble to these marks). Take out mounting screws in cover flange.

TRANSMISSION:—**Own Make.** All helical gear, constant-mesh (all speeds), synchro-mesh (second & high) with remote type steering column shift.

See article in Mechanical Equipment Section for data.

Cruising Gear (Overdrive):—Warner Model AS12-R6 with electrical 'kick-down' control optl.

See article in Mechanical Equipment Section for data.

Transmission Control:—Steering col. mechanical shift.

See article in Mechanical Equipment Section for data.

Removal:—Disconnect shift rods, speedometer cable, overdrive control and wires (if used), and drive-shaft. Remove two upper mounting studs and install pilot studs (to support transmission and avoid bending clutch plate). Remove remaining mounting stud nuts, remove transmission from below. NOTE—Do not remove inspection hole cover in floor.

UNIVERSAL JOINTS:—**Mechanics Type 2C.** Roller bearing type. 2 used.

See article in Mechanical Equipment Section for data.

REAR AXLE:—**Own Make.** Semi-floating, hypoid gear type with Hotchkiss drive.

See article in Mechanical Equipment Section for data.

Ratio—4.1-1 Std., 4 4/9-1 Optl.

Backlash—.005-.007". Shim adjustment.

Removal:—Hoist rear of car, remove axle shafts (see below). Free axle from springs by disconnecting U-bolts and rear shackles and withdraw from car.

Axle Shaft Removal:—Remove wheel and drum. Disconnect brake line and cable. Remove backing plate mounting bolt nuts, oil seal retainer, brake backing plate, bearing adjusting shims and withdraw shaft and bearing (do not drag shaft on oil seal).

Wheel Bearing Adjustment—Shims at flanged end of housing. To adjust, remove backing plate, add or remove shims (equally at both ends of axle).

Endplay—.003-.006".

SHOCK ABSORBERS:—**Delco. Front**—Model 1947-C, D. **Rear**—Model 1006-DD, 1006-EE (heavy springs), 1723-N, P (heavy springs—Export). Double acting, hydraulic. Direct acting on rear (except 1723).

See articles in Mechanical Equipment Section for data.

STEERING:—**Steering Gear.** Gemmer Model 305. Worm-and-Roller type with 'push-pull' adjustment. New type steering linkage with idler arm on right frame side member. *See Mechanical Equip. Section for data.*

Front Suspension:—Independent, linked parallelogram type with coil springs.

See article in Mechanical Equipment Section for data.

IMPORTANT—Insert 2" blocks (Tool J886) between upper support arm and frame flange (at each side) to level frame when checking specifications.

Kingpin Inclination—4½° crosswise.

Caster—0° to Negative ½°. Adjustable.

Camber—Pos. ¼° to Pos. ¾°. Adjustable.

Toe In—1/32-3/32". Adjust tie rod tube for each wheel equally.

Steering Geometry (Toe-out on Turns)—Inner wheel turned 21½°, Outer wheel 20°.

BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type without eccentric adjustment. Hand lever applies rear wheel service brakes.

See article in Mechanical Equipment Section for data.

Drums—Cast-iron. Diameter—10".

Lining—Moulded. Width 2". Thickness 3/16". Length per wheel 22".

Clearance—.015" at each end of secondary shoe with primary shoe forced out against drum.

Braking Power—53% front wheels, 47% rear.

Hand Brake:—See Service Brakes above.

NoRol:—Optl. *See Mechanical Equipment Section.*

TORQUE WRENCH SPECIFICATIONS:—*See Torque Wrench article in Mechanical Equipment Section for tightening specifications for Cylinder Head, Main & Connecting Rod Bolts, etc.*

F-40 '60' & G-40 '70' ENGINE NOTE:—Same engine used for both F-40 '60' and G-40 '70' models.

HOOD LOCK USED ON 1940 SIX & EIGHT CARS:—Alligator type hood with instrument panel lock. To raise hood, pull out on control knob at left of steering wheel (hood will raise 1½"), press up on safety catch tab under front edge of hood at center. When installing hood, engage front latch, adjust rear edge to secure ⅛" uniform clearance between rear edge of hood and cowl before installing and tightening hinge bracket bolts. Adjust hinges as required for alignment and smooth operation. Hood latch pilot bolt is also adjustable. Side panels are integral with front fenders.

FRONT END SHEET METAL ASSEMBLY REMOVAL:—May be removed to facilitate work on front of engine as follows: drain radiator, disconnect radiator hose, disconnect wires at junction block on fender plate (each side), free wiring harness from clips on radiator top tank and on left fender plate. Disconnect hood latch cable at front and pull back through core support. Remove 2 screws at radiator tie rod bracket between fender and core support, fender to hood hinge hex head bolt and washers (at upper rear edge of fender), frame to fender plate hex head self tapping screws (2 on 'F' & 'L', 1 on 'G') at each side at lower rear end of plate. Disconnect rear of fender from frame brace, running board and body rocker panel ('L' only). On 'G' and 'L' remove lower body to fender capscrew from under car. Remove front bumper assembly and nut from radiator support at center of frame front cross member. On 'L', free fabric splash apron at snap-in fasteners at front cross member. Remove cowl kick pads (inside car) at each side and 3 body-to-fender capscrews. Lift front end assembly clear of center support stud and pull forward. Replace assembly in same manner.

FENDER PLATE REMOVAL:—For access to side engine compartments (for valve adjustment, etc.) remove fender plate as follows: Disconnect wires at junction block and remove from plate, remove 4 ('F' & 'G'), 6 ('L') hex head screws at top edge of plate, 2 screws at radiator tie rod bracket-to-fender and core support, 3 hex head cap screws under fender at front edge of plate, 1 ('G'), 2 ('F' & 'L') hex head self tapping screws at frame at lower rear edge. Slide plate to rear (from under fender) to clear radiator core support. Tip top of plate in until free from fender, raise over shock absorber and slide out to rear and down.

CYLINDER HEAD SERVICING:—Steel-asbestos cylinder head gasket used. **This gasket cannot be reused.** When installing new gasket, coat both sides with thin coat of P.O.B. Perfect Gasket Seal with room temperature of approximately 70° F. (edges at cylinder bore holes must be wiped clean). Plain washers used under cylinder head bolts to prevent leakage at front end. Car manufacturer recommends use of torque wrench (if J-1264 torque wrench used, car manufacturer recommends reading 65-70 lbs. ft.). *See Cylinder Head Tightening Diagrams in Mechanical Equipment Section.*

F-40 & G-40 Note—Same head used on both engines but changed over 1939 by moving hot water heater connection to left side and heater indicator hole size increased due to use of electric type heat indicator.

L-40 Note—Install new neoprene grommet in pump by-pass hole on front end of head whenever cylinder head removed.

OIL PAN REMOVAL:—Steering linkage must be lowered to allow pan removal. Disconnect Pitman Arm from Pitman Arm shaft and steering arm support (on right side) from frame and lower steering relay rod permitting access to oil pan.

L-40 Note—Holes provided in frame cross member for removal of some screws at front end. Car manufacturer recommends front end of car be raised slightly for access to extreme front end screws. To do this, remove 2 front engine mounting cap screws, fender plates (see data following) and disconnect flexible feed line at fuel pump (to avoid lamaging line).

PISTON PINS:—**Servicing**—Standard size pins only furnished for service. Pin bosses in pistons electrolited and must not be reamed. Replacement pistons (standard and oversize) furnished with pins fitted.

Removal:—To remove pin, take out lockscrew, place assembly in boiling water for one minute. With Tool HM-535 push pin out through plain boss end. NOTE—Piston Heater and Pin Assembly Fixture No. J-849 consisting of piston and pin heater compartments and piston holder available.

Fitting:—Pin fit in piston .0001" loose to .0002" tight (plain boss), .0002-.0005" tight (lock screw boss). Pin fit in rod bushing .0003-.0006". If rod bushing worn, press new bushing in place (align oil hole in bushing and rod), burnish with Tool HM-587E and line ream with Reamer HM-586 to .8558-.8562".

Installing:—To install pin, heat piston and pin (as for Removal above), dip pin in hot light engine oil, start pin through plain boss end of piston and through rod (make sure lock screw hole in pin and boss will be aligned), then with Tool HM-535 lightly push pin in place until hole in pin and boss aligned (use punch in hole to correct slight mis-allgnment).

IMPORTANT—Pin must not be forced (if heavy push required, indicates piston has cooled, disassemble and reheat piston and pin). After pin in place, coat screw with graphite and tighten.

CONNECTING ROD BOLT NUT CHANGE:—Later production cars equipped with self tightening (Marsden) type nuts (no cotter key used). May be identified by increased slot length on each face of nut (extends half way up face). These self locking nuts should be tightened to 50-55 lbs. ft. Early cars use conventional castellated nut and cotter key. Tighten conventional type nuts to 30-35 lbs. ft. with Tool J-1264.

MAIN BEARING UPPER HALVES:—**Removal**—May be removed without removing crankshaft by removing bearing cap and inserting pin (Tool HM-J-173) in oil hole in shaft. With tang on pin engaging plain end of bearing shell, rotate shaft in usual direction and turn shell out.

L-40 Note—Front of engine must be raised to remove upper half of front bearing.

Installation—Remove sharp edge from plain end of bearing, insert this end at indented side of support and rotate in place using pin in oil hole.

CRANKSHAFT END THRUST:—Taken by front (#1) bearing. A solid bronze thrust washer plate (.1205-.1245" thick) is dowelled to each face of bearing cap. A steel thrust collar is assembled between front thrust plate and crankshaft gear.

REAR MAIN BEARING OIL SEAL:—Consists of oil slinger on crankshaft to rear of bearing with asbestos covered wiper seal in groove to rear of slinger. Cork strips used to seal vertical joints between cap and block.

Installation—With crankshaft out of engine and bearing cap and shells off, crowd seal in rear groove of bearing support by hand. Use seal compressor Tool J-955 over seal and tap tool 3 or 4 times to seat seal. With tool resting on seal, cut ends flush at each end. Repeat operation for bearing cap. Seal must entirely fill groove and be trimmed flush to prevent oil leaks. Install cork seals in vertical grooves when installing cap.

OIL PUMP:—Gear type pump. Six and Eight pump identical except for gear faces which are ¼" wider on Eight. When assembling pump gear on shaft, press shaft on gear flush with outer end of gear (Six), with gear extending ¼" beyond end of shaft (Eight—Use Tool J-954 which properly positions gear on shaft). Pump drive gear must be assembled with Feeler Gauge J-954-1 between inner face of gear hub and pump body to give proper end clearance for pump shaft. Use new gasket between pump body and cylinder block.

Installation—Set engine in firing position for #1 cylinder with rotor opposite #1 segment in distributor cap. Note position of distributor shaft tongue for proper oil pump drive gear mesh, then raise distributor and mesh pump drive gear with camshaft gear. Replace distributor in position and reset ignition timing.

CLUTCH HOUSING REINFORCING PLATE:—Used on all 'L' models with conventional transmission and on first 6488 'G' cars (with 15" transmission rear extension—same as 1939). Later 'G' cars with 11" extension do not use plate (see note following). Consists of 3/16" steel plate bolted between clutch housing and underpan (replaces conventional gasket). Plate is secured to housing by 2 screws. 12 screws used to bolt underpan (through plate) to housing. When installing reinforcing plate, coat both sides with Permatex.

F-40 and G-40 Note—'G' models (after first 6488 cars—see data above for first cars) and all 'F' models (equipped with conventional transmission) have clutch housings drilled for 12 cap screws. Only 8 cap screws used.

HOOD LOCK, FRONT END SHEET METAL ASSEMBLY & OIL PAN REMOVAL:—*See Oldsmobile Shop Notes.*

SERIAL NUMBER:—On left frame side member under hood. 1st No. as follows:

	F-40	G-40
Lansing, Mich.	F-703001	G-355001
South Gate, Calif.	CF-515001	CG-16001
Linden, N. J.	LF-556001	LG-108001

ENGINE NUMBER:—First number G-79001, GR-3001 (RHD). Same number for both Series. NOTE—Cars with Hydra-matic drive carry prefix GA.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3 7/16". **Stroke**—4⅛".
Displacement—229.7 cu. ins. **Rated HP**—28.4.
Developed Horsepower—95 HP (Std. hd.), 90 HP (Optl. LC. hd.) at 3300 RPM.
Compression Ratio—6.1-1 Std., 5.61-1 Optl. LC hd.
Compression Pressure—146 lbs. (Std. hd.), 120 lbs. (Optl. LC. hd.) at 1000 RPM or approximately 102-112 lbs. at cranking speed.
Vacuum Reading—Steady 17" min. at 6 MPH.
See Oldsmobile Shop Notes for Cylinder Head Servicing.

PISTONS:—Aluminum alloy, T-slot, cam ground type with hard oxide bearing surface.
Weight—17.44 ozs. (stripped). **Length**—4 1/32".
Removal—Pistons and rods removed from above.
Clearance—Top .026". Skirt .0013-.0018".
Replacement Pistons:—Finished pistons (pins fitted) .003", .005", .010", .015", .030" oversize. Same wt.as std.
Fitting New Pistons:—Check piston for size with micrometer (pin removed) 90° from pin bosses ⅜" below lower ring groove and ⅜" from bottom of skirt. Insert .002" X ½" feeler between piston (pin removed) and cylinder wall on valve side with piston inverted and T-slot on opposite side from feeler. Pull to withdraw feeler must be 4 to 11 lbs. (piston & block at 70°—low limit below 70°, high above).
Installing Pistons:—Mark 'V-S' on head toward valves (slot away from valves). Pin hole offset 3/32"

PISTON RINGS:—2 compression (tapered, O.D. .001" larger at bottom), 2 oil control rings per piston, all above pin. All rings are coated type.
NOTE—Install compr. rings with mark TOP up.

Ring	Width	End Gap	Side Clearance
Compr.	.0925-.0935"	.008-.018"	.001-.003"
Oil Cont.	.1860-.1865"	.007-.015"	.001-.0025"

Replacement Rings:—.010", .020", .030" oversize.

PISTON PIN:—**Diameter**—.8554-.8557". **Length**—3 5/32". Pin locked in one piston boss by lockscrew (opposite end slotted). Pin bosses are plated and must not be reamed. Standard size pins only serviced.
Pin Fit in Piston—.0001" loose to .0002" tight (plain boss end), .0002-.0005" tight (lock boss end).
Pin Fit in Rod Bushing—.0003-.0006" clearance.
See Oldsmobile Shop Notes for Pin Fitting directions.

CONNECTING ROD:—**Length**—7 13/16". **Weight**—28.0 ozs. (complete except less bearing inserts).
Crankpin Journal Diameter—2.123-2.124".
Lower Bearing—Removable steel-backed, babbitt.
Clearance—.0005-.0025". **Sideplay**—.0055-.0105".
Bearing Adjustment:—None. Replace bearings.
Installing Rods:—Oil spit hole at lower end toward valves and grooves on rod and cap bolt bosses (part number side) matched. Special ground bolts used.
See Oldsmobile Shop Notes for Connecting Rod Bolt Nut change and installation data.

CRANKSHAFT:—4 bearing, 7 integral counterweights.
Journal Diameters—#1, 2.478-2.479"; #2, 2.5405-2.5415"; #3, 2.6655-2.6665"; #4, 2.6855-2.6865".
Bearings—Removable, steel-backed, babbitt. Upper and lower halves interchangeable except #1 (front).
Clearance—.0005-.002" (rear), .001-.003" (all others).
Bearing Adjustment:—None (no shims). Replace bearings. Do not file caps. **Endplay**—.004-.008".
NOTE—Undercut bearing cap bolts (#412550) used at No. 3 cap for improved holding capacity. Always install these special cap bolts at #3 bearing.
See Oldsmobile Shop Notes for Main Bearing Removal, End Thrust and Oil Seal data.

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 1.9970-1.9975"; #2, 1.9345-1.9350"; #3, 1.8720-1.8725"; #4, 1.8095-1.8100".
Bearings—Bronze bushings. **Clearance** .0015-.0035".
End Thrust:—Spring-loaded steel plunger in front end of camshaft bears against steel plate on chain cover.
Timing Chain:—Whitney No. 411239. Width 1". Pitch .500" (½"). Length 47 links or 23½".
Camshaft Setting:—Mesh chain with sprocket marks adjacent and in line with a straightedge across the shaft centers (or use Tool HM-408-0).

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 9/16"	.3415-.3425"	5 51/64"
Exhaust	1 27/64"	.3410-.3418"	5 51/64"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.303"	.00175-.00375"
Exhaust	45°	.298"	.00245-.00425"

Tappet Clearance:—.008"Int., .011"Exh. Engine warm. NOTE—Self-locking tappet screws are used.
See Oldsmobile Shop Notes for Fender Plate removal.
Valve Guides:—Intake and exhaust guides same. Press guides in so top end ⅞" below top of block (Tool J-1042 positions guide correctly in block). Ream to .34425-.34525" inside diam. (no taper).
Valve Springs:—Same spring used on both valves and on Six and Eight engines. Damper used in top of each spring.

	Spring Pressure	Spring Length
Valve Closed	50½ lbs.	2¼"
Valve Open	95½ lbs.	1 15/16"

Valve Lifters:—Mushroom type. Lifter holes in block. Body Diam. .6235-.6240". Furnished .001", .0015", .002", .005",. 010" oversize. **Clearance**—.0005-.0008". NOTE—Lifter holes have bearing-ized finish. Fit lifters without reaming holes wherever possible.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 5° BTDC. Close 45° ALDC.
Exhaust Valves—Open 45° BLDC. Close 5° ATDC.
Valve Timing Check—With .0124" tappet clearance, #1 intake valve should open with piston 5° (.0163") before top dead center when a point on the flywheel approximately 2 teeth before TDC mark (steel ball insert) lines up with pointer (inspection hole on left face of housing). Reset tappet clear. .008" hot.

LUBRICATION:—Pressure (gear type pump on right of engine). *See Oldsmobile Shop Notes for Oil Pump data.*
Normal Oil Pressure:—28-33 lbs.
Oil Pressure Regulator:—On pump, opens at 27 lbs. Non-adjustable type.
Crankcase Capacity—5 quarts.

COOLING SYSTEM:—**Capacity**—18 quarts.
Water Pump:—Packless, sealed ball-bearing type.
See article in Mechanical Equipment Section for data.
Thermostat:—Harrison. In cylinder head outlet.
Setting—Starts to open at 152°F. Fully open 173°.
Temperature Gauge:—AC Electric #1510918 (dash), #1510772 (engine unit).
See article in Mechanical Equipment Section for data.

CLUTCH (STD. TRANS.):—**Borg & Beck Model 9A7 with 'Borglite' driven member.** Marked #924 on cover. Single plate, dry disc type. New steel and asbestos composition pressure plate baffle used.
G-40 Note—Steel reinforcing plate (same as 1939) between clutch housing and underpan used on first 6488 cars. Must be removed to take out clutch.
Hydra-matic Drive Car Note—No clutch used.
See article in Mechanical Equipment Section for data.
Facings—Spiral wound (spirally grooved) molded woven, 2 used. Inside Diam. 6". O.D. 9¼". ⅛" thick.
Pedal Adjustment:—Free travel 1-1½" (adjusting clevis and locknut on link at clutch fork).
Removal:—Remove transmission (see following), clutch underpan and reinforcing plate (if used). Take out 6 mounting screws in clutch cover. NOTE—Use 2 long shank mounting screws in second hole on each side of locating dowel. *See Oldsmobile Shop Notes for Clutch Housing Reinforcing Plate data.*

TRANSMISSION (STD.):—**Own Make.** All helical gear, constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse) with new remote shift.
G-40 Note—First 6488 cars use 15" transmission extension (same as '39), later cars 11" extension.
See article in Mechanical Equipment Section for data.
Transmission Control:—Oldsmobile 'Handi-shift' type.
See article in Mechanical Equipment Section for data.
Removal:—Disconnect shift and selector rods and speedometer cable at transmission. Disconnect rear universal and slide propeller shaft and slip yoke to rear. Remove 4 transmission mounting bolts, pull transmission straight back and lift out.

HYDRA-MATIC DRIVE (OPTL.):—**Own Make**—Consists of fluid coupling & automatic transmission.
See article in Mechanical Equipment Section for data.

UNIVERSAL JOINTS:—**Mechanics 2C.** Roller bearing.
See article in Mechanical Equipment Section for data.
NOTE—Slip joint formed at rear of transmission ahead of front universal (driveshaft solid type).

REAR AXLE:—**Own Make.** Semi-floating, hypoid gear type with torque taken through 2 support arms.
See article in Mechanical Equipment Section for data.
Ratio—4.1-1 (F40), 4.3-1 (G40), 4.55-1 (Optl). Ring gear ratio stamped on top side of carrier.
Backlash—.004-.008". Screw adjustment.
Removal:—Disconnect drive shaft at rear universal, (do not disengage spline joint at transmission), remove axle shafts (see below), remove capscrews on carrier flange, pull carrier assembly out.
Axle Shaft Removal:—Hoist rear end, remove wheel, brake drum, backing plate mounting nuts, static collector and loosen bearing retainer (do not allow backing plate to shift to damage brake line). Pull shaft and bearing with puller J-942 (do not allow shaft to drag on oil seal), replace one backing plate nut. **Wheel Bearing Adjustment**—None.
Rear Suspension:—Quadri-coil type (support arms).
See article in Mechanical Equipment Section for data.

SHOCK ABSORBERS:—**Delco. Front**—Model 1947-C (right), 1947-D (left). **Rear**—1754-L (right), 1754-M (left). Double acting, hydraulic types.
See article in Mechanical Equipment Section for data.

STEERING:—**Steering Gear**—Saginaw Worm-and-Double roller type.
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
Kingpin Inclination—4°51'10".
Caster—0-¾° negative. Adjustable.
Camber—Negative ¼° to Pos. ¾°. Adjustable.
Toe In—1/16-⅛". Adjust each tie rod.
Steering Geometry (Toe-out on Turns)—Inner wheel turned 23° ± ½°. Outer wheel 20°.

BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type without eccentric adjustment. Hand lever applies rear wheel service brakes.
See article in Mechanical Equipment Section for data.
Wheel Cylinder Bore—Front wheel 1 3/32". Rear 1".
Drums—Cast-iron. Diameter—11".
Lining—Molded. Width 1¾". Thickness 3/16". Length—Primary Shoe 9 11/32", Secondary 11 31/32".
Clearance—.015" both ends of secondary shoe (with primary shoe forced out against drum).
Hand Brake:—See Service Brakes above.

HOOD LOCK, FRONT END SHEET METAL ASSEMBLY AND OIL PAN REMOVAL:—*See Oldsmobile Shop Notes.*

SERIAL NUMBER:—On left frame side member under hood. First number L-242001 (Lansing, Mich), CL-190501 (California), LL-202001 (Linden, N. J).

ENGINE NUMBER:—First number L-334001, LR-1801 (RHD) On left side of engine behind water pump. **Hydra-matic Drive Cars**—Carry prefix 'LA'.

ENGINE SPECIFICATIONS:—8 cylinder, 'L' head. **Bore**—3¼". **Stroke**—3⅞" **Displacement**—257 1 cu ins **Rated HP**—33 8 **Developed Horsepower**—110 HP (Std. Hd.), 105 HP (Optl. LC Hd) at 3600 RPM. **Compression Ratio**—6 2-1 Std 5 8-1 Optl. LC Hd **Compression Pressure**—152 lbs (Std Hd.), 145 lbs (Optl LC Hd) at 1000 RPM or approximately 104-114 lbs at cranking speed for Std. head **Vacuum Reading**—Steady 17" min at 6 MPH *See Oldsmobile Shop Notes for Cylinder Head servicing.*

PISTONS:—Aluminum alloy, T-slot, cam ground type with hard oxide bearing surface **Weight**—16 ozs (stripped) **Length**—3 15/16". **Removal**—Pistons and rods removed from above. **Clearance**—Top .026" Skirt .0013-.0018". **Replacement Pistons:**—Finished pistons (pins fitted) .003", .005", .010", .015", .030" oversize Same wt as std **Fitting New Pistons:**—Check piston for size with micrometer (pin removed) 90° from pin bosses ⅜" below lower ring groove and ⅜" from bottom of skirt Insert .002" X ½" feeler between piston (pin removed) and cylinder wall on valve side with piston inverted and T-slot on opposite side from feeler Pull to withdraw feeler must be 4 to 11 lbs (piston and block at 70°F —low lbs pull below 70°, high lbs above). **Installing Pistons**·—Mark 'V-S' on head toward valves (slot away from valves) Pin hole offset 3/32" to left

PISTON RINGS·—2 compression (tapered, O D .001" larger at bottom), 2 oil control rings per piston, all above pin Both oil ring grooves drilled for oil drains All rings are coated. NOTE—Install compr rings with mark TOP up.

Ring	Width	End Gap	Side Clearance
Compr.	.0925-.0935"	.009-.014"	.001-.003"
Oil Cont	.1860-.1865"	.009-.014"	.001-.0025"

Replacement Rings:— .010", .020", .030" oversize.

PISTON PIN:—**Diameter**— .8554-.8557" **Length** 2 31/32". Pin locked in one piston boss by lockscrew (opposite end slotted). Pin bosses are plated and must not be reamed Standard size pins only serviced. **Pin Fit in Piston**— .0001" loose to .0002" tight (plain boss end), .0002-.0005" tight (lock boss end). **Pin Fit in Rod Bushing**— .0003-.0006" clearance. *See Oldsmobile Shop Notes for Pin Fitting directions.*

CONNECTING ROD:—**Length**—7 13/16". **Weight**—28 0 ozs (complete except less bearing inserts). **Crankpin Journal Diameter**—2.123-2.124". **Lower Bearing**—Removable steel-backed, babbitt. Tangs on shells seat in notches on rod and cap. **Clearance**— .0005-.0025" **Sideplay**— .0055-.0105". **Bearing Adjustment:**—None Replace bearings **Installing Rods:**—Oil spit hole at lower end toward valves and grooves on rod and cap bolt bosses (part number side) matched Special ground bolts used *See Oldsmobile Shop Notes for Connecting Rod Bolt Nut change and installation data.*

CRANKSHAFT:—5 bearing, 8 integral counterweights **Journal Diameters:**—#1, 2.478-2.479"; #2, 2.5405-2.5415"; #3, 2.603-2.604"; #4, 2.6655-2.6665"; #5, 2.6855-2.6865" **Bearings**—Removable, steel-backed, babbitt Upper and lower halves interchangeable except #1 (front). **Clearance**—.0005-.002" (rear), .001-.003" (all others). **Bearing Adjustment:**—None (no shims). Replace bearings Do not file caps **Endplay**—.004-.008". *See Oldsmobile Shop Notes for Main Bearing Removal, End Thrust and Oil Seal data.*

CAMSHAFT:—5 bearing. Non-adjustable chain drive. **Journal Diameters**—#1, 2.0600-2.0595", #2, 1.9975-1.9970"; #3, 1.9350-1.9345"; #4, 1.8725-1.8720"; #5, 1.8100-1.8095". **Bearings**—Bronze bushings. **Clearance** .0015-.0035". **End Thrust:**—Spring-loaded steel plunger in front end of camshaft bears against steel plate on chain cover. **Camshaft Setting:**—Mesh chain with sprocket marks adjacent and in line with a straightedge across the shaft centers (or use Tool HM-408-0) **Timing Chain:**—Link Belt No. 365. Width 1". Pitch .500". Length 47 links or 23½".

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 9/16"	.3415-.3425"	5 51/64"
Exhaust	1 27/64"	.3410-.3418"	5 61/64"
	Seat Angle	**Lift**	**Stem Clearance**
Intake	30°	.286"	.00175-.00375"
Exhaust	45°	.313"	.00245-.00425"

Tappet Clearance:—.008"Int , .011"Exh. Engine warm NOTE—Self-locking tappet screws are used. *See Oldsmobile Shop Notes for Fender Plate removal.* **Valve Guides:**—Intake and exhaust guides same. Press guides in so top end ⅞" below top of block (Tool J-1042 positions guide correctly in block). Ream to .34425-.34525" inside diam. (no taper).

Valve Springs:—Same spring used on both valves and on Six and Eight engines Damper used in top of each spring

	Spring Pressure	Spring Length
Valve Closed	50½ lbs	2¼"
Valve Open	95½ lbs	1 15/16"

Valve Lifters:—Mushroom type Lifter holes in block Body Diam. .6235-.6240". Furnished .001", .0015", .002", .005", .010" oversize **Clearance**— .0003-.0007". NOTE—Lifter holes have bearing-ized finish. Fit lifters without reaming holes wherever possible **Valve Timing:**—See Camshaft Setting above **Intake Valves**—Open at TDC Close 35° ALDC. **Exhaust Valves**—Open 45° BLDC Close 10° ATDC. **Valve Timing Check**—With .0124" tappet clearance #1 intake valve should open with piston at top dead center (.000") when flywheel mark 'TDC/' (NOT steel ball insert) lines up with pointer (inspection left face of housing). Reset tappet clear. .008" hot.

LUBRICATION:—Pressure (gear type pump on right of engine) *See Oldsmobile Shop Notes for Oil Pump data.* **Normal Oil Pressure:**—28-33 lbs **Oil Pressure Regulator:**—On pump, opens at 27 lbs Non-adjustable type. **Crankcase Capacity:**—6 quarts

COOLING SYSTEM:—**Capacity**—21 quarts. **Water Pump:**—Packless, sealed ball-bearing type. *See article in Mechanical Equipment Section for data.* **Removal**—Remove fan belt, 3 pump mounting cap-screws, and lower radiator hose Lift pump out. **Thermostat:**—Harrison In cylinder head outlet. **Setting**—Starts to open at 152°F. Fully open 173°. **Temperature Gauge:**—AC Electric #1510918 (dash), #1510772 (engine unit) *See article in Mechanical Equipment Section for data.*

CLUTCH (STD. TRANS.):—**Borg & Beck 10A7 with 'Borglite' driven member.** Marked #927 on cover Single plate, dry disc type with sheet metal pressure plate baffle **Hydra-matic Drive Car Note**—No clutch used. *See article in Mechanical Equipment Section for data.* **Facings**—Spiral wound (spirally grooved) molded woven, 2 used. Inside Diam. 7". O D. 10". ⅛" thick. **Pedal Adjustment:**—Free travel 1-1½" (adjusting clevis and locknut on link at clutch fork). **Removal:**—Remove transmission (see following), clutch underpan and reinforcing plate. Take out 6 mounting screws in clutch cover. NOTE—Use 2 long shank mounting screws in second hole on each side of locating dowel. *See Oldsmobile Shop Notes for Clutch Housing Reinforcing Plate data.*

TRANSMISSION (STD.):—**Own Make.** All helical gear, constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse) with new remote shift. *See article in Mechanical Equipment Section for data.* **Transmission Control:**—Oldsmobile 'Handi-shift' type. *See article in Mechanical Equipment Section for data.* **Removal:**—Disconnect shift and selector rods and speedometer cable at transmission. Disconnect rear universal and slide propeller shaft and slip yoke to rear Remove 4 transmission mounting bolts, pull transmission straight back and lift out.

HYDRA-MATIC DRIVE (OPTL.):—**Own Make**—Consists of fluid coupling & automatic transmission. *See article in Mechanical Equipment Section for data.*

UNIVERSAL JOINTS:—**Mechanics 2C.** Roller bearing. *See article in Mechanical Equipment Section for data.* NOTE—Slip joint formed at rear of transmission ahead of front universal (driveshaft solid type).

REAR AXLE:—**Own Make.** Semi-floating, hypoid gear type with torque taken through 2 support arms. *See article in Mechanical Equipment Section for data.* **Ratio**—4 3-1 Std 4.55-1 Optl. Ring and pinion gear ratio stamped on upper outside of carrier. **Backlash**— .004-.008". Screw adjustment. **Removal:**—Disconnect drive shaft at rear universal, (do not disengage spline joint at transmission), remove axle shafts (see below), remove capscrews on carrier flange, pull carrier assembly out. **Axle Shaft Removal:**—Hoist rear end, remove wheel, brake drum, backing plate mounting nuts, static collector and loosen bearing retainer (do not allow backing plate to shift to damage brake line). Pull shaft and bearing with puller J-942 (do not allow shaft to drag on oil seal), replace one backing plate nut **Wheel Bearing Adjustment**—None. **Rear Suspension:**—Quadri-coil type (support arms). *See article in Mechanical Equipment Section for data.*

SHOCK ABSORBERS:—**Delco. Front**—Model 1947-C (right), 1947-D (left). **Rear**—1754-L (right), 1754-M (left) Double acting, hydraulic types. *See article in Mechanical Equipment Section for data.*

STEERING:—**Steering Gear**—Saginaw Worm-and-Double roller type. *See article in Mechanical Equipment Section for data.* **Front Suspension:**—Independent, linked parallelogram type with coil springs. *See article in Mechanical Equipment Section for data.* **Kingpin Inclination**—4°51'10". **Caster**—0-¾° negative. Adjustable. **Camber**—Negative ¼° to Pos. ¾°. Adjustable. **Toe In**—1/16-⅛". Adjust each tie rod. **Steering Geometry (Toe-out on Turns)**—Inner wheel turned 23° ± ½°. Outer wheel 20°.

BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type without eccentric adjustment. Hand lever applies rear wheel service brakes. *See article in Mechanical Equipment Section for data.* **Wheel Cylinder Bore**—Front wheel 1 3/32". Rear 1". **Drums**—Cast-iron. Diameter—11". NOTE—Drum turn down limit .030" cut. **Lining**—Molded. Width 1¾" Thickness 3/16". Length—Primary Shoe 9 11/32", Secondary 11 31/32". **Clearance**—.015" both ends of secondary shoe (with primary shoe forced out against drum) **Braking Power**—54½% front, 45½% rear. **Hand Brake:**—See Service Brakes above.

TORQUE WRENCH SPECIFICATIONS:—*See Torque Wrench article in Mechanical Equipment Section for tightening specifications for Cylinder Head, Main & Connecting Rod Bolts, etc.*

FRONT END REMOVAL:—For work on front of engine, remove radiator and fender assembly as a unit as follows: drain cooling system, remove fender-to-body bolts, fender-to-running board bolts, fender to brace bolts, disconnect radiator hoses, free radiator tie rods, free radiator anchor bolt on frame remove running board molding from fender and lift entire assembly off.

ORIGINAL BORE & PISTON SIZES:—Piston size indicated by mark stamped on head of each piston. Cylinder bore size indicated by mark stamped on top left face of cylinder block at Cylinder #4 (Six), #8 ('120' Eight), #1 (Super Eight). Piston and cylinder marks should correspond (AA piston in AA bore, etc.) as shown in following tables:

'110' SIX, '160' AND '180' SUPER EIGHT

Mark	Piston Size	Cylinder Size
AA	3.49825-3.49850"	3.49950-3.49975"
A	3.49850-3.49875"	3.49975-3.50000"
BB	3.49875-3.49900"	3.50000-3.50025"
B	3.49900-3.49925"	3.50025-3.50050"
CC	3.49925-3.49950"	3.50050-3.50075"
C	3.49950-3.49975"	3.50075-3.50100"
DD	3.49975-3.50000"	3.50100-3.50125"
D	3.50000-3.50025"	3.50125-3.50150"

'120' EIGHT

Mark	Piston Size	Cylinder Size
AA	3.24825-3.24850"	3.24950-3.24975"
A	3.24850-3.24875"	3.24975-3.25000"
BB	3.24875-3.24900"	3.25000-3.25025"
B	3.24900-3.24925"	3.25025-3.25050"
CC	3.24925-3.24950"	3.25050-3.25075"
C	3.24950-3.24975"	3.25075-3.25100"
DD	3.24975-3.25000"	3.25100-3.25125"
D	3.25000-3.25025"	3.25125-3.25150"

CYLINDER HEADS (ALL MODELS):—Cast iron heads used on all models. Each head marked by part number on front end (and letters 'HC' for optional high compression heads).

Car	Standard	High Compression
Six	354122	354675
Eight	348200	351243
Super 8	341586	351254

Head Installation—Coat both sides of gasket with good grade of gasket paste (not necessary on Packard service gaskets which are supplied coated). See Cylinder Head Tightening data pages in Mechanical Equipment Section for tightening order and tension. Coat studs with grease and tighten stud nuts cold. Recheck tension figures when warm.

REPLACEMENT PISTONS:—Finished Autothermic, Cam-ground, Tin-plated type pistons (as furnished for installation on 1940 and previous car models) are stamped on head with decimal figure (.005, .010, etc.) indicating nominal oversize and one or two letters (AA, A, BB, B, CC, C, DD, D) which indicates the actual variation of the piston (in .00025" steps) from indicated nominal oversize. See oversizes listed below and size variations for each letter (in table).

This system of marking makes it possible to order a finished piston (using number and letter) for any particular finished bore size within these limits.

Piston Oversizes (Figures Stamped on Piston Head)—Standard size and .005", .010", .020", .030", .040" oversize. See Piston Variation in table below for size variation indicated by letter.

Piston Variation
(Letters Stamped on Piston Head)
For All Models and Piston Oversizes

AA—.00025" Under marked size.
A—Same as marked size.
BB—.00025" Over marked size.
B—.0005" Over marked size.
CC—.00075" Over marked size.
C—.001" Over marked size.
DD—.00125" Over marked size.
D—.0015" Over marked size.

PISTON PIN BUSHING (ALL MODELS):—Formed by two split type bushings pressed in rod eye from opposite sides so as to form oil groove in center. Rifle-drilled oil passage in rod must open into this groove. New bushings should be burnished (Packard Tool ST-5008)—(grind pilot end of tool to diameter of .861" so that it will enter 1939-40 type bushings) and then ream bushing to size for correct fit.

CONNECTING ROD 'PALNUTS' (SIX & EIGHT):—Special patented self-locking locknuts are used on connecting rod bolt nuts in place of cotter pins. To install, turn regular connecting rod bolt up to desired point (see Tightening Specifications in Mechanical Equipment Section). Turn 'Palnut' on bolt (smooth side toward regular nut) until it contacts nut, then tighten Palnut ¼-⅓ additional turn to lock it in place.

OIL PUMP INSTALLATION (ALL MODELS):—Install pump with driving slot as near parallel as possible to center-line of camshaft with distributor rotor in line with #1 segment in cap. Punch mark on pump gear should be at the bottom (Six), at the top (Eight and Super 8). Recheck ignition timing.

SERIAL NUMBER:—On left side of cowl (use Eng No.).

ENGINE NUMBER:—First number C-1501. On left side of block between #1 & #2 cylinders.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head type. **Bore**—3½". **Stroke**—4¼".
Displacement—245 3 cu ins **Rated HP**—29 4.
Developed Horsepower—100 HP (Std. 6 39-1 head), 103-105 HP (Optl 6 71-1 head) at 3200 RPM.
Compression Ratio and Pressure:—As follows: 6 39-1 Std cast-iron head—110 lbs. at 125 RPM
6 71-1 Optl. HC cast-iron hd —118 lbs. at 125 RPM.
Vacuum Reading—Steady 18-21" idling at 6 MPH.
See Packard Shop Notes for Cylinder Head data.

PISTONS:—Nelson Bohnalite, aluminum alloy, autothermic, strut type, tin plated, cam ground type.
Weight—20¼ ozs (stripped), 26½ (with rings & pin).
Length—3⅞".
Removal—Pistons and rods removed from above
Clearance— 0005- 001" See Fitting Pistons
Original Bore & Piston Sizes, Replacement Pistons:—*See Packard Shop Notes for complete data.*
Fitting New Pistons:—Insert 0015" feeler ½" wide between piston and cylinder wall on side opposite slot. Pull to withdraw feeler should be 12-18 lbs.
Installing Pistons:—Slot toward valves

PISTON RINGS:—2 coated compression (Perfect Circle #200, No 1 upper inner edge beveled, #70 No 2), 1 oil cont. (X90-85 expander type), all above pin.

Ring	Width	End Gap	Side Clearance
Comp (#1)	0930- 0935"	007- 017"	0025-.003"
Comp (#2)	.1240- 1235"	007.-017"	0025-.003"
Oil Cont.	1860- 1865"	007- 015"	0015-.002"

Replacement Rings:—Furnished standard size and 005", 010", 020", 030", 040" oversize

PISTON PIN:—**Diameter**—⅞". **Length**—3 1/64".
Pin floats in piston and rod, held by locking rings
Pins furnished Std and 003", 006" oversize
Pin Fit in Piston—Finger push fit with piston heated to 160° F.
Pin Fit in Rod Bushing—Finger push fit at 70° F.

CONNECTING ROD:—**Length** 7 11/16". **Weight** 31 60 ozs
Upper Bearing (Piston Pin Bushing)—Split type.
See Packard Shop Notes for complete data.
Crankpin Journal Diameter—2 3/32"
Lower Bearing—Interchangeable steel-backed, babbitt-lined Bearings furnished standard and 001", 002", 003", .015" undersize
Clearance— 0005- 0015" **Endplay**— 004- 010".
Bearing Adjustment:—None (no shims). Replace bearings Do not file rods or caps *See Packard Shop Notes for 'Palnut' installation data.*
Installing Rods:—Oil squirt hole toward camshaft

CRANKSHAFT:—4 bearings, 6 integral counterweights and rubber friction disc vibration damper.
Journal Diameters—2¾"
Bearings—Interchangeable steel-backed, babbitt-lined Furnished std , 001", 002" undersize
Clearance— 001- 003".
Bearing Adjustment:—None (no shims). Replace bearings (upper half can be 'rotated' in or out). Do not file caps
End Thrust:—Taken by front (#1) bearing
Endplay— 003- 008"

CAMSHAFT:—4 bearing Non-adjustable chain drive
Bearing Type—Steel-backed, babbitt-lined
Clearance— 001- 003"
End Thrust:—Taken by thrust plate in back of camshaft sprocket **Endplay**— 002- 004"
Timing Chain:—Morse Type C-3682R (#1525) or Ramsey Width 1¼" Pitch 375" Length 21¾" or 58 links Same as 1939
Camshaft Setting:—Install chain and sprockets together with '0' marks on sprockets adjacent and in line with a straightedge across the shaft centers
See Packard Shop Notes for Radiator & Fender (unit) removal for work on front end of engine.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 17/32"	34025"	5⅝"
Exhaust	1⅜"	34025"	5⅝"

	Seat Angle	Lift	Stem Clearance
Intake	30°	318"	001- 003"
Exhaust	45°	3175"	.003- 005"

Tappet Clearance:— 007" Int , 010" Exh. (hot & idling) NOTE—Self-locking tappet screw used Remove right front fender plate for access to valves.
Valve Guides:—Pressed in block from above with upper end 31/32" below valve seat Exhaust guides counter-bored on upper inner diameter
Valve Springs:—Intake and exhaust springs interchangeable

	Spring Pressure	Length
Valve Closed	47-52 lbs	1⅝"
Valve Open	114-124 lbs	1 5/16"

NOTE—Serrated washer installed on top of spring.
Valve Lifters:—New larger (diameter ⅝") mushroom type Remove from below with camshaft out Service by reaming (work through valve guide using ST-5144—23/32") and installing oversize lifters furnished 001", 002", 005" oversize
Diameter— 6235- 6240" **Clearance**— 0003- 0012".
NOTE—1939 tool (ST-5101) cannot be used
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 1° BTDC Close 39° ALDC
Exhaust Valves—Open 45° BLDC Close 5° ATDC.
To Check Timing—With 0125" tappet clearance #1 intake valve should open with #1 piston 1° or 0004" BTDC when 1° point on flywheel (½ graduation before '1 UP DC' mark) lines up with pointer in inspection hole in flywheel housing below starter (left side) Permissible variation plus or minus 2 graduations Reset tappet cl at 007" (hot & idling).

LUBRICATION:—Gear type pump on right of engine
See Packard Shop Notes for Oil Pump installation.
Normal Oil Pressure:—45 lbs at 45 MPH
Oil Pressure Relief Valve:—Mounted on pump cover Not adjustable Spring pressure should be 14 lbs plus or minus 2 ounces at 1⅞"
Crankcase Capacity:—5 quarts (refill)

COOLING SYSTEM:—**Capacity**—17 quarts
Water Pump:—Packless type with ball-bearing shaft
See article in Mechanical Equipment Section for data.
Removal—Remove fan belt, disconnect pump hose, take out pump mounting screws, lift out pump
Thermostat:—Harrison In cylinder head outlet Starts to open at 145° F

CLUTCH:—**Long Model 9½ CF-CS.** Semi-centrifugal, single plate, dry disc type
NOTE—Borg & Beck Model 10A7 (marked #948) Single plate, dry disc type with 'Borglite' driven member used on early cars
See article in Mechanical Equipment Section for data.
Facings (Long)—Spiral or chevron wound woven, US Asbestos No 1133G 2 used Inside Diam 6". Outside Diam 9½" Thickness 125"
Adjustment:—Adjust nut on pedal rod (at clutch fork) for 1½-2" pedal free movement
Removal:—Remove transmission (see Transmission Removal following) and flywheel housing lower cover Disconnect and remove pedal rod, clutch throw-out bearing Remove clutch cover screws and remove assembly from below

TRANSMISSION:—**Own Make.** Constant-mesh helical, ball-bearing mounted low speed gear (sliding spur gear for reverse) Synchro-mesh (second and high)
See article in Mechanical Equipment Section for data.
Econo-Drive Transmission:—New Warner-Packard type (Warner model AS1-R9) overdrive unit with electrical control Optional equipment on all cars
See article in Mechanical Equipment Section for data.
Transmission Control:—Own Remote Control type.
See article in Mechanical Equipment Section for data.
Removal:—Disconnect shifter rods, speedometer cable, hand brake cable at equalizer, engine ground strap, overdrive cable and solenoid wires (if used), front universal (block drive shaft up against floor pan) and rubber bearing at rear of overdrive. Support rear of engine with jack and unbolt cross member (at frame ends and flywheel housing lower cover). Disconnect clutch retractor spring and fore and aft restraint rod Take out transmission-to-flywheel housing mounting screws and remove assembly from car.

UNIVERSAL JOINTS:—**Mechanics.** Model 2C (Std.), 3C (with Econo-Drive). Needle bearing type. 2 used.
See article in Mechanical Equipment Section for data.
CAUTION—Rear universal flange controls pinion bearing pre-load. See Packard Rear Axle article in Mechanical Equipment Section for data.

REAR AXLE:—**Own Make.** Semi-floating, hypoid gear type with Hotchkiss drive Cover welded.
NOTE—Axle bearings not interchangeable with 1700 cars.
See article in Mechanical Equipment Section for data.
Ratio—4 36-1 Std , 4 55-1 with Econo-Drive trans'm.
Backlash— 003- 005". Screw adjustment.
Removal:—Remove wheel, hub, and brake backing plate assembly. Withdraw axle shafts. Disconnect rear universal joint and drop drive shaft Remove carrier-to-housing bolt nuts, withdraw carrier.
Wheel Bearing Adjustment—Endplay controlled by shims between flanged end of housing and brake backing plate Unbolt backing plate and clips holding brake tube to housing. Add or remove shims (endplay up to 050" can be adjusted at one wheel).
Endplay— 004- 007".

SHOCK ABSORBERS:—

	Front	Rear
Domestic	Delco 2206-A,B	Monroe 347416
Exp & Spec	Delco 2206-A,B	Delco 1130-W

Front shocks are parallel cylinder type Rear shocks are direct acting (adjustable type Delco).
See articles in Mechanical Equipment Section for data.
NOTE—No Fifth Shock Absorber used.

STEERING:—**Steering Gear**—Packard (Gemmer design) Worm-and-Roller type with center steering
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent 'Safe-T-fleX' type with coil springs
See article in Mechanical Equipment Section for data.
NOTE—Frame height must be set first before checking Caster and Camber.
Frame Height—With car on level floor, distance from floor to top of frame side rail at front wheel center-line 18⅝" (load car until figure correct).
Kingpin Inclination—1°54' crosswise.
Camber—Pos. ½° (plus ¾°, minus 0°). Adjustable.
Caster—Pos. 1½° ± ½° Shim adjustment
Toe In—0" (+1/16", —0") at hub height Turn both tie rods equally (must be equal after adjusting).
Steering Geometry (Toe-out on Turns)—Inner wheel turned 23° Outer wheel 20°.

BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type without eccentric adjustment. Hand lever applies rear wheel service brakes.
See article in Mechanical Equipment Section for data.
Drums—Centrifuse Diameter—11"
Lining—Moulded Width 1¾". Thickness 3/16". Length per shoe 10⅝" (primary), 12" (secondary).
Clearance—.015" at both ends of secondary shoe with primary shoe forced out against drum.
Hand Brake:—See Service Brakes (above).

SERIAL NUMBER:—On left side of cowl (use Eng. No.).
ENGINE NUMBER:—First number C-300001. On left side of block between #1 & #2 cylinders.
ENGINE SPECIFICATIONS:—8 cylinder, 'L' head type.
Bore—3¼". **Stroke**—4¼".
Displacement—282.04 cu. ins. **Rated HP**—33.8.
Developed Horsepower—120 (Std. hd.) at 3600 RPM.
Compression Ratio—6.41-1 Std., 6.85-1 Optl. CI hds.
Compression Pressure—110 lbs. (Standard 6.41-1 hd.), 118 lbs. (Optl. 6.85-1 head) at 125 RPM.
Vacuum Reading—Steady 18-21" idling at 6 MPH.
See Packard Shop Notes for Cylinder Head data.

PISTONS:—Nelson Bohnalite, aluminum alloy, autothermic, strut type, tin plated, cam ground type.
Weight—17¼ ozs. stripped, 23⅛ with rings & pin.
Length—3⅞".
Removal—Pistons and rods removed from above.
Clearance—.0005-.001". See Fitting Pistons.
Original Bore & Piston Sizes, Replacement Pistons:—***See Packard Shop Notes for complete data.***
Fitting New Pistons:—Insert .0015" feeler ½" wide between piston and cylinder wall on side opposite slot. Pull to withdraw feeler should be 12-18 lbs.
Installing Pistons:—Slot toward valves.

PISTON RINGS:—2 coated compression (Perfect Circle #200, No. 1 upper inner edge beveled, #70 No. 2), 1 oil cont. (X90-85 expander type), all above pin.

Ring	Width	End Gap	Side Clearance
Comp. (#1)	.0930-.0935"	.007-.017"	.0025-.003"
Comp. (#2)	.1240-.1235"	.007-.017"	.0025-.003"
Oil Cont.	.1860-.1865"	.007-.015"	.0015-.002"

Replacement Rings:—Furnished standard size and .005", .010", .020", .030", .040" oversize.

PISTON PIN:—**Diameter**—⅞". **Length**—2 51/64".
Pin floats in piston and rod, held by locking rings. Pins furnished Std. and .003", .006" oversize.
Pin Fit in Piston—Finger push fit with piston heated to 160° F.
Pin Fit in Rod Bushing—Finger push fit at 70° F.

CONNECTING ROD:—**Length** 7 11/16". **Weight** 31.60 ozs.
Upper Bearing (Piston Pin Bushing)—Split type.
See Packard Shop Notes for complete data.
Crankpin Journal Diameter—2 3/32".
Lower Bearing—Interchangeable steel-backed, babbitt-lined. Bearings furnished standard and .001", .002", .003", .015" undersize.
Clearance—.0005-.0015". **Endplay**—.004-.010".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps. ***See Packard Shop Notes for 'Palnut' installation data.***
Installing Rods:—Oil squirt hole toward camshaft.

CRANKSHAFT:—5 bearings, 8 integral counterweights and rubber friction disc vibration dampener.
Journal Diameters—2¾".
Bearings—Interchangeable steel-backed, babbitt-lined. Furnished std., .001", .002" undersize.
Clearance—.001-.003".
Bearing Adjustment:—None (no shims). Replace bearing (upper half can be 'rotated' in or out).
End Thrust:—By #3 bearing. **Endplay**—.003-.008".

CAMSHAFT:—5 bearing. Non-adjustable chain drive.
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.001-.003".
End Thrust:—Taken by thrust plate in back of camshaft sprocket. **Endplay**—.002-.004".
Timing Chain:—Morse Type C-3682R (#1525) or Ramsey. Width 1¼". Pitch .375". Length 21¾" or 58 links. Same as 1939.
Camshaft Setting:—Install chain and sprockets together with '0' marks on sprockets adjacent and in line with a straightedge across shaft centers with #1 piston on top dead center.
See Packard Shop Notes for Radiator & Fender (unit) removal for work on front of engine.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 31/64"	.34025"	5⅝"
Exhaust	1⅜"	.34025"	5⅝"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.318"	.001-.003"
Exhaust	45°	.3175"	.003-.005"

Tappet Clearance:—.007" Int., .010" Exh. (hot & idling). NOTE—Self-locking tappet screw used. Remove right front fender plate for access to valves.
Valve Guides:—Pressed in block from above with upper end 31/32" below valve seat. Exhaust guides counter-bored on upper inner diameter.
Valve Springs:—Intake and exhaust springs interchangeable.

	Spring Pressure	Length
Valve Closed	47-52 lbs.	1⅝"
Valve Open	114-124 lbs.	1 5/16"

NOTE—Serrated washer installed on top of spring.
Valve Lifters:—New larger (diameter ⅝") mushroom type. Remove from below with camshaft out. Service by reaming (work through valve guide using ST-5144—23/32") and installing oversize lifters furnished .001", .002", .005" oversize.
Diameter—.6235-.6240". **Clearance**—.0003-.0012".
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 1° BTDC. Close 39° ALDC.
Exhaust Valves—Open 45° BLDC. Close 5° ATDC.
To Check Timing—With .0125" tappet clearance #1 intake valve should open with #1 piston 1° or .0004" BTDC when 1° point on flywheel (½ graduation before '1 UP DC' mark) lines up with pointer in inspection hole in flywheel housing below starter (left side). Permissible variation plus or minus 2 graduations. Reset tappet cl. at .007" (hot & idling).

LUBRICATION:—Gear type pump on right of engine.
See Packard Shop Notes for Oil Pump installation.
Normal Oil Pressure:—45 lbs. at 45 MPH.
Oil Pressure Relief Valve:—Mounted on pump cover. Not adjustable. Spring pressure should be 14 lbs. plus or minus 2 ounces at 1⅞".
Crankcase Capacity:—6 quarts (refill).

COOLING SYSTEM:—**Capacity**—18 quarts.
Water Pump:—Packless type with ball-bearing shaft.
See article in Mechanical Equipment Section for data.
Removal—Remove fan belt, disconnect pump hose, take out pump mounting screws, lift out pump.
Thermostat:—Harrison. In cylinder head outlet (1801) in radiator top tank controlling shutters (1801A). Starts to open at 145° F.

CLUTCH:—**Long Model 10CF-CI.** Semi-centrifugal, single plate, dry disc type.
NOTE—Borg & Beck Model 10A7 (marked #922) Single plate, dry disc type with 'Borglite' driven member used in early cars.
See article in Mechanical Equipment Section for data.
Facings (Long)—Spiral or chevron wound woven, US Asbestos No. 1133G, 2 used. Inside Diam. 6". Outside Diam. 10". Thickness .125".
Adjustment:—Adjust nut on pedal rod (at clutch fork) for 1½-2" pedal free movement.
Removal:—Remove transmission (see Transmission Removal following) and flywheel housing lower cover. Disconnect and remove pedal rod, clutch throw-out bearing. Remove clutch cover screws and remove assembly from below.

TRANSMISSION:—**Own Make.** Constant-mesh, helical, ball-bearing mounted low speed gear (sliding spur gear for reverse). Synchro-mesh (second and high). ***See article in Mechanical Equipment Section.***
Econo-Drive Transmission:—New Warner-Packard type (Warner model AS1-R9) overdrive unit with electrical control. Optional equipment on all cars.
See article in Mechanical Equipment Section for data.
Transmission Control:—Own Remote Control type.
See article in Mechanical Equipment Section for data.
Removal:—Disconnect shifter rods, speedometer cable, hand brake cable at equalizer, engine ground strap, overdrive cable and solenoid wires (if used), front universal (block drive shaft up against floor pan) and rubber bearing at rear of overdrive. Support rear of engine with jack and unbolt cross member (at frame ends and flywheel housing lower cover). Disconnect clutch retractor spring and fore and aft restraint rod. Take out transmission-to-flywheel housing screws, remove assembly.

UNIVERSAL JOINTS:—**Mechanics Model 3C.** Needle bearing type. Two used.
See article in Mechanical Equipment Section for data.
CAUTION—Rear universal flange controls pinion bearing pre-load. See Packard Rear Axle article in Mechanical Equipment Section for data.

REAR AXLE:—**Own Make.** Semi-floating, hypoid gear type with Hotchkiss drive. Cover welded.
See article in Mechanical Equipment Section for data.
Ratio—1801—4.09-1 Std., 4.36-1 with Econo-Drive transmission. 1801A Comm'l—4.7-1 Std.
Backlash—.003-.005". Screw adjustment.
Removal:—Remove wheel, hub, and brake backing plate assembly. Withdraw axle shafts. Disconnect rear universal joint and drop drive shaft. Remove carrier-to-housing bolt nuts, withdraw carrier.
Wheel Bearing Adjustment—Endplay controlled by shims between flanged end of housing and brake backing plate. Unbolt backing plate and clips holding brake tube to housing. Add or remove shims **Endplay**—.004-.007".

SHOCK ABSORBERS:—

	Delco Front	Rear
1801 Domestic	2206-A,B	1001-V
1801 Exp. & Spec.	2206-A,B	1130-W
1801A Comm'l	1966-C,D	1751-M,Z

Parallel cylinder type (2206-A,B), Direct Acting (1001-V). Direct Acting Adjustable (1130-W), Double Acting (1966-C,D & 1751-M,Z).
Fifth Shock Absorber (Stabilizer):—Houdaille Model NFT. Double acting, hydraulic, adjustable type.
See articles in Mechanical Equipment Section for data.

STEERING:—**Steering Gear**—Packard (Gemmer design) Worm-and-Roller type with center steering.
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent 'Safe-T-fleX' type with coil springs.
See article in Mechanical Equipment Section for data.
NOTE—Frame height must be set first before checking Caster and Camber.
Frame Height—With car on level floor, distance from floor to top of frame side rail at front wheel center-line should be 18¾" (1801), 19¼" (1801A). Load car until this figure correct.
Kingpin Inclination—1°54' crosswise.
Camber—Pos. ½° (plus ¾°, minus 0°). Adjustable.
Caster—Pos. 1½° ± ½°. Shim adjustment.
Toe In—0" (+1/16", —0") at hub height. Turn both tie rods equally (must be equal after adjusting).
Steering Geometry (Toe-out on Turns)—Inner wheel turned 22°50'. Outer wheel 20°.

BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type (no eccentric adjustment on 1801). Hand lever applies rear wheel service brakes.
NOTE—Brakes on 1801A Heavy Duty Ambulance same as on Model 1803A (see next page).
See article in Mechanical Equipment Section for data.
Drums—Centrifuse. Diameter—12".
Lining—Moulded. Width 1¾" (1801), 2¼" (1801A). Thickness 3/16". Length per shoe—13" (except 1801 primary), 11½" (1801 primary).
Clearance—1801—.015" at both end of secondary shoe with primary shoe forced out against drum.
1801A—.010" at heel and toe of each shoe.
Hand Brake:—See Service brakes (above).

SERIAL NUMBER:—On left side of cowl (use Eng. No.).

ENGINE NUMBER:—First number C-500,051 (1803,4,5), CC-500,051 (1806,7,8). Stamped on left side of cylinder block between #3 and #4 cylinders.

ENGINE SPECIFICATIONS:—8 cylinder, 'L' head type. **Bore**—3½". **Stroke**—4⅝". **Displacement**—356 cu. ins. **Rated HP**—39.2. **Developed Horsepower**—160 at 3600 RPM (Std. hd.). **Compression Ratio**—6.45-1 Std. 6.85-1 Optl. CI hds. **Compression Pressure**—118 lbs. at cranking speed for standard head. **Vacuum Reading**—18½" steady idling at 6 MPH.

PISTONS:—Nelson Bohnalite, aluminum alloy, autothermic, strut type, tin plated, cam ground. **Weight**—20¼ ozs. (stripped), 26½ (with rings & pin). **Length**—3⅞". **Removal**—Pistons and rods removed from above. **Clearance**—.0005-.001". See Fitting Pistons.

Original Bore & Piston Sizes, Replacement Pistons:—*See Packard Shop Notes for complete data.*

Fitting New Pistons:—Insert .0015" feeler ½" wide between piston and cylinder wall on side opposite slot. Pull to withdraw feeler should be 12-18 lbs.

Installing Pistons:—Slot toward valves.

PISTON RINGS:—2 coated compression (Perfect Circle #200, No. 1 upper inner edge beveled, #70 No. 2), 1 oil cont. (X90-85 expander type), all above pin.

Ring	Width	End Gap	Side Clearance
Comp. (#1)	.0930-.0935"	.007-.017"	.0025-.003"
Comp. (#2)	.1240-.1235"	.007.-017"	.0025-.003"
Oil Cont.	.1860-.1865"	.007-.015"	.0015-.002"

Replacement Rings:—Furnished standard and .005", .010", .020", .030" and .040" oversize.

PISTON PIN:—**Diameter**—⅞. **Length**—3 1/64". Pin floats in piston and rod, held by locking rings. Furnished standard and .003", .006" oversize. **Pin Fit in Piston**—Finger push fit with piston heated to 160°F. **Pin Fit in Rod Bushing**—Finger push fit at 70°F.

CONNECTING ROD:—**Length**—9¼". **Weight**—42.0 ozs. **Upper Bearing (Piston Pin Bushing)**—Split type. *See Packard Shop Notes for complete data.* **Crankpin Journal Diameter**—2¼". **Lower Bearing**—Interchangeable steel-backed, babbitt lined type. Bearings furnished std. and .001", .002", .003", .015" undersize. **Clearance**—.0005-.0015". **Sideplay**—.004-.010".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps.

Installing Rods:—Oil squirt hole to camshaft.

CRANKSHAFT:—9 bearing type with 8 bolted-on counter-weights. Vibration dampener on front end. **Journal Diameters**—2¾". **Bearings**—Interchangeable steel-backed, babbitt-lined. Furnished std., .001", .002" undersize. **Clearance**—.001-.003".

Bearing Adjustment:—None (no shims). Replace bearings (upper half can be 'rotated' in or out). Do not file caps.

End Thrust:—Taken by #5 bearing. **Endplay** .003-.008".

CAMSHAFT:—8 bearing. Non-adjustable chain drive. **Bearing Type**—Steel-backed, babbitt-lined. **Clearance**—.001-.003".

End Thrust:—Taken by thrust plate behind camshaft sprocket. **Endplay**—.002-.004".

Timing Chain:—Morse Type C-3682R (#765) or Ramsey. Width 1¼". Pitch ⅜". Length 62 links or 23¼".

Camshaft Setting:—Install chain and sprockets together with '0' marks on sprockets adjacent and in line with a straightedge across the shaft centers. *See Packard Shop Notes for Radiator & Fender (unit) removal for work on front end of engine.*

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 43/64"	.34025"	6 3/16"
Exhaust	1 7/16"	.34025"	6 3/16"

	Seat Angle	Lift	Side Clearance
Intake	30°	.340"	.001-.003"
Exhaust	45°	.340"	.003-.005"

Tappet Clearance:—None (automatic take-up used).

Valve Guides:—Straight reamed type pressed in block from above. Install with stepped end up (Intake), down (Exh) & top of guide 31/32" below valve seat.

Valve Springs:—Washer used on top of each spring.

	Spring Pressure	Length
Valve Open	147-157 lbs.	1 13/32"

Valve Lifters:—Wilcox-Rich 'Zero-lash' type hydraulic lifters (mushroom type). Remove from below with camshaft out. Service by reaming (use tool ST-5101, work through valve guide hole) and installing lifters furnished .001", .002", .005" oversize. **Diameter** .7177-.7182". **Clearance** .0002" selective. *See article in Mechanical Equipment Section for data.*

Valve Timing:—See Camshaft Setting above. **Intake Valves**—Open 4° BTDC. Close 51° ALDC. **Exhaust Valves**—Open 49° BLDC. Close 10° ATDC. **To Check Timing**—#1 exhaust valve closes 10° or .0438" after top dead center with hydraulic lifter dry (oil drained) and built up with shim stock for zero tappet clearance.

LUBRICATION:—Pressure system with gear type oil pump mounted on right side of engine. *See Packard Shop Notes for Oil Pump installation.* **Normal Oil Pressure:**—50 lbs. at 45 MPH.

Oil Pressure Relief Valve:—Mounted on pump cover. Not adjustable. Spring pressure should be 17½-18½ lbs. at 1⅞".

Crankcase Capacity:—7 quarts.

COOLING SYSTEM:—**Capacity**—20 quarts.

Water Pump:—Packless type with ball-bearing shaft. *See article in Mechanical Equipment Section for data.* **Removal**—Remove fan belt, disconnect pump hose, take out pump mounting screws, lift out pump.

Thermostat:—Harrison. In radiator top tank. Operates radiator shutters.

CLUTCH:—**Long Model 11CFS-CI.** Semi-centrifugal, single plate, dry disc type (riveted assembly). NOTE—Borg & Beck Model 11A6 (marked #944) Single plate dry disc type with 'Borglite' driven member used on early cars. *See article in Mechanical Equipment Section for data.* **Facings (Long)**—Ammco No. 8263M1, 2 used. Inside Diam. 6½". Outside Diam. 11". Thickness .125".

Adjustment:—Adjust nut on pedal rod (at clutch fork) for 1¾-2¼" pedal free movement.

Removal:—Remove transmission (see Transmission Removal following) and flywheel housing lower cover. Disconnect and remove pedal rod, clutch throw-out bearing. Remove clutch cover screws and remove assembly from below.

TRANSMISSION:—**Own Make.** Constant-mesh, helical, ball-bearing mounted low speed gear (sliding spur gear for reverse). Synchro-mesh (second and high). *See article in Mechanical Equipment Section.*

Econo-Drive Transmission:—New Warner-Packard type (Warner Model AS1-R9A) overdrive unit with electrical control. Optional. *See article in Mechanical Equipment Section for data.*

Transmission Control:—Own Remote Control type. *See article in Mechanical Equipment Section for data.*

Removal:—Disconnect shifter rods, speedometer cable, hand brake cable at equalizer, engine ground strap, overdrive cable and solenoid wires (if used), front universal (block drive shaft up against floor pan) and rubber bearing at rear of overdrive. Support rear of engine with jack and unbolt cross member (at frame ends and flywheel housing lower cover). Disconnect clutch retractor spring and fore and aft restraint rod. Take out transmission-to-flywheel housing screws, remove assembly.

UNIVERSAL JOINTS:—**Mechanics Model 3C.** Needle bearing type. 2 used. *See article in Mechanical Equipment Section for data.* CAUTION—Rear universal flange controls pinion bearing pre-load. See Packard Rear Axle article in Mechanical Equipment Section for data.

REAR AXLE:—**Own Make.** Semi-floating, hypoid gear type with Hotchkiss drive and special Ring Gear Support Roller. Cover is welded in place. *See article in Mechanical Equipment Section for data.*

Model	Ratios:— Std.	Econ-Dr.	Optl.
1803, 1806	3.92-1	4.36-1	4.09-1
1804, 1807	4.09-1	4.36-1	4.36-1
1805, 1808	4.36-1	4.54-1	4.54-1
1803A	4.54-1	4.7-1	4.7-1

Backlash—.003-.005". Screw adjustment.

Removal:—Remove wheel, hub, and brake backing plate assembly. Withdraw axle shafts. Disconnect rear universal joint and drop drive shaft. Remove carrier-to-housing bolt nuts, withdraw carrier. **Wheel Bearing Adjustment**—Endplay controlled by shims between flanged end of housing and brake backing plate. Unbolt backing plate and clips holding brake tube to housing. Add or remove shims (endplay up to .050" can be adjusted at one wheel). **Endplay**—.004-.007".

SHOCK ABSORBERS:—

	Front	Rear
1803,6	Delco 2206-A,B	Monroe 351194
" " Export	Delco 2206-A,B	Delco 1130-W
1804,5,7,8	Delco 1966-C,D	Delco 2007-G,H
1803A Comm'l	Delco 1966-C,D	Delco 1751-M,Z

Parallel cylinder type (2206-A,B). Double acting type (1966-C,D; 2007-G,H; 1751-M,Z). Direct acting type (Monroe 351194). Direct acting adjustable type (Delco 1130-W).

Fifth Shock Absorber (Stabilizer):—Houdaille Model NFT. Double acting, hydraulic, adjustable type. *See articles in Mechanical Equipment Section for data.*

STEERING:—**Steering Gear**—Packard (Gemmer design) Worm-and-Roller type with center steering. *See article in Mechanical Equipment Section for data.*

Front Suspension:—Independent 'Safe-T-fleX' type with coil springs. *See article in Mechanical Equipment Section for data.* NOTE—Frame height must be set first before checking Caster and Camber. **Frame Height**—With car on level floor, distance from floor to top of frame side rail at front wheel center-line 19¼" (load car until figure correct). **Kingpin Inclination**—1°54' crosswise. **Camber**—Pos. ½° (plus ¾°, minus 0°). Adjustable. **Caster**—Neg. 1° ± ½° (except 1803A). Pos. 2½° ± ½° (1803A Comm'l). **Toe In**—0" (+1/16", —0") at hub height. Turn both tie rods equally (must be equal after adjusting). **Steering Geometry**—Inner wheel turned 22°50' 1803,6), 22°30' (1804,7), 22°20' (1805,8). Outer 20°.

BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type with eccentric adjustment (except 1803,6). Hand lever applies rear service brakes. *See article in Mechanical Equipment Section for data.* **Drums**—Centrifuse. Diameter 12". **Lining**—Moulded. Width 2" (1803,6), 2¼" (1804,5,7, 8), 2½" (1803A). Thickness 3/16". Length per shoe 13" (except 1803,6 primary shoe which is 11½"). **Clearance**—All except 1803,6—.010" at heel and toe of each shoe. 1803,6—.015" at both ends of secondary shoe with primary shoe forced out against drum.

Hand Brake:—See Service brakes (above).

FRONT END ASSEMBLY (UNIT) REMOVAL:—Should be removed as a unit for work on front of engine. *See Chrysler Shop Notes for directions.*

SERIAL NUMBER:—On right front door hinge post.

	Detroit	Los Angeles	Evansville	Canada
P9	1,378,001	3,114,801	9,062,201	9,368,516
P10	10,883,001	3,242,501	20,063,001	9,607,611

ENGINE NUMBER:—P9-1001 Up (P9), P10-1001 Up (P10). Left side of block between #1 and #2 cylinders. *See Chrysler Shop Notes for Engine Number Lettering ('Special Standard' bore and bearing sizes).*

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head type. **Bore**—3⅛". **Stroke**—4⅜".
Displacement—201.3 cu. ins. **Rated HP**—23.44.
Developed Horsepower—84 at 3600 RPM (Std. hd.).
Compression Ratio and Pressure—As follows:

Ratio	Pressure at 1000 RPM	At 100 RPM
6.7-1 cast-iron hd.	145-155 lbs.	Approx. 115 lbs.
7.0-1 aluminum hd.	150-160 lbs.	Approx. 120 lbs.

Vacuum Reading—Steady 18-21" idling at 6 MPH. *See Chrysler Shop Notes for Engine Removal data.*

PISTONS:—Aluminum alloy, U-slot, cam ground, tin coated. **Length** 3 11/16". **Weight** 14.4 ozs. (stripped). **Removal**—Pistons and rods removed from above.
Clearance—Top .011". Skirt .0001-.0011".
Original Bore & Piston Sizes, Replacement Pistons:—*See Chrysler Shop Notes for sizes and markings.*
Fitting New Pistons:—Use micrometers. Check piston at bottom of skirt at right angles to pin bosses. With piston and wall dry, piston should pass through bore of own weight with slight drag (pin out). **Installing Pistons**—Slot away from camshaft.

PISTON RINGS:—4 rings, all above pin—#1 Compression (upper inner edge beveled), #2 Comp. (lower outer edge stepped), #3 & 4 (slotted oil rings).

Ring	Width	End Gap	Side Clearance
Comp. (Top)	⅛"	.007-.015"	.002-.004"
Comp. (#2)	⅛"	.007-.015"	.0015-.0035"
Oil Control	5/32"	.007-.015"	.001-.0025"

Replacement Rings:—Std. & .003", .005", .010", .015", .020", .023", .025", .030", .040", .050", .060" oversize.

PISTON PIN:—**Diameter**—55/64". **Length**—2⅝". Floating type. Pin hole in rod bronze bushed.
Pit Fit in Piston—Thumb push fit with piston heated to 100°F.
Pin Fit in Rod Bushing—Thumb push fit at 70°F.
Replacement Pins:—Std. & .003", .005", .008" oversize.

CONNECTING ROD:—**Weight**—30.7 ozs. (with bearings and bolts). **Length**—7 15/16".
Crankpin Journal Diameter—1 15/16".
Lower Bearing—Removable, precision type, steel-backed babbitt. *See Chrysler Shop Notes for undersizes.* **Clearance** .0005-.0025". **Sideplay** .0055-.0115".
Bearing Adjustment:—None (no shims). Install bearings with boss engaging groove in rod and cap.
Installing Rods:—Wide portion of bearing to rear (#1, 3, 5), to front (#2, 4, 6). Oil hole to camshaft.

CRANKSHAFT:—4 bearing type with 7 counterweights. *See Chrysler Shop Notes for Replacement Main Bearing Caps and Crankshaft Front and Rear Oil Seals.*
Journal Diameters—2¼" all bearings.
Bearing Type—Removable, precision type, steel-backed, babbitt-lined. **Clearance**—.001-.002".
Bearing Adjustment:—*See Chrysler Shop Notes for bearing removal, front main bearing cap removal, replacement bearing sizes and adjustment data.*
End Thrust:—Taken by flange faces on rear (#4) main bearing. **Endplay**—.003-.007".

CAMSHAFT:—4 bearing. Non-adjustable chain drive. *See Chrysler Shop Notes for camshaft removal.*
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1¼".
Bearing Type—Removable steel-backed, babbitt-lined bushings (except #4 machined in block).
Clearance—.001-.003" (#1), .0015-.0035" (all others).
End Thrust:—Taken by thrust plate behind camshaft sprocket hub. **Endplay**—.002-.006".

Timing Chain:—Morse Type 1883-N, No. 2661. Width 1". Pitch .500" (½"). Length 24" or 48 links.

Camshaft Setting:—Sprockets marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
All valves	1 15/32"	.340-.341"	4 25/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	5/16"	.001-.003"
Exhaust	45°	5/16"	.003-.005"

See Chrysler Shop Notes for Exh. valve seat insert data.

Tappet Clearance:—.006" Int., .008" Exh. (hot & idling). .002" addt'l exh. clearance desirable for sustained high speeds. NOTE—Tappet screws self-locking (no locknuts). Remove right front wheel, lower housing panel and pump shield for access.

Valve Guides:—Remove from above. Press new guides in (stepped end down) with upper end ⅞" below top of block, then finish ream (Tool CM-83) to .342-.343" Intake, .344-.345" Exhaust.

Valve Springs:—Install with closely coiled ends to top.

Free length 2 3/32".	Spring Pressure	Length
Valve Closed	34-38 lbs.	1¾"
Valve Open	77-83 lbs.	1 7/16"

Valve Lifters:—Mushroom type (remove from below). Stem diam. ⅝". Ream holes from above (pilot in valve stem guide). Oversizes .001", .008", .030", .060". **Clearance in block**—.000-.001".

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 6° ATDC. Close 46° ALDC.
Exhaust Valves—Open 42° BLDC. Close 8° ATDC.
Valve Timing Check—With .011" (cold) tappet clearance, #6 intake valve should open with #6 piston 6° or .0153" ATDC with 6th graduation after DC mark on crankshaft pulley aligned with pointer on chain cover. Reset tappet clearance .006" (hot).

LUBRICATION:—Pressure (pump on right of engine). *See Chrysler Shop Notes for oil pump removal.*
Normal Oil Pressure:—30-45 lbs. @ 30 MPH, 15 idling.
Oil Pressure Relief Valve:—Under plug below starter. Opens at 40-45 lbs. To increase pressure use heavy (green)spring, to decrease use light (red) spring.
Crankcase Capacity:—5 quarts (refill).

COOLING SYSTEM:—**Capacity**—14 quarts. *See Chrysler Shop Notes for radiator core removal.*
Water Pump:—Packless type with belt drive. *See article in Mechanical Equipment Section for data.*
Removal—Drain water. Remove fan belt. Disconnect pump inlet hose. Remove pump mounting stud nuts and lockwashers and move pump and fan assembly against radiator core. Remove 3 pump mounting studs (use pipe wrench or stud pliers between pump and block). Lift pump and fan out.
Thermostat:—Bishop & Babcock or Fulton (Fulton only on P9). Starts to open 157-162°F. Fully open 183°.

CLUTCH:—**Borg & Beck Model 9A7, 11A6 (Taxi) with 'Borglite' driven member.** #926 (9A7), #931 (11A6) stamped on cover. Single plate dry disc type with spiral grooved facings, pressure plate oil baffle & pedal over-center return spring. *See article in Mechanical Equipment Section for data.*
Facings—Spiral wound moulded woven, 2 used. Inside Diam. 6" (9A7), 6½" (11A6). Outside Diam, 9¼" (9A7), 11" (11A6). Thickness ⅛" (all).
Adjustment:—Pedal should just clear toeboard (adjust stopscrew on lower end) and have 1" free movement (adjusting nut on link rod at clutch fork).
Removal:—Remove release fork pull-back spring, Transmission (see following) and housing underpan. Disconnect release fork from pivot and pull out as far as possible. Mark cover and flywheel, remove clutch cover screws evenly, lower assembly out.

TRANSMISSION:—**Own Make.** All helical gear, constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse) with remote shift. *See article in Mechanical Equipment Section for data.*
Transmission Control:—Steering column shift Std. *See article in Mechanical Equipment Section for data.*
Removal:—Remove propeller shaft (loosen comp. flange nut if transmission to be disassembled—See Chrysler Shop Notes for Propeller Shaft Center Bearing Removal on 7 pass.). Disconnect speedometer cable, battery ground cable, hand brake cable, and gear shift rod and cable at transmission. Remove mounting stud nuts and lockwashers. Pull unit back, lower and remove from under car.

UNIVERSAL JOINTS:—**Detroit-Universal Series 4200 (3 & 5 pass.), Series 7200 (7 pass.).** Roller bearings with ball & trunnion (4200), cross type (7200). *See articles in Mechanical Equipment Section for data.*
Propeller Shaft Center Bearing:—Used on 7 passenger sedans. *See Chrysler Shop Notes for servicing.*

REAR AXLE:—**Own Make.** Semi-floating, hypoid gear type with Hotchkiss drive. *See article in Mechanical Equpiment Section for data.*
Ratio—3.54-1 (P9 Econ.). 3.73-1 (P9 Spec., P10 Econ.). 3.9-1 (P9 Std., P10 Coupe). 4.1-1 (P10 Sedan). 4.3-1 (P9, 10—18 or 20" whls.; P10 7 Pass.).
Backlash—.006-.010". Screw adjustment.
Removal:—Disconnect drive shaft at rear universal. Remove axle shafts (see below) and capscrews on carrier flange. Pull carrier assembly out.
Axle Shaft Removal—Remove wheel, hub, and drum assembly (use screw type hub puller—Tool C-319), block brake pedal, disconnect brake line at wheel cylinder, take off backing plate with oil seal, pull shaft and bearing (Tool C-158). NOTE—Use Tool C-358 to pull oil washer, C-201, 2 to install.
Wheel Bearing Adjustment:—Shims between backing plate and axle housing. With wheel and hub removed, check endplay with dial indicator. To adjust, remove backing plate, add or remove shims at both wheels equally. **Endplay**—.003-.008".

SHOCK ABSORBERS:—**Domestic**—Delco Direct Acting. **Export**—Delco Direct Acting or Delco Adjustable Direct Acting (Special Equip. Dom. also). *See article in Mechanical Equipment Section for data.*

STEERING:—**Steering Gear**—Chrysler (Gemmer design Model 300) standard. Gemmer Model 305 'push-pull' adjustment (7 pass.). Worm-and-roller types. *See articles in Mechanical Equipment Section for data.*
Front Suspension:—Independent, linked parallelogram type with coil springs. *See article in Mechanical Equipment Section for data.*
Kingpin Inclination—4¾° to 6°.
Camber—Pos. ¼°. Limits 0° to Pos. ¾°.
Caster—Neg. 1° to Pos. 1°. Not adjustable.
Toe In—1/16" (0-⅛"). Turn both rods equally.
Steering Geometry—Outer wheel 20°, Inner 22°.

BRAKES:—**Service.** Lockheed hydraulic, double anchor type. Hand brake applies independent shaft brake. *See article in Mechanical Equipment Section for data.*
Wheel Cylinders—Stepped or two-stage bore type.
Drums—Centrifuse. Diameter—10", 11" (7 pass.).
Lining—Molded. Width 2". Thickness 13/64". Length per shoe: Front—10 5/16", 11 15/32" (7 pass.); Rear—7 11/16", 7 13/32" (7 pass.).
Clearance—.012" toe, .006" heel, for each shoe.
Hand Brake:—On drum at rear of transmission.
Adjustment—*See Chrysler Shop Notes for data.*
Drum—Cast-iron. Diameter—6".
Lining—Width 2". Thick. 5/32". Length 17 1/16".

TORQUE WRENCH SPECIFICATIONS:—*See Torque Wrench article in Mechanical Equipment Section for tightening specifications for Cylinder Head, Main & Connecting Rod Bolts, etc.*

HOOD LOCK ADJUSTMENT:—Should be made whenever considerable force necessary to lock or unlock hood. Remove hand hole cover for access to stud nuts. Height correct when distance between hood and front of locking ornament (in released position) is 1⅝". Only light hand pressure should be necessary to snap locking ornament in place.

FITTING HOOD PANELS:—Hoods that are slightly loose at cowl can be fitted snugly by inserting 7/16" flat washer between flange of hood and hinge at each of three attaching bolts located on lower edge of hood at each hinge. This will place more tension on hood when in closed position.

FRONT FENDER AND RADIATOR REMOVAL:—To facilitate work on front of engine remove front end assembly as follows: Remove hood side panels, front bumper assembly, hex head fender-to-body bolts, Fender-to-frame brace bolts, headlamp wires from top side of fender apron and headlamp terminal at body side of terminal, right headlamp wires from back of terminal on right fender side apron, wire harness from radiator, and 2 nuts from beneath radiator support. Lift front end assembly off

FRONT ENGINE INSULATOR REMOVAL:—Remove hood side panels, disconnect exhaust pipe, remove 2 front engine-to-mounting bolts, raise engine with jack until insulator accessible, remove dirt on mounting from below, take out 2 mounting-to-frame screws, lift off mounting together with 'U' shaped shield. When re-installing, reverse procedure and tighten mounting bolts securely.

RADIATOR CORE REMOVAL:—Drain cooling system, disconnect radiator hoses, take out 3 capscrews at each side of radiator and lift core out (rotate fan to clear radiator water outlet).

ENGINE REAR SUPPORT INSULATOR REINFORCEMENT PLATE:—On some cars engine rear support insulators loosen from frame (insulator-to-frame bolt self-locking nuts gouge into washers). New hardened reinforcement plate #504992 (replacing washers) and longer bolts #120758 used in production starting with following serial numbers:
Special Six—P6HA-5026, L6HA-1976, C6HA-1467.
Deluxe Six—P6HB-17109, L6HB-4067, C6HB-3165.
Deluxe 8—P8HA-8047, L8HA-2425, C8HA-1863.
Torpedo 8—P8HB-5440, L8HB-1969, C8HB-1541.
NOTE—This plate can be installed on early cars.

ORIGINAL BORE & PISTON SIZES:—Original bore sizes, and size of pistons installed in each cylinder bore, may be determined by letter stamped on piston head and on top face of cylinder block. Piston sizes graduated in .0005" steps as follows:

Piston & Engine Mark	Six	Eight
'A'	3.4355"	3.247"
'B'	3.436"	3.2475"
'C'	3.4365"	3.248"
'D'	3.437"	3.2485"
'E'	3.4375"	3.249"

REPLACEMENT PISTONS:—**Standard.** Pistons furnished in following sizes for replacement of Standard Production Pistons listed above. Sizes and part numbers for each model as follows:

Part No. (6)	Size	Part No. (8)	Size
503045	3.4355"	503048	3.247"
503046	3.4365"	503049	3.248"
503047	3.4375"	503050	3.249"

First size covers 'A' and low limit 'B'. Second size covers high limit 'B', 'C' and low limit 'D'. Third size covers high limit 'D' and 'E' pistons

Oversize Replacement Pistons:—Finished pistons furnished in following oversizes: .005", .010", .020", .030". NOTE—Factory replacement pistons up to .030" oversize held to 1/16 oz. max. weight variation.

PISTON PIN FITTING:—Case harden, ground pins used (out-of-round .0002" max.). To install pins, coat inside of piston bosses with graphite grease, insert slotted end of pin in lockscrew boss and press in place. Pressure to install pin in piston should be 200-300 lbs. Car manufacturer recommends use of following tools (in conjunction with arbor press): hydraulic cylinder & gauge (J-1325-SA-1), piston rest block (J-1325-1), piston pin remover (J-1325-2), piston skirt plug (J-1325-3).

PISTON PIN BUSHING:—Consists of two hard rolled bronze bushings assembled in connecting rod.
Installation—Press bushings in place, making sure that 3/32" groove between bushings aligned with oil hole in rod. Then burnish bushings securely in place with burnishing bar. Finally ream or hone bushing for .0003-.0005" clearance on pin. Car manufacturer recommends use of following tools for servicing pin bushings: J-540-1—Bushing Remover. J-540-2—Bushing Replacer (tool fitted with shoulder which prevents bushings from being pressed through too far in rod boss). HMJ-516 Burnishing Bar. NOTE—Bushing Remover and Replacer used in conjunction with an arbor press.

CONNECTING ROD LOWER BEARING:—Removable type. No adjustment. Shims should not be used or bearing caps filed. When replacing bearings check crankpins. If scored or out-of-round and taper exceeds .001" crankshaft should be replaced.
Fitting—Use .0015" brass shim ½" wide and ⅞" long. Remove cap and lay shim across bearing. Tighten cap (with shim in place). Check bearing fit as follows:—Rod should be locked when testing end movement by hand but should slide on crankpin when tapped lightly with hammer (if rod can be moved by hand, install .001" undersize bearing). Rod should move freely on pin with shim removed.
Installation—Bearing shells fitted with tangs (Six—one to each edge of bearing, Eight—two on each edge). Install cap with tangs on opposite sides of rod (Six), on opposite ends of crankpin (Eight).

MAIN BEARINGS:—**Removal.** Bearings can be removed with caps removed and crankshaft in place by inserting suitable tool (see NOTE following) in oil hole in shaft and rotating shaft in usual direction. NOTE—Bearing Removal Tool can be made from ⅛"x1½" cotter key. Bend each end of key up 5/16" to make ⅝" long base. With this as a base, bend key to form 59° angle. With this tool inserted in place end will just protrude far enough to engage bearing.
Installation—Insert plain edge of bearing in indented side of bearing support, slowly rotate crankshaft until bearing seated.

FITTING MAIN BEARINGS:—If the crankshaft is badly scored manufacturer recommends that it be replaced. To check bearing fit, use .002" brass shim ½" wide and 1" long. With cap removed place shim across bearing. Tighten cap (with shim in place). Test bearing fit by rocking flywheel by hand. **Do not rock flywheel more than 1" in either direction** or bearing may be damaged by shim. If crankshaft locks with shim in place and rotates freely with shim removed bearing size correct. If shaft moves with shim in place use .001" undersize bearing.
IMPORTANT—Do not file main bearing caps. These caps are not furnished separately.

REAR MAIN BEARING OIL SEAL (Six only):—Consists of oil slinger on crankshaft to rear of rear main bearing operating in groove formed in block and cap (drain hole in cap returns oil to crankcase) with asbestos seal fitted in separate groove at rear.
Installation—With crankshaft out of engine and bearing shells removed, press packing in rear groove in block, seat packing using Tool J-1045 (large diameter to front of engine) by tapping tool with lead or rawhide hammer. With tool in place, cut each end of seal flush with bearing cap seat. Repeat operation for cap. Install crankshaft & bearings.

HARMONIC BALANCER:—Replace for service.
Removal & Installation—Can be removed from under car without removing front assembly. Use 13/16" (6), 1" (8) socket wrench to remove retaining screw, remove balancer. NOTE—If balancer corroded on crankshaft, remove Front Assembly and use Puller J-496.

CAMSHAFT:—All bearing sizes, removal and installation directions same as for 1939 models. *See 1939 Pontiac Shop Notes for data.*

TIMING COVER NOISE:—Timing cover oil seal noise may develop in some cases due to insufficient clearance between hub of crankshaft balancer and timing cover cork seal. Crankshaft balancer hub diameter has been reduced .006-.007" during production to overcome this condition. This change can be made in the field by removing balancer (without removing radiator and other front end parts) and turning hub down to diameter of 1.866-1.868". NOTE—Balancer removal on Torpedo can be facilitated by using a socket on balancer retaining screw and turning socket with small wrench.

OIL PUMP:—**Removal & Installation**—Same as for 1939 models. *See 1939 Pontiac Shop Notes.*

OIL PUMP CLEARANCES:—Shaft bearing .0005-.002". Idler gear bearing .0005-.002". Driving gear backlash .003-.004". Backlash between pump gears .006-.008". Pump Gear end clearance .002-.006".

OIL PAN REMOVAL:—**Deluxe Eight 40-28.** For access to front oil pan screws, remove Front Engine Insulator (see above) and rest front of engine on steel block (5¼" long, 1½" wide, 15/16" high).
Torpedo Eight 40-29—For access to front oil pan screws, take out Front Engine Insulator-to-Radiator Support Bracket screws, jack up engine and allow it to rest on 1" board.

CLUTCH PILOT BUSHING:—New clutch pilot bushing #412562 (oilless type) available for 1935 to 1940 cars. This can be used in place of regular production roller bearing where hole in crankshaft worn. Bushing can be driven into worn hole to give snug fit and provides a smooth running surface for shaft.
Installation—Soak bushing in light engine oil, place bushing on end of driver (Tool J-1329-P), insert tool through hole in flywheel housing and drive bushing in place making certain that it bottoms in hole. Manipulate driver out of bushing. NOTE—Clutch pilot bushing remover (Tool J-1448-1) available for bushing removal.

EIGHT CYLINDER CLUTCH NOTE:—Starting with engine number 8-217982 clutch cover spring tension has been increased from 1200 to 1400 lbs. to overcome clutch slippage and consequent damage to facings due to regularly starting car in second gear with excessive throttle opening. Car manufacturer recommends that new style clutch cover and pressure plate (Part No. 753615) be installed whenever clutch damage found due to this condition.

REAR AXLE OIL SEAL LEAKS:—Rear axle oil leaks may develop due to oil passing by axle shaft oil seal outer edge and working through between rear wheel bearing retainer and flange of axle housing and down onto brake lining. To correct this condition, coat axle housing shaft oil seal seat with sealing material (Permatex or Permagasket) before installing seal and also coat both sides of rear brake oil deflector gasket.

HOOD FITTING, HOOD LOCK ADJUSTMENT, AND FRONT FENDER & RADIATOR (UNIT) REMOVAL:—*See Pontiac Shop Notes for data.*

SERIAL NUMBER:—First number 6HA-1001 (Special), 6HB-1001 (Deluxe) with prefixes indicating factory as follows: P—Pontiac, Mich., C—South Gate, Calif., L—Linden, N. J. On plate fastened to left end of frame front cross member under hood.

ENGINE NUMBER:—First number 6-595801. Stamped on boss on top left front corner of engine block.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3 7/16". **Stroke**—4".
Displacement—222.7 cu. ins. **Rated HP**—28.3.
Developed Horsepower—87 at 3520 RPM (Std. hd.).
Compression Ratio—6.5-1 Std., 7.2-1 HC. Optl.
Compression Pressure—155-158 lbs. at 1000 RPM or approx. 118-120 lbs. at cranking speed (Std. head).
Vacuum Reading—Steady 18-20" idling at 7 MPH.
See Pontiac Shop Notes for Front Engine Insulator Removal and Engine Rear Support Reinforcement Plate.

PISTONS:—Electro-plated, chrome nickel alloy type with rib under head. Cannot be ground.
Length—3 37/64". **Weight**—27⅛ ozs. (stripped). Piston and pin weight variation 1/16 oz. max.
Removal—Pistons and rods removed from above.
Clearance—Top land .0175-.0295". Skirt .002".
Original Bore & Piston Sizes, Replacement Pistons:—*See Pontiac Shop Notes for complete data.*
Fitting New Pistons:—Insert .0015" x ½" feeler between piston and cylinder wall. Pull to withdraw feeler must be 10-25 lbs. Piston taper or out-of-round .0005". Cylinder bore out-of-round or taper .001" max. (new).

PISTON RINGS:—Two taper faced compression rings above pin, 1 oil control ring below pin. **NOTE**—Install compression rings with mark TOP up.

Ring	Width	End Gap	Side Clearance
Compression	.0930-.0935"	.009-.014"	.0015-.003"
Oil Control	.1860-.1865"	.007-.017"	.001-.0025"

Replacement Rings:—Oversizes .005", .010", .020", .030".

PISTON PIN:—**Diameter** 15/16". **Length** 3 1/16". Pin locked in one piston boss. Free end slotted.
Pin Fit in Piston—*See Pontiac Shop Notes.*
Pin Fit in Rod Bushing—.0003-.0005".
Replacement Pins:—.001" (red & brown), .003" (red), .005" (blue) oversize. Paint marked on end of pin.

CONNECTING ROD:—**Weight** 2.31 lbs. **Length** 7 9/16".
Piston Pin Bushing (Upper Bearing)—Split bronze bushings. *See Pontiac Shop Notes for servicing.*
Crankpin Journal Diameter—2⅛".
Lower Bearing—Removable steel-backed, babbitt-lined type. Furnished standard & .001" undersize.
Clearance—.0005-.0015". **Endplay**—.005-.010".
Bearing Adjustment:—None (no shims). *See Pontiac Shop Notes for Fitting and Installing Bearings.*
Installing Rods:—Not offset (install either way). NOTE—Self-locking rod bolt nuts used.

CRANKSHAFT:—4 bearing, integral counterweights. *See Pontiac Shop Notes for Balancer Removal and Rear Main Bearing Oil Seal Renewal.*
Journal Diameters—#1, 2½"; #2, 2 17/32"; #3, 2 19/32"; #4, 2⅝".
Bearings—Interchangeable (upper and lower) steel-backed, babbitt-lined type. Furnished std. & .001" undersize. **Clearance**—.001-.003".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file caps. *See Pontiac Shop Notes.*
End Thrust:—At #3 bearing. **Endplay**—.003-.008".

CAMSHAFT:—4 bearing. Non-adjustable chain drive. *See Pontiac Shop Notes for Camshaft Removal, Bearing Finished Sizes and Timing Cover Oil Seal data.*
Journal Diameters—#1, 2"; #2, 1 31/32; #3, 1 15/16"; #4, 1 29/32".
Bearing Type—Steel-backed, babbitt-lined.
Clearance—.0015-.0025".
End Thrust:—Steel thrust plate behind camshaft sprocket. Replace if worn. **Endplay** .002-.005".
Timing Chain:—Morse No. 1532, Type C-1882-K. Width 1". Pitch ⅜". Length 21" or 56 links.
Camshaft Setting:—Sprockets marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 19/32"	.310-.311"	5.718"
Exhaust	1 15/32"	.310-.311"	5.718"

	Seat Angle	Lift	Stem Clearance
Intake	30°	19/64"	Free fit to .0006"
Exhaust	45°	19/64"	Free fit to .0006"

NOTE—Valve heads not slotted.
Tappet Clearance:—.011-.013" all valves (engine warm). Use .011" feeler as 'go' gauge, .013" as 'no go'. NOTE—Car manufacturer recommends .013" exhaust clearance for sustained high speed driving.
Valve Guides:—Removable, tapered guides (.001" taper to the inch with greatest clearance at top). IMPORTANT—Measure clearance at bottom end. Valve should just fall through guide of own weight when started in guide. NOTE—Guides should be cleaned with wire brush or taper reamer Tool P.R. 131. Replacement guides straight cut, ream to fit valve stem after installing with reamer P.R. 131.
Valve Springs:—Intake and exhaust springs identical. Install with two closed coils at top and dampener on top of each spring. Use new dampeners whenever springs installed. **Free Length**—2 9/16".

	Spring Pressure	Spring Length
Valve Closed	56-63 lbs.	1 29/32"
Valve Open	97-105 lbs.	1 19/32"

Valve Lifters:—Barrel type, cast-iron. Guides holes reamed in block. Lifters furnished .005" oversize (use special pilot reamer J-706-P when installing to obtain proper alignment). **Clearance**—Free fit. Lifter should just move freely with finger touch.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 5° BTDC. Close 39° ALDC.
Exhaust Valves—Open 45° BLDC. Close 5° ATDC.
Valve Timing Check—With .015" tappet clearance #6 intake valve should open with piston 5° or .0096" before top dead center with first straight line of flywheel mark '/IGN.ONE/' slightly past indicator in left front face of flywheel housing.

LUBRICATION:—Pressure type (gear type pump on right side). *See Pontiac Shop Notes for Oil Pump data.*
Normal Oil Pressure:—35-40 lbs. above 40 MPH.
Oil Pressure Regulator:—On pump. Opens at 40 lbs. Non-adjustable type.
Crankcase Capacity:—6 qts. (refill).

COOLING SYSTEM:—**Capacity**—17 quarts.
See Pontiac Shop Notes for Radiator Core Removal.
Water Pump:—Packless, sealed ball-bearing shaft. *See article in Mechanical Equipment Section for data.*
Removal—Remove fan belt, pump mounting bolts and lower hose. Lift off pump and fan assembly.
Thermostat:—Harrison. In cylinder head outlet.
Setting—Closed 140°F. Starts 145°. Fully open 172°.
Temperature Gauge:—AC #1510916 (dash), #1510772 (engine unit). Electric type.
See article in Mechanical Equipment Section for data.

CLUTCH:—**Inland.** 'Diaphragm' type, single plate, dry disc type with Long 9CF-CS, 10CF-CS (Taxi) driven member. *See Mechanical Equipment Section for data.*
Facings—Moulded (Ammco), 2 used. Inside Diam. 5¾", 6" (Taxi). O.D. 9", 10" (Taxi). Thickness .125". *See Pontiac Shop Notes for Clutch Pilot Bushing.*
Pedal Adjustment:—Free travel ⅞-1⅛" (adjusting nut on link at clutch fork). Pedal height above toe board (engaged) 5⅛" (Special), 4¾" (Deluxe), stop screw at lower end of pedal arm.
Removal:—Remove transmission (see below), take off bottom housing cover, unlock pedal pull-back spring, remove fork ball support, fork and throwout bearing. Remove cover screws evenly until tension relieved. Move clutch away from flywheel at bottom to remove disc, then lower cover assembly out.

TRANSMISSION:—**Own.** All helical gear, constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse) with remote steering col. shift.
See article in Mechanical Equipment Section for data.
Transmission Control:—Pontiac 'Safety-Shift' type.
See article in Mechanical Equipment Section for data.
Removal:—Remove floor mat and center panel. Disconnect speedometer cable, gearshift selector and control rods at transmission. Disconnect rear universal (wire trunnions) and pull propeller shaft to rear to disengage U-joint front yoke from transmission main shaft at slip joint. Remove upper transmission mounting screws, install guide pins (J-851), remove lower screws, pull unit to rear to free main drive gear, then up and forward at front,

UNIVERSAL JOINTS:—**Mechanics 2C.** Roller bearing. 2 used. *See article in Mechanical Equipment Section.*
NOTE—Solid propeller shaft used. Slip joint formed at rear of transmission mainshaft ahead of front universal (front yoke of universal splined directly to mainshaft—no front companion flange used).

REAR AXLE:—**Own Make.** Semi-floating, hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.3-1 Std. (white), 4.55-1 Mount. (yellow), 4.1-1 Plains (green), 3.9-1 Economy (red). NOTE—Color marked on end of right or left axle shaft.
Backlash—.003-.012" (new).
See Pontiac Shop Notes for Axle Oil Leak correction.
Removal:—Disconnect rear universal and wire trunnions (do not disengage spline joint at front end of shaft), remove axle shafts (below), remove carrier flange capscrews, pull carrier assembly out.
Axle Shaft Removal:—Hoist rear of car, remove wheel, brake drum, 4 backing plate mounting bolt nuts and loosen bearing retainer (do not allow backing plate to shift to damage brake line). Pull shaft (Puller J-942) taking care not to drag shaft on oil seal. **Wheel Bearing Adjustment**—None.

SHOCK ABSORBERS:—**Delco. Front**—1947-C,D. **Rear**—1000-V (Domestic), 1754-E,F (Export 25), 1754-A,B (Export 26). Double acting, hydraulic (1000-V direct acting). *See articles in Mechanical Equipment Section.*

STEERING:—**Steering Gear.** Saginaw Worm-and-Double roller type.
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
Kingpin Inclination—4⅝° to 5¼°.
Caster—Negative ¾°. Limits Neg. ½° to Neg. 1°.
Camber—Positive ⅜°. Limits 0° to ⅝° positive.
Toe In—0-1/16". Adjust tie rod tubes equally.
Steering Geometry—Inner wh'l 23° ± ½°. Outer 20°.

BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type without eccentric adjustment. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Drums—Chrome nickel iron. Diameter—11".
Wheel Cylinder Bore—Front wheel 1". Rear 15/16".
Lining—Moulded. Width 1¾". Thickness 3/16". Length 9 11/32" (Primary—D-R Multibestos), 11 31/32" (Secondary—L-8 Multibestos).
Clearance—.015" at both ends of secondary shoe (with primary shoe forced out against drum).
Braking Power—53% front wheels, 47% rear.
Hand Brake:—See Service Brakes above.

HOOD FITTING, HOOD LOCK ADJUSTMENT, AND FRONT FENDER & RADIATOR (UNIT) REMOVAL:—*See Pontiac Shop Notes for data.*

SERIAL NUMBER:—First number 8HA-1001 (Deluxe), 8HB-1001 (Torpedo) with prefixes indicating factory as follows: P—Pontiac, Mich., C—Southgate, Calif., L—Linden, N. J. On plate fastened to left end of frame front cross member under hood.

ENGINE NUMBER:—First number 8-194401. Stamped on boss on top left front corner of engine block.

ENGINE SPECFICATIONS:—8 cylinder, 'L' head.
Bore—3¼". **Stroke**—3¾".
Displacement—248.9 cu. ins. **Rated HP**—33.8.
Developed Horsepower—100 (Deluxe), 103 (Torpedo), 110 (Deluxe HC head) at 3700 RPM.
Compression Ratio—6.5-1 Std., 7.2-1 HC. Optl.
Compression Pressure—155-158 lbs. at 1000 RPM or approx. 118-120 lbs. at cranking speed (Std. head).
Vacuum Reading—18-20" steady idling at 7 MPH.
See Pontiac Shop Notes for Oil Pan Removal, Front Engine Insulator Removal, and Engine Rear Support Reinforcement Plate data.

PISTONS:—Electro-plated, chrome nickel alloy type with rib under head. Cannot be ground.
Length—3 19/32". **Weight**—24⅝ ozs. (stripped). Piston & pin and rod weight variation 1/16 oz. max.
Removal—Pistons and rods removed from above.
Clearance—Top land .0175-.0295". Skirt .002".
Original Bore & Piston Sizes, Replacement Pistons:—*See Pontiac Shop Notes for complete data.*
Fitting New Pistons:—Insert .0015" x ½" feeler between piston and cylinder wall. Pull to withdraw feeler must be 10-25 lbs. Taper and out-of-round limits—Piston .0005", Cylinder—.001" max. new.

PISTON RINGS:—Two taper faced compression rings above pin, 1 oil control ring below pin. NOTE—Install compression rings with mark TOP up.

Ring	Width	End Gap	Side Clearance
Compression	.0930-.0935"	.009-.014"	.0015-.003"
Oil Control	.1860-.1865"	.007-.017"	.001-.0025"

Replacement Rings:—Oversizes .005", .010", .020", .030".

PISTON PIN:—**Diameter**—15/16". **Length**—2⅞". Pin locked in one piston boss. Free end slotted.
Pin Fit in Piston—*See Pontiac Shop Notes.*
Pin Fit in Rod Bushing—.0003-.0005".
Replacement Pins:—.001" (red & brown), .003" (red), .005" (blue) oversize. Paint marked on end of pin.

CONNECTING ROD:—**Weight** 1.98 lbs. **Length** 7 9/16".
Piston Pin Bushing (Upper Bearing)—Split bronze bushings. *See Pontiac Shop Notes for servicing.*
Crankpin Journal Diameter—2".
Lower Bearing—Removable steel-backed, babbitt-lined type. Furnished standard & .001" undersize. **Clearance**—.0005-.0015". **Endplay**—.005-.010".
Bearing Adjustment:—None (no shims). *See Pontiac Shop Notes for Fitting and Installing Bearings.*
Installing Rods:—Not offset (install either way). NOTE—Self-locking rod bolt nuts used.

CRANKSHAFT:—5 bearing, integral counterweights.
See Pontiac Shop Notes for Balancer Removal.
Journal Diameters—#1, 2¼"; #2, 2 13/32"; #3, 2 7/16"; #4, 2 15/32"; #5, 2½".
Bearings—Interchangeable (upper and lower) steel-backed, babbitt-lined type. Furnished std. & .001" undersize. **Clearance**—.001-.003".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file caps. *See Pontiac Shop Notes.*
End Thrust:—At #4 bearing. **Endplay**—.003-.008".

CAMSHAFT:—5 bearing. Non-adjustable chain drive.
See Pontiac Shop Notes for Camshaft Removal, Bearing Finished Sizes and Timing Cover Oil Seal data.
Journal Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1 29/32"; #5, 1⅞".
Bearing Type—Steel-backed, babbitt-lined. **Clearance**—.0015-.0025".
End Thrust:—Steel thrust plate behind camshaft sprocket. Replace if worn. **Endplay**—.002-.005".
Timing Chain:—Morse No. 2660, Type 766-T. Width ⅞". Pitch ⅜". Length 21" or 56 links.
Camshaft Setting:—Sprockets marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 15/32"	.310-.311"	5.53"
Exhaust	1 11/32"	.310-.311"	5.53"

	Seat Angle	Lift	Stem Clearance
Intake	30°	19/64"	Free fit to .0006"
Exhaust	45°	19/64"	Free fit to .0006"

NOTE—Valve heads not slotted.
Tappet Clearance:—.011-.013" all valves (engine warm). Use .011" feeler as 'go' gauge, .013" as 'no go'. NOTE—Car manufacturer recommends .013" exhaust clearance for sustained high speed driving.
Valve Guides:—Removable, tapered guides (.001" taper to the inch with greatest clearance at top). IMPORTANT—Measure clearance at bottom end. Valve should just fall through guide of own weight when started in guide. NOTE—Guides should be cleaned with wire brush or taper reamer Tool P.R. 131. Replacement guides straight cut, ream to fit valve stem after installing with reamer P.R. 131.
Valve Springs:—Intake and exhaust springs identical. Install with two closed coils at top and dampener on top of each spring. Use new dampeners whenever springs installed. **Free Length**—2 9/16".

	Spring Pressure	Spring Length
Valve Closed	56-63 lbs.	1 29/32"
Valve Open	97-105 lbs.	1 19/32"

Valve Lifters:—Barrel type, cast-iron. Guides holes reamed in block. Lifters furnished .005" oversize (use special pilot reamer J-706-P when installing to obtain proper alignment). **Clearance**—Free fit. Lifter should just move freely with finger touch.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 5° BTDC. Close 39° ALDC.
Exhaust Valves—Open 45° BLDC. Close 5° ATDC.
Valve Timing Check—With .015" tappet clearance #8 intake valve should open with piston 5° or .0089" before top dead center with first straight line of flywheel mark '/IGN.ONE/' slightly past indicator in left front face of flywheel housing.

LUBRICATION:—Pressure type (gear type pump on right side). *See Pontiac Shop Notes for Oil Pump data.*
Normal Oil Pressure:—35-40 lbs. above 40 MPH.
Oil Pressure Regulator:—On pump. Opens at 40 lbs. Non-adjustable type.
Crankcase Capacity:—6 qts. (refill).

COOLING SYSTEM:—**Capacity**—19 quarts.
See Pontiac Shop Notes for Radiator Core Removal.
Water Pump:—Packless, sealed ball-bearing shaft.
See article in Mechanical Equipment Section for data.
Removal—Remove fan belt, pump mounting bolts and lower hose. Lift off pump and fan assembly.
Thermostat:—Harrison. In cylinder head outlet.
Setting—Closed 140°F. Starts 145°. Fully open 172°.
Temperature Gauge:—AC #1510916 (dash), #1510772 (engine unit). Electric type.
See article in Mechanical Equipment Section for data.

CLUTCH:—**Inland.** 'Diaphragm' type, single plate, dry disc type with Long 9¼CF-CS driven member.
See article in Mechanical Equipment Section for data.
Facings—Moulded (Ammco), 2 used. Inside Diam. 5¾". Outside Diam. 9¼". Thickness .125".
See Pontiac Shop Notes for Clutch change and Pilot Bushing data.
Pedal Adjustment:—Pedal free travel ⅞-1⅛" (adjusting nut and locknut on link at clutch fork). Pedal height above toeboard (engaged) 4¾" (Deluxe), 5" (Torpedo). Adjusting screw on pedal.
Removal:—Remove transmission (see below), take off bottom housing cover, unlock pedal pull-back spring, remove fork ball support, fork and throwout bearing. Remove cover screws evenly until tension relieved. Move clutch away from flywheel at bottom to remove disc, then lower cover assembly out.

TRANSMISSION:—**Own.** All helical gear, constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse) with remote steering col. shift.
Transmission Control:—Pontiac 'Safety-Shift' type.
See articles in Mechanical Equipment Section for data.
Removal:—Remove floor mat and center panel. Disconnect speedometer cable, gearshift selector and control rods at transmission. Disconnect rear universal (wire trunnions) and pull propeller shaft to rear to disengage U-joint front yoke from transmission main shaft at slip joint. Remove upper transmission mounting screws, install guide pins (J-851), remove lower screws, pull unit to rear to free main drive gear, then up and forward at front.

UNIVERSAL JOINTS:—**Mechanics 2C.** Roller bearing. 2 used. *See article in Mechanical Equipment Section.* NOTE—Solid propeller shaft used. Slip joint formed at rear of transmission ahead of front universal.

REAR AXLE:—**Own Make.** Semi-floating, hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.3-1 Std. (white), 4.55-1 Mount. (yellow), 4.1-1 Plains (green), 3.9-1 Economy (red). NOTE—Color marks on end of right or left axle shaft (Torpedo carries additional blue mark on end of shaft).
Backlash—.003-.012" (new).
See Pontiac Shop Notes for Axle Oil Leak correction.
Removal:—Disconnect rear universal and wire trunnions (do not disengage spline joint at front end of shaft), remove axle shafts (below), remove carrier flange capscrews, pull carrier assembly out.
Axle Shaft Removal:—Hoist rear of car, remove wheel, brake drum, 4 backing plate mounting bolt nuts and loosen bearing retainer (do not allow backing plate to shift to damage brake line). Pull shaft (Puller J-942) taking care not to drag shaft on oil seal. **Wheel Bearing Adjustment**—None.

SHOCK ABSORBERS:—**Delco. Front**—1947-C, D. **Rear**—1000-V (Domestic), 1754-A, B (Deluxe Export), 1754-G, H (Torpedo Export). Double acting, hydraulic (1000-V direct acting). *See articles in Mechanical Equipment Section.*

STEERING:—**Steering Gear.** Saginaw Worm-and-Double roller type.
See article in Mechanical Equipment Section for data.
Front Suspension:—Independent, linked parallelogram type with coil springs.
See article in Mechanical Equipment Section for data.
Kingpin Inclination—4⅝° to 5¼°.
Caster—Negative ¾°. Limits Neg. ½° to Neg. 1°.
Camber—Positive ⅜°. Limits 0° to ⅝° positive.
Toe In—0-1/16". Adjust tie rod tubes equally.
Steering Geometry—Inner wh'l 23° ± ½°. Outer 20°.

BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type without eccentric adjustment. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Drums—Chrome nickel iron. Diameter—11".
Wheel Cylinder Bore—Front wheel 1". Rear 15/16".
Lining—Moulded. Width 1¾". Thickness 3/16". Length 9 11/32" (Primary—D-R Multibestos 40-28 all wheels, 40-29 front wheels, 1236A Multibestos 40-29 rear wheels). 11 31/32" (Secondary—L-8 Multibestos 40-28, 2320K Hycoe 40-29).
Clearance—.015" at both ends of secondary shoe (with primary shoe forced out against drum).
Hand Brake:—See Service Brakes above.

TORQUE WRENCH SPECIFICATIONS:—*See Torque Wrench article in Mechanical Equipment Section for tightening specifications for Cylinder Head, Main & Connecting Rod Bolts, etc.*

HOOD LOCK FOR ALL 1940 MODELS:—These cars use an Alligator type hood with lock handle in driver's compartment and separate side panels. To raise hood, press down on lock handle at right of steering column (Champion), left of steering column (Commander & President). Hood will raise slightly, allowing safety latch on Commander & President models (located directly behind latch bolt and spring) to be pressed back which will release hood.

HOOD SIDE PANEL REMOVAL:—To remove the separate hood side panels, take out two screws on top side of panel and two wing screws on bottom side, lift panel out.

RADIATOR REMOVAL:—To remove radiator, remove brace rods, uncouple hose connections, free radiator from shell and lift straight up.

ORIGINAL BORE SIZE:—May be determined by marks stamped on top of block opposite each cylinder bore as follows:

Cylinder Bore Sizes

Commander		President	
Mark	Size	Mark	Size
25	3.3125"	25	3.0625"
3	3.313"	2	3.0620"
35	3.3135"	15	3.0615"
4	3.314"	1	3.061"
45	3.3145"	5	3.0605"

Champion Model

Mark	Size
0	3.000"
05	3.0005"
1	3.001"
15	3.0015"
2	3.002"
25	3.0025"

NOTE—Variation in any one engine is held to .001" maximum difference between individual bores.

CYLINDER HEAD INSTALLATION:—Coat both bottom of head gasket and lower face of cylinder head with Perfect Seal Gasket Cement (use sparingly), coat head capscrews with white lead. Tighten head screws to tension of 600-650 in. lbs. (Champion), 1000 in. lbs. (Commander & President) and recheck before starting engine.

CONNECTING ROD 'PALNUT' INSTALLATION:—Used on all 1940 cars. Consists of special patented locknut installed on top of regular nut instead of cotterpin. To install Palnut, tighten regular nut to tension of 650 in. lbs., turn up Palnut until it contacts regular nut (open face of Palnut out), then tighten Palnut ¼-⅓ turn additional to lock it in place.
NOTE—On Champion tighten regular nut to 300-325 in. lbs. tension.

PISTON PIN REMOVAL & INSTALLATION:—Champion—Tapered pin and nut secures pin in rod. To remove pin, place rod and piston on assembling fixture No. J1293, take nut off and install on opposite end of pin and turn nut down pulling pin out. To install, place pin on fixture, slip piston and rod on pin, tighten pin nut (rock rod to insure lock pin seats properly). One nut only used on tapered lock pin.

SELF-LOCKING TAPPETS:—Champion—Tappet screws slotted on upper end and require no locknuts. When tappet screws replaced, car manufacturer recommends that screws must check as follows: Pull required to move tappet screw must be 25 in. lbs. minimum (4 lbs. pull on 6" wrench).

VIBRATION DAMPENER:—President—Consists of a spring-loaded flywheel mounted on four tapered rubber cushions between a friction facing on the fan pulley and a damper plate on the front end of the crankshaft. The flywheel oscillation is controlled by the friction of the friction facing and the compression of the rubber cushions. Flywheel radial movement is controlled by a fibre ring on the fan pulley hub. Spring tension is adjusted by shims under spring in flywheel, compression of rubber cushions adjusted by shims on bolt sleeve between cushion and damper plate.

Servicing—Damper can be removed from crankshaft as an assembly. If disassembled, note position of all parts and reassemble in same order. Fibre ring should be press fit on pan pulley hub and should have .004-.006" clearance in flywheel. Install shims under springs, as required, to secure 50 lbs. pressure per spring or 200 lbs. total with damper bolts tightened. Install shims on rubber cushions so that cushions compressed .015" (.020" for 1936) with bolts tightened (plate against spacers).

NOTE—When installing crankshaft nut, make certain that copper-asbestos gasket in place under nut (necessary to prevent oil leaks at this point).

Commander Model:—Consists of a flywheel mounted on two rubber rings on forward end of crankshaft. Compression of rubber rings is limited by length of vibration damper and fan pulley hub and does not require checking or adjusting.

TIMING GEARS:—Removal and Installation—Holes provided in gears (on Champion and Commander), gear hub recess threaded (President) for gear puller to remove gears. Use tool HM-925 (Champ.&Comm.), HM-865 (President). See Replacement Camshaft Gear Sizes (below) for size selection when replacing gears. Use gear pusher tool HM-861X (all models) to install gears. CAUTION—Do not drive gears on with a hammer which will loosen gear at hub.

Replacement Camshaft Gear Sizes:—Furnished in three sizes: 'S'—Standard, 'H'—High Limit, 'L'—Low Limit. When replacing gear on engine with considerable service, install next largest camshaft gear size. For reconditioned engine with new camshaft and main bearings use same size gear. Crankshaft gear furnished in standard size only.

VALVE SPRING SERVICING:—Commander—Valve springs will not clear lifter and tappet adjusting screw when in extended position and should be installed as follows: Place spring seat in place on bottom of spring, use 'C' type valve lifter to compress spring slightly so that it will clear tappet adjusting screw as it is pressed up into place, install valves, compress spring, install valve spring seat locks. NOTE—Make certain that valve lifter tension spring installed on top of each valve lifter.

OIL PUMP INSTALLATION:—Commander. To insure correct rotor position of distributor when pump installed, install pump as follows: Remove distributor, crank engine over (with piston #1 on compression) until vibration damper mark 'UDC/1-6' lines up with pointer on gear case, sight down distributor shaft hole and mesh oil pump drive gear so that drive tongue on shaft is 30° from the horizontal and offset toward the top.

Champion:—Install oil pump as follows: Turn engine over until #1 piston at TDC. entering power stroke (flywheel mark U.D.C.1-6 in line with pointer on left rear engine plate). Engage pump shaft with camshaft gear with key-way pointing down (key-way will rotate to rear when gears meshed), assemble pump to engine. Check distributor drive tongue position by sighting down distributor shaft hole (distributor out). With #1 cylinder in firing position, tongue should be parallel with camshaft and offset (narrow half of shaft) toward camshaft.

President:—Install oil pump as follows: Turn engine over until piston #1 is on TDC entering power stroke with vibration damper mark 'UDC/1-8' lined up with pointer on gear case, turn pump shaft so that distributor drive slot is two teeth clockwise (viewed from below) from correct installed position with slot parallel to camshaft (wide side of shaft toward camshaft). Shaft will be rotated into position as gears are meshed. Check by sighting down distributor shaft hole (distributor out) to see that shaft slot parallel to camshaft and wide halve of shaft toward camshaft.

REAR SUPPORT INSTALLATION (OVERDRIVE TRANSMISSION):—On cars with Overdrive, rear support (must be removed to remove transmission) should be installed with original shims in same location in order to maintain alignment. These shims located between support and frame at each end. If shims lost or readjustment necessary, install support as follows: Hold support in place under transmission case, install sufficient shims at each end to take up all except 1/16" clearance between support and frame, install frame bolts, tighten bolts securely with shims in place. This clearance will provide correct compression of the support rubber cushions.

HILL HOLDER ADJUSTMENT:—On cars with Hill-Holder (optional equipment), check action whenever clutch adjusted to make certain that brakes release just before clutch engages.

Adjustment—Loosen locknut on end of Hill-holder control rod, shorten rod for earlier brake release, lengthen rod for later release, tighten locknut.

NOTE—On Champion, adjusting sleeve and locknut provided on rod.

HOOD LOCK & SIDE PANEL:—*See Studebaker Shop Notes for data.*

SERIAL NUMBER:—First number G-30501 (South Bend), G-803701 (Los Angeles). Stamped on right hand body front hinge pillar.

ENGINE NUMBER:—First number 34101. Stamped on pad on upper left front corner of engine block.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3". **Stroke**—3⅞".
Displacement—164.3 cu. in. **Rated HP.**—21.6.
Developed Horsepower—78 at 4000 RPM.
Compression Ratio—6.5-1 Std. cast-iron hd.
Compression Pressure—105 lbs. at 150 RPM.
Vacuum Reading—Steady 17-18" at 8 MPH. idle speed.
See Studebaker Shop Notes for Head installation.

PISTONS:—Aluminum alloy, tin-plated, T-slot, cam ground type.
Length—2⅝". **Weight**—.53 lbs.
Removal—Pistons and rods removed from above.
Clearance—.0005" new. See Fitting New Pistons.
Original Bore Size:—*See Studebaker Shop Notes.*
Replacement Pistons:—Finished pistons (pins fitted) furnished standard and .002", .004", .010", .015", .020", .030" oversize. Exact size stamped on piston head.
Fitting New Pistons:—Insert .002"x1" feeler between piston and wall on camshaft side (pin parallel to crankshaft, T-slot away from camshaft). Pull to withdraw feeler must be between 16 to 22 lbs. NOTE—Cylinder bore out-of-round and taper .002" maximum.
Installing Pistons:—T-slot away from camshaft.

PISTON RINGS:—3 rings, all above pin—#1 Comp. P-C 200 (with step up), #2 Comp. P-C 70 (with step down), #3 Oil P-C 85 (slotted type). Oil ring groove drilled with drain holes. Heat-dam groove (no ring) above #1 ring groove.

Ring	Width	End Gap	Side Clearance
Comp. (Top)	3/32"	.007-.017"	.0015-.002"
Comp. (#2)	⅛"	.007-.017"	.0015-.002"
Oil Control	3/16"	.007-.017"	.0015-.002"

Replacement Rings:—.010", .020", .030" oversize.

PISTON PIN:—**Diameter** .7491-.7495". **Length** 2⅝". Pin locked in rod by tapered lockscrew and nut (small end of connnecting rod not split).
Pin Fit in Piston—.0001-.0003" clearance or light push fit. Replacement pistons have fitted pins.
See Studebaker Shop Notes for Pin removal and installation instructions.

CONNECTING ROD:—**Length** 6 7/16". **Weight** 1.28 lbs.
Crankpin Journal Diameter—1.81175-1.81275".
Lower Bearing—Spun babbitt. Exchange rods furnished std. and .010" and .020" undersize.
Clearance—.0005-.002". **Sideplay**—.005-.009".
Bearing Adjustment:—None. Replace rods. *See Studebaker Shop Notes for 'Palnut' installation.*
Installing Rods:—Narrow portion of bearing to front (#1,3,5), to rear (#2,4,6). Side marked with number and oil spray hole toward camshaft.

CRANKSHAFT:—4 bearing, integral counterweights.
Journal Diameters—2.437-2.4375".
Bearing Type—Removable steel-backed, babbitt-lined type. **Clearance**—.0005-.0025".
Bearing Adjustment:—None (no shims). Replace bearings. Furnished Std., .010", .020" undersize. Tighten bearing cap screws to 1100 in. lbs.
NOTE—Front oil pan seal block may be removed for access to front main bearing cap by removing lower timing gear cover screws (on front face).
End Thrust:—Thrust plate assembled between front bearing and crankshaft gear. Controlled by shims between plate & journal face. **Endplay .003-.006".**

CAMSHAFT:—Four bearing with helical gear drive.
Journal Dieameters—#1, 1.74750-1.74800"; #2, 1.71625-1.71700"; #3, 1.68575-1.68650; #4, 1.62325-1.62400".
Bearings—Steel-backed, babbitt-lined bushings. Align oil hole in block and bushing.
Clearance—.00075-.00225" (#1), .001-.00275" (others).
End Thrust:—Steel thrust washer and spacer assembled between gear hub and front bushing.
Timing Gears:—Crankshaft (cast-iron), Camshaft (Celeron Fabric). *See Studebaker Shop Notes for Gear Removal & Replacement Gear size selection.*
Backlash—.001-.003".
Camshaft Setting:—Mesh marked camshaft gear tooth between two marked teeth on crankshaft gear.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 11/32"	.310-.311"	4 11/32"
Exhaust	1 9/32"	.310-.311"	4 11/32"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	5/16"	.001-.0035"

Tappet Clearance:—.016" (cold) all valves. *See Studebaker Shop Notes for Hood Side Panel removal and Self-Locking tappet data.*
Valve Guides:—Pressed in block from above 1 3/16" below top of block. Finish ream to .312-.3135".
Valve Springs:—Install with closed coils at top. Replace if springs 10% weak.

	Spring Pressure	Spring Length
Valve Closed	49-53 lbs.	1 21/32"
Valve Open	90-94 lbs.	1 11/32"

Valve Lifters:—Mushroom type. Lifter clearance in block .0005-.0015".
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 15° BTDC. Close 49° ALDC.
Exhaust Valves—Open 54° BLDC. Close 10° ATDC.
To Check Timing—Set tappet clearance #1 intake valve at .020". This valve should open with piston 15° or .0835" before top dead center when flywheel mark 'IN.OP.1-6/' lines up with pointer on left rear engine plate. Reset tappet clearance at .016" (cold).

LUBRICATION:—Pressure system with oil pump mounted on right side of engine. *See Studebaker Shop Notes for Oil Pump installation instructions.*
Normal Oil Pressure:—40 lbs. at 40-60 M.P.H.
Oil Pressure Regulator:—Opens with 40 lbs. pressure. On right front corner of block. Not adjustable.
Crankcase Capacity:—5 quarts.

COOLING SYSTEM:—**Capacity**—10½ quarts.
Water Pump:—Packless, sealed ball-bearing shaft.
See article in Mechanical Equipment Section for data.
Removal—Drain water, remove fan belt, fan blades and pulley, hose, 3 pump mounting screws.
Thermostat:—Bishop & Babcock. In cyl. head outlet.
Setting—Starts to open 156° F. to 160° F.
Temperature Gauge:—Auto-Lite (Motometer) Vapor tension type. Part No. H-9210.
See article in Mechanical Equipment Section for data.

CLUTCH:—**Borg & Beck Model 8A7.** Single plate, dry disc type. Identified by #925 stamped on cover.
See article in Mechanical Equipment Section for data.
Facings—Molded (flywheel side), woven (pressure plate side), Inside Diam. 5⅛". Outside Diam. 7⅞". Thickness .125". NOTE—Grooved facing used on pressure plate side (After '39 Engine No. 17804).
Adjustment—Free travel 1" (min.). Turn clutch adjusting sleeve on connector link. Check Hill-holder.
Removal:—Remove transmission (see below), take off clutch housing, take out mounting screws in clutch cover flange, remove clutch cover assembly.

TRANSMISSION:—**Warner.** Model AS2-T84F. (Std.), AS2-T84F-R7A (overdrive with electrical 'kick-down' control, optl.). Helical gear and synchro-mesh (second & high), sliding spur (low & reverse).
Std. Transmission Note—Companion flange and rear extension discontinued. Solid propeller shaft used and slip joint formed ahead of front universal (transmission mainshaft splined with front yoke of front universal). Not used on cars with overdrive.
See Transmission, Overdrive, and Overdrive Control articles in Mechanical Equipment Section.
Transmission Control:—Remote steering col. shift Std.
See articles in Mechanical Equipment Section for data.
Removal (Std.):—Disconnect shift rods and speedometer cable, disconnect rear universal and withdraw propeller shaft from transmission. Place jack under engine rear plate, free rear engine mountings. Take out transmission mounting bolts, pull transmission out.
Overdrive Model—Same as Std. (above) except that top radiator hose must be disconnected, exhaust pipe loosened at manifold and engine rear plate, clutch shaft pulled free of engine, overdrive shift lever and solenoid leads disconnected, engine rear support cross-member removed, and rear of engine lowered so that transmission clears underside of frame X-member when removed. Also propeller shaft disconnect at front universal by removing U-bolts.

UNIVERSAL JOINTS:—**Spicer.** Model 1268-102 (all except front on cars with Overdrive). 1261-101 (front on cars with Overdrive). Needle bearing type. 2 used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—**Spicer Model 23.** Semi-floating, hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.56-1 standard. 4.1-1 optional.
Backlash—.003-.005". Shim adjustment.
Removal:—Hoist rear of car, disconnect propeller shaft at rear universal, hydraulic brake lines, brake cables, and shock absorbers. Remove spring U-bolts, disconnect rear spring shackles, and withdraw axle
Wheel Bearing Adjustment—Shims provided between flanged end of axle housing and brake backing plate. To adjust, remove wheel, hub and drum assembly (Puller J-446), and backing plate. Remove shims to decrease endplay, add shims to increase. Shims furnished .003", .005", .010", .030" thick.
Endplay—.001-.005". Measure with dial indicator.

SHOCK ABSORBERS:—**Houdaille.** Model BBFSS (front), BBDS (rear). Double acting, hydraulic.
See article in Mechanical Equipment Section for data.

STEERING:—**Steering Gear**—Ross Model T-12. Cam-and-Twin Lever type.
See article in Mechanical Equipment Section for data.
Front Suspension:—Planar type independent suspension with transverse spring.
See article in Mechanical Equipment Section for data.
Kingpin Inclination—5½°.
Caster—1° to 2°.
Camber—¼-¾°. Shim adjustment.
Toe In—⅛-7/32". Adjust right reach rod only for toe-in (left rod should be adjusted for left wheel straight-ahead position only).
Steering Geometry (Toe-out on Turns)—Inner wheel turned 22½°, Outer wheel 20°.

BRAKES:—**Service.** Lockheed hydraulic, single anchor type. Hand lever applies rear service brakes.
See article in Mechanical Equipment Section for data.
Drums—Diameter 9".
Lining—Front shoe (U.S. #714) 10 3/16". Rear shoe (Man. DV-2921) 7 13/16". Width 1¾". Thickness 3/16".
Clearance—.010" toe, .006" heel, for each shoe.
Braking Power—43% rear.
Hand Brake Adjustment:—See Service Brakes.
Hill-Holder:—Optional equipment.
See article in Mechanical Equipment Section for data.

HOOD LOCK:—*See Studebaker Shop Notes for data.*

SERIAL NUMBER:—First number 4148501 (South Bend), 4807601 (Los Angeles). Stamped on left hand body front hinge pillar.

ENGINE NUMBER:—On left side of cylinder block. First Number—H-87601.

ENGINE SPECIFICATIONS:—Model 10A. 6 cylinder, 'L' head. **Bore**—3 5/16". **Stroke**—4⅜".
Displacement—226 cu. ins. **Rated HP**—26.35.
Developed Horsepower—90 HP (Std. head), 94 HP (Optl. high altitude head) at 3400 RPM.
Compression Ratio—6.0-1 Standard cast-iron head. 7.0-1 aluminum head Optl. (high altitude only).
Compression Pressure—105 lbs. @ 150 RPM (Std. head).
See Studebaker Shop Notes for Cyl. Head Installation.
Vacuum Reading—18-20" at 450 RPM or 8 MPH.

PISTONS:—Lynite, aluminum alloy, tin-plated, T-slot, cam ground type. **Length** 3¾". **Weight** 14.4 ozs. (stripped).
Removal—Pistons and rods removed from above.
Clearance—.0005" new. Measure ¼" up on skirt 90° from pin bosses. See Fitting New Pistons.
Original Bore Sizes:—*See Studebaker Shop Notes.*
Replacement Pistons:—Finished pistons (pins fitted) furnished standard and .002", .004", .010", .015", .020", .030" oversize. Exact size stamped on piston head.
Fitting New Pistons:—Insert .002" x 1" feeler between piston and wall on camshaft side (pin parallel to crankshaft, T-slot away from camshaft). Pull to withdraw feeler must be between 7-15 lbs.
Installing Pistons:—T-slot away from camshaft.

PISTON RINGS:—New sealed power type compression rings (2 used) with upper inner edge beveled, 1 oil control ring, all above pin. Narrow heat-dam groove (no ring fitted) above top ring. Oil ring groove drilled with oil drain holes. NOTE—New type ring used on 1939 Commander starting with Eng. #H-81539.

Ring	Width	End Gap	Side Clearance
Compression	3/32"	.013-.018"	.0015-.002"
Oil Control	3/16"	.013-.018"	.0015-.002"

NOTE—Install compr. rings with bevel edge up.
Replacement Rings:—Oversizes .010", .020", .030".

PISTON PIN:—Diameter—⅞". **Length**—2⅞".
Pin locked in connecting rod.
Pin Fit in Piston—Light push fit (rod should rock in piston of own weight. Clearance .0001-.0003".
NOTE—Replacement pistons have pins fitted.

CONNECTING ROD:—Weight—33.2 ozs. **Length**—8⅛".
Crankpin Journal Diameter—2.18675-2.18775".
Lower Bearing—Spun babbitt. Rods exchanged.
Clearance—.0005-.002". **Sideplay**—.005-.009".
Bearing Adjustment:—None. Replace rods. Rods furnished std. and .010", .020" undersize. Ream to give clearance of .0005-.002". *See Studebaker Shop Notes for 'Palnut' installation instructions.*
Installing Rods:—Install rods with narrow half of bearing toward front in cylinders #1, 3, 5, toward rear in #2, 4, 6. Marks on rods and caps must be together and oil hole toward camshaft.

CRANKSHAFT:—4 bearing, 5 integral counterweights with vibration dampener mounted at forward end.
Journal Diameters—2.4995-2.500" all bearings.
Bearing Type—Removable steel-backed, babbitt-lined type. **Clearance**—.0005-.0025".
Bearing Adjustment:—None (no shims). Replace bearings. Furnished Std., .010", .020" undersize.
End Thrust:—Thrust plate assembled between front bearing and crankshaft gear. Controlled by shims between plate and bearing. **Endplay**—.003-.006".

CAMSHAFT:—Four bearing. Helical gear drive.
Bearings—Steel-backed, babbitt-lined, split type bushings. When replacing bushings, oil holes in block and bushing must be in alignment.
Clearance—.00075-.00225"(#1), .002-.00375"(others).
End Thrust:—Steel thrust washer and spacer between gear hub and front bushing.
Timing Gears:—Crankshaft (cast-iron). Camshaft (Celeron fabric with steel hub). Two threaded holes in gears provided for puller for gear removal. *See Studebaker Shop Notes for Gear Removal & Replacement Gear size selection.*
Camshaft Setting:—Mesh marked camshaft gear tooth with two marked teeth on crankshaft gear.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 15/32"	11/32"	5 7/32"
Exhaust	1 9/32"	11/32"	5 7/32"

	Seat Angle	Lift	Stem Clearance
All valves	45°	11/32"	.001-.003"

Tappet Clearance:—.016" all valves (cold). Remove right hood side panel for work on valves. *See Studebaker Shop Notes for Hood Side Panel Removal.*
Valve Guides:—Pressed in block from above (1 5/32" below upper edge of valve seat) with stepped end down. Ream to inside diameter of .3425-.3445".
Valve Springs:—Install with closed coil at top. Damper on top of spring. Replace spring if 10% weak. *See Studebaker Shop Notes for Valve Spring Installation instructions.*

	Spring Pressure	Spring Length
Valve Closed	54-60 lbs.	2 3/32"
Valve Open	125-135 lbs.	1¾"

Valve Lifters:—Barrel type (no separate guides). Can be removed from top. Furnished .0005", .001" ov'size.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 15° BTDC. Close 49° ALDC.
Exhaust Valves—Open 54° BLDC. Close 10° ATDC.
Valve Timing Check—Set tappet clearance #1 intake valve at .020". This valve should open with piston 15° or .0942" before top dead center when mark 'IN-OP.1-6/' on vibration damper at front of engine lines up with pointer on gear case cover at front of engine. Reset tappet clearance at .016" (cold).
Motor Gauge—Weidenhoff Adapter #104, Rod #2.

LUBRICATION:—Pressure system with oil pump mounted on right side of engine. *See Studebaker Shop Notes for Oil Pump installation instructions.*
Normal Oil Pressure:—40 lbs. at 25-30 MPH.
Oil Pressure Regulator:—Located on right front corner of engine. Operates at 40 lbs. Non-adjustable.
Crankcase Capacity:—6 quarts.

COOLING SYSTEM:—Capacity—14½ quarts.
Water Pump:—Centrifugal with adjustable packing. *See article in Mechanical Equipment Section for data.*
Removal—Drain water, remove fan belt, disconnect pump inlet hose, take out pump mounting bolts, lift fan and pump assembly out.
Thermostat:—Bishop & Babcock or Fulton. In Cylinder head water outlet. Install with bellows down.
Setting—Starts to open at 156-160°F.
Drain Valves:—Left side of radiator lower tank and plug on left side of block at rear.

CLUTCH:—Borg & Beck Model 9A7 with 'Borglite' driven member. Model #943 stamped on cover. Single plate, dry disc type.
See article in Mechanical Equipment Section for data.
Facings—Spiral wound molded woven, 2 used. Inside Diam. 6". Outside Diam. 9¼". Thickness ⅛".
Pedal Adjustment:—Free travel 1". min. (sleeve on pedal connecting rod, turn out for greater travel, in for less). Check Hill-Holder after clutch adjustment.
Removal:—Disconnect clutch linkage, remove transmission (see Transmission Removal following), support engine at rear, remove rear engine mountings and clutch housing. Take out mounting screws in clutch cover flange (turn screws out evenly) and remove clutch.

TRANSMISSION:—Warner. Synchro-mesh, all helical gear type with remote control shift. Overdrive with electrical control 'kick-down' Optl. (adjust control whenever accelerator linkage disturbed). *See Transmission, Overdrive, and Overdrive Control articles in Mechanical Equipment Section.*
Transmission Control:—New type remote shift.
See article in Mechanical Equipment Section for data.
Removal:—Disconnect shift rods from levers and speedometer cable at transmission, take out U-bolts in front universal and lower propeller shaft (on cars with Overdrive disconnect rear support at frame ends and wires at solenoid). Remove transmission mounting screws at clutch housing, pull transmission back and lift out. *See Studebaker Shop Notes for Overdrive Rear Support Installation data.*

UNIVERSAL JOINTS:—Spicer—1271-101 (front), 1278-101 (rear). Needle bearing type. 2 used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—Spicer Model 41-2. Semi-floating, hypoid gear type with Hotchkiss drive.
See article in Mechanical Equipment Section for data.
Ratio—4.55-1 Std., 4.82-1 Optl.
Backlash—.005-.007". Shim adjustment.
Removal:—Hoist rear of car, disconnect propeller shaft at rear universal, brake line, and shock absorbers, remove spring U-bolts, disconnect rear spring shackles, withdraw axle assembly from car.
Wheel Bearing Adjustment—Shims provided between flanged end of axle housing and brake backing plate. To adjust, remove wheel, hub, drum, and backing plate (retained by 6 nuts). Remove shims to decrease endplay, add shims to increase. Shim thickness at both wheels must be equal within .005".
Endplay—.001-.005". Measure with dial indicator.

SHOCK ABSORBERS:—Houdaille, Type BBFS (front), ACHS (rear). Double acting, hydraulic, adjustable type with thermostatic control (rear only).
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear. Ross Cam-and-Twin-Lever type. Model T-14.
See article in Mechanical Equipment Section for data.
Front Suspension:—Planar type independent suspension with transverse spring. Specifications below apply with car unloaded on level floor.
See article in Mechanical Equipment Section for data.
Kingpin Inclination—5½°.
Caster—Negative ¼° to Positive ¾°. Not adjustable.
Camber—¼° to ¾°. Adjustable.
Toe In—1/16-⅛". Adjust right reach rod for toe-in.
Steering Geometry (Toe-out on Turns)—Inner wheel turned 22°, Outer wheel 20°.

BRAKES:—Service—Lockheed hydraulic, double anchor type. Hand lever applies rear wheel service brakes.
See article in Mechanical Equipment Section for data.
Wheel Cylinders—Stepped or two-stage bore type: Front Wheels—Front shoe cylinder 1⅜", Rear 1". Rear Wheels—Front shoe cylinder 1¼". Rear 1".
NOTE—Wheel cylinder bore size marked on casting.
Drum—Budd composite. Diameter 11".
Lining—Front shoe—woven. Rear—moulded. Width 2". Thickness 3/16". Length per wheel 19 11/16".
Clearance—.010" toe, .005" heel, for each shoe.
Braking Power—45% rear.
Hand Brake Adjustment:—See Service Brakes
Hill-Holder:—Optl. *See Mechanical Equipment Section.*

HOOD LOCK:—*See Studebaker Shop Notes for data.*

SERIAL NUMBER:—First number 7133101 (South Bend), 7803301 (Los Angeles). Stamped on left hand body front hinge pillar.

ENGINE NUMBER:—On left rear of cylinder block. First Number—B-38501.

ENGINE SPECIFICATIONS:—**Model 6C.** 8 cylinder, 'L' head type. **Bore**—3 1/16". **Stroke**—4¼". **Displacement**—250.4 cu. ins. **Rated HP**—30. **Developed Horsepower**—110 at 3600 RPM. **Compression Ratio**—6.0-1 standard cast-iron head. 6.5-1 high compression head optional. **Compression Pressure**—105 lbs. at 150 RPM (std. head). **Vacuum Reading**—18" at 450 RPM or 8 MPH. *See Studebaker Shop Notes for cyl. head installation.*

PISTONS:—Lynite, aluminum alloy, T-slot, Cam ground, tin-plated type. **Length**—3¾". **Weight**—13.6 ozs. (stripped). **Removal**—Pistons and rods removed from above. **Clearance**—.0015" (¼" up on skirt 90° from pin).

Original Bore Sizes:—*See Studebaker Shop Notes.*

Replacement Pistons:—Finished pistons (with pins fitted) furnished .002", .004", .010", .015", .020",. 030" oversize. Exact size stamped on piston head.

Fitting New Pistons:—Install .003" x 1" hardened feeler between piston and cylinder wall on camshaft side (T-slot away from camshaft, pin bosses parallel to crankshaft). Pull to withdraw feeler must be 7-15 lbs.

Installing Pistons:—T-slot away from camshaft.

PISTON RINGS:—Two compression, 1 oil control ring, all above pin with narrow heat-dam groove (no ring) above top ring groove. Oil ring groove drilled with oil drain holes.

Ring	Width	End Gap	Side Clearance
Compression	⅛"	.013-.018"	.0015-.002"
Oil Control	3/16"	.013-.018"	.0015-.002"

NOTE—Install compression rings with step down. Inner ring used with oil ring only.

Replacement Rings:—Oversizes .010", .020", .030".

PISTON PIN:—**Diameter**—⅞. **Length**—2⅝". Pin locked in rod by clampscrew. **Pin Fit in Piston**—Light push fit (rod should rock in piston of own weight). Clearance .0001-.0003". NOTE—Replacement Pistons have pins fitted.

CONNECTING ROD:—**Weight**—32 ozs. **Length**—8". **Crankpin Journal Diameter**—1.87425-1.87525". **Lower Bearing**—Removable, steel-backed, lead-bronze lined type. **Clearance**—.00075-.00275". **Sideplay**—.005-.010".

Bearing Adjustment:—None. Replace bearings. Furnished Std. and .005", .010", .020" undersize. Crankpin must be turned down to size (bearings should not be reamed). See that tongues on bearings engage slots and that oil holes are aligned. *See Studebaker Shop Notes for 'Palnut' installation.*

Installing Rods:—Oil hole in rod toward camshaft.

CRANKSHAFT:—9 bearing, 12 bolted counterweights. Vibration dampener mounted on forward end. *See Studebaker Shop Notes on Vibration Dampener installation.* **Journal Diameters**—2 3435-2.3440" all bearings. **Bearing Type**—Removable steel-backed, babbitt-lined type. **Clearance**—.001-.003".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps. Bearings furnished .010" and .015" undersize.

End Thrust:—Thrust plate between front main bearing and crankshaft gear with shim adjustment. **Endplay**—.003-.006".

CAMSHAFT:—Six bearing. Helical gear drive. **Bearings**—Split steel-backed, babbitted bushings. NOTE—Oil holes in bushing & block must line up. **Clearance**—.00075-.00225" (#1), .002-.00375" (others).

End Thrust:—Steel thrust washer and spacer between gear hub and bearing. **Endplay**—.003-.006".

Timing Gears:—Cast-iron (crankshaft). Celeron Fabric (camshaft). *See Studebaker Shop Notes for Gear Removal and Replacement Gear Size Selection.*

Camshaft Setting:—Mesh marked tooth on camshaft gear between two marked teeth on crankshaft gear.

VALVES:—	Head Diameter	Stem Diameter	Length
Intake	1 13/32"	11/32"	5 7/32"
Exhaust	1 9/32"	11/32"	5 7/32"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	11/32"	.001-.003"

Tappet Clearance:—.016" all valves—engine cold. Remove right hood side panel for work on valves. *See Studebaker Shop Notes for Side Panel Removal.*

Valve Guides:—Pressed in block from above (1 5/16" below top of block) with stepped end down. Ream to inside diameter of .343-.344".

Valve Springs:—Install with closed-coil up and dampener on top of spring. Replace springs if 10% weak.

	Spring Pressure	Spring Length
Valve Closed.	49-53 lbs.	2 3/32"
Valve Open	125-135 lbs.	1¾"

Valve Lifters:—Mushroom type in bolted-on guide brackets (clusters of four). Assemblies may be removed through valve opening on side of engine.

Valve Timing:—See Camshaft Setting above. **Intake Valves**—Open 15° BTDC. Close 49° ALDC. **Exhaust Valves**—Open 54° BLDC. Close 10° ATDC. **Valve Timing Check**—Set tappet clearance for #1 intake valve at .020". This valve should open with piston 15° or .0915" before top dead center when 'IN.OP/1-8' mark on vibration dampener at front of engine lines up with pointer on gear cover. Reset tappet clearance at .016" cold. **Motor Gauge**—Weidenhoff Adapter #104, Rod #40.

LUBRICATION:—Pressure type. Gear type oil pump in crankcase. *See Studebaker Shop Notes for Oil Pump Installation directions.*

Normal Oil Pressure:—60 lbs. (min.) at 25-30 MPH.

Oil Pressure Regulator:—Located at right front corner of engine. Opens at 60 lbs. Non-adjustable.

Crankcase Capacity—8 quarts.

COOLING SYSTEM:—**Capacity**—17 quarts.

Water Pump:—Centrifugal with adjustable packing. *See article in Mechanical Equipment Section for data.* **Removal**—With water drained and fan belt removed, disconnect hose, take out mounting bolts, lift off pump and fan assembly.

Thermostat:—Bishop & Babcock or Fulton. In cylinder head outlet. Install with bellows down. **Setting**—Starts to open 156-160°F.

Drain Valves:—On left side of radiator lower tank and plug at left rear of engine block.

CLUTCH:—**Inland.** 'Diaphragm' type, single plate, dry disc type with Long 9½CF-CS driven member. *See article in Mechanical Equipment Section for data.* **Facings**—Molded (spiral or chevron wound), 2 used. Inside Diam. 6". Outside Diam. 9½". Thickness .125".

Pedal Adjustment:—Free travel 1" min. Sleeve adjustment on pedal connecting rod. Check Hill-Holder after adjusting clutch.

Removal:—Disconnect clutch pedal linkage, remove transmission (see Transmission Removal following), support engine at rear, remove rear engine mountings and clutch housing, take out mounting screws in clutch cover flange (turn all screws out evenly), remove clutch assembly. CAUTION—Support pressure plate by hand to avoid distorting pressure plate tension springs.

TRANSMISSION:—**Warner.** Synchro-mesh, all helical gear type with remote control shift. Overdrive with electrical control 'kick-down' Optl. (adjust control whenever accelerator linkage disturbed). *See Transmission, Overdrive, and Overdrive Control articles in Mechanical Equipment Section.*

Transmission Control:—New type remote shift. *See article in Mechanical Equipment Section for data.*

Removal:—Disconnect shift rods from levers and speedometer cable at transmission, disconnect front universal by removing U-bolts and lower propeller shaft (on cars with Overdrive disconnect rear support at frame ends and wires at solenoid). Remove transmission mounting screws at clutch housing, pull transmission straight back and lift out. *See Studebaker Shop Notes for Overdrive Rear Support Installation instructions.*

UNIVERSAL JOINTS:—**Spicer**—1271-101 (front), 1278-101 (rear). Needle bearing type. 2 used. *See article in Mechanical Equipment Section for data.*

REAR AXLE:—**Spicer Model 41-2.** Semi-floating, hypoid gear type with Hotchkiss drive. *See article in Mechanical Equipment Section for data.* **Ratio**—4.55-1 Std., 4.82-1 Optl. (Std. with Overdrive). **Backlash**—.005-.007". Shim adjustment.

Removal:—Hoist rear of car, disconnect brake line, shock absorbers, drive shaft at rear universal, rear spring U bolts and rear spring shackles, withdraw axle assembly from car. NOTE—Bleed brake lines when axle installed.

Wheel Bearing Adjustment:—Shims located between flanged end of axle housing and brake backing plate. To adjust, remove wheel, hub, brake drum, and backing plate (retained by 6 bolts). Remove shims to decrease endplay, add shims to increase. Shim thickness at both wheels must be equal within .005". **Endplay**—.001-.005". Measure with dial indicator.

SHOCK ABSORBERS:—Houdaille, Type BBFS (front), ACHS (rear). Double acting, hydraulic, adjustable type with thermostatic control (rear only). *See article in Mechanical Equipment Section for data.*

STEERING:—**Steering Gear**—Ross Model T-14. Cam-and-Twin Lever type. *See article in Mechanical Equipment Section for data.*

Front Suspension:—Planar type independent suspension with transverse spring. Specifications below apply with car weight on wheels but without load. *See article in Mechanical Equipment Section for data.* **Caster**—Negative ¼° to Pos. ¾°. Not adjustable. **Camber**—¼° to ¾°. Adjustable. **Toe In**—1/16-⅛". Adjust right reach rod for toe-in. **Steering Geometry (Toe-out on Turns)**—Inner wheel turned 22°, Outer wheel 20°.

BRAKES:—**Service**—Lockheed hydraulic, double anchor type. Hand lever applies rear wheel service brakes. *See article in Mechanical Equipment Section for data.* **Wheel Cylinders**—Stepped or two-stage bore type: Front—Front Shoe Cylinder 1⅜". Rear 1". Rear—Front Shoe Cylinder 1¼". Rear 1". NOTE—Wheel cylinder bore size marked on casting. **Drum**—Budd Composite. Diameter 11". **Lining**—Front shoe—woven. Rear—moulded. Width 2¼". Thick. 3/16". Length per wheel 19 11/16". **Clearance**—.010" toe, .005" heel, for each shoe. **Braking Power**—45% rear, 55% front.

Hand Brake:—See Service Brakes above.

Hill-Holder:—Optl. *See Mechanical Equipment Section.*

PANEL DELIVERY NOTE:—Engine data given below applies to later cars beginning with Engine No. 35129 which have the Model 440 Engine (same as Pick-up model). First Panel Delivery cars (before Engine No. 35129) have the Model 440P Engine which is similar to that used on Willys 48 (1939). *See next page for Engine data on first Panel Delivery model.*

SERIAL NUMBER:—First No. 440-17001 (all models). Stamped on plate on frame front cross-member and on right side of cowl under engine hood (Pass. cars & Pick-up), or on right front floor riser at door (Panel Delivery).

ENGINE NUMBER:—First No. 17001 (all models). Stamped on right front upper corner of engine block.

ENGINE:—Own Model 440. 4 cylinder, 'L' head type.
Bore—3.125" (3⅛"). **Stroke**—4.375 (4⅜").
Displacement—134.2 cubic inches.
Rated Horsepower—15.63.
Developed Horsepower—61 (Pass. Car), 58 (Pick-up & Panel Delivery) at 3600 RPM. with Std. Heads.
Compression Ratio & Pressure—For each model as follows (All heads Cast Iron except H. C. (7.0-1) head which is Aluminum.

Model	Ratio	Pressure (Crk. Speed)
Pass. Car Std.	6.48-1	111 lbs., 185 RPM.
Pass. Car High Alt.	6.81-1	111 lbs., 185 RPM.
Pass. Car Optl. H.C.	7.0-1	111 lbs., 185 RPM.
Pick-up & Panel Dlvry	6.1-1	107 lbs., 185 RPM.

Vacuum Reading—Steady 21-23" idling at 8 MPH.
NOTE—Cylinders offset ⅛" from center-line of crankshaft toward camshaft side of engine.

PISTONS:—Lynite Lo-Ex aluminum alloy, 'T' slot, Cam ground, Tin-plated type with narrow 'heat-dam' groove above top piston ring.
Weight—12 ozs. (stripped). **Length**—3¾".
Removal—Pistons and rods removed from above.
Clearance—.014-.019" top, .003" skirt.
Original Bore & Piston Sizes:—Engines and pistons graded in four .0005" steps as shown in table below and marked as follows: **Piston**—Letter stamped on head, **Cylinder Bore**—Letter stamped on top of block between valve ports and bore at center.

Grade Letter	Cylinder Bore Size	Piston Size
A	3.1255-3.1250"	3.1235-3.1230"
B	3.1260-3.1255"	3.1240-3.1235"
C	3.1265-3.1260"	3.1245-3.1240"
D	3.1270-3.1265"	3.1250-3.1245"

Replacement Pistons:—Finished pistons furnished Std. (see Original Piston size table) and .002", .005", .010" oversize.
Fitting New Pistons:—Use .0025" feeler stock ¾" wide inserted between piston and cylinder wall on side opposite slot to check clearance. Pull required to withdraw feeler must be within 5-10 lbs.
Installing Pistons:—Slot toward left (valve) side.

PISTON RINGS:—Two compression, one oil control ring per piston, all above pin (narrow heat-dam groove above top ring). Oil ring groove drilled for drainage.

Ring	Width	End Gap	Side Clearance
Compr.	3/32"	.008-.013"	.0015-.002"
Oil Cont.	3/16"	.008-.013"	.0015-.002"

Wall Thickness—.130-.140" (Compr.—same as 1939), .090-.103" (oil ring with inner ring), .135-.145" (later oil ring without inner ring).
NOTE—Install taper-faced compression ring with mark 'TOP' up toward head of piston.
Replacement Rings:—Furnished Standard and .005", .010", .020", .030" oversize.

PISTON PIN:—Diameter .8117-.8127". **Length** 2 25/32".
Pin is locked in connecting rod by clampscrew.
Pin Fit in Piston—.0001-.0009" clearance or light push fit at 60° F.
Replacement Pins:—Furnished Standard and .001", .002", .003" oversize.

CONNECTING ROD:—Weight 34 ozs. **Length** 9 3/16".
Crankpin Journal Diameter—1.9395" (1 15/16").
Lower Bearing—Spun babbitt-lined type.
Clearance—.0008-.0023". **Sideplay**—.005-.009".
Bearing Adjustment:—None (no shims). Replace or rebabbitt rods. Do not file rods or bearing caps. Rods furnished Standard and .010" undersize.
Installing Rods:—Lower bearings offset. Install rods with short side of bearing toward nearest main bearing (toward front of engine for #1 and #3, toward rear for #2 and #4) with oil squirt hole in rod toward right (away from camshaft) on all rods.

CRANKSHAFT:—Three bearing, counterweighted type.
Journal Diameters—2.334" all bearings.
Bearing Type—Removable slip-in steel-backed, babbitt-lined type. Bearings furnished Standard and .010" undersize.
Clearance—.001-.0025".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps.
End Thrust:—Taken by #1 front bearing. Adjustable by adding or removing shims between crankshaft thrust washer and shaft. **Endplay**—.004-.006".

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Bearing Type—Removable bushing (front), machined in crankcase (all others).
Bearing Clearance—.002-.0035".
End Thrust:—Taken by thrust plate behind camshaft sprocket and spring-loaded plunger in forward end of camshaft bearing against thrust stud on chain case cover. NOTE—Make certain that plunger and spring in place when replacing chain case cover.
Timing Chain:—Link-Belt #82, 1¼" (Before Engine No. 34266); #S-40936, 1" (After Engine No. 34266). Pitch ½". Length 47 links or 23½".
Camshaft Setting:—With #1 piston on top dead center, mesh chain so that timing marks on sprockets are adjacent and in line with straightedge across shaft centers.

VALVES:—	Head Diam.	Stem Diam.	Length
Intake	1 17/32"	.373"	5¾" (overall)
Exhaust	1 15/32"	.3725"	5¾" (overall)

	Seat Angle	Lift	Stem Clearance
Intake	45°	23/64"	.0015-.00325"
Exhaust	45°	23/64"	.002-.00375"

NOTE—Separate valve seat inserts not used.
Tappet Clearance:—.014" all valves, engine cold.
NOTE—Remove hand hole in left front fender splash shield by taking out screws for valve adjustment.
Valve Guides:—Installed with taper end up. Remove old guides from above, press new guides in until lower end extends ¾" below valve spring seat recess in block.
Valve Springs:—Free length 2 11/16". Damper installed within each spring at upper end.

	Spring Pressure	Length
Valve Closed	46 lbs.	2¼"
Valve Open	85½ lbs.	1 15/16"

Valve Lifters:—Mushroom type. Guide holes reamed directly in block. Serviced by reaming guide hole and installing lifters furnished .004" oversize.
Lifter Clearance—.0005-.002".
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 9° BTDC. Close 50° ALDC.
Exhaust Valves—Open 47° BLDC. Close 12° ATDC.
To Check Timing—Set tappet clearance #1 intake valve at .020". This valve should open with piston 9° or .039" before top dead center when flywheel mark 'I.O.' centered in inspection hole in right front face of rear motor support (¼" variation permissible. Reset tappet clearance at .014" Cold.

LUBRICATION:—Pressure system. Gear type oil pump mounted on outer left side of crankcase.
Oil Pump Installation Note—Turn engine over until 'IGN' mark on flywheel lines up with indicator (inspection hole in top left surface of flywheel housing) with #1 piston on compression stroke, turn distributor shaft so that rotor is at #1 segment in distributor cap, mesh oil pump gear so that distributor not disturbed when tongue-and-slot drive coupling engaged.
Normal Oil Pressure:—75 lbs. (on gauge) at 30 MPH.
Oil Pressure Regulator:—Under plug on oil pump cover. Opens at 40 lbs. Adjustable by adding or removing shims within plug above spring.
Oil Pressure Gauge:—King-Seeley Electric. K-S No. 7860—first, 8115—later (Dash Units), No. 6425 (Engine Unit). NOTE—Dial on first dash unit has ivory lines, later unit has ivory dots.
See article in Mechanical Equipment Section for data.
Crankcase Capacity—4 quarts.

COOLING SYSTEM:—Water Capacity—11¾ quarts.
Water Pump:—Ball-bearing, packless type.
See article in Mechanical Equipment Section for data.
Removal—Drain water, remove fan belt and fan blades, loosen radiator mounting nuts, take out mounting bolts and lift pump out.
Thermostat:—Harrison. In outlet elbow on head. Starts to open 148-155°. Fully open at 173° F. NOTE—Thermostat not used on first Pick-up & Panel Delivery.
Temperature Gauge:—King-Seeley Electric. K-S No. 7850—first, 8110—later (Dash Units), No. 7000 (Engine Unit). NOTE—First dash unit has ivory lines, later dash unit has ivory dots.
See article in Mechanical Equipment Section for data.

CLUTCH:—Atwood Model TP 28-7 (Pass. Cars), Rockford UCLA-13-1098 (Pick-up & Panel Delivery). Single plate, dry disc type. No adjustment for wear required. NOTE—Borg & Beck driven member used with both clutches.
See article in Mechanical Equipment Section for data.
Facings—Molded type (Pass. Car). Molded & Woven type (Pick-up & Panel Delivery). Inside Diam. 5⅛". Outside Diam. 7⅞". Thickness .125".
Adjustment:—Pedal free travel must be ¾-1" (providing 1/16" clearance between release bearing and release levers). To adjust, loosen locknut, turn clutch fork connecting cable.
Removal:—Remove Transmission (see Transmission Removal below) and flywheel bell housing, take out mounting screws in clutch cover rim, lift clutch assembly and driven member out.

TRANSMISSION:—Warner Model AS3-T84D (Speedway Pass. Cars, Pick-up & Panel Delivery), AS4-T84F (Deluxe Pass. Cars with Steering Column Gearshift). Constant-mesh, synchro-mesh, helical gears (Second & High), sliding spur gears (Low & Reverse).
See article in Mechanical Equipment Section for data.
Transmission Control:—Own remote control type mounted on steering column. Std. on Deluxe Pass. Cars only.
See article in Mechanical Equipment Section for data.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Removal:—Cover front seat cushion and door trim. On Deluxe Pass. Cars, disconnect control rods at transmission. On all other models, disconnect gearshift lever at retaining collar. Disconnect accelerator pedal from rubber socket, remove toeboards, disconnect propeller shaft at front universal, remove bell housing hand hole cover and disconnect clutch throw-out bearing retracting spring. Remove lower nuts on engine mounting bolts at rear of transmission, jack up rear of engine (Caution—see that fan blades do not damage radiator) to clear frame cross-member, remove transmission mounting bracket, remove bell housing-to-transmission case bolts, pull transmission straight back and lift out.

UNIVERSAL JOINTS:—Detroit Series 4100. Needle bearing, Ball-and-trunnion type. Two used.
See article in Mechanical Equipment Section for data.

REAR AXLE:—Own Model 440 (Pass. Cars), Spicer (Salisbury) Model 21-1 (Pick-up & Panel Delivery). Semi-floating, spiral bevel gear type with Hotchkiss drive. *See article in Mechanical Equipment Section.*
Ratio—4.3-1 (Speedway), 4.55-1 (Deluxe), 4.7-1 (Pick-up), 5.1-1 (Panel Delivery).
Backlash—.004-.008". Shim adjustment.
Removal:—Hoist rear of car. Disconnect drive shaft at rear universal, brake tube and cables, shock absorbers, spring U-bolts, rear spring shackles. Pull axle assembly out toward rear.

SHOCK ABSORBERS:—Monroe or Gabriel (Pass. Cars), Monroe (Pick-up & Panel Delivery). Direct acting type.
See article in Mechanical Equipment Section for data.

STEERING:—Steering Gear—Gemmer Model 250 Worm and-Roller type (Pass. Cars), Model 120 Worm-and-Sector type (Pick-up & Panel Delivery).
See article in Mechanical Equipment Section for data.
Front Suspension:—Own Model 440 Front Axle. Conventional type with 'I' beam section and Reverse-Elliott ends.
Kingpin Inclination—7½° crosswise.
Caster—3°. Adjustable by installing wedge shims between spring and spring pad on axle.
Camber—2°. Not adjustable.
Toe-In—1/16-⅛". Adjustable by loosening tie rod clamp bolts and turning tie rod.
Steering Geometry (toe-out on turns)—With outer wheel turned 20°, inner wheel should turn 23°15'. Not adjustable (check for bent steering arms).

BRAKES (PASS. CARS):—Service—Bendix (Lockheed) Hydraulic, double anchor type. Hand lever applies rear wheel service brakes. *See 'Lockheed Double Anchor' Brake article in Mechanical Equipment Section.*
Drums—Alloy cast iron. Diameter 9".
Lining—Molded type. Width 1¾". Thickness 3/16". Length 18⅝" per wheel.
Clearance—.010" toe, .005" heel for each shoe.
Braking Power—55% front, 45% rear.
Hand Brake:—See Service Brakes above.

BRAKES (PICK-UP & PANEL DELIVERY):—Service. Bendix Mechanical, Duo-servo, Single Anchor. Hand lever applies all service brakes.
See article in Mechanical Equipment Section for data.
Drums—9" Pressed Steel (Pick-up), 11" alloy iron (Panel Delivery).
Lining—Molded & Woven type (Pick-up), Molded (Panel Delivery). Width 1¾". Thickness 3/16". Length per wheel 19 3/16" (Pick-up), 23 15/16" (Panel Delivery).
Clearance—.010" at heel and toe of each shoe.
Hand Brake:—See Service Brakes above.

PANEL DELIVERY 440P
BEFORE ENGINE NUMBER 35129

LATER PANEL DELIVERY NOTE:—Engine data below applies to first cars only (from Engine No. 17001 to 35129). After Engine No. 35129, these models equipped with Model 440 Engine (same as used on Passenger Cars and Pick-up models). *See preceding page for data on this later engine and for data on Clutch, Transmission, Universal Joints, Rear Axle, Steering, and Brakes on all Panel Delivery cars.*

SERIAL NUMBER:—First number 440-17001. Stamped on plate on front center of frame front cross-member and on right front floor riser at door.

ENGINE NUMBER:—First number 17001. Stamped on right front upper corner of engine block.

ENGINE:—Own Model 440P. 4 cylinder, 'L' head type.
Bore—3⅛". **Stroke**—4⅜".
Displacement—134.2 cubic inches.
Rated Horsepower—15.63 (A.M.A.).
Developed Horsepower—48 HP at 3200 RPM.
Compression Ratio—5.7-1 cast-iron hd.
Compression Pressure—87 lbs. at 216 RPM.
Vacuum Reading—Steady 18½" idling at 8 MPH.
NOTE—Cylinder bore offset ⅛" from center line of crankshaft toward valve side of engine.

PISTONS:—Full skirt, hard grey iron, light weight type.
Weight—21-23 ozs. (stripped). **Length**—3¾".
Removal—Pistons and rods removed from above.
Clearance—Top .0165-.017". Skirt .0025-.003".
Replacement Pistons:—Finished pistons furnished Std. and .003", .005", .010", .015", .020", .025", .030" oversize.
Fitting New Pistons:—Use .0025" feeler stock ¼" wide inserted between piston and cylinder wall to check clearance. Pull required to withdraw feeler must be 4 lbs. plus or minus 2 lbs.

PISTON RINGS:—Three compression, one oil control ring per piston, all above pin.

Ring	Width	End Gap	Side Clearance
Compression	3/32"	.008-.013"	.0015"
Oil Control	3/16"	.008-.013"	.0015"

Wall Thickness—.130-.140" (Comp.), .098-.103" (oil).
Replacement Rings:—Furnished Std. and .003", .005", .010", .015", .020", .025", .030", .040" oversize.

PISTON PIN:—Diameter—15/16" (.9375"). **Length**—2.682". Pin floats in piston and rod. Retained by locking rings. Furnished .001", .003" oversize.
Pin Fit in Piston—.0002-.0004" clearance or hand push fit with piston dry.
Pin Fit in Rod Bushing—.0002-.0004" clearance or thumb press fit.

CONNECTING ROD:—Weight 34 ozs. **Length** 9 3/16".
Upper Bearing (Piston Pin Bushing)—Bronze.
Crankpin Journal Diameter—1.9395" (1 15/16").
Lower Bearing—Spun-babbitt-lined type.
Clearance—.001-.0025". **Sideplay**—.004-.009".
Bearing Adjustment:—None (no shims). Replace or rebabbitt rods. Do not file rods or bearing caps. Rods furnished Standard and .010" undersize.
Installing Rods:—Lower bearings offset. Install rods with short side of bearing toward nearest main bearing (toward front of engine for #1 & 3, toward rear for #2 & 4) with oil squirt hole in rod toward right (away from camshaft) on all rods.

CRANKSHAFT:—Three main bearing type.
Journal Diameters—2.334" all bearings.
Bearing Type—Removable slip-in steel-backed, babbitt-lined type. Bearings furnished Standard and .010" undersize. **Clearance**—.001-.0025".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file caps.
End Thrust:—Taken by #1 front bearing. Adjustable by adding or removing shims between crankshaft thrust washer and shaft. **Endplay**—.004-.006".

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Bearing Type—Removable bushing (front), machined in crankcase (all others).
Bearing Clearance—.002-.0035".
End Thrust:—Taken by thrust plate behind camshaft sprocket and spring-loaded plunger in forward end of camshaft bearing against thrust stud on cover.
Timing Chain:—Link-Belt #82 (Willys #S-40936). Width 1". Pitch ½". Length 23½" or 47 links.
Camshaft Setting:—With #1 piston on top dead center, mesh chain so that timing marks on sprockets are adjacent and in line with a straightedge across the shaft centers.

VALVES:	Head Diam.	Stem Diam.	Length
Intake	1 17/32"	.372"	5 13/64" (5¾" overall)
Exhaust	1 15/32"	.371"	5 13/64" (5¾" overall)

	Seat Angle	Lift	Stem Clearance
Intake	45°	21/64"	.002-.004"
Exhaust	45°	21/64"	.003-.005"

NOTE—Exhaust valve seat inserts are used.
Tappet Clearance:—.004" Int., .006" Exh., engine warm
Valve Guides:—Removable. Installed with taper end up. Remove old guides from above and press in new guides until lower end extends ¾" below valve spring seat recess in block. Exhaust guide longer than intake guide.
Valve Springs:—Free length 2 11/16".

	Spring Pressure	Length
Valve Closed	46½ lbs.	2¼"
Valve Open	85½ lbs.	1 15/16"

Valve Lifters:—Mushroom type. Guide holes reamed directly in block. Serviced by reaming guide hole and installing lifters furnished .005", .010", .020" oversize. **Clearance**—.0007-.001".
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open TDC. Close 45° ALDC.
Exhaust Valves—Open 40° BLDC. Close 5° ATDC.
To Check Timing—Set tappet clearance #1 intake valve at .010" (cold). This valve should open with piston on top dead center when flywheel mark 'T.C. I.O.1-4' lines up with pointed end of inspection plate screw in inspection hole on left top face of flywheel housing (permissible variation ¼" either way from mark). Reset tappet clearance at .004" warm.

LUBRICATION:—Pressure system. Gear type oil pump mounted on outer left side of crankcase.
Oil Pump Installation Note—Turn engine over until 'IGN' mark on flywheel lines up with indicator (inspection hole in top left surface of flywheel housing) with #1 piston on compression stroke, turn distributor shaft so that rotor is at #1 segment in distributor cap, mesh oil pump gear so that distributor not disturbed when tongue-and-slot drive coupling engaged.
Normal Oil Pressure:—75 lbs. (gauge) at 30 MPH.
Oil Pressure Regulator:—Located under plug on oil pump cover. Opens at 40 lbs. Adjustable by adding or removing shims within plug above spring.
Oil Pressure Gauge:—King-Seeley Electric. K-S No. 6275 (dash unit), No. 6425 (engine unit).
See article in Mechanical Equipment Section for data.
Crankcase Capacity:—4 quarts.

COOLING SYSTEM:—Capacity—11 quarts.
Water Pump—Ball bearing, packless type.
See article in Mechanical Equipment Section for data.
Temperature Gauge:—King-Seeley Electric. K-S No. 6632 (first), 7140 (later) Dash Units; No. 5700 (first), 7000 (later) Engine Units.
See article in Mechanical Equipment Section for data.

For all other Data, see Later Panel Delivery Model on preceding page.

MECHANICAL EQUIPMENT SECTION

'ME' PAGES

The MECHANICAL EQUIPMENT SECTION contains the *Complete Separate Treatment* of the Illustrations, Operation, Performance, Adjustment, Overhaul and Trouble Shooting of the various MECHANICAL UNITS AND SYSTEMS.

IMPORTANT: ALWAYS REFER TO INDEX ON FOLLOWING PAGES.

Used On:
SUPERCHARGER MODELS 67 & 69 (1934), 75 (1935), 110 (1936), 116 & 120 (1937), 97 (1938-39)

NOTE:—Supercharger is separate unit mounted on the side of engine and driven through a flexible coupling by an extension of the water pump shaft (1934-35), special shaft driven by separate chain (1936), twin 'Vee' belts (1937 on). All units are similar except that on 1934 model generator was flange-mounted on rear face of supercharger housing and driven through tongue-and-slot coupling by supercharger cross-shaft. On later models, generator is independently mounted and belt driven.

TYPE:—Centrifugal type. Consists of a blower vane or rotor mounted at the upper end of a vertical shaft and driven by worm-and-wheel gearing from a horizontal cross-shaft. Carburetor is mounted directly on upper cover so that fuel mixture is sucked into supercharger by rotor and delivered to manifold under pressure. Supercharger cover and cross-tube connection to manifold are water-jacketed for temperature control. Worm gear ratio is 4.8-1 and total drive ratio 5.75-1 so that rotor speed is 23,000 RPM. at 4000 RPM. of engine. Gears are special 'cone' type worm and worm gear designed for long life and quiet operation. All bearings are bronze-backed babbitt lined and pressure lubricated from engine oiling system by external oil line.

ADJUSTMENT:—No adjustment required (see car model page for drive chain adjustment on first models). Vertical shaft endplay can be adjusted (required only after long service) and oil retainer at top of vertical shaft and on drive or cross-shaft can be renewed without dismantling supercharger or removing unit from car. All other service work requires complete dismantling of the unit (see Service Caution below).

Vertical Shaft Endplay Adjustment:—Remove cover at lower end of vertical shaft, mount dial indicator on housing with pin against end of shaft. Pry shaft up and down and read endplay on indicator. If endplay more than .002", remove nut and first thrust washer, install thicker washer (this washer furnished from .140" to .160" thick in .001" steps) so that endplay is .002", replace nut and cover. Use micrometer to measure washer thickness and be certain that endplay is between .001-.002".

Vertical Shaft Oil Retainer:—On upper end of shaft under rotor. Worn or loose retainer will allow air leak into manifold (may cause high-pitched whistle or make it impossible to adjust carburetor) or cause oil to be drawn into engine (engine will smoke badly). To renew oil retainer, disconnect throttle linkage, choke, gasoline line and vacuum advance tube at carburetor, take out supercharger cover screws and remove cover and carburetor as a unit. Remove nut on top of vertical shaft, pull rotor **(use special puller)** or hold rotor up by gripping two opposite rotor blades with large pliers, place wooden block on end of shaft and tap sharply with small hammer. **Do not use bar to pry up on edge of rotor or shaft will be bent.** Remove old retainer. Use new gasket with new retainer, center retainer carefully on shaft before tightening screws (retainer hole is .808-.809" and will provide .0005-.001" clearance on shaft—**retainer must not touch shaft**). Install rotor, being careful that both keys are in place, and tighten nut securely.

Cross-shaft Oil Retainer:—Renew retainer if oil leaks out around shaft. Remove drive shaft between couplings, take off nut on end of shaft and remove drive flange, take out screws in retainer cover, remove cover and old retainer. Install new oil retainer, replace drive flange before tightening retainer cover screws (to center retainer on shaft). NOTE—When installing flexible coupling nuts, tighten nuts only so that distance from edge of coupling flange to edge of washer against opposite flange is 5/8" (excessive tightening will crush rubber bushings).

SERVICING:—Caution. Because of precision design and high speed at which supercharger operates, manufacturer strongly recommends that unit not be dismantled for servicing unless all special tools are used and extreme care taken that all clearances held to exact specifications. Use new worm and worm gear (matched set) whenever unit is rebuilt. Follow directions below carefully to insure correct fitting of each part.

Installing New Bushings:—Drive out old bushings (except cross-shaft rear bushing held by two screws), drive in new bushings (use special drivers) in following order: 1. Vertical shaft lower bushing (see that oil groove is at end of housing), 2. Intermediate bushing, 3. Upper bushing, 4. Cross-shaft front bushing in cover (press new bushing into cover from inside, see that cover fits squarely against housing and install in place), 5. Cross-shaft rear bushing (slip fit in housing and held in place by two machine screws). Line-ream upper and lower vertical shaft bushings in one operation (use special tandem reamer), then ream intermediate bushing (use special reamer). Set special adjustable reamer to cut hole size of exactly .751", ream both cross-shaft bushings. Remove side cover and rear bushing so that worm gear position can be checked.

Worm Gear Setting:—Assemble parts on cross-shaft (from rear or gear flange end forward) as follows: .032" shim thickness against shoulder, thrust washer (see that it engages dowel pins on flange). Install this assembly in side cover and continue assembly at outer end of shaft as follows: Thrust washer (see that it engages dowel pins on cover), .022" shim thickness, thrust washer (plain), drive flange and nut. Tighten nut securely and check endplay. Add or remove shims (outer .022" group) until there is no endplay. Bolt special gauge on cross-shaft flange (worm gear not installed), install cover assembly on supercharger housing making certain that lead gasket is in place under cover flange, install rear bushing to locate shaft. Install vertical shaft, check gap between gauge and vertical shaft (use feelers). This gap must be exactly .010". If gap not correct, remove vertical shaft and cross shaft assembly, dismantle cross-shaft assembly and add or remove shims from first (.032") shim pack located on shaft against worm gear flange. Recheck shaft endplay (adjust by adding or removing shims from outer (.022") shim pack, assemble and recheck gap. With gap exactly .010", add shims at outer shim pack to provide .002" endplay in shaft (check with two .002" feelers, placing one on each side of shaft between outer thrust washers). Remove nut and driving flange, install oil retainer assembly on cover, replace driving flange and tighten nut securely. Complete cross-shaft assembly by installing worm gear.

Worm Gear Installation:—Clean worm gear and mounting flange thoroughly, heat gear in hot water (will not clear flange unless heated), bolt gear on flange using special mounting screws and lockwashers (tighten all screws evenly and securely), wire screws together in pairs. Check gear runout on centers with dial indicator. Runout must not exceed .001".

Worm Setting & Installation:—Mount rotor on vertical shaft (not necessary to install keys) and tighten nut securely. Install shaft in housing, threading shaft down through special gauge at lower end (turn shaft until gauge is against shoulder on shaft —cross-shaft assembly must be out of housing to permit gauge installation). Place special plate gauge on housing cover flange and install rear cross-shaft bushing to locate gauge plug (gauge must be held firmly in place). Hold vertical shaft down, check clearance between two gauges with feelers. This must be determined accurately—incorrect measurement will cause noisy operation. Remove gauge, install shim thickness exactly equal to clearance (as measured above) on shaft against shoulder, install worm, special lockwasher and nut, tighten nut securely and turn down lockwasher ears against nut. Use dial indicator to check concentricity at each end of worm. Must check within .0005". Install special thrust washer (furnished from .122" to .128" thick in .001" steps) making certain that it engages dowel pins in housing, floating or plain thrust washer, second special thrust washer (furnished from .140" to .160" thick in .001" steps), castellated nut. Tighten nut securely. Mount dial indicator on housing and check vertical shaft endplay. Must be between .001-.002". Adjust by changing thickness of special thrust washer. Install cotter pin on nut, install lower cover and gasket. Pull rotor and install gasket and oil retainer at upper end (see Adjustment section for complete directions).

Final Assembly:—When installing worm gear and cross-shaft assembly in housing, see that screw with slotted head is used opposite worm (other screws will strike worm). Lead gasket must be in place under cover flange. On first type with mounting flange, line up flange with straightedge before tightening cover screws. Make certain that oil tube for upper bushing is in place and that entire assembly turns freely.

TORQUE WRENCH READINGS:—All torque wrenches are calibrated to read directly in Foot Pounds (Ft. Lbs.) or Inch Pounds (In. Lbs.) as noted in the following table, or are calibrated in accordance with a special table which may be converted into Ft. Lbs. or In. Lbs. as directed below.

Torque Indicating Wrenches

Wrench Manufacturer	Wrench Reading
Ammco	Special
Blackhawk Torqflash	Ft.Lbs. & In.Lbs.
Bonney #56 & #66	Ft. Lbs.
Duro-Chrome	Ft. Lbs.
Kwik-Way	In. Lbs.
Snap-On Torqometer (First Type)	Special
Snap-On Torqometer (Later Type)	Ft. Lbs.
Sunnen	In. Lbs.
Williams Measurrench	Ft. Lbs.

Special Wrench Types:—For both Ammco and first type Snap-On Torqometer wrenches, which are calibrated to a special scale, the Ft. Lbs and In. Lbs. tables given below must be converted into this special scale by dividing the Ft. Lbs. figure by .35 and the In. Lbs. figure by 4.2. NOTE—If the tables given below are used for these wrenches, it will be simpler to multiply the wrench reading by .35 (for Ft. Lbs.) or by 4.2 (for In. Lbs.) and compare the resulting wrench reading (which will be in Ft. Lbs. or In. Lbs.) with the table below.

Ft. Lbs. & In. Lbs. Special Note:—Ft. Lbs. figures are a measure of the force applied multiplied by the distance or leverage in feet (10 lb. force on end of 12" or 1' wrench equals 10 ft. lbs.). In. Lbs. figures are the same except that distance is measured in inches (10 lb. force on end of 12" wrench equals 120 In. Lbs.). Any figure can be changed from one system to the other as follows:

To Change In. Lbs. to Ft. Lbs.—Divide by 12.

To Change Ft. Lbs. to In. Lbs.—Multiply by 12.

CYLINDER HEAD TIGHTENING DATA:—It is not only important to tighten cylinder head screws or stud nuts to the correct tension as shown in table below, but they should be tightened in correct order as shown in diagrams on following page. Cast iron and Aluminum heads are tightened differently as follows:

Cast Iron Heads—With engine cold, tighten screws or nuts to correct tension as shown in table below. Run engine until thoroughly warm, then check and retighten nuts (additional tightening necessary to bring them back to correct tension).

Aluminum Heads—With engine cold, tighten screws or nuts to correct tension as shown in table below. Run engine until thoroughly warm, then allow engine to cool off, check and retighten nuts after engine has become cool—do not tighten aluminum heads hot.

Cylinder Head Tightening Order—See following page for cylinder head diagrams for each model. NOTE—Where head bolts are not numbered, no particular order is recommended by manufacturer. In general, these models should be tightened from center outward.

AUBURN—CORD

	Ft. Lbs.	In. Lbs.
Cylinder Head	50	600

BUICK

	Ft. Lbs.	In. Lbs.

These units standard equipment on the following car models:

Car Model	Year	Windshield Wiper No.
Chrysler Royal C22	1939	EW-5001, 5101
Chrysler Imperial C23	1939	EW-5001, 5101
Chrysler Cust. Imp. C24	1939	EW-5001, 5101
DeSoto S6, Dodge D11	1939	EW-5001, 5101
Studebaker Comm. 9A	1939	EW-5003
Studebaker Pres. 5C	1939	EW-5003

MODEL NUMBERING NOTATION:—Model numbers given above are assembly numbers and include Links, Pivots, Wiper Arms, etc. Model numbers of Motors used on each assembly are as follows:

Assembly No.	Motor No.
EW-5001, EW-5002	EW-4001, EW-4101 (See Note).
EW-5003	EW-4002, EW-4102 (See Note).

NOTE—EW-4001 and EW-4002 motors were original design and have been superseded by improved design Models EW-4101 and EW-4102.

IMPORTANT CHRYSLER, DE SOTO, AND DODGE CHANGES:—See Special Servicing Notes below for production changes and corrections which should be made on first cars.

WIPER FUSE:—14 ampere (Chrysler, De Soto, Dodge), 20 ampere (Studebaker) in lead between ignition switch and wiper control switch (on switch on later Chrysler, De Soto, Dodge cars). Do not substitute any other capacity fuse.

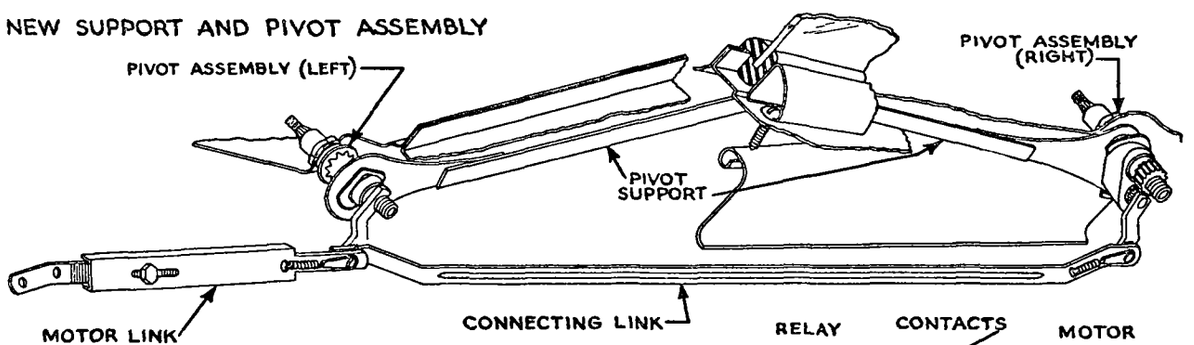
DESCRIPTION:—Windshield wiper consists of a two-pole shunt wound motor driving a crank arm through worm gearing. Crank arm is linked to left hand windshield wiper pivot arm (right and left pivot arms connected in tandem by additional link) so that rotation of the crank arm imparts the usual wiping action to the blade attached to each pivot arm. The motor is controlled by a two-position switch on the instrument panel with special circuits so that relay and cam-operated contacts in control box on motor housing return the wiper blades to the off or parking position when the control switch is turned off. A friction clutch is incorporated in each pivot assembly to allow blades to be moved by hand when cleaning windshield and to prevent stalling of motor when blades blocked by heavy snow or sleet (motor will operate independently). Clutches will slip with pull of 1¾-2¾ lbs. at end of wiper arm.

OPERATION:—***'On' or Running.*** When control switch button is pulled out to the 'on' position, circuit is completed through the motor armature and also through the relay winding '2' (see illustration). Relay contacts then close which completes the motor field circuit so that the motor runs as a shunt wound machine to operate the windshield wiper blades. With motor running, contacts '3' and '4' (see illustration) are alternately opened and closed by the cam on the motor crank arm but this has no effect on the motor operation since the contact circuits are not in use.

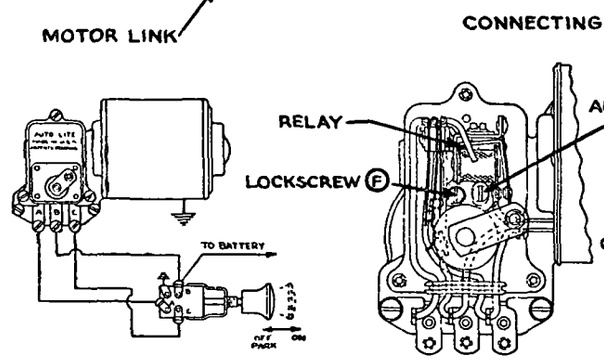
'Off' or Parked. When control switch button is pushed in to the 'off' position, motor continues to run until the parking position is reached when cam 'D' on crank arm opens contacts '4' and closes contacts '3' (motor circuit is completed through contacts '4' from terminal 'B' to terminal 'C' even though switch is in the off position). Closing of contacts '3' ground the armature through relay winding '1'. This action causes the motor to operate as a dynamic brake and retards the opening of the relay contacts (which breaks the field circuit) so that the motor is brought to a positive stop in the park position. This park position is adjustable by changing the relation of the crank arm cam 'D' and the movable contact arm 'E'.

ADJUSTMENT:—**Park Position.** Angle between motor crank arm and line parallel to armature shaft with motor stopped under load (control switch pushed in to 'off' position) is shown in table below. This angle must be correctly set to insure proper position of wiper blades on windshield when not operating.

Windshield Wiper Model	Park Angle
EW-4001, EW-4101	21°
EW-4002, EW-4102	14°
EWA-4001, EWA-4101	21°
EWA-4002, EWA-4102	14°

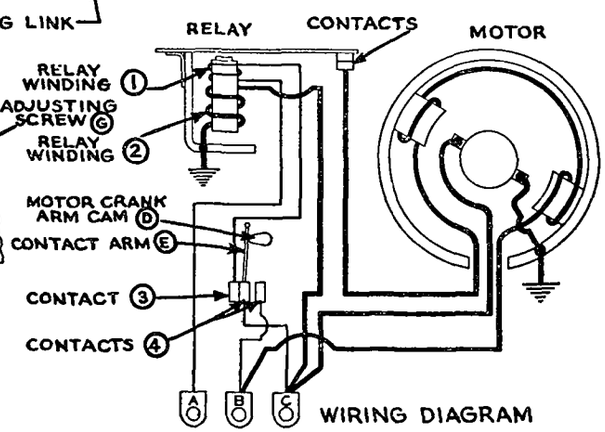


To adjust Park position, remove relay cover, loosen lockscrew 'F' (see illustration), turn eccentric adjusting screw 'G' to secure correct angle. After making this adjustment, check contact gap '4' (.025" minimum with motor stopped in park position), and contact pressure (2 ozs. minimum).



SERVICING:—**Motor.** Bearings (commutator and drive end) do not require lubrication in service and no oilers provided. Gear box should be filled ¾ full with special Auto-Lite ST-294 gear grease before assembly and crank arm cross shaft should be coated for entire length with this same grease before assembly in housing. Use extreme care to prevent grease getting on commutator and contact points.

Bearing Alignment—After motor completely assembled (but before running) strike frame several sharp blows with rawhide hammer to align bearings at commutator and drive end of armature shaft.



Armature Endplay—Must not be less than 1/32" (measure by removing gear case cover and moving crank arm back and forth. If necessary to reduce endplay to eliminate noise caused by excessive end motion, install thrust washers but make certain that endplay not less than 1/32".

NEW SUPPORT AND PIVOT ASSEMBLY

SWITCH CONNECTIONS (EARLY CHRYSLER CARS)

WIRING DIAGRAM

Motor Specifications

Starting (Under Load)—4 volts min. (all 6 volt units), 8 volts min. (all 12 volt units).

Running (Light)—3.0-4.5 amperes at 5.8 volts (all 6 volt units), 1.5-2.25 amperes at 11.6 volts (all 12 volt units).

Field Current—1.5-1.7 amperes at 6.0 volts (all 6 volt units), .7-.9 amperes at 12.0 volts (all 12 volt units).

Relay Specifications

Closing Voltage—4 volts max. (all 6 volt units), 8 volts max. (all 12 volt units).

Opening Voltage—.2 volt min., .5 volt max. (all 6 volt units), .25 volt min., 1.0 volt max. (all 12 volt units).

Contact Gap—.020" min., .025" max. Adjust by bending stop 'H' as required. Do not disturb relay armature hinge lug.

Air Gap—Armature should be sealed flat against top of core with contacts closed.

TROUBLE SHOOTING:—If operation not satisfactory, check as directed below (see Chrysler Special Servicing directions for corrections on first cars).

Motor will not Start or Run

1. Fuse Blown. Check following possible causes before replacing fuse. Use only correct capacity fuse for replacement—14 ampere (Chrysler, De Soto, Dodge), 20 ampere (Studebaker).

(a) Examine relay contacts and resurface or clean if dirty. Use strip of clean linen tape and carbon-tetrachloride, finishing with clean dry tape to remove all residue. If filing necessary, use ST-290 file.

(b) Check connections. Resolder connections and tighten all terminals.

(c) Check motor ground. Tighten ground strap and mounting screws.

(d) Low battery voltage. Check battery and recharge if necessary.

(e) Grounded motor leads. Check leads at point where wires go through drive end head into motor. Insulate wires and install sleeve to protect wires from sharp edge of motor frame casting.

2. Loose Connections in Wiper Circuit. Check all wiring. Tighten connections at Windshield Wiper, Control Switch, and Ignition Switch.

3. Crank Arm Shaft Binding. If necessary, replace drive end head. Make certain that cross shaft greased for entire length with special ST-294 grease before installing and that all wire connections are clean and tight.

4. Linkage Binding. Make certain that linkage between crank arm and pivot arms is not binding and that wiper blades and pivot arms operate freely.

Motor Stops with Blades in Wrong Position

1. Park angle incorrectly set. See adjustment section above.

Motor Will Not Stop

1. Loose connections at switch. Examine and tighten connections at Control Switch 'A' terminal and ground connection.

2. Parking mechanism out of adjustment. Check Park adjustment (see Adjustment section above) and particularly contact gap (contacts '4').

3. Relay Operation Incorrect. Check relay and adjust to specifications given in Service section above. Replace relay if satisfactory performance cannot be secured by adjustment.

NOTE—On units manufactured before December 1, 1938, complete motor should be replaced.

Overtravel of Right hand Blade.

1. Pivot Assembly defective. See that right hand pivot assembly does not move in mounting and that bearing clearance of pivot assembly is not excessive. See special servicing notes below for new pivot installation directions.

2. Insufficient Wiper Blade Tension. Check wiper blade tension on glass (measure with spring scale at instant wiper blade leaves the glass). Increase tension to 5-6 ozs. by bending lower spring holding lug.

3. Excessive sideplay between arm and blade. Wiper blade should be press fit in arm. Adjust by pressing the two blade holding fingers together.

CHRYSLER, DE SOTO, DODGE SPECIAL SERVICING NOTES:—Improved pivot assemblies and special support assembly welded to body designed to correct excessive motor movement on bracket or pivot assemblies moving in mountings were put in production on all cars beginning with the following serial numbers:

Chrysler Royal Model C22	7574866
Chrysler Royal Windsor Model C22	6948303
Chrysler Imperial Model C23	6742485
Chrysler New Yorker Model C23	6609905
**De Soto Model S6	5634616
Dodge Special Model D11	4278375
Dodge Deluxe Model D11	30105170

**Service Pivot Support Assembly installed on all cars before this Serial Number.

On all cars before these serial numbers, if windshield wiper fails to operate, if blade travel is incorrect, or if cowl panel flexes and motor moves excessively on bracket when operating, check following table for possible causes and install new pivot assemblies (Part No. EW-1089B—left hand, EW-2172—right hand) and special Service Pivot Support (Chrysler Part No. 837954) as directed below. NOTE—Service Pivot Support installed on all De Soto cars, new pivot assemblies only need be installed on these cars.

Motor Stalls Causing Fuse to Blow

1. Inoperative Pivot Clutches. Clutches should slip with pull of 1¾-2¾ lbs. applied at end of wiper arm. If clutches do not slip, any obstruction preventing wiper blade movement will stall motor.

2 Binding or Seizure of Pivot Shafts. May be caused by improper lubrication, incorrect assembly (square sleeve not properly entered in washers when assembled), improper adjustment of motor and pivot link, stiff pivot clutches, bent pivot shafts. NOTE—Binding or sticking of pivot shafts may cause distortion of linkage as well as motor stalling.

3. Connecting Links Binding. May cause erratic operation or complete failure.

Incorrect Wiper Blade Travel

1. Pivot Shaft Bearing Clearance Excessive. Excessive bearing clearance at right hand pivot will cause under or overtravel of the wiper blade.

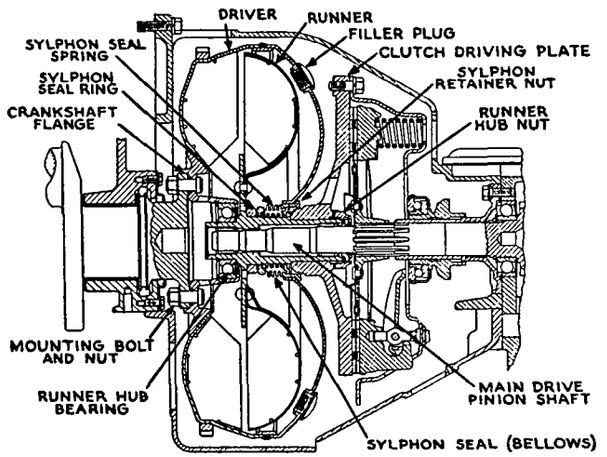
2. Pivot Shaft Assembly Moving in Mounting. Movement of right hand pivot assembly will cause incorrect travel and may allow blades to strike lower edge of windshield or center dividing strip.

NOTE—Check connecting link binding complaints by disconnecting motor link (between motor and left hand pivot assembly) and operating wiper by hand. If binding caused by incorrect pivot alignment or linkage distortion, new pivot assemblies, or new linkage should be installed as follows:

New Support & Pivot Assembly Installation: Remove windshield wiper blades, pivots, and connecting links (On cars with radio, remove glove compartment box to facilitate assembly). Cut off end of center instrument panel-to-belt bar screw flush with bar. Place new support assembly (Chrysler No. 837954) over pivot and arm assembly (EW-2172—R.H., EW-1089B—L.H.) by removing cotter pin from left hand pivot assembly. Connect pivot link assembly (EW-100) with pivot arm pointing toward right. Install lockwasher over square shank of each pivot and arm assembly and install in position in car with bowed section of support toward front, filing cowl ventilator hinge flange if required to provide clearance for connecting link. Install fiber washer (EW-160), plain washer (EW-159), and nut (EW-81) on pivot support. Tighten nut securely and make certain that square holes on washers are properly engaged on square shank of each pivot shank. This is very important for correct wiper operation. See that motor and crank arm are in parked position (motor will stop in this position automatically if operated with regular control switch), connect motor to pivot link and to left hand pivot and arm assembly. Adjust motor to pivot assembly connecting link (loosen adjusting nut and slide connector end in link) so that end of link slips freely over pin on crank arm. With correct adjustment, gap between left hand pivot clutch spring and motor connecting link should be 1/16" with pivot arm at end of travel away from motor. Install windshield wiper blades.

NOTE—This installation made on no-charge basis on cars with motor code date previous to 1T provided car mileage is less than 10000 miles.

Used On:
CUSTOM IMPERIAL MODEL C24 (1939)



DESCRIPTION & OPERATION:—The Fluid Drive (Fluid Coupling) Assembly consists of a self-contained, factory-sealed assembly which is mounted on the rear end of the crankshaft in place of the conventional flywheel (unit has ring gear for starter mesh on outer rim and separate clutch driving plate for clutch mounting bolted on end of runner shaft at rear end). The case and integral 'driver' vanes rotate with the crankshaft and transmit power to the 'runner' or free vane assembly within the case without any mechanical connection through the oil with which the case is filled. The 'Runner' is integral with the hub (short hollow shaft extending through rear of case with clutch driving shaft mounted on rear end) and is mounted on a large ball bearing within the fluid drive case at the forward end and piloted on the clutch shaft at the rear end (clutch shaft mounted on needle bearings within runner hub at each end). Oil leakage is prevented by spring-loaded Sylphon Assembly or bellows and Sealing Ring (on runner hub within case at rear), leather oil seal (at rear end of runner hub on clutch shaft), rubber grommets on mounting bolts (fitted in recess on front face of case) and thin gasket installed between fluid drive case and crankshaft flange.

SERVICING:—Unit is sealed and no adjustment required. Service operations are restricted to filling unit with oil (15,000 mile intervals or when drained) and renewing sylphon assembly and sealing ring (to correct oil leakage). See Removal & Installation directions below if Fluid Drive Assembly is being removed from engine.

Checking Oil Level & Adding Oil:—Recommended at 15,000 mile intervals. Take out removable screen on upper right side of clutch housing, turn fluid drive assembly until one filler plug visible through this opening (2 plugs—180° apart). Use Allen wrench to remove plug, fill case to level of filler plug hole with special Chrysler Fluid Drive Oil, replace plug and tighten securely to prevent oil leakage.

Sylphon Assembly & Seal Ring Renewal:—Remove Transmission and Clutch (see Chrysler C24 'M' page for instructions). Bend down tab on lockwasher and remove runner hub nut (in center of clutch driving plate). Mark spline on runner hub and mating spline on clutch driving plate (to insure correct installation), use special puller to remove clutch driving plate being careful to line up two points on the plate horizontally (plate is hexagonal) so that two top points on plate line up with recesses in clutch housing which will permit plate to be withdrawn from housing. Rotate fluid drive unit until one filler plug is at bottom, remove filler plug with Allen wrench and drain unit. Use special Sylphon Spring Compressor to compress sylphon spring, remove retainer snap ring from sylphon nut, withdraw spring retainer and spring. Use special spanner wrench to unscrew sylphon nut, withdraw sylphon assembly. If Sealing Ring to be replaced, use special puller to remove ring from runner hub. NOTE—Mating surfaces on Sylphon and Sealing Ring must be smooth and show continuous line of contact over entire 360° of circumference. Replace both parts if surfaces are scored or show poor contact.

Installation. To install Sealing Ring, screw ring in special installing tool, heat ring in boiling water, shake free of water and quickly push ring snugly in

place against ground face of runner hub, then unscrew tool and remove. Install sylphon bellows assembly, tighten sylphon nut securely, install sylphon spring, retainer, and snap ring. Fill unit with oil as directed above and install new gasket under filler plug. See that filler plug securely tightened. When installing clutch driving plate on runner hub, coat splines on hub and in driving plate with white lead, use special assembling tool to install plate on hub and see that marks on splines are lined up. Clean surfaces of driving plate and clutch pressure plate thoroughly of all oil and white lead before installing clutch. A special clutch aligning tool is available to line up driven member when installing clutch (extra clutch shaft can be used for this purpose if desired).

Correction for Oil Leaks at Crankshaft Mounting Flange:—If oil leakage occurs at mounting bolts, tighten nuts on eight bolts (nuts are on forward end of bolts, accessible by removing oil pan and rear main bearing cap) evenly and securely. If this does not correct leakage, it will be necessary to replace mounting gasket or mounting bolt grommets (see Removal & Installation directions below).

FLUID DRIVE ASSEMBLY REMOVAL & INSTALLATION:—**Removal.** Remove Transmission & Clutch (See Chrysler C24 'M' page for instructions), rotate fluid drive unit until one filler plug is at bottom, use Allen wrench to remove filler plug, drain unit. Remove engine oil pan and rear main bearing cap. Take off nuts on mounting bolts (on front face of crankshaft flange), pull fluid drive unit back to free bolts from crankshaft flange, remove unit from below.

Installation. Install new grommets on mounting bolts, seating grommets in recess in front face of fluid drive case. Carefully clean face of crankshaft flange and fluid drive unit case (remove all traces of old gasket and any burrs which might prevent flat, even contact of mounting faces). Coat both sides of new .010" thick gasket with shellac, install gasket on fluid drive case (one bolt hole 4° out of line to insure installation in correct position), install fluid drive assembly on crankshaft flange threading mounting bolts through holes in flange, install nuts on mounting bolts, tighten nuts evenly and securely.

CADILLAC
ALL V12 & V16 MODELS (1930-37)

DESCRIPTION:—Automatic take-up is a spring-loaded plunger in a dashpot at the pushrod end of the rocker arm which bears against a cam on the eccentric sleeve. The double springs below the plunger (single spring used on first models) force the plunger up and rotate the eccentric, shifting the rocker arm to take up all clearance. The dashpot is filled with oil and resists the downward movement of the plunger when the valve is opened (the slow escape of oil around the plunger is sufficient to allow the plunger to move down enough to compensate for expansion of the valve gear as the engine warms up).

SERVICING:—The Automatic Take-up mechanism does not require any service operations. A spring-loaded check valve within the plunger allows the free passage of oil into the dashpot below the plunger and prevents the escape of oil when the engine is running. Plungers are a selective fit in the dashpot and should not be interchanged (plungers have a stamped identification mark on the top shoulder and should be installed in cylinders stamped with this same mark on the top). Complete assemblies consisting of plungers, springs, and plunger cylinder or dashpot are furnished for service only (assembly consists of take-up mechanism for two adjacent cylinders as dashpot cylinders are cast in pairs). The initial clearance for the take-up mechanism must be set whenever valves are ground or replaced.

ADJUSTMENT:—First Models. With camslide on heel of cam, use special plunger releasing tool (#109624) to release oil pressure under plunger and hold plunger down at end of stroke with spring compressed (plunger must be held in this position while making the adjustment). Rotate eccentric sleeve so that cam rests on top of plunger. Use special combination screwdriver and wrench (#109627-T) and turn adjusting setscrew on pushrod end of rocker arm until clearance between rocker arm and valve stem is .030". This adjustment can be made with engine running or, if engine is not running, turn engine over until piston is at firing position to make certain that camslide is on heel of cam. Lock adjustment with adjusting setscrew locknut. Check to see that plunger is down at bottom of stroke with eccentric sleeve cam in contact with top of plunger. This is important to provide sufficient plunger stroke to take up clearance when engine is operated.

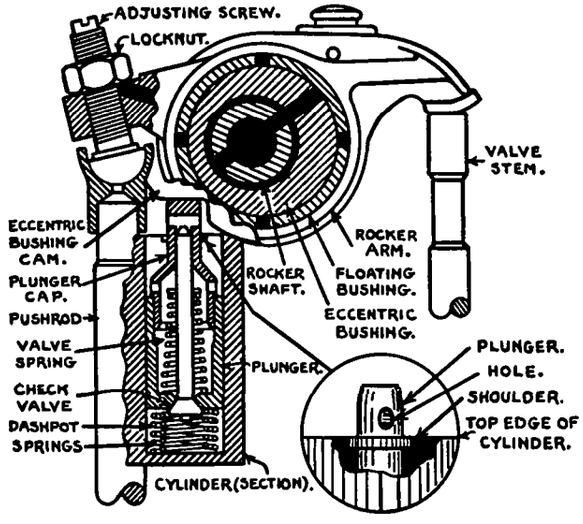
Later Models. On models with a shoulder just below the hole in the top of the plunger, adjustment can be made by releasing oil pressure in dashpot cylinder (by pressing down on check valve) and pushing plunger down in cylinder until the bottom of the hole in the upper end is below the top edge of dashpot. Use special combination screw driver and wrench #109627T and turn adjusting screw on pushrod end of rocker arm down until all clearance taken up. Release plunger and back adjusting screw off until top of shoulder on plunger is even with top edge of dashpot (see illustration), tighten adjusting screw locknut.

PACKARD
ALL V12 MODELS

DESCRIPTION:—On these models, valve actuating mechanism consists of a rocker arm mounted above the camshaft with a cam follower on the lower end of the arm and upper end of arm contacting the valve stem. Rocker arm is mounted on an eccentric sleeve which is rotated by the Automatic Take-Up mechanism so that all clearance is taken up between the rocker arm and the valve stem under ordinary running conditions. Pressure is not sufficient to hold the valve off its seat and take-up mechanism backs off enough to compensate for expansion of valve mechanism as the engine warms up (permitted by slight leakage of oil from plunger cylinder). Rocker arm and cam follower are mounted on needle bearings and no provision is made for manual adjustment of the tappet clearance (see Checking Clearance directions below). The automatic take-up consists of a spring loaded plunger in a cylinder above the rocker arm which bears on a cam on the eccentric sleeve. A spring above the plunger forces the plunger down and rotates the eccentric sleeve to take up all clearance between the rocker arm and the valve stem. The dashpot within the plunger is filled with oil and resists the upward movement of the plunger when the valve opens (slow escape of oil around piston allows plunger to move up enough to compensate for expansion of valve gear as engine warms up).

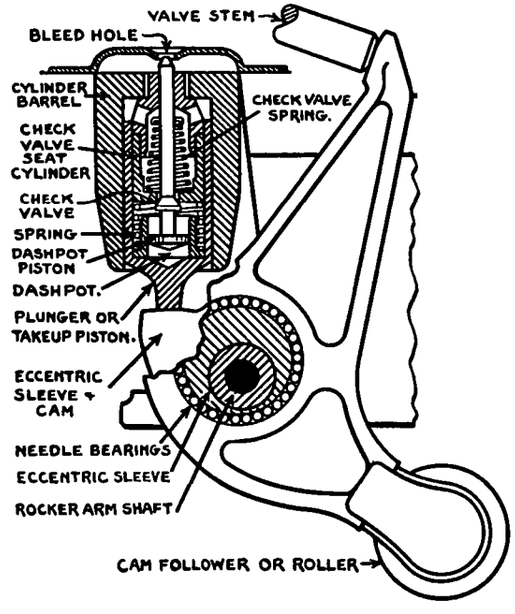
A spring-loaded check-valve on the dashpot piston stem allows the free passage of oil into the dashpot and prevents the escape of oil when the engine is running.

SERVICING:—The Automatic Take-up does not require any servicing operations. All parts are a selective fit and should not be disturbed or interchanged. Whenever valves are ground it will be necessary to bleed the take-up to allow valves to seat with valve springs removed, and the valve clearance or stroke of the mechanism must be checked when valves reassembled.



Bleeding Take-up Mechanism (Grinding Valves)—With valve springs removed, valve should be held approximately .028" off seat by rocker arm. Bleed Automatic Take-up mechanism by inserting ⅛" round rod in bleeder hole in top and pressing down on rod to open check valve. Press rocker arm lever back away from valve stem (do not force lever) and hold in this position by installing wedge (#ST-879) between lever and crankcase while valve is being ground. Do not crank engine with these wedges in place.

Checking Clearance (Installing Valves)—With valve refaced and reseated ready for installation, check clearance by installing valve in engine with clearance gauge (#ST-865) in place between valve and cylinder and centered on valve. Make certain that rocker lever roller or cam follower is on low side of cam by cranking engine over until valve is fully open, and then turning engine over one additional revolution. **Do not crank engine with wedges in place.** Remove wedges and hold rocker arm as far away from valve stem as possible by hand while engine is being turned over. Use feeler gauge and check clearance between valve stem and rocker arm. Clearance must be .002" minimum (providing .040" automatic take-up) to .015" maximum (providing .025" automatic take-up). If clearance is not within these limits, the end of the valve stem can be ground off to provide .015" clearance. The plunger is designed for a stroke of ⅛" downward, 3/32" upward to provide an average automatic take-up of .040" plus or minus .010" on new engines.



SPECIFICATIONS:—The take-up plunger clearance within the cylinder barrel is held to .0015-.0025". Clearance of check-valve seat cylinder and inner wall of plunger is .0007" plus or minus .0001". Clearance between dashpot piston and dashpot is .006-.008". The check-valve seat is ground and the check valve burnished to provide an oil-tight seat.

NOTE ON VALVE GRINDING:—A split type valve retaining key was used on the first cars and care should be taken in removing them to prevent them dropping into the crankcase. Valve springs should be installed with the japanned end down toward rocker arm. The spring has a closer-spaced first coil at the upper end.

CADILLAC.

PACKARD.

AUTOMATIC VALVE TAPPET TAKE-UP

WILCOX-RICH ZERO-LASH HYDRAULIC TYPE

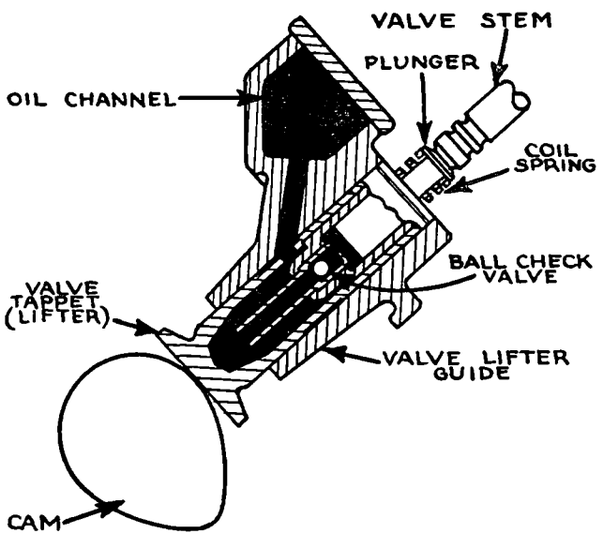
Std. Equipment On:
CADILLAC V8, ALL SERIES (1936-37-38-39)
CADILLAC V16, SERIES 90 (1938-39)
LA SALLE V8, SERIES 50 (1937-38-39)
LINCOLN, V12 MODEL (1937-38-39)
LINCOLN-ZEPHYR, MODEL 86H ('38), 96H ('39)
PIERCE ARROW 8, ALL MODELS (1932-38)
PIERCE ARROW 12, ALL MODELS (1932-38)

DESCRIPTION:—This type automatic take-up is hydraulically operated and is built inthe valve lifter or tappet (engines are 'L' head type). The conventional tappet clearance adjusting screw is not used and the lifter plunger contacts the end of the valve stem directly. The lifter is made in two parts; a lower or lifter section (mushroom or barrel type) which contacts the camshaft cam, and an upper or plunger section which contacts the end of the valve stem. The plunger fits into a cylinder in the head of the lifter body and is raised to contact the valve stem end by a spring under the plunger head. Oil from the pressure lubricating system of the engine flows through the oil reservoir in the lifter bracket and the oil passage in the lifter body to fill the cylinder below the lifter plunger. When the lifter is raised by the cam to open the valve, the ball check valve in the bottom of the cylinder closes, preventing the escape of oil from the cylinder and the cam motion is transmitted directly through the lifter to open the valve. The combination of plunger spring (to take up any clearance between lifter and valve stem end) and oil trapped in the plunger cylinder by the check valve (so that cam pressure is transmitted solidly through the lifter assembly) result in an entirely automatic take-up with positive valve opening action.

Pierce Arrow Note—Lifters are of different design with ball check valve retained by pin in lower end of plunger and coil spring mounted on lower end of plunger and engaging counterbore in plunger body. On 1935 and previous models, lifters interchangeable on 8 and 12 cylinder models with exception of plunger cap (see Service Note below on Plunger Caps).

SERVICING:—Removal. On mushroom lifter types with removable brackets, disconnect oil supply tube (when external oil line used), take out capscrews in each lifter bracket, lift bracket out taking care that lifters do not fall out of bracket (on some installations, lifters prevented from falling through bracket by locking ring at upper end of cylinder). On barrel type lifters which operate in guide holes in block (no guide brackets), lifters may be removed from upper end after valves and springs removed.

Disassembly. On mushroom types, remove locking ring at top of cylinder, withdraw lifter unit from below. Pull plunger and cylinder assembly out of lifter body. Unlock plunger spring by twisting plunger, pull plunger and spring out of cylinder (plunger is selective fit in cylinder and must be re-installed in same cylinder). Ball check valve in bottom of cylinder may be unseated if necessary by using small blunt tool.



Servicing—Wash all parts in gasoline, wipe with soft cloth or dry with air (air hose must not be held closer than 2"). If plunger or cylinder scored or clearance excessive, replace as a unit (old lifter body may be used if clearance in bracket or block guide holes not excessive). Check ball check valve tightness (see Testing). Ball should rattle when unit is shaken. Clean out oil reservoir and oil passages in brackets and engine block.

Reassembly—Place plunger spring on plunger, insert plunger in cylinder, lock spring in cylinder by twisting plunger. Make certain that same plunger and cylinder used together (plungers must not be interchanged). Install plunger and cylinder assembly in lifter, insert lifter assembly in bracket and install locking ring at upper end of lifter body above bracket (when used).

Pierce Arrow Plunger Cap Note—On 1935 and earlier cars, lifters interchangeable between 8 and 12 cylinder cars by installing correct plunger cap (longer cap on 8). To exchange caps, clamp cap (not plunger) in vise, use pin inserted in plunger holes and pull plunger off cap, press correct cap in place. Use extreme care not to distort or mar plunger body.

Installation—Valve lifters should be installed without oil in the cylinder (mechanical clearance must be checked if new parts installed or valves serviced) and engine should be run to quiet valve action (may require running for as long as an hour, if oil seals off air escape between plunger and cylinder before all air expelled, valve may not quiet until oil is warm).

Pierce Arrow Note—After installing lifter bracket assemblies on engine, see that lifters spin in brackets when engine is running. If they do not, loosen bracket mounting bolts, shift bracket to front or rear slightly, tighten bolts. Do not overtighten bolts which will distort brackets and cause lifters to bind. See that gasket projects evenly above and below lifter bracket (gasket is 1/16" wider) to insure oil holes being in line and open.

Checking Clearance—When new parts installed or valves reseated, check clearance between plunger and valve stem with plunger held down at bottom of stroke (no oil in cylinder). Clearance must be .030-.070". If clearance less than .030", grind off lower end of valve stem slightly.

Cadillac V8 Note—Use tool J-1055 to check valve stem length before installing lifters (measures distance from heel of cam to valve stem). Grind off end of valve stem until tool slides into place. Use tool J-827 to compress plunger springs when installing lifter bracket assemblies.

Pierce Arrow Note—Clearance between plunger cap and valve stem must be .015" with lifter dry. If clearance less than this amount, remove plunger from plunger body, grind off lower end of plunger slightly using care not to grind into ball check retaining pin.

TESTING:—Plunger Fit in Cylinder. With all oil washed out and unit dry, pull plunger up to release spring from counterbore in cylinder, raise plunger as high as possible while still guided in cylinder, push plunger down into cylinder quickly and release. If unit holds air to extent that plunger tends to bounce back when released, clearance is satisfactory. **Plungers are selective fit in cylinders and must not be interchanged** (clearances cannot be measured directly).

Check Valve Tightness. Check by filling cylinder with kerosene and noting rate at which this leaks past the ball check valve. Maximum allowable leakage is 1 drop per second.

Engine Oil Pressure. Oil pressure at lifters not ordinarily indicated by instrument panel oil pressure gauge (reduced by metering restriction, etc. in oil lead to lifters). Pressure at lifters should be 4 lbs. minimum at idling speed, 12 lbs. minimum at high speed. Pressure in excess of 55 lbs. may cause noisy valve operation. Check by connecting pressure gauge in lifter oil line (where external oil lines to lifters used, disconnect line; on Lincoln Zephyr remove plug between banks at **rear** of engine directly above lifter metering hole.

TROUBLE SHOOTING:—If operation not satisfactory, check as follows:

All Valves are Noisy.

NOTE—Hydraulic lifters should be installed without oil and operation will not be quiet until engine has been run for a short time. Oil in lifters when installed will hinder this quieting operation.

1. Oil Level Low—Oil level in crankcase must not be allowed to become excessively low which may permit air to enter pump inlet.

2. Oil Level High—Oil level in crankcase should not be above 'Full' line on indicator. Higher level may cause foaming.

3. Oil Pressure Low—Oil supply to lifters will be inadequate. Must be sufficient to replace normal relief leakage between plunger and cylinder. Check oil pressure (See Testing above).

4. Oil Pressure High—High pressure may lift entire hydraulic unit against plunger spring tension causing excessive wear. If noise particularly noticeable when oil is hot, check pressure in oil supply line at lifter assembly (See Testing above).

One or More Valves Noisy.

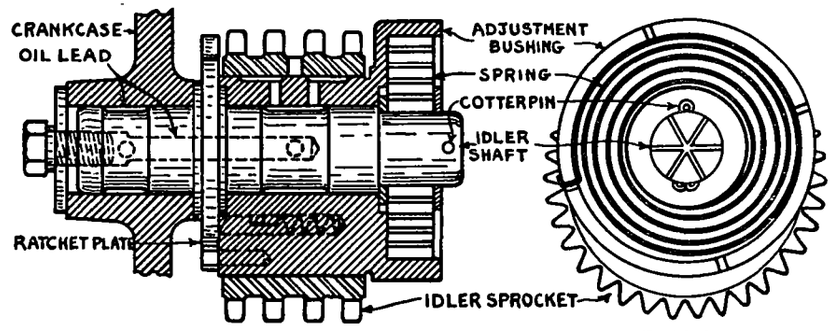
1. Incorrect Clearance—Check mechanical clearance for particular unit (see directions above). Check clearance between plunger and cylinder (if parts interchanged, replace as a unit), check clearance between cylinder and lifter body.
2. Sticking Caused by Dirt or Grit—Disassemble and clean units as directed above. Drain crankcase, clean oil pan, flush engine, refill crankcase with new oil to prevent repetition of trouble.

DESCRIPTION:—Link-Belt Timing Chains used on automobile engines are of three types: 1) Middle Guide with guide link at center of chain which engages groove in sprocket teeth, 2) Side Flange with flanged or guide links at each side of chain which fit over edges of sprocket teeth, 3) Duplex or back type which is a double faced chain designed to engage tooth type sprockets on either side (used with automatic take-up idler sprocket which engages back face of chain).

NOTE—All chains used for two-sprocket drives, and some three-sprocket drive chains are fitted with no-back-bend or check links which permit the chain to bend only in the direction of the sprockets. This prevents all 'whipping' action of the chain in service.

Link Construction. The Link-Belt Patented Liner Joint is used in all chains for two and three-sprocket drives. Liners are built with .004" spring (ends spring back .004" from center—see illustration). As installed in new chains, the liners are straight. However, as wear occurs, the spring in the liners tends to compensate for any slack which develops so that the chain is kept tight throughout its life.

INSTALLATION:—Chains should be installed 'endless' (with sprockets removed from engine) whenever possible. Whenever chain disassembly is necessary, split the washer under the riveted head of the pin, push the pin out, remove liners. To assemble chain, mesh chain links, install both liners, then push pin in place between liners, install washer on pin and rivet end of pin securely.



ADJUSTMENT TYPES:—Link Belt Chains are used with the various types of adjustments listed on the previous page. In addition a special type of eccentric manual adjustment and a special automatic adjustment idler sprocket have been developed.

Eccentric Manual Adjustment. On this type the sprocket revolves on an eccentric stub shaft which is mounted in the crankcase and which can be rotated by hand to take up the timing chain. The accessory drive shaft passes through the center of the chain (its center does not shift). A toothed flange is bolted on the end of the accessory shaft and corresponds with teeth on the forward end of the drive sprocket. The two are held together by a small chain which is assembled around them directly in front of the timing chain. This type of mounting permits the removal of the accessory shaft or generator (where the generator shaft extends through the eccentric mounting) without disturbing the timing chain simply by removing the nut on the end of the shaft which holds the drive flange in place. Any desired relation between the crankshaft and accessory shaft can be secured (where this is necessary for timing, etc.) by removing the small coupling chain and rotating the accessory shaft.

***Automatic Adjustment* Idler Sprocket.** This type sprocket is designed in two types which differ in construction principally in the manner of mounting the take-up spring (see illustration). It is used with a duplex type chain and is ordinarily mounted between the accessory drive sprocket and the crankshaft sprocket and engages the back of the chain (where the chain is wrapped around the crankshaft sprocket), or inside the chain (where the chain passes over the crankshaft sprocket). The sprocket revolves on an eccentric sleeve which is mounted on a short stub shaft mounted in the crankcase. A spiral spring is placed under tension in such a manner as to tend to revolve the eccentric sleeve (one end of the spring is engaged in the slotted end of the stub shaft and the other end is fastened to the eccentric sleeve) thus forcing the sprocket toward the chain and taking up the slack. The sprocket is designed to take up all slack developed during the life of the chain and no adjustment is necessary.

To Remove Automatic Idler Sprocket. First take out the cotter pin in the end of the stub shaft. Then take hold of the adjustment bushing (eccentric sleeve) and pull out by hand. The washer, adjustment bushing and spring will come out together. The chain can then be lifted up and the sprocket wheel lifted off.

To Install Automatic Idler Sprocket. Place the sprocket wheel on the shaft and mesh it in the chain. Push the adjustment bushing or eccentric bushing on the shaft until the spring is close to the slotted end of the shaft and rotate the bushing by hand until the spring slack is all taken up. Wind up the spring one and one quarter turns (not more than one and one half turns) and push the end of the spring into the nearest slot of the shaft. A special spring winder should be used in winding up the spring. Press the spring back into the spring box, place the washer on the shaft and insert the cotter pin. The assembly can be checked by turning the eccentric bushing in a direction opposite to the winding direction. The spring should return it to the initial position when it is released.

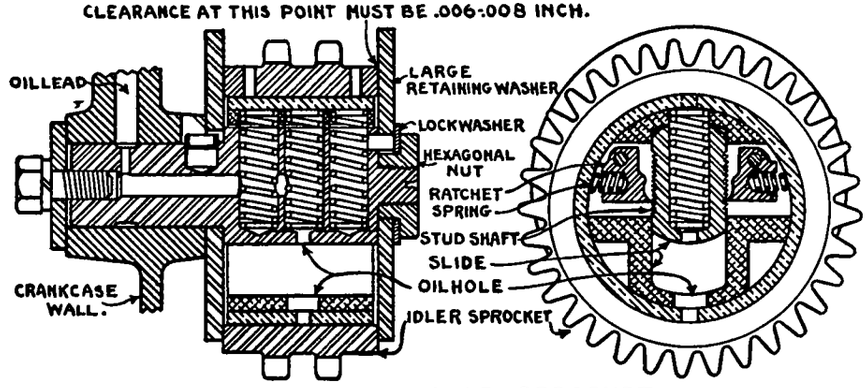
The Effect:

Link-Belt Spring Liner Construction

MORSE CHAIN TYPES & AUTOMATIC TAKE-UP SPROCKET

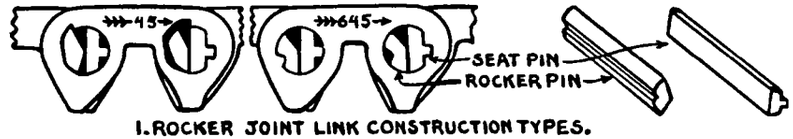
CHAIN TYPES:—Morse Silent Timing Chains are furnished in center guide and duplex types. Three types of joint construction will be found in service. These are Rocker Joint, Bushed Joint, and Oscillating Joint types

1. Rocker Joint. The Rocker Joint link assembly consists of two pins, a ribbed seat pin, and a plain rocker pin. The chain is designed to operate in one direction which is indicated by an arrow stamped on the face of the outside links. The seat pin is the leading pin and is assembled with the rib pointing in the direction of the arrow. This rib engages in a slot cut in the end of the links and prevents the seat pin from turning. The rocker pin is free to oscillate in the link. In assembly the two pins are slipped in place in the link and a retaining washer is slipped over the end of the seat pin. The seat pin is then riveted over the washer. To disassemble the chain, first turn the chain until the link which is to be taken out is directly over one of the sprockets, then split the washers at each end of the link with a cold chisel and push out the pins. The chain can then be removed and the link will fall from place.



2. Bushed Joint. In Bushed Joint construction, the links are held in place by a round pin and two half round bushings. The bushing is held rigidly in the end of the link but is free to turn in the intermediate links, permitting the chain to adapt itself to the sprockets. In assembling the chains the bushings are slipped in place and the outer link assembled with the 'D' shaped end of the pin projecting through the link. The pin is then riveted over the link. To disassemble the chain, turn chain until the hunting link is on the sprocket. Then drive out the pin at each end of the link and take out the pin and bushings. Chains of this type without direction arrows are designed to run in either direction. Certain chains are marked with direction arrows on the outside links. The chain should be assembled so as to run in the direction of the arrow.

3. Single Pin Joint. The single pin joint consists of a special shaped hardened pin with the ends riveted in the outside links. Pins are securely held in one row of links with clearance provided in the other row to permit the links to turn on the pin. Links are symmetrical in shape and chains may be run in either direction. Chains with this type joint are supplied in flexible types and also in anti-whip or non-back bend types which have a special shaped pin hole in one row of links which prevent any back bend in the chain. Chains are furnished with one coupling pin (headed pin with cotter pin fastener on opposite end) which may be taken out to permit the chain to be installed without removing the sprockets.



ADJUSTMENT TYPES:—Morse Chains are used with the various types of adjustment detailed on the preceding page. In addition a special Morse type eccentric manual adjustment drive and automatic adjustment have been developed. Details concerning these types are given below.

1. Eccentric Manual Adjustment. This installation incorporates a special accessory drive sprocket which is carried on an eccentric sleeve. The accessory drive shaft passes through the eccentric shaft on which the sprocket revolves and has a fixed center which is not disturbed when the timing chain is adjusted. The eccentric sleeve is carried in a sleeve in the rear of the timing chain case and extends through to an adjustment clamp arm on the rear face. The adjustment consists of loosening the clamp screw and turning the clamp arm. This revolves the eccentric sleeve within the accessory sprocket, causing the sprocket to move outward thus taking up the chain slack. The full range of adjustment is 180 degrees or 5/16 inch. When this point is reached the hunting link should be removed from the chain and the adjustment clamp returned to its original position.

2. Morse Automatic Adjustment. The Morse Automatic Adjustment consists of an idler sprocket engaging the rear face of a Duplex type timing chain. The idler sprocket revolves on a bushing which is mounted eccentrically on a stationary shaft. Three coil springs in the shaft maintain a constant pressure on the bushing tending to move the sprocket toward the chain and thus take up the chain slack. Two dogs or ratchets are held in engagement with serrations in the sides of the shaft. These provide stops for the adjustment and prevent reverse action. Provision is made for force lubrication. The adjustment range is sufficient to take up all allowable wear in the chain. When the sprocket reaches the point of maximum adjustment the chain should be replaced. Shortening the chain will cause excessive wear on the sprockets since the chain teeth will not mesh properly.

MORSE AUTOMATIC IDLER SPROCKET.

1. ROCKER JOINT LINK CONSTRUCTION TYPES.

To replace the chain, take off the hexagon nut, lock washer and large retaining washer. This will expose the sprocket mounting on the stud shaft. Insert a small flattened pin in the two slots in the slide adjacent to the shaft. This will release the ratchets. Then press down on the sprocket compressing the springs and insert a hardwood plug in the slide opening under the stud shaft to hold the sprocket in place. The chain can then be replaced. If it is desired to disassemble the automatic sprocket this can be done after the chain has been removed by sliding the sprocket off and then forcing the bushing outward. After the bushing has been removed the slide can be removed and disassembled. Be careful to save the five springs used in the assembly. In reassembling, the large retaining washer must not be clamped tight against the face of the sprocket. The clearance at this point should be .006-.008 inch.

DESCRIPTION:—Whitney chains are furnished for original or replacement equipment on car models in both the conventional internal engagement and the Duplex or back-laced types (for use with automatic idler take-up sprockets). The internal engagement type is fitted with the Whitney patented 'Inside Face Link and Sprocket Tooth Engagement' by which the sprocket tooth is engaged in the recess at the center of the link while clearance is provided at the ends of the link so that they do not contact the sprocket tooth. The "Anti-Whip' guide links may be fitted at the center (Center Guide) or at either side (Side Guide) of the chain. These Anti-Whip guide links consist of wedge shaped pieces which replace the usual guide links. They are cut away on the lower edge to permit the chain to wrap around the sprocket but the straight upper edges contact when the chain is drawn out straight between the sprockets so that no whip is possible (see illustration). The two types of link construction are as follows:

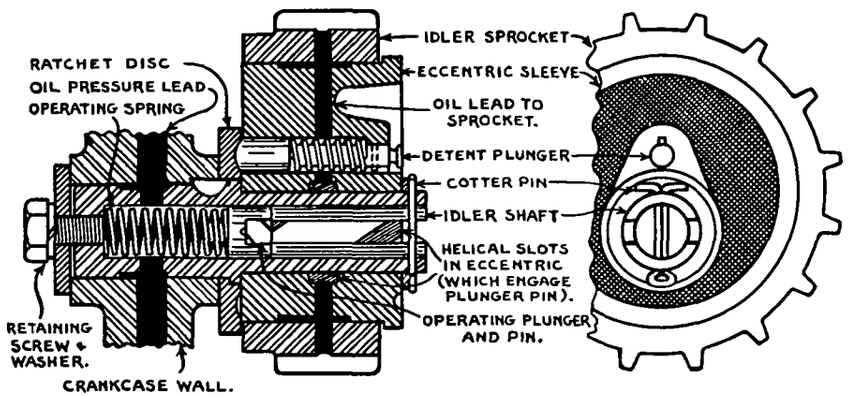
Double Bearing Pin and Bushing Type. In this type the links are joined by a pin on which a row of bushings are assembled. The bushings are free to turn on the pin so that a double bearing surface is provided, an inner bearing between the pin and the bushing, and an outer bearing between the bushing and the link ends. See Installation Directions below for details of assembly.

Single Floating Pin and Link. In this type the links are joined by a single pin which is inserted through the link ends and the end then riveted over a washer installed on the end of the link. The bearing surface is between the pin and the link.

INSTALLATION:—Chains are ordinarily furnished 'endless' and should be installed in this condition whenever possible. On 'two-sprocket' drives where no adjustment is furnished, the camshaft sprocket is usually mounted on a flange or hub and can be removed in order to permit the chain to be meshed on the sprockets. On three-sprocket drives, where an adjustment is provided, the adjustment should be backed off as much as possible and if necessary the camshaft sprocket or accessory sprocket removed. If it is necessary to split the chain so that it may be wrapped around the sprockets, proceed as directed below:

To Install Double Bearing Pin and Bushing Types. File off the heads of two rivets and drive out the assembly of two pins and outside link. Drive out one row of bushings. Use a punch and be careful not to damage bushings or links. Install chain on sprockets and mesh end links in proper order. Insert connecting link assembly (see illustration), which has one row of bushings assembled on pin, install loose outside plate or guide link, install cotter pins in pins. Check to see that connecting link and cotter pins do not strike any part of chain case.

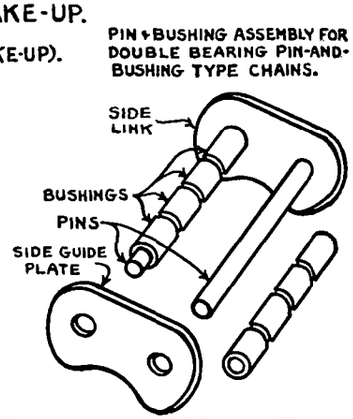
To Install Single Floating Pin and Link Types. Grind or file off the riveted end of any link pin, drive out pin. Install chain on sprockets and mesh end links in proper order. Use special connecting pin and washer to join chain. Insert connecting pin, install open washer on end of pin, pinch washer shut. Check to see that end of connecting pin does not strike any part of chain case.



NOTE:—Duplex or back-laced chains and chains equipped with Anti-Whip guide links must be installed endless and should never be split or opened. Whitney chains will run in either direction and direction need not be considered when chains are installed.

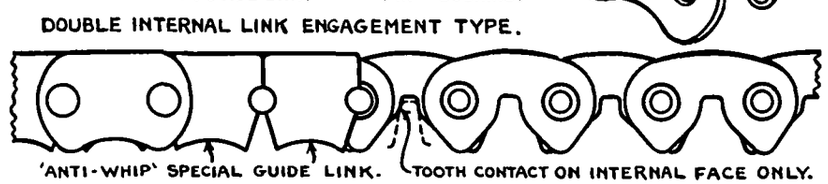
ADJUSTMENT:—See individual car pages for chain adjustment directions where this is required (no adjustment possible on two-sprocket type drives).

WHITNEY AUTOMATIC TAKE-UP IDLER SPROCKET



DESCRIPTION:—This type take-up is designed to be used with Duplex or back-laced chains and with Roller chains. The design and operation of the idler is the same in either case (sprocket tooth form differs only).

OPERATION:—The automatic take-up consists of an idler sprocket mounted on an eccentric which is rotated around a stationary hub or shaft so as to maintain a uniform tension on the timing chain. The range of adjustment is sufficient to take up all play developed during the life of the chain and the chain should be replaced when the sprocket reaches 'maximum' position. The eccentric is rotated by a spring plunger within the stationary hub which engages helical slots on the inner surface of the eccentric and is pushed forward by the spring behind it. A detent plunger located at the side of the stationary hub engages successive slots in the hub flange as the eccentric is turned and prevents any backward motion. The take-up should be locked in 'minimum' position when chain is installed (if camshaft sprocket is removed) or may be disassembled (if camshaft sprocket cannot be removed). See directions below.



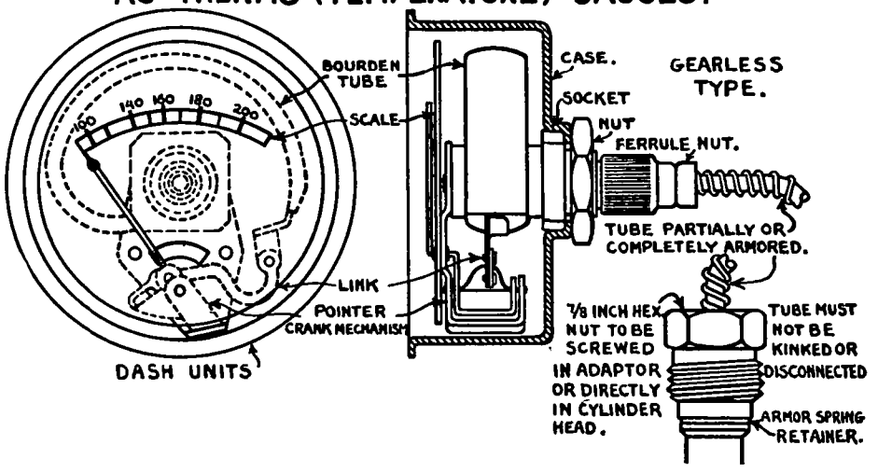
WHITNEY AUTOMATIC TAKE-UP.

REVERSIBLE TYPE (USED WITH AUTOMATIC TAKE-UP).

SERVICING:—**To lock Take-up in Minimum Position.** Pull out detent pins until released (one pin only used on first type idler, several pins on later types), turn take up sprocket to minimum position by pushing plunger tool and lock tool. When chain is installed, release tool and release detent pins (pins locked out of engagement when withdrawn).

To assemble Take-up Idler. Insert plunger spring and plunger in recess in hub, use special assembly tool and compress spring, rotate assembly tool slightly until it locks. Install idler sprocket and mesh sprocket in chain. Insert eccentric in sprocket, place plunger retaining washer on shaft and insert cotter pin. Press on assembly tool until released, withdraw assembly tool and release detent pins.

AC TYPE



DESCRIPTION:—A.C. Temperature Gauges are of the Bourden tube type and consist of a dash unit in which the Bourden tube is mounted, together with the gauge pointer and connecting mechanism, and an engine unit or bulb. The units are connected by a hermetically sealed copper tube and the entire assembly is filled with a special liquid. The engine unit is mounted on the cylinder head and is immersed in the cooling water. As the temperature of the water increases the liquid in the bulb is vaporized causing a pressure to be exerted in the Bourden tube. The Bourden tube consists of a curved tube mounted rigidly at one end and connected to the gauge pointer through a crank mechanism or gear system at the other. The pressure within the Bourden tube results in a movement of the free end causing the pointer to move across gauge dial which is calibrated in degrees.

INSTALLATION:—Gauges are made in three types: Gearless, in which the gauge pointer is connected to the Bourden tube through a simple crank mechanism; Gear Type,, employing a smaller Bourden tube which is connected to the pointer through a sector and pinion gear system to amplify the tube movement, and a Gear Type Heavy Duty design.

Engine unit bulbs are designed in three sizes although for automotive use with a capillary tube length of less than 8 feet the smallest size, .365 inch in diameter and 1⅜ inches long, is used. Capillary tubing between the two units is completely armored or partially armored (at each unit). The engine bulb plug has a ⅝-18 N.F.-3 thread and may be screwed directly into a tapped hole in the cylinder head although it is recommended that an adapter be used in the hole in the cylinder head.

SERVICING:—The entire gauge—dash unit, engine bulb, and capillary tubing—are assembled at the factory as one unit and no attempt should ever be made to disconnect the units or cut the tubing as this will render the gauge inoperative. Gauge must be replaced when found to be defective.

AC THERMO (TEMPERATURE) GAUGES.

AC ELECTRIC TYPE

DESCRIPTION:—This is an Electric gauge of the 'balanced coil' type and consists of a Dash Unit or recording gauge and an Engine Unit or temperature reacting unit mounted in the cylinder head or engine block in contact with the cooling water in the engine. Dash unit is connected to the 'Gauge' side of the ignition switch (controlled by switch and operative only with switch on) and to the engine unit and each unit is grounded (see wiring diagram). Dash unit consists of two coils at a 90° angle with an armature (on which the pointer is mounted) at the intersection of the coil axis. One coil is connected directly between the 'IGN' (feed) terminal and ground on the gauge case, the other coil being connected between the two gauge terminals (in series with the engine unit). Engine unit consists of a fixed resistance unit which has a high resistance value Cold and a relatively low resistance value Hot (gauge operated by this change in resistance due to temperature changes in the engine—gauge engine unit has no moving parts).

OPERATION:—When the ignition switch is turned on with the engine cold, current flows directly through coil 'A' to ground. The high resistance of the engine unit causes a relatively smaller current to flow through coil 'B' (which is connected in series with this resistance) so that the pointer is deflected toward the 'Low' or coil 'A' side of the scale. As the engine warms up, the resistance of the engine unit decreases, allowing an increasingly greater current flow through coil 'B' so that the pointer is drawn over toward the 'High' end of the scale. The balanced action of the two coils compensates for battery voltage variations and in addition an inertia dampener is built in the armature assembly to prevent pointer vibration on rough roads, etc.

SERVICING:—All defective units should be replaced.

TROUBLE SHOOTING:—If gauge operation not satisfactory, check as directed under correct heading in following table, being careful to turn ignition switch off when disconnecting or re-connecting leads on terminals and using extreme care not to reverse connections at dash unit terminals. Do not allow dash unit to be placed in strong electric field which will affect magnetic armature.

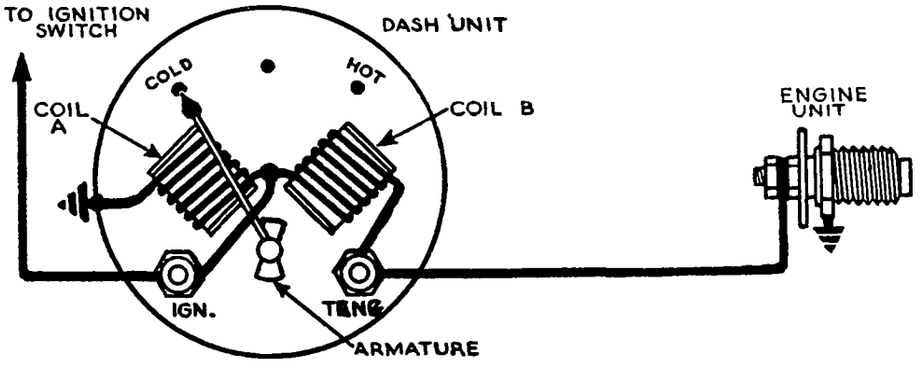
CONNECTION NOTE—Left hand (small diameter) terminal on dash unit should be connected to ignition switch, right hand (large diameter) terminal connected to engine unit. Terminals marked for identification.

Gauge does not register with Ignition Switch turned on:

1. Lead between Ignition Switch and Dash Unit broken or grounded (open or short-circuit). Check by connecting test lead between these two points with regular lead disconnected at both ends.

Gauge register 'Cold' under all conditions:

1. Lead between Dash Unit and Engine Unit broken (open-circuit). Check by connecting test lead between these two units.
2. Coil 'B' (right hand coil) in dash unit defective or lead to coil broken.



Gauge registers 'Hot' under all conditions:

1. Lead between Dash Unit and Engine Unit short-circuited. Check by disconnecting this lead at engine unit terminal and noting gauge reading. If gauge still reads high, this lead is shorted. If gauge reads low, engine unit is shorted and must be replaced.
2. Dash Unit not grounded. Clean all paint from under dash unit mounting flange, tighten mounting screws.
3. Engine Unit burned out. See check under (1) above or install replacement engine unit and note operation.
4. Coil 'A' (left hand coil) in dash unit defective or lead to coil broken.

Gauge registers Inaccurately:

To check, disconnect lead at engine unit terminal, remove engine unit, ground engine unit shell to car frame with test lead, re-connect engine unit, immerse inner end of unit in pan of water at known temperature (use reliable thermometer and heat water as required), note gauge reading.

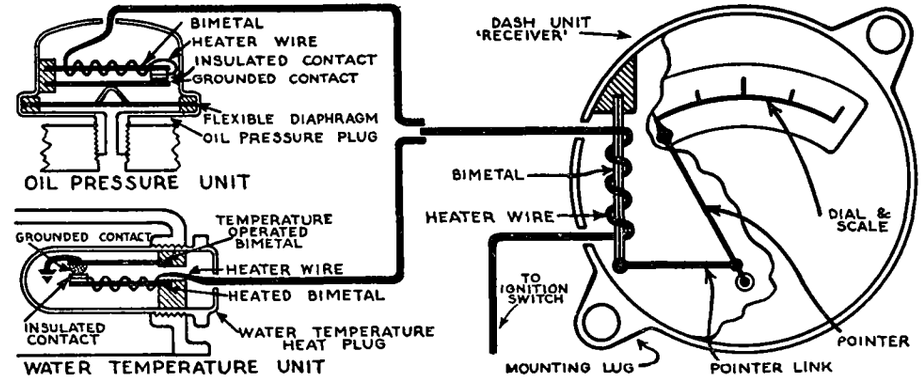
CAUTION—When making this test, do not completely immerse engine unit in water which may allow leakage within shell or short-circuit lead on terminal.

OIL PRESSURE GAUGE

DESCRIPTION:—This is an electric oil pressure gauge comprising an engine unit, and a dash or recording unit connected by a wire. The dash unit is also connected to the ignition switch (gauge operative only with engine turned on) and the gauge circuit is completed to ground through the engine unit contacts. The dash unit consists of a thermostatic bi-metal arm linked to the instrument pointer around which is wound a heating coil. The engine unit has a similar bi-metal arm and heating coil. One of the engine unit contacts is mounted on this bi-metal arm and the other contact is mounted on a diaphragm which is deflected when oil pressure is built up in the engine so as to increase the contact pressure and lengthen the time period over which the contacts are closed. The diaphragm contact completes the gauge circuit to ground.

OPERATION:—When the engine is operated and oil pressure is built up, the pressure deflects the diaphragm in the engine unit and, with the contacts closed, a current flows through the heating coils of the dash and engine unit. The heating effect of the coil in the dash unit tends to bend the bi-metal arm which is linked to the pointer and record a reading on the gauge. At the same time, the heating coil in the engine unit causes the bi-metal arm to flex to a point where the contacts open and the current is interrupted. When this occurs the bi-metal arm in the engine unit flexes in the opposite direction and again closes the contacts. Contact pressure and length of time (amount of flexing necessary to open contacts) is directly proportionate to the oil pressure in the engine, and as this determines the amount of current flowing in the gauge circuit and the deflection of the bi-metal arm in the dash unit, the dash unit indicates the oil pressure. The opening and closing of the contacts is extremely rapid (approximately 120 cycles per minute with engine oil pressure of 25 lbs.). The dash unit is calibrated in pounds and the accuracy of the gauge is established at the time of assembly by the use of calibrating shunts.

SERVICING:—No service operations are necessary other than to see that connections are tight and that lead is properly connected to engine unit. If gauge operation is unsatisfactory, check Trouble Shooting Table and make tests outlined below. Repair or calibration of units is not practical and manufacturer recommends replacement of Receiver or Sender units which are defective.



Trouble Shooting Table

1. **Gauge pointer is erratic.** Engine unit probably defective.
2. **Gauge reading inaccurate.** Engine unit probably defective.
3. **Gauge does not register.** Engine unit defective or dash unit burnt out as result of short-circuit in lead between units.
4. **Gauge registers with engine not running (ignition on).** Short-circuit in lead between dash unit and engine unit or short-circuit in dash unit (a short-circuit of this type will usually result in dash unit burning out, resulting in no reading).

TESTING (ALL UNITS):—Use a gasoline gauge tank unit which is known to be OK. for test purposes. Connect flexible test lead to terminal on this test unit and second lead to test unit mounting flange (for ground circuit). Make tests in order as given below before removing units from car.

Testing Dash Unit Receiver. Disconnect engine unit Sender, connect test unit terminal lead to this wire, ground test unit to engine block. Turn on ignition switch. With float of test unit at bottom (tank empty) position, dash unit receiver pointer should be even with lowest mark on dial. Move test unit float rod up to top position. Dash unit receiver pointer should move to top mark on dial (allow one minute for pointer to come to rest). If dash unit receiver does not operate satisfactorily, see that connections at receiver and ignition switch are tight, check line to ignition switch and line to engine unit, then replace receiver. NOTE—When testing temperature gauges, readings will be reversed (Hot reading with test unit float at bottom, Cold reading with test unit float at top).

Testing Engine Unit Sender. If receiver tests OK. (above), see that motor unit is well grounded, disconnect and check radio condenser (shorted condenser will cause high reading on dash unit). Then replace engine unit sender, connect to dash unit receiver and note performance.

TEMPERATURE GAUGE

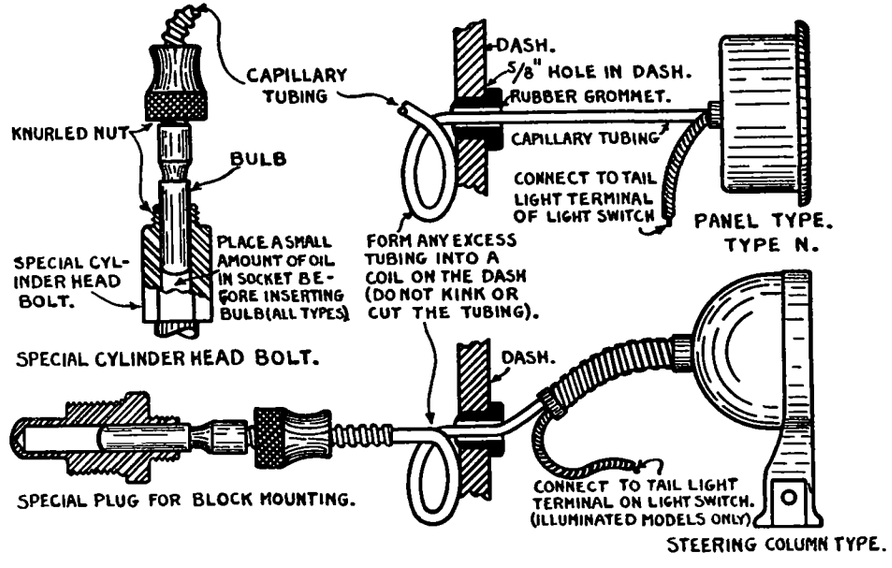
IMPORTANT NOTE:—**All Models.** Temperature gauges will read 'Hot' or 212° with the ignition switch turned off (engine not running). This reading does not mean that gauge is defective and is caused by the linkage design which is designed to conserve current (less current consumed when engine is at normal running temperatures). Gauge readings should only be taken with the ignition switch turned on.

Willys 48 1939. Temperature gauge on this model consists of a tell-tale light on the instrument panel which is controlled by a thermostatic type engine unit similar in appearance to those used on other King-Seeley gauges. This engine unit must never be used with regular thermostatic type dash units (as used on Willys Overland Model 39) as it will result in the dash unit burning out. NOTE—These engine units may be identified by groove around hexagonal head of the engine unit plug. Regular type engine unit for Willys-Overland Model 39 is not marked by these grooves.

DESCRIPTION:—Dash unit or Receiver same design as for Oil Pressure Gauge. Engine Unit or Sender consists of two bi-metal arms within a heat bulb which is designed to be screwed in the engine block so that cooling water temperature is transmitted to the arms. Heating coil (connected to dash unit) is wound on one arm and connected to insulated contact at free end of arm. Ground contact is mounted on free end of second bi-metal arm which is so located that contacts are normally closed (with arms not flexed) and gauge circuit is completed through heating coil and contacts to ground when ignition is turned on.

OPERATION:—When heating coil on bi-metal arm in engine unit is energized, the temperature rise tends to flex the arm and open the contacts. This interrupts current flow, allows bi-metal arm to cool off and flex back so that contacts are again closed. This action is extremely rapid and arm has a vibrating motion. Second bi-metal arm is longer and thinner than heater arm so that flexing action, as engine temperature increases, is greater and tends to increase contact pressure and length of time contacts are closed. Consequently current flow in gauge circuit increases in proportion to the rise in engine temperature and this increased current produces a greater deflection of the dash unit bi-metal arm so that a higher reading is indicated on the dial.

TESTING & SERVICING:—Same as for Oil Pressure Gauges (above). See Note for reversed readings secured on temperature gauges when using special gas gauge tank unit as a test sender.



MOTOMETER (AUTO-LITE TYPES)

DESCRIPTION:—These Motometer Temperature Gauges are of the Vapor Tension type. They consist of a dash unit calibrated to read in degrees of engine temperature, an operating bulb or engine unit, and a capillary tube connecting the dash unit with the engine unit. The Types US, UL, and NS are designed for steering column or dash mounting with the engine unit mounted in a special cylinder head nut or screwed into the engine block in place of the special half inch plug which is provided for this purpose on some engines. The bulb of the engine unit is filled with a liquid and the remainder of the system (capillary tubing and dash instrument) is evacuated. For this reason the capillary tubing must never be disconnected from the bulb or the dash unit and must not be cut or kinked.

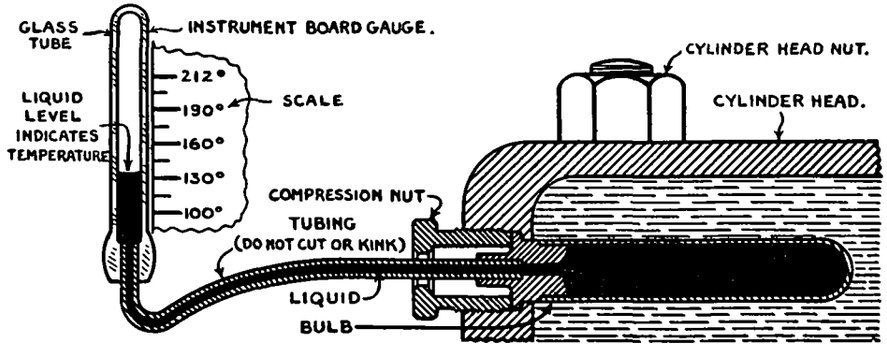
OPERATION:—The bulb is exposed to the heat of the engine block (or the water in the cooling system in the Type N and L gauge) and the liquid in the system is raised to the same temperature. The pressure which results from this increase in temperature causes the dash unit to indicate a reading which is calibrated in degrees. All these models are of the illuminated 'Red Ball' type and must be connected to the lighting system of the car. See Mounting.

MOUNTING:—**Types US, UL NS.** These gauges are of the 'Distance Type' and are designed to be mounted on the steering column or on the dash with the engine unit or operating bulb mounted on the engine block. They are furnished with a special cylinder head bolt and with a special plug which is screwed in the engine block on engines where provision is made for this mounting (these engines are equipped with a half inch plug which should de taken out and the special mounting plug screwed in the opening). To mount the gauge, first mount the dash unit on the steering column or drill a 2 1/16 inch hole in the dash for dash mounting. The securing clamp on the dash mounting type is adjustable for mounting on dash boards of various thicknesses. Then drill 5/8 inch hole in the partition at the left of the engine and pass the engine bulb, capillary tubing and knurled nut through this hole. A special rubber plug or grommet is supplied for this opening to prevent the capillary tubing chafing on the edge of the hole. Then remove the nut from the second cylinder head stud at the left of the engine and take out the stud with a Stillson wrench. Screw the special cylinder head bolt in place. Put a small quantity of oil in the bulb socket, insert the bulb and tighten the knurled nut.

Types L and S. The engine unit or bulb on these types is designed to be inserted in the water outlet hose connection at the front of the engine. Mount the dash instrument as directed above, connect the lead to the tail light terminal of the switch and pass the capillary tubing and bulb through to the engine compartment. Drain the water from the engine, and with the special cutter cut a half inch hole in the hose midway between the ends. Force the bulb socket through this opening, place the reinforcement plate on the outside of the hose and tighten the lock nut. This will make a water tight connection. Form a one inch coil in the tubing and insert the bulb in the socket and tighten the knurled nut. This coil will take up any strain and allow for vibration. Form the surplus tubing into a coil and fasten to the dash. Support the tubing on the radiator tie rod so there is no strain on the tubing at any point. Under no circumstances should any attempt be made to remove surplus tubing by cutting the tube or disconnecting it from the dash gauge or operating bulb as this will destroy the instrument.

If it is necessary to replace the lamp in these instruments, remove the two screws holding the bottom case at the rear of the gauge and insert a 6-8 volt, 2 cp. single contact bulb. If this provides too much light, a 12 volt bulb can be used.

SERVICING:—It is not possible to repair these instruments and they must be replaced whenever they are found to be defective.



K-S HEAT INDICATOR

DESCRIPTION:—The K-S Heat Indicator or temperature gauge is a thermometer in which the glass tube or indicator (dash unit) and the bulb (engine unit) are connected by a sealed copper tube. The entire device is assembled as a unit and the copper tubing must not be cut or the joints broken.

OPERATION:—The liquid with which the bulb and tubing are filled expands evenly with temperature increases and rises into the glass tube so that a reading is obtained when the engine warms up. The location of the bulb in the cylinder head is selected to accurately indicate the cooling water temperature and should not be changed.

SERVICING:—No service operations are necessary. The entire unit must be replaced if found to be defective as a result of mutilation or breakage.

Removal of Bulb from Engine—To disconnect gauge when removing cylinder head, loosen corrosion or sediment around bulb by tapping on cylinder head with a ball-pein hammer, take out compression nut, withdraw bulb. If bulb cannot be withdrawn without great effort, pry gently with a screwdriver. Bulb must not be distorted and must retain its original round shape in order to read correctly.

Used On:
1940 CONVERTIBLE CAR MODELS.

NOTE:—Power tops on all cars are of similar design with differences in power cylinder mounting, linkage design and control hook-up as noted below.

DESCRIPTION:—Convertible tops used on cars with power actuation have the conventional top bows and braces modified for connection of the vacuum power cylinders and are equipped with counterbalancing springs. Two vacuum power cylinders are mounted at sides of car behind seat trim (one on each side) and are linked to the top frame. Each cylinder is double acting type, with vacuum line hose connection to upper and lower end, and operate when control valve button on dash is manipulated to connect either end of cylinder to engine manifold vacuum line (both strokes of cylinder piston rod are positive and top is both raised and lowered by vacuum power). Control valve is double acting type and is normally centered in the 'off' position by a spring within the valve. When the control valve button is pushed in, or pulled out, vacuum connection is made through the valve to one end or the other of both power cylinders. Button must be held in or out during entire time cylinders are operating to raise or lower top.

OPERATION:—Engine should be running (idle engine with closed throttle) and car should be stopped when top control is operated. CAUTION—Top should never be raised or lowered when car is in motion.

Lowering Top—Unlatch top from widshield header on both sides, raise top slightly so that locating dowels or pins are free of header, press in or pull out on control valve button (pull out on button on Buick, Cadillac, Chevrolet, La Salle, Oldsmobile, Pontiac, Packard; press in on button on Chrysler, De Soto, Dodge, Plymouth) and **hold button in this position** until top is completely lowered. In this position, control valve connects lower end of each cylinder to engine manifold vacuum line and opens upper end of each cylinder to atmospheric pressure.

Raising Top—See that top straps or boots are removed so that top is free. Press in on control valve button (Buick, Cadillac, Chevrolet, La Salle, Oldsmobile, Pontiac, Packard), or pull out on button (Chrysler, De Soto, Dodge, Plymouth) and **hold in this position** until top is completely raised. Top should come to rest within 1-2" of windshield header and side rail should be straight (see Adjustment section below). Top must then be pulled down and fastened in place by hand.

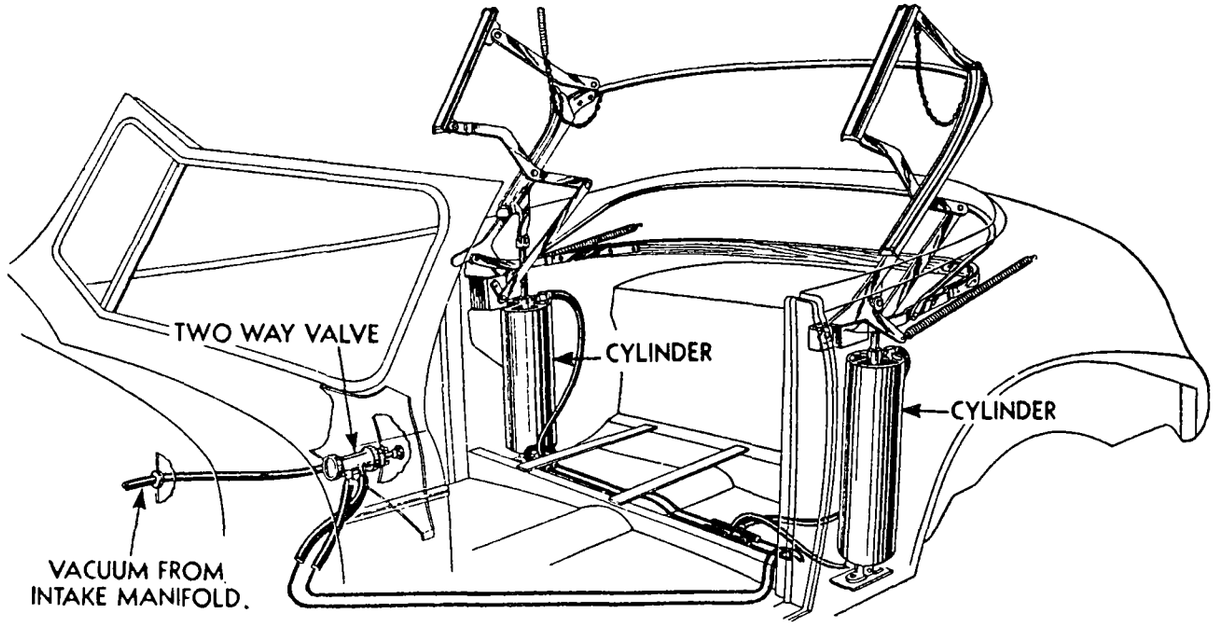
ADJUSTMENT:—Chevrolet—If top does not come to rest within 1-2" of windshield header and side rails do not straighten out when top is raised, or if top travel is excessive so that it comes to rest on windshield header, adjust as follows: Lower top, remove mounting screws and take out rear quarter trim panels. Loosen two nuts anchoring adjustment plate on control link bracket (directly above and forward of top of vacuum power cylinder on each side of car), tap adjustment plate down ⅛" (if travel insufficient), up ⅛" (if travel excessive), tighten anchor nuts. **Adjust both sides of car exactly alike.** Check performance, repeat adjustment until correct operation secured.

Top Alignment—Top alignment to insure correct registering of locating dowels or pins and sockets on top and windshield header can be adjusted by shimming body at mounting bolts.

SERVICING:—Vacuum Cylinder—To remove vacuum cylinder, remove rear quarter trim panel, take out bolt linking piston rod to top, disconnect both connections, remove bolt mounting cylinder on body bracket at lower end (on General Motors cars, remove locknut on end of bolt, then remove bolt with a 5/16" Allen setscrew wrench), lift cylinder out. When replacing cylinder, use care not to bend or distort piston rod or cylinder, make certain that cylinder and piston rod lined up between mounting bolt and top connector bolt (if cylinder out of alignment, piston rod will bind and operation will be faulty). See that vacuum line hoses are properly connected to top and bottom of cylinder.
NOTE—Use care not to reverse hose connections.

Lubricating Cylinder (Chrysler Models)—If piston is tight in cylinder, lubricate with half-and-half mixture of Neatsfoot Oil and Kerosene by submerging hose connection at upper end of cylinder (hose removed) in 1 oz. glass of lubricant and operating piston downward which will draw lubricant into cylinder. Work piston up and down several times.

Control Valve—To remove valve, disconnect and tag hose connections (to insure correct reassembly), remove mounting nut and withdraw valve assembly. To disassemble valve, remove large nut on stem end of valve and withdraw plunger. On General Motors cars, an air cleaner is mounted under the perforated plate on the end of the valve and is retained by a locking ring.



Vacuum Line Connections (Buick, Cadillac, Chevrolet, La Salle, Oldsmobile, Pontiac)—Rubber tubing should extend over ends of metal tubing connections 1" or more (except at control valve which should be ½"). Joints should be cemented tight with rubber cement such as Fisher F.S. 621.

TROUBLE SHOOTING:—If top does not operate satisfactorily, check the following points:

Vacuum Lines—Check all connections for leaks, see that hose connections and metal tubing are not kinked or broken. NOTE—Lines can be checked with vacuum gauge by noting gauge reading at engine manifold, and then connecting gauge to each hose connection at cylinder (hose to opposite cylinder must be plugged, and control valve button must be operated to open valve in order to secure gauge reading). See Vacuum Line connections in Servicing section above.

Vacuum Power Cylinder—Check piston rod for binding or tightness caused by lack of lubrication (see Cylinder Lubrication in Servicing section above). To check cylinder, disconnect bolt linking piston rod to top, see that piston moves freely in cylinder. Check alignment by raising top in stages, and checking piston rod in each position. IMPORTANT NOTE—Cylinder rocks on lower mounting bolt as top is raised and lowered. Any mis-alignment caused by top and bottom mounting bolts not being in same plane (so that cylinder or piston rod cocked sideways) will cause binding and faulty operation.

Top Mechanism—See that top folding arm assembly operates freely without binding. This can be checked by operating top with vacuum cylinders disconnected, or by operating top manually with engine not running (operate control valve in usual manner so as to permit piston to move up or down in vacuum cylinder).

TORQUE WRENCH READINGS:—All torque wrenches are calibrated to read directly in Foot Pounds (Ft. Lbs.) or Inch Pounds (In. Lbs.) as noted in the following table, or are calibrated in accordance with a special table which may be converted into Ft. Lbs. or In. Lbs. as directed below.

Torque Indicating Wrenches

Wrench Manufacturer	Wrench Reading
Ammco	Special
Blackhawk Torqflash	Ft.Lbs. & In.Lbs.
Bonney #56 & #66	Ft. Lbs.
Duro-Chrome	Ft. Lbs.
Kwik-Way	In. Lbs.
Snap-On Torqometer (First Type)	Special
Snap-On Torqometer (Later Type)	Ft. Lbs.
Sunnen	In. Lbs.
Williams Measurrench	Ft. Lbs.

Special Wrench Types:—For both Ammco and first type Snap-On Torqometer wrenches, which are calibrated to a special scale, the Ft. Lbs and In. Lbs. tables given below must be converted into this special scale by dividing the Ft. Lbs. figure by .35 and the In. Lbs. figure by 4.2. NOTE—If the tables given below are used for these wrenches, it will be simpler to multiply the wrench reading by .35 (for Ft. Lbs.) or by 4.2 (for In. Lbs.).

Ft. Lbs. & In. Lbs. Special Note:—Ft. Lbs. figures are a measure of the force applied multiplied by the distance or leverage in feet (10 lb. force on end of 12" or 1' wrench equals 10 ft. lbs.). In. Lbs. figures are the same except that distance is measured in inches (10 lb. force on end of 12" wrench equals 120 In. Lbs.). Any figure can be changed from one system to the other as follows:

To Change In. Lbs. to Ft. Lbs.—Divide by 12.

To Change Ft. Lbs. to In. Lbs.—Multiply by 12.

CYLINDER HEAD TIGHTENING DATA:—It is not only important to tighten cylinder head screws or stud nuts to the correct tension as shown in table below, but they should be tightened in correct order as shown in diagrams on following page. Cast iron and Aluminum heads are tightened differently as follows:

Cast Iron Heads—With engine cold, tighten screws or nuts to correct tension as shown in table below. Run engine until thoroughly warm, then check and retighten nuts (additional tightening necessary to bring them back to correct tension).

Aluminum Heads—With engine cold, tighten screws or nuts to correct tension as shown in table below. Run engine until thoroughly warm, then allow engine to cool off, check and retighten nuts after engine has become cool—do not tighten aluminum heads hot.

Cylinder Head Tightening Order—See following page for cylinder head diagrams for each model. NOTE—Where head bolts are not numbered, no particular order is recommended by manufacturer. In general, these models should be tightened from center outward.

CHRYSLER TYPE

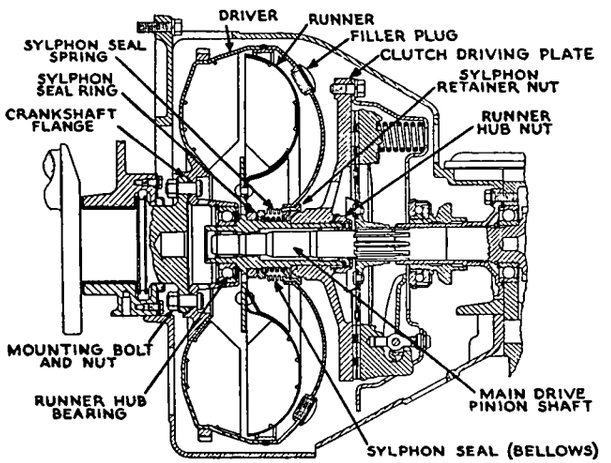
Used On:

CHRYSLER C26, TRAVELER, SARATOGA & NEW YORKER (1940) OPTL.

CHRYSLER, C27 CROWN IMPERIAL (1940)

This Fluid Drive same design as used on 1939 Model C24 except as noted below.

1940 CHANGES:—Design changed from 1939 type as follows:



Fluid Drive Housing & Mounting—Fins have been added on front and rear face of fluid drive housing to circulate air within housing for cooling. Fluid drive mounting on crankshaft flange has been modified by installing oil seal and bearing retaining plug in forward end of driver hub (mounting flange). Mounting studs are screwed in flange with nuts located on front face of crankshaft flange (same as 1939 except studs used instead of bolts). Grommets on mounting bolts and oil seal gasket (between crankshaft and fluid drive flanges) are not used. Filler plug now has 1⅛" hexagonal head (use 1⅛" socket wrench instead of Allen setscrew wrench used on 1939 plugs).

Sylphon Seal Assembly—Floating seal ring now used between inner seal ring (on runner hub) and sylphon seal ring. Manufacturer recommends that inner seal ring not be removed and that Fluid Drive assembly be replaced if this ring requires renewal.

SERVICING:—Unit is sealed and no adjustment required. Service operations are restricted to filling unit with oil (15,000 mile intervals or when drained) and renewing sylphon assembly and sealing ring (to correct oil leakage). See Removal & Installation directions below if Fluid Drive Assembly is being removed from engine.

Checking Oil Level & Adding Oil:—Recommended at 15,000 mile intervals. Take out removable screen on upper right side of clutch housing, turn fluid drive assembly until one filler plug visible through this opening (2 plugs—180° apart). Use 1⅛" wrench to remove plug, fill case to level of filler plug hole with special Chrysler Fluid Drive Oil, replace plug and tighten securely to prevent oil leakage.

Sylphon Assembly & Seal Ring Renewal:—Remove Transmission and Clutch (See Chrysler 'M' pages for instructions). Bend down tab on lockwasher and remove runner hub nut (in center of clutch driving plate). Mark spline on runner hub and mating spline on clutch driving plate (to insure correct installation), use special puller to remove clutch driving plate being careful to line up two points on the plate horizontally (plate is hexagonal) so that two top points on plate line up with recesses in clutch housing which will permit plate to be withdrawn from housing. Rotate fluid drive unit until one filler plug is at bottom, remove filler plug with 1⅛" wrench and drain unit. Use special Sylphon Spring Compressor to compress sylphon spring, remove retainer snap ring from sylphon nut, withdraw spring retainer and spring. Use special spanner wrench to unscrew sylphon nut, withdraw sylphon assembly.

Remove floating seal ring. Inner seal ring (on runner hub) should not be disturbed and Fluid Drive should be replaced if this ring requires renewal.

NOTE—Mating surfaces on Sylphon, floating seal ring, and inner seal ring must be smooth and show continuous line of contact over entire 360° of circumference. Replace sylphon and floating seal ring if surfaces are scored, scratched, or show poor contact.

Installation—Install floating ring and sylphon assembly and tighten nut securely, install sylphon spring, retainer, and snap ring. Fill unit with oil as directed above and install new gasket under filler plug. See that filler plug securely tightened. When installing clutch driving plate on runner hub, coat splines on hub and in driving plate with white lead, use special assembling tool to install plate on hub and see that marks on splines are lined up. Clean surfaces of driving plate and clutch pressure plate thoroughly of all oil and white lead before installing clutch. A special clutch aligning tool is available to line up driven member when installing clutch (extra clutch shaft can be used for this purpose if desired).

FLUID DRIVE ASSEMBLY REMOVAL & INSTALLATION:—Removal—Remove Transmission & Clutch (see Chrysler 'M' pages for instructions), rotate fluid drive unit until one filler plug is at bottom, use 1⅛" socket wrench to remove filler plug, drain unit (NOTE—Unit need not be drained unless it is to be dismantled). Remove engine oil pan and rear main bearing cap. Take off nuts on mounting studs (on front of crankshaft flange), pull fluid drive unit back to free mounting studs from crankshaft flange, remove unit from below.

Installation—Carefully clean face of crankshaft flange and fluid drive housing mounting flange to remove all dirt and burrs which might prevent flat even contact of mounting faces. Install fluid drive assembly and thread mounting studs through holes in crankshaft flange, install nuts on studs, tighten nuts evenly and securely.

OLDSMOBILE HYDRA-MATIC TYPE

Used On:

ALL CARS WITH HYDRA-MATIC DRIVE (1940)

DESCRIPTION:—This Fluid Coupling replaces the conventional clutch on cars with Hydra-matic drive (no clutch used and clutch pedal omitted). Design is unlike other Fluid Drives in that, although the assembly is mounted in a case bolted on the engine flywheel, the drive is not direct from the engine crankshaft through the fluid drive (see Operation below). Fluid drive case is kept filled with same oil used in transmission case and oil is pumped into case by the transmission front oil pump. A return line and control valve allows the oil to circulate between the fluid drive and transmission so that temperatures are equalized and overheating is prevented.

OPERATION:—The engine drives the fluid coupling case which is bolted on the flywheel. The case is splined on a sleeve integral with the ring gear (drive gear) of the front planetary gear unit so that this gear is driven positively by the engine. This gear drives the planetary gear pinions and pinion plate (which is keyed on tubular intermediate shaft) and the rear unit or driver of the fluid coupling which is bolted on a mounting flange splined on the forward end of this tubular shaft. At idling speed, the driver rotates freely and does not transmit engine torque to the forward unit or runner of the fluid coupling. As soon as the engine speed is increased slightly (when accelerator pedal depressed to start car in motion), the fluid coupling driver causes the runner to rotate (driving through the oil with which the case is filled). The runner is bolted on a mounting flange which is splined on the forward end of the intermediate shaft (within the tubular shaft) and the engine torque is transmitted back through this shaft through the transmission to the rear wheels. NOTE—See separate Oldsmobile Hydra-matic Transmission article for complete description of transmission operation in each of the four forward speeds.

SERVICING:—Lubrication—Fluid Coupling case is kept filled with oil, and oil is automatically circulated, by pump in transmission case. Fluid coupling case is sealed and requires no attention.

Disassembly & Servicing—See Oldsmobile Hydra-matic Transmission article for complete instructions.

Std. Equipment On:

Car Model	Year	Model No.
Chrysler C25, C26, C27	1940	EWB-4001
De Soto S7, Dodge D14	1940	EBW-4001
Studebaker 10A, 6C	1940	EWB-4002

MODEL NOTATION:—Model number given above Windshield Wiper Motor. Wiper Pivots, Links, and Arms are serviced separately and have separate part numbers.

DESCRIPTION & OPERATION:—Same as for 1939 type (see 1939 Supplement) except for new Two-speed motor and control circuit, and independent drive crank for each wiper arm as follows:

Two-speed Motor Control—Wiper motor is two pole shunt wound type (new armature & field windings but same design as used on 1939 types) with a field resistance mounted on the control switch (Chrysler), or on motor frame (Studebaker). This resistance is cut in or out of the field circuit by the switch and provides low speed operation (resistance cut out) or high speed operation (with resistance cut in series with field). See wiring diagram for circuits.

Wiper Drive Cranks—Second crank arm has been added so that each wiper arm is driven independently by a separate gear and crank. Drive gear for each crank is driven by worm gear on motor shaft.

CIRCUIT BREAKER:—Chrysler Models—Wiper is protected by a thermostatic type circuit breaker mounted on the control switch. Circuit breaker operates when current reaches 12 amperes.

Studebaker Models—No circuit breaker used. Wiper is protected by regular 20 ampere accessory fuse on fuse block.

ADJUSTMENT:—Park Angle—Crank arms must stop at correct parking angle to insure wiper blades being parked in proper position on windshield (see illustration for 'park angle' measurement).

Car Model	Parking Angle
Chrysler, De Soto, Dodge	26°
Studebaker	12½°

To adjust, remove relay cover, loosen parking angle lockscrew, and turn parking angle adjusting screw (see illustration), with correct adjustment, contact gap of right hand control contacts should be .025" minimum and contact pressure of left hand control contacts should be 2 ozs. minimum (contacts closed) with wiper motor stopped in park position.

SERVICING:—Motor Lubrication—No oilers provided and motor bearings do not require lubrication in service. Gear box should be filled ¾ full with special Auto-Lite ST-295 gear grease (do not use any other type) before assembly and both crank cross-shafts should be coated for entire length with this same grease before installed in housing. Use care not to get grease on motor commutator or control contacts. CAUTION—See that both crank arms are installed in correct position so that parking angle is correct (parking angle controlled by left hand crank only, right hand crank operates independently).

Bearing Alignment—After motor completely assembled (but before running), strike frame several sharp blows with rawhide hammer to insure correct alignment of bearings with armature shaft.

Armature Endplay—Must be .005" minimum, .010" maximum. To adjust endplay, remove gear housing cover, expand or contract armature stop button support arms (in housing at end of armature shaft).

Motor Specifications

Starting (Under Load)—4.0 volts (6 volt units), 8.0 volts (12 volt units) with control switch in High Speed position.

Current Draw—Depends on motor speed (less at high speed) as follows:

	Voltage	Amperes Low Speed	Amperes High Speed
6 Volt Units	5.8 volts	4.5 max.	4.0 max.
12 Volt Units	11.6 volts	2.25 max.	2.0 max.

Field Current—2.4-2.75 amperes at 6 volts (6 Volt Units), 1.2-1.4 amperes at 12 volts (12 Volt Units).

Relay Specifications

Closing Voltage—4 volts maximum (6 Volt Units), 8 volts maximum (12 Volt Units). Armature should be sealed flat against top of core with contacts closed.

Opening Voltage—.2 volt min., .5 volt max. (6 Volt Units), .25 volt min., 1.0 volt max. (12 Volt Units). **Contact Gap**—.020" min., .025" max. Adjust by bending armature stop. CAUTION—Do not bend relay armature hinge lug.

Air Gap—Armature should be sealed flat against top of core with contacts closed.

Relay Windings—At 80°F., relay winding resistances should be as follows: Shunt Coil—21-25 ohms (6 Volt Units), 42-50 ohms (12 Volt Units). Series Coil —.035 ohm (6 & 12 Volt Units).

TROUBLE SHOOTING:—If wiper action not satisfactory, check as follows:

Motor Will Not Start or Run

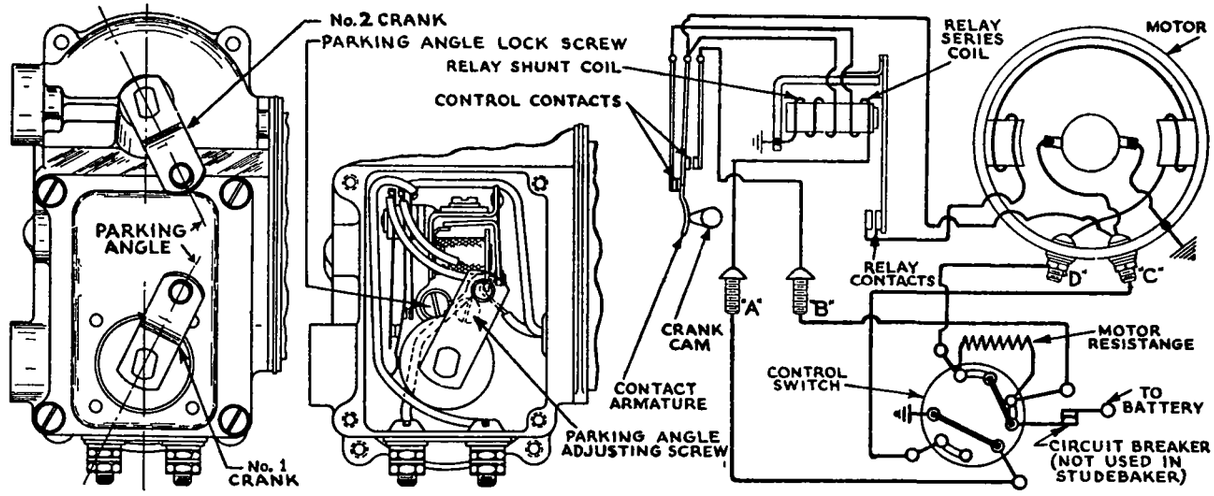
1. Fuse Blown (Studebaker only). Before replacing blown fuse, check following possible causes: Check all connections, examine relay contacts and clean if dirty, check motor ground, check all motor leads for grounds.

2. Loose Connections in Wiper Circuit. Check all wiring. Tighten connections at Windshield Wiper, Control Switch, and Ignition Switch.

3. Crank Arm Shafts Binding. Make certain that cross shafts greased for entire length with special ST-295 grease before installing and that all wire connections are clean and tight.

4. Linkage Binding. Make certain that linkage between crank arm and pivot arms is not binding and that wiper blades and pivot arms operate freely.

Motor Stops with Blades in Wrong Position



1. Park angle incorrectly set. See adjustment section above.

Motor Will Not Stop

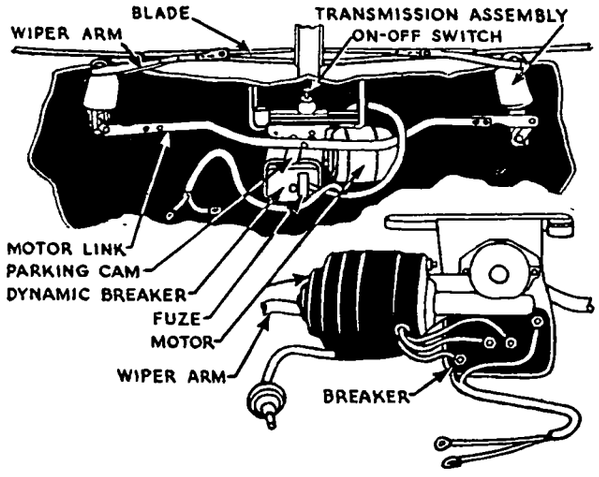
1. Loose connections at switch. Examine and tighten connections at Control Switch 'A' terminal and ground connection.

2. Parking mechanism out of adjustment. Check Park adjustment (see Adjustment section above).

3. Relay Operation Incorrect. Check relay and adjust to specifications given in Service section above. Replace relay if satisfactory performance cannot be secured by adjustment.

Series 645
Standard Equipment On:
Packard Six, '110' Model 1800 (1940)
Packard Eight, '120' Model 1801 (1940)

DESCRIPTION:—Windshield wiper consists of an electric motor and gear driven crank arm linked to two wiper arm assemblies mounted on cowl at lower edge of windshield. Each wiper arm assembly consists of a wiper arm and a transmission assembly which transmits the reciprocating motion of the motor driven-link to the wiper arm and blade. Motor assembly includes an off-on switch and a Dynamic Breaker which causes the motor to stop in the correct 'parking' position when switch is turned off so that blades are moved down to the edge of the windshield and out of the way.



Wiper throw-out Safety Clutches—Wiper arms are connected through safety clutches which will prevent damage to mechanism if arms frozen or operation is interrupted.

NOTE—First models equipped with 8¼" wiper blade, later models have 9" blade.

WINDSHIELD WIPER FUSE:—A 14 ampere fuse is mounted in a holder on the Dynamic Breaker housing of the motor assembly. Do not use any other than 14 ampere fuse at this point.

ADJUSTMENT:—**Parking Position**—Both blades should park evenly at base of windshield when switch is turned off (within several strokes after switch turned off). If blades do not park properly or if blades are not synchronized, adjust linkage as follows:

Linkage Adjustment—Remove both wiper blades and arms (see Removal Note below), loosen two adjusting screws clamping wiper arm transmission link to motor link at each wiper arm assembly. Adjust right unit by pressing transmission link toward motor (center of car) as far as possible, then pull link back 1/16" and lock adjusting screws. Adjust left hand unit by pulling transmission link out or away from motor as far as possible, then push link back 1/16" and tighten adjusting screws. Reassemble wiper arms and blades.

Transmission Connector Slack Adjustment—To remove slack from connectors in each wiper arm transmission housing, disconnect adjusting screws clamping transmission link to motor link, make certain that rods are hooked into connectors. Loosen adjusting nut on lower end of transmission housing, press down on link or press down on connectors on both sides of housing until all slack removed, tighten adjusting nut before releasing link. NOTE—Transmission housing need not be removed to make this adjustment.

Wiper Blade Installation—Use care not to damage spring within wiper arm when replacing blades. To remove blade, hold arm away from windshield glass and pull blade out toward end.

SERVICING:—**Lubrication**—No lubrication required in service. Motor bearings are oilless type and gears are lubricated for life when assembled.

Dynamic Breaker—Can not be adjusted or repaired in the field and should be serviced by replacement only. Do not dismantle Dynamic Breaker assembly.

Transmission Housing Gear Renewal—Gears can be renewed as an assembly as follows: Remove wiper blade and arm, take out adjusting screws and free transmission link from motor link, remove upper mounting screw on transmission housing (do not disturb lower slack adjusting nut), remove assembly. When new assembly installed, adjust to remove slack from internal connectors as directed above.

Motor—Motor can be disconnected from gear housing by disconnecting lead and taking off nuts on mounting studs. Average motor current consumption is 4 amperes.

KING-SEELEY ELECTRIC TEMPERATURE GAUGE

1940 CAR MODEL TYPE:—King-Seeley Electric Temperature Gauges installed on 1940 car models are similar to design used on previous cars except for new smaller Engine Unit as follows:

No. 7000 Engine Unit—This new unit has ⅜" pipe thread for mounting in engine block and over all length is 2⅝". It can be distinguished from earlier No. 5700 or 6450 types by smaller size and mounting thread (old units were 3⅜" long and had ½" pipe thread).

TESTING & SERVICING:—All operations same as for previous types. ***See 'King-Seeley Temperature Gauge' in Mechanical Equipment Section of manual for complete instructions.***

1939 & EARLIER CAR MODEL REPLACEMENT UNITS:—Original No. 5700 & 6450 type Motor Units have been superseded by new type No. 7000 and this new No. 7000 type unit only is furnished for service. Whenever Engine Unit requires replacement, install special #7113 ½"-⅜" adapter bushing in engine block, and install new type Engine Unit and new Dash Unit as an assembly. All of these parts—Adapter Bushing, Engine Unit, and Dash Unit furnished in a Service Kit for each car model as listed in table below. CAUTION—New Dash Unit must be installed whenever new type Engine Unit installed (dash unit furnished in each service kit).

Dash Unit Replacement—If original Dash Unit only is being replaced (original Engine Unit retained in use), new Dash Unit of same type as originally installed should be used (see 'Original Dash Unit Part No.' in table below). If Dash Unit supplied in Service Kit (for use with new type Engine Unit) is being replaced, see 'New Dash Unit Part No.' in table below for correct type for each car model.

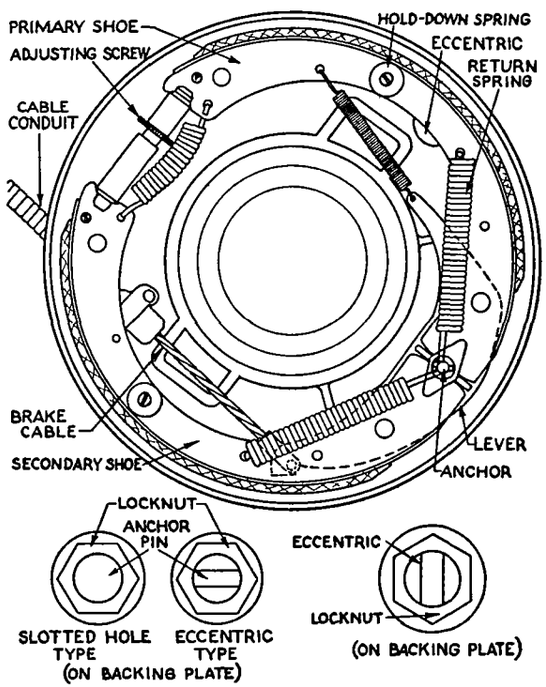
NOTE—Bendix Vacuum Power operation used on Lincoln V-12 and all Packard Models. See separate article on this unit and note under adjustment below.

DESCRIPTION AND OPERATION:—Wheel Brakes—Two shoes per wheel, connected together by turn buckle type adjusting screw at one end and bearing against single anchor pin at other end. Cable actuated lever concentric with anchor pin forces anchor end of primary shoe against drum when brakes applied. Primary shoe applies secondary. Shoes returned to off position by independent spring hooked to lever and brake shoe. Shoes held in position by coiled springs and clips hooked to backing plate. Adjustments consist of eccentric screw (brake shoe stop) to centralize shoes, and adjusting screw (between shoes) to control clearance between shoes and drum.



Brake Linkage:—Wheel brakes actuated by cables from single cross-shaft or rotary plate or equalizer mounted at center of frame 'X' member (Hudson & Terraplane 1935 models, La Fayette 1934-35). Brake cables protected by flexible conduits between frame and wheel. Brake pedal linked to cross-shaft with Vacuum Power Cylinder Control Valve (when used) incorporated in pedal linkage.

Hand Brake:—Hand Brake lever linked to cross-shaft or equalizer plate applies all four service brakes.

ADJUSTMENT:—Jack up all four wheels, disconnect cables at cross-shaft, remove adjusting screw hole covers on backing plates and inspection hole covers on drums (remove wheels if disc type). Check pedal position with cross-shaft levers against stops. Pedal should clear underside of toeboard by ½". Adjust by disconnecting pedal link and changing length. Then proceed as follows:

Minor Adjustment (For Wear):—1—At each wheel—loosen eccentric locknut, turn eccentric in direction of forward wheel rotation until .010" feeler is snug at both ends of this shoe. Hold eccentric from turning, tighten locknut. Clearance at both ends must be the same within .003" with smaller clearance preferably at anchor end. If variation greater than .003", anchor pin must be relocated (see Major Adjustment below). NOTE—If feeler gauge not used, turn eccentric up until slight drag felt when wheel turned by hand, then back eccentric off until wheel is just free.

2—At each wheel—insert tool or screwdriver in adjusting screw hole, turn notched adjusting screw toward backing plate rim (move outer end of tool up toward center of wheel) until shoes are expanded so that drum can just be turned, pull brake cables toward cross-shaft to remove all slack, adjust clevis position (loosen locknut, turn clevis, tighten locknut) until pins just enter clevises at cross-shaft lever freely, reconnect brake cables.

3—Back off adjusting screws same number of notches at each wheel until wheels are free. Apply brakes with hand lever or use pedal jack until wheel with least drag can just be turned, equalize brakes by backing off adjusting screws on tight wheels not more than two or three notches. Do not tighten loose wheels.

4—Check pedal reserve (distance from pedal to floorboard with brakes applied). This should be one half total travel (minimum). Recheck adjustment if less than this amount. Then check hand lever position (below).

NOTE—On Packard Models, brake lining for left front wheel is of narrower width (see Car Specifications) so that if brakes checked on tester, difference in pull should be in ratio of 6.5-6.75 (right front wheel) to 5.0 (all other wheels).

Major Adjustment (New Shoes or Relined Brakes):—1—At each wheel loosen anchor pin nut one turn, tap anchor pin out toward drum (slotted hole type with plain end) or turn anchor pin in direction of forward wheel rotation (eccentric type with slotted end). Loosen locknut, turn eccentric in direction f forward wheel rotation until .010" feeler snug at both ends of this shoe, hold anchor pin, tighten locknut securely with 16" wrench, hold eccentric from turning, tighten eccentric locknut. Then proceed with (2) and (3) under Wear Adjustment above.

NOTE—On Packard 8 & Super 8 ('35-36), vacuum unit control valve, mounted on brake pedal, adjustable to provide more or less vacuum booster action. Brake pedal vertical lever is connected to vertical arm through link engaged in one of three holes in lever. On new cars or with new lining requiring minimum booster action, engage link in lower hole in lever (factory setting on new cars). Engage link in center hole for softer pedal after linings are run in. Upper hole used only for very soft pedal action. This adjustment not provided on Packard Twelve.

Hand Lever Adjustment:—With hand lever in released position, and cross-shaft levers against stops adjust length of hand lever cable or rod to eliminate all slack (see note on Lincoln Zephyr).

Lincoln Zephyr—On this model, hand lever adjusted by moving cable conduit forward or backward at support bracket at cross-shaft until free movement or lash at extreme end of hand brake lever is ¼-½". Conduit end is threaded and positioned by adjusting nut on each side of support bracket. Loosen locknuts. back off front adjusting nut (to decrease lash) or rear nut (to increase lash), turn up second adjusting nut until conduit clamped in support, tighten locknuts.

Willys ('37-39). Hand brake lever linked to intermediate lever on left frame side member by cable with adjustable clevis at lower end. Lower end of intermediate lever is connected to lever on cross-shaft by slotted link (slot provides 'overrun' for foot brake operation). Left hand lever on cross-shaft (to which cables for left front and left rear wheels attached) serves as stop for entire brake system and must contact bracket when brakes are released.

RELINING BRAKES:—Manufacturer recommends use of replacement shoes furnished with new linings installed and ground concentrically. If shoes relined, use same type lining as fitted originally (see Car Model article). Lining on primary and secondary shoes may be of different types (woven on primary, moulded on secondary, etc.), or of different lengths. Shoes may be identified by 'P' (primary) 'S' (secondary) stamped on rib at adjusting screw end.

Lining Specifications—See car model 'M' page for complete lining data.

SERVICING:—Brake Linkage—Whenever adjustment made, lubricate brake pedal hand lever, cross-shaft. overrunning linkage and all clevis pins. See that linkage operates freely and returns sharply to stops when pedal and hand lever released.

Cable Conduits:—Lubricate cable and conduit assemblies through fittings (when so equipped) or disconnect cable at both ends, clean thoroughly, pull cable out at wheel end to expose portion normally in conduit, clean and coat with Bendix Cable Lubricant, or graphite grease such as Gredag #213½, pull cable back and forth to spread lubricant in conduit. See that conduit is bottomed firmly in abutment brackets and that bracket bolts are tight.

Wheel Brakes:—With shoes removed, coat brake cam, anchor pin, cable ramps, eccentric, backing plate shoe edges and all other contact points with Bendix Lubriplate. Examine shoe return springs and see that heavier spring it attached to shoe which covers cable end of brake lever.

BENDIX MECHANICAL TYPE DUO-SERVO, DOUBLE ANCHOR

Used on:

LINCOLN, V12 MODEL (1932).
LINCOLN, MODEL V-12-136 (1933).
LINCOLN, MODEL V-12-145 (1933).

DESCRIPTION & OPERATION:—Wheel Brakes—Two shoes per wheel, connected together by turn-buckle type adjusting screw at one end and bearing against individual anchor bolts at opposite (cam) end. Floating cam on brake lever shaft between shoes applies primary shoe and primary applies secondary shoe. Shoes returned to off position by large return spring hooked between shoes at each end and a small return spring hooked to each shoe and the backing plate at a point near the adjusting screw end.

Brake Linkage:—Wheel brakes actuated by rods (cable from frame to wheel at front wheels only) from a single cross-shaft on frame. Cables protected by flexible conduit terminating at bracket on backing plate adjacent to brake levers. Brake pedal linked to cross-shaft by rod in which Vacuum Power cylinder control valve (external type) incorporated.

Hand Lever:—Linked to cross-shaft by rod and applies all four service brakes.

ADJUSTMENT:—Minor Adjustment for Wear—Jack up all four wheels. Place hand lever in released position. Make following adjustments in order.

1. At each wheel—Loosen eccentric locknut, turn eccentric in direction of forward wheel rotation until slight drag evident when wheel is turned, back off eccentric until wheel is just free, hold eccentric from turning, tighten locknut.
2. At each wheel—Remove cover plate on outside of brake drum, insert screwdriver or adjusting tool, turn notched adjusting screw toward rim of backing plate until slight drag felt, back off adjusting screw until wheel is just free.
3. Apply brakes by depressing pedal approximately 3" (use hand lever to hold pedal in this position). Check equalization. Equalize wheels by backing off adjusting screw on tight wheel slightly. Do not tighten loose wheels.

Major Adjustment (New Shoes or Relined Brakes):—Jack up all four wheels. At each wheel, loosen nuts on anchor bolts (one on each side of brake lever shaft) so that nuts are completely free from lock washers and bolt is free to move in slotted hole. Remove cover plate on outside of brake drum, turn notched adjusting screw up until wheel can just be turned by hand. Use soft hammer and tap anchor bolts on threaded end to insure their assuming correct position, tighten anchor bolt nuts securely using 16" wrench. Back adjusting screw off until wheel is free. Adjust at each wheel as directed for wear (1, 2, 3) above.

NOTE—Inspection hole (closed by cover plate) provided on backing plate for use of feeler gauge in setting shoe clearance. If feeler gauges used, clearance between shoe and drum should be .008" at anchor end, and .014" at adjusting screw end.

Brake Linkage:—No adjustment required for wear Inspect linkage for play or lost motion when major adjustment is made. Adjust by loosening locknut and turning clevis on cross-shaft end of brake rods. Do not shorten rods sufficiently to expand shoes away from anchor pins with brake released.

RELINING BRAKES:—Manufacturer recommends installation of factory replacement linings. Woven lining used on primary shoe and molded lining on secondary. Lining should be ground concentrically after installation. First type primary lining (brass wire insert) changed to later type (zinc wire insert) to eliminate brake noise.

SERVICING:—Removal of Shoes—Unhook return springs, take out cotter pins in anchor bolts, lift off anchor bolt plate, take out cotter pins in spacer or hold-down nuts, take off nuts, lift shoes out.

Brake Cable Lubrication:—Special lubrication fitting required (conduit can not be moved to expose cable).

Brake Lever Lubrication:—Remove plugs on inner end of levers, install lubrication fitting, inject approximately ½ teaspoonful gear lubricant at 5000 mile intervals. Excess grease at this point will be forced out on linings.

BENDIX MECHANICAL TYPE DUO-POWER, DOUBLE ANCHOR

Used on:

STUDEBAKER SIX, MODEL 56 (1933).
STUDEBAKER COMMANDER, MODEL 73 (1933).
STUDEBAKER PRESIDENT, MODEL 82 (1933).
STUDEBAKER SPDWY. PRES. MODEL 92 (1933).
STUDEBAKER COMMANDER, MODEL B (1934).
STUDEBAKER PRESIDENT, MODEL C (1934).

DESCRIPTION AND OPERATION:—Wheel Brakes—Double anchor, two shoe type. Design not similar to previous double anchor brakes and adjustments are entirely different. Shoes are connected together by turn-buckle type adjusting screws at both ends (upper adjusting screw combined with brake operating lever strut). The shoe on which the brake lever is mounted (front shoe, front brakes; rear shoe, rear brakes) is positioned by eccentrics at both ends. Each shoe is anchored by non-adjustable anchor pin which engages slot in shoe near lever end. Shoes are actuated by short lever pivoted on one shoe and linked to second shoe by an adjustable strut (upper adjusting screw). Shoes returned to off position by return spring hooked to shoe and backing plate so that shoe is held against anchor.

Brake Linkage:—Brakes operated through flexible cable control from cross-shaft on frame. Brake pedal linked to cross-shaft by rod.

Hand Brake:—Hand lever applies all four service brakes.

ADJUSTMENT:—Anchor pins not adjustable and anchor pin nuts should be kept tight at all times. All adjustments made by means of eccentrics (clearance for one shoe) and upper and lower adjusting screws (clearance for second shoe). To adjust brakes, jack up all four wheels, disconnect brake cables at cross-shaft, push cables firmly through conduit toward wheels to insure shoes being in 'off' position. Make adjustments in following order:

1. At each wheel, remove inspection hole covers, loosen eccentric locknuts, turn each eccentric toward drum until clearance at each end of shoe is .008-.010" as measured by feeler gauge inserted through inspection hole (eccentrics control front shoe in front brakes and rear shoe in rear brakes), hold eccentrics from turning, tighten locknuts.
2. At each wheel, remove adjusting screw covers, insert screwdriver or adjusting tool, turn screws by moving outer end of tool toward axle until clearance at both ends of second shoe is .008-.010".
3. Adjust cable lengths by loosening locknut and turning clevis on cross-shaft end of cable until clevis pins can just be inserted with cross-shaft against stops and all slack removed from cables Cables must not be under tension as this will pull shoes away from anchors and cause erratic brake action.
4. Apply brakes by using pedal jack to depress pedal until heavy drag secured on all wheels. Equalize brakes by backing off both adjusting screws on tight wheel equal amount. Do not tighten loose wheels.

Studebaker Special Instructions:—Simplified wear adjustment recommended by car manufacturer as follows:

At each wheel, remove adjusting screw covers, insert tool, turn lower adjusting screw (move handle of tool toward axle) until shoes are tight against anchor pin and drum at bottom, turn upper adjusting screw until shoes are tight against drum at top. Loosen eccentric locknuts, turn each eccentric out until it contacts shoe. Adjust cable lengths by loosening locknut and turning clevis until pins can just be inserted with cross-shaft in released position against stops, connect cables. Back off lower adjusting screw exactly 12 notches and upper adjusting screw exactly 4 notches. Centralize shoes by turning each eccentric back an equal amount until no drag is evident, hold eccentrics in this position, tighten locknuts. Apply brakes by depressing pedal with pedal jack, equalize brakes by backing off lower adjusting screw in tight wheels slightly. Do not change setting of upper adjusting screw and do not tighten loose wheels.

SERVICING:—Same as for other types of Bendix mechanical brakes. See article on Bendix Mechanical, Single anchor type.

POWER UNIT:—Vacuum suspended, internal valve type. See special article following for adjustment instructions.

BENDIX VACUUM CYLINDER. PLAIN TYPE—EXTERNAL VALVE.

Used On:

BUICK, ALL MODELS (1934-35).
CHRYSLER, CUST. IMPERIAL MODEL CL* (1933).
LINCOLN, V12 MODEL (1932 to 1939)
PACKARD, ALL EIGHTS (1933-36).
PACKARD, ALL SUPER EIGHTS (1933-36)
PACKARD, ALL TWELVES (1933-36).
PIERCE ARROW, ALL MODELS (1936).
PIERCE ARROW 8, 1701 ('37), 1801 ('38)
PIERCE ARROW 12, 1702,3 ('37), 1802,3 ('38)
STUTZ, ALL MODELS (1932-34)

NOTE:—Lincoln. This model has dash-controlled regulating valve which supplements standard control valve so that operator may select amount of power application.

Pierce Arrow. Reserve vacuum tank used so that brakes may be applied with engine not running.

DESCRIPTION:—Consists of vacuum cylinder mounted on frame with piston rod linked to brake cross-shaft or pedal. Rod or boot end of piston chamber open to atmosphere (through air cleaner in cover) and opposite chamber behind piston connected to engine manifold through control valve. Piston normally held in outer position against boot end by brake linkage return springs with brakes 'off' when both chambers are open to atmosphere.

OPERATION:—Control valve connected in pedal linkage is two-way diaphragm type. With brakes 'off' and no tension on valve rods, atmospheric valve is bottomed in chamber so that air is admitted through cleaner in cover is free to flow to power unit balancing pressure on both sides of piston. Vacuum connection to manifold is cut off by seating of diaphragm. When brakes are applied, atmospheric valve moves forward and contacts diaphragm, cutting off air intake. Further movement unseats diaphragm opening manifold vacuum connection, and makes connection with power unit line so that air in chamber in exhausted. Air pressure on boot face of piston forces piston in, applying brakes. Vacuum, and consequently booster action of power unit, is directly proportional to pedal application. When atmospheric valve stop bottoms in housing (total travel approximately 3/32"), pedal pressure is transmitted directly through control valve housing to brake cross-shaft so that brakes are applied both by pedal and vacuum power unit. When pedal is released, movement of atmospheric valve first seats diaphragm cutting off vacuum, and then admits air to cylinder allowing power unit piston to move off position.

ADJUSTMENT:—Control Valve Setting—Pedal linkage should be adjusted so that there is no load on control valve (atmospheric valve should be bottomed in chamber) with pedal released and against its stop, and cross-shaft levers against stops. Any tension on control valve in this position will cause dragging brakes.

Buick Models—Special diaphragm type control valve used on these models. Plunger type valve floats between tension spring and spring-loaded diaphragm which forms vacuum chamber. Vacuum acting on valve diaphragm is always equal to vacuum in brake power cylinder so that braking action proportional to pedal pressure.

Lincoln Models—Regulating valve with control knob located on front compartment floor (1932), or on instrument panel (1933 on) used to supplement standard type control valve.

Packard Models—On 1933-34 models, regulating valve with control knob on instrument panel provides four settings (minimum to maximum vacuum power). On 1935-36 Eights, control valve linkage adjustable to provide more or less vacuum power (see brake adjustment instructions). On these models, control valve is adjusted by taking out clevis pin in link under control valve, loosening locknut and turning link in or out to relieve load on valve when brakes released.

Power Unit:—With brakes 'off', and cross-shaft levers against stop, disconnect piston cable, pull piston all the way out (against boot end stop) adjust cable length to remove all slack, reconnect cable.

TROUBLE SHOOTING:—Engine misses and stalls when brakes applied:—

1—Loose hose connection between control valve and power unit. Check connections. Replace hose.

2—Dry Piston Seal in Power Unit cylinder. Check by disconnecting piston cable and hose connection at cylinder. Push piston all the way in. Hold finger over hose nipple on end of cylinder, pull on piston rod. If piston can be pulled out, piston seal is leaking. Lubricate as directed in Servicing below, repeat test. If operation still unsatisfactory piston seal should be replaced.

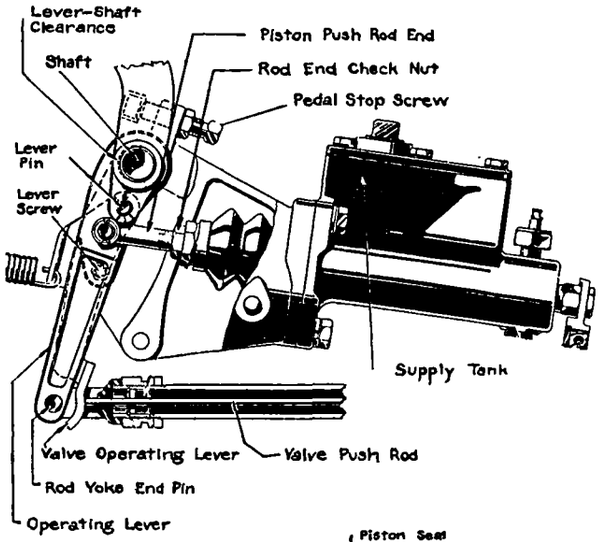
3—Cracked Diaphragm in Control Valve or dirt between valve and diaphragm seat. To check, disconnect all connections and remove valve from car. Apply suction to nipple from which manifold connection removed. If air can be drawn through valve, diaphragm does not seat or is cracked. Disassemble and inspect unit.

Engine misses or stalls when idling:—

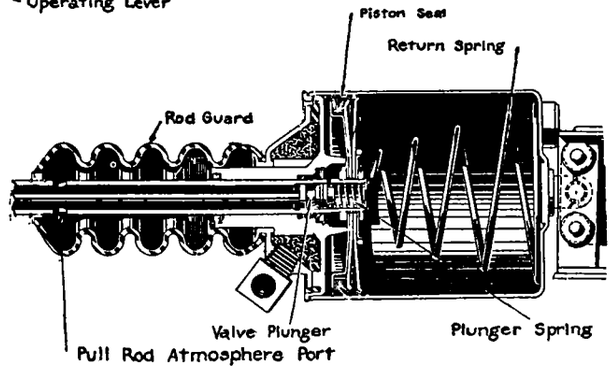
1—Loose connections or leaky hose between control valve and manifold. Examine connections, replace hose.

SERVICING:—Piston Seal Lubrication—Remove Power Unit from car, hold unit vertical with piston rod down, inject approximately 2 ounces Bendix Vacuum Oil through hose nipple in upper end of cylinder, work piston up and down and around to spread oil.

BENDIX VACUUM CYLINDER. INTERNAL VALVE TYPE.



Used On:



AUBURN, MODEL 850Y (1934) FIRST 1597 CARS.

DUESENBERG, MODELS J, SJ (1937)
HUDSON EIGHT (1933).
LA SALLE V8, MODELS 345B, C (1932-33).
PACKARD TWELVE, 1506, 7, 8 (1937)
PACKARD TWELVE, 1607,8 (1938), 1707,8 (1939)
STUDEBAKER, ALL MODELS (1933-34).

NOTE:—Packard Models. Individual vacuum power unit used for both Brake operation and Clutch operation. See Clutch Section for Clutch Power cylinder adjustment.

DESCRIPTION:—Vacuum cylinder mounted on frame with hollow pull rod connected directly to brake pedal extension lever. Spring loaded piston type control valve located within hollow pull rod and operated by push-rod which extends out through pull rod to pedal lever. Vacuum line from manifold connected directly to rear end of cylinder so that vacuum always present in rear chamber behind piston. Front chamber controlled by control valve.

OPERATION:—Control valve push-rod setting provides slight clearance at brake pedal lever with brakes 'off' so that valve is seated in forward position by spring. This cuts off air passage (air inlet is through air cleaner in cover and boot to hole in piston pull rod and through pull rod to atmospheric valve). Vacuum passage from rear chamber through push-

rod stem and front chamber port in side of pull rod uncovered by valve is open so that both piston chambers are evacuated (pressure equal) and piston will be held in 'off' position (forward against boot end) by spring in cylinder. When brake pedal depressed, pull rod clevis pin contacts valve push-rod, moving valve to rear, cutting off vacuum and connecting front chamber port to atmosphere so that air pressure forces piston to rear applying brakes. When pedal travel is stopped, control valve cuts off air so that no further movement of piston takes place, and when pedal is released, further travel of control valve forward opens vacuum connection to front chamber, balancing pressure and piston is returned to 'off' position by spring.

BENDIX VACUUM CYLINDER CONT.

ADJUSTMENT:—On all models, see that brake pedal position is correct (clearance at toeboard) and that cross-shaft is in released position against stops. Disconnect power cylinder piston rod by taking out clevis pin, adjust piston rod length so that clevis pin can just be inserted with piston pulled all the way out at the end of its stroke and power lever pressed forward so that clearance in hole is at opposite side of shaft. Then adjust valve rod length so that valve rod yoke just contacts yoke pin in valve lever with valve rod pulled all the way out. Special instructions on individual models given below.

Cadillac & La Salle V8:—Disconnect brake pedal from pull rod, see that vacuum cylinder fully released, both cross-shafts against stops and equalizer link all the way forward so that cross-shaft lever pin is against rear end of slot in link. Loosen locknut and turn up adjusting nut on forward end of spring-loaded rod (nut is in flange of cross-member) to eliminate all backlash in brake connections. Disconnect power cylinder piston rod clevis at power lever, replace clevis pin, loosen locknut and adjust clevis so that clevis pin is ⅛" from end of valve rod, connect power cylinder.

Cadillac V8 (Series 20, 30 '34-35) V12, V16 Models:—NOTE—Cadillac V16 (1937) fitted with hydraulic brakes and push rod (to master cylinder) used instead of pull rod. Adjust as follows:

1—Disconnect brake pedal pull rod and vacuum power unit from pedal lever, reinstall clevis pin in upper end of valve lever, loosen locking screw in upper end of pedal lever and turn eccentric bushing clockwise to bring rear edge of hole in lower end of pedal lever in line with rear edge of hole in valve lever bushing, tighten locking screw.

2—Loosen locknut, adjust brake pedal stopscrew so that clearance between pedal and underside of toeboard is ¼-⅜", tighten locknut.

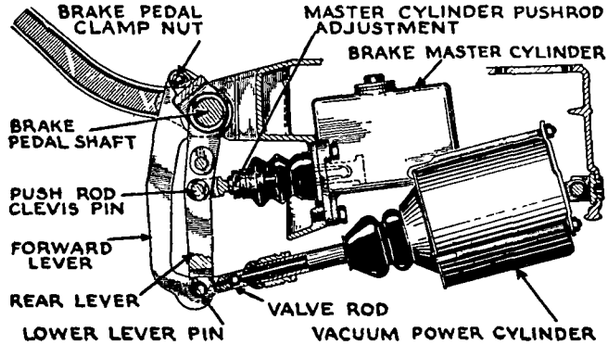
3—See that spring between valve lever and pedal lever has sufficient tension to separate levers as far as clevis pin at top of levers permits. Spring cotter pin should have ⅛" clearance at valve lever.

4—Check length of Power Unit pull rod. Distance from face of boot and flange to center of clevis pin must be 8 3/16" (1932-36), 13⅞" (1937) with pull rod pulled out to end of stroke.

1937 Model. Adjust master cylinder push rod length (loosen locknut, turn turnbuckle at master cylinder) so that clevis pin end of vacuum cylinder pull rod just fits on lever pin with vacuum cylinder piston in released (forward) position and master cylinder piston against its stop.

5—Adjust length of control valve clevis or fork by loosening locknut and turning fork out until it contacts clevis pin, then turn fork in 1½ turns and tighten locknut.

6—Connect Power Unit, readjusting pedal stopscrew if necessary to allow Power Unit pull rod clevis to enter levers without disturbing piston.



7—Connect brake pedal pull rod and see that clearance between front end of clevis and clevis pin is 1/32" with pedal and cross-shafts against stops. (Mechanical brake type—before 1937).

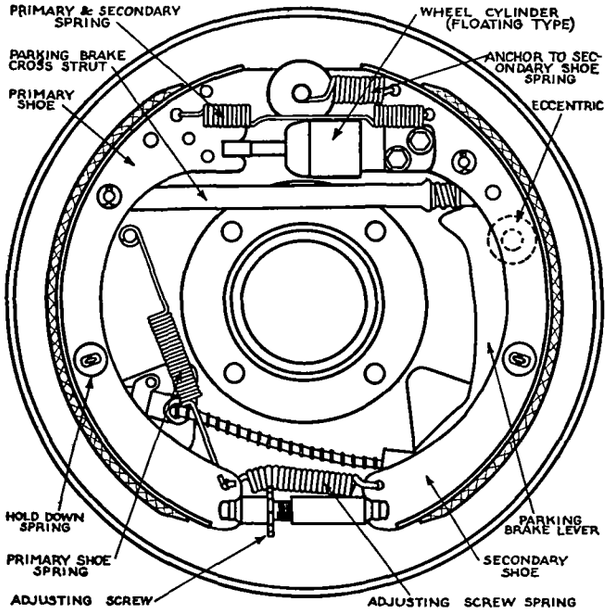
Chrysler Model CQ (1933):—Vacuum power cylinder mounted in front of pedal shaft under brake master cylinder. Check brake pedal position and adjust by turning pedal stopscrew. Push vacuum cylinder piston forward against its stop, adjust piston rod length so that it can be connected to power lever without disturbing position of pedal. Push valve rod forward against its stop and adjust length of rod so that it can be connected without disturbing position of pedal lever.

Chrysler (1934 and later):—See illustration for vacuum cylinder mounting location and linkage.

1. Adjust brake pedal stopscrew so that pedal just clears underside of floor board when released.
2. Remove clevis pin linking vacuum cylinder pullrod and operating lever. Loosen two studs holding valve operating lever to pedal so that pedal is free. Hold operating lever so that clearance between lever and brake pedal shaft is all on forward side of shaft (shaft is smaller than hole in lever), disconnect master cylinder pushrod and adjust pushrod length so that clevis pin can just be inserted with master cylinder piston against its stop (do not allow operating lever to shift from position while making this adjustment).
3. With operating lever still held so that clearance between lever and pedal shaft is on forward side of shaft, loosen vacuum cylinder frame bracket mounting bolt, shift bracket and vacuum cylinder on frame until clevis pin can just be inserted in pullrod and operating lever with vacuum cylinder piston pulled out against its stop. Make certain that clevis pin goes through ferrule on end of valve operating rod and that forked valve operating lever is hooked over ferrule (do not adjust valve operating rod).
4. With studs holding valve operating lever to pedal loosened so that pedal is free, allow valve operating rod to assume correct position (ferrule against clevis pin), tighten studs.
5. Make certain that entire power unit is in alignment and that links line up so that parts do not require springing to install clevis pins.

Packard Twelve:—Remove front floor boards, depress brake pedal at least 10 times (to exhaust vacuum supply tank), see that pedal is against toeboard with brakes released. Loosen clamp nut at top of brake pedal levers (above pedal shaft), press lower

end of rear lever toward rear and front lever toward front until all clearance at pedal shaft (upper end of levers) and clevis pin (lower end of levers) is all on forward side, hold levers in this position and tighten clamp nut. Remove master cylinder push rod clevis pin in rear lever, move brake pedal down until all clearance at pedal shaft and clevis pin at lower end of levers is on rear side, adjust master cylinder pushrod length so that clevis pin can just be inserted with master cylinder piston against stop and pushrod just contacting piston.



SERVICING:—**Power Unit**—At 6000 mile intervals, remove plug on boot end of cylinder, inject 2 ounces of Bendix Vacuum Cylinder Oil, work piston around and up and down to spread il in cylinder.

BENDIX HYDRAULIC TYPE SINGLE ANCHOR, FLOATING CYLINDER

Used on:
LA SALLE, MODEL 350, SERIES 50 (1934-35).
OLDSMOBILE SIX, MODEL F-34 (1934).
OLDSMOBILE EIGHT, MODEL L-34 (1934).

DESCRIPTION & OPERATION:—**Wheel Brakes**—Two shoe, single anchor type similar to other Bendix designs except for number and location of return springs. Single return spring hooked between shoes at anchor end above hydraulic cylinder. Additional short return spring hooked between anchor pin and upper end of secondary shoe on which hydraulic cylinder is mounted. Return spring also hooked to backing plate and primary shoe at adjusting screw end.

NOTE—The small return spring must be attached to the secondary shoe. Operation will not be satisfactory if this spring is attached in any other manner.

Wheel Cylinder:—Single acting floating type mounted on secondary shoe with piston linked to primary shoe. Same design as Rigid type cylinders except that conical piston return spring has locating cap and stop lug on piston end.

Master Cylinder:—Compensating type same as for other Bendix Hydraulic brake systems.

Hand Brake:—Hand lever applies rear wheel service brakes through cable linked to lever pivoted on one shoe and connected to other shoe by non-adjustable strut.

ADJUSTMENT:—All adjustments for service brakes same as for Bendix Hydraulic type with rigid cylinder. See following article for complete data.

Hand Brake (La Salle):—Adjust hand brake cable lengths by loosening locknut and turning clevis at cross-shaft end until brake lever strut just begins to operate brake shoe with hand lever in released position. Equalize by slacking off on cable attached to tight wheel.

BENDIX HYDRAULIC FLOATING CYLINDER TYPE CONT.

SERVICING:—Brake Shoe Removal—Remove wheels and brake drums (use clamp to retain wheel cylinder piston and do not apply brakes with drum off to avoid necessity of bleeding line when brakes reassembled). Disconnect hand brake cables at cross-shaft clevises. Remove shoe hold-down cups and spring, remove all return springs, disconnect secondary shoe from wheel cylinder by taking out two screws in mounting flange. Remove shoes. Disconnect hand brake cables at levers on rear wheels.

Wheel Cylinder:—With shoes removed (above), disconnect hose coupling, withdraw cylinder, remove piston boot, withdraw piston and return spring. Cylinders serviced in same manner as rigid type. See separate Hydraulic Brake Servicing article for data.

NOTE—Cylinders for front and rear wheels are of different size and must not be interchanged.

Master Cylinder:—See complete servicing directions in separate Hydraulic Brake Servicing article.

BENDIX HYDRAULIC TYPE DOUBLE ANCHOR

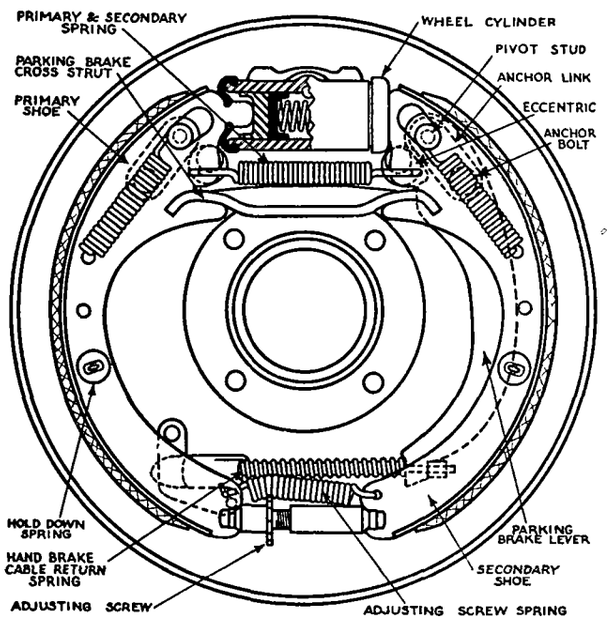
Used On:

HUDSON '112', MODELS 89 (1938), 90 (1939)

HUDSON MODEL 90 UTILITY COACH & COUPE (1939)

DESCRIPTION:—Wheel Brakes. Two shoes linked together by strut and star adjusting wheel in same manner as on other Bendix Duo-Servo designs. Hydraulic cylinder is mounted on backing plate and has been moved up between shoes at anchor end so that pistons bear directly on ends of brake shoes. Anchor design is new and consists of a short anchor link (for each shoe) pivoted at lower end on anchor bolt (on backing plate) with short stud at opposite end engaging slot in brake shoe web (shoe held against stud when brakes released by short spring hooked between stud and shoe). Shoes are positioned on backing plate by eccentrics (one for each shoe, adjacent to anchor links) and are held against eccentrics by retracting spring hooked between shoes.

Master Cylinder:—Compensating type. Same design as used on other Bendix hydraulic brake systems.



Hand Brake:—Incorporated in rear wheel brakes. Consists of cable actuated lever pivoted on secondary brake shoe anchor link stud and linked to primary shoe by strut. Applies brake shoes mechanically for parking.

OPERATION:—When brake pedal depressed and fluid in wheel cylinder forces piston and shoe out against drum, anchor link stud slides freely in slot in shoe until shoes contact drum. Primary shoe then applies secondary shoe which moves to bring anchor link stud against end of shoe slot and this link serves as anchor for both shoes. Links are mounted so that this braking thrust is in line with link axis so that shoes and anchors are free to swing within limit of eccentric adjustment (shoes follow drum and high spots due to irregular drums are eliminated). When brakes are applied with car in reverse motion, the application is exactly the same except that the opposite anchor link comes into use (only one anchor acts at a time).

ADJUSTMENT:—Hydraulic system (Bleeding lines, pedal clearance etc.). These operations performed in same manner as on other hydraulic brake systems. See Bendix Single Anchor Brake article (following) for data.

Minor Adjustment (For Wear):—Jack up all four wheels. Make certain hand brake released and that cables are free enough so that brake shoes rest against eccentrics or disconnect cables at equalizer. Remove wheels. Make following adjustments in order at each wheel.

1. Loosen locknut on primary brake shoe (forward shoe) eccentric, turn eccentric in direction of forward wheel rotation until wheel can just be turned by hand, then turn eccentric slowly in opposite direction until wheel is just free of drag, hold eccentric in this position and tighten locknut. If

feeler gauge used, insert .010" feeler between shoe and drum at anchor (upper) end of shoe, adjust eccentric until feeler gauge is snug, hold eccentric from turning and tighten locknut.

2. Adjust secondary shoe eccentric in same manner as primary shoe (above).

3. Remove adjusting hole cover on backing plate, use Tool HM-13985 (or screwdriver) and turn star wheel until brake shoes are expanded tightly against drum (move outer end of tool toward axle to expand shoes, in opposite direction to release shoes). Back off star wheel exactly 12 notches (both rear wheels must be backed off same amount to maintain hand brake balance). Check all wheels to make certain that they are entirely free of drag.

Complete Adjustment (For Wear or when New Shoes or Linings Installed):—Whenever new shoes or linings installed, or if adjustment does not give satisfactory operation, wheel brakes and cables should be cleaned and lubricated (see Servicing directions below). Jack up all four wheels, disconnect parking brake cable to each rear wheel at equalizer bar. Make following adjustments in order, repeating adjustment at each wheel as noted.

CAUTION—If hand brake cables not disconnected, shoes may be held away from eccentrics (if cables adjusted too short) so that correct brake adjustment cannot be secured.

1. At each wheel, remove inspection hole cover on brake drum, insert .010" feeler between drum and primary shoe (front shoe) near anchor end. Loosen eccentric locknut, turn eccentric in direction of forward wheel rotation until feeler is just snug, hold eccentric in this position, tighten locknut.

2. At each wheel, adjust secondary shoe (rear shoe) eccentric in same manner as primary shoe (above) using same .010" feeler.

3. At each wheel, remove adjusting hole cover on backing plate, use tool HM-13985 (or screwdriver), turn star wheel until brake shoes are expanded tightly against drums (move outer end of tool toward axle to expand shoes, in opposite direction to release shoes). Set parking brake hand lever two notches from released position (⅛" clearance between equalizer plate and stop), pull cables toward equalizer bar to remove all slack, adjust clevis at equalizer end of each cable so that clevis pins can just be inserted, tighten clevis locknuts, connect cables. Release hand lever.

4. At each wheel, back off star adjusting wheel until wheel is just free of any drag with parking brake lever in released position. Check parking brake equalization by pulling on lever until wheels can just be turned by hand and noting if drag on rear wheels is equal. Check brakes for balance.

Mechanical Follow-up Adjustment:—Turn adjusting nut on pushrod until clearance between face of nut and end of pushrod tube is 1 7/16", tighten locknut. See separate article for complete Follow-up data.

SERVICING:—Brake Shoes. To remove shoes, install clamp (HMO-145) on wheel cylinder (this will make it unnecessary to bleed lines when shoes installed if brakes not applied with shoes off). Remove retracting spring and shoe anchor link springs, release hold-down springs and remove shoe retaining washers, pull anchor end of shoes free from wheel cylinder, lift shoe assembly out. Install shoes in same manner making certain that eccentrics are turned so that high side is away from anchor links.

NOTE—Beginning with 90906, heavier (25 lbs.) spring used on secondary shoe. Lighter (20 lbs.) spring continued for primary shoes.

Backing Plate and Linkage. Remove anchor links by removing anchor bolt nuts on backing plate. Apply thin film of Bendix Lubri-plate to backing plate side of anchor links, shoe support ledges on backing plate, eccentrics, parking brake cable ramp, and all other moving or sliding parts. When installing anchor links, tighten anchor bolt nuts so that all sideplay removed but make certain that anchor links move freely.

Parking Brake Linkage. Disconnect brake cables at equalizer bar, clean exposed portion of cable, pull cable through conduit at wheel end until portion in conduit is exposed, clean and lubricate this part of cable with Bendix Cable Lubricant, push cable back into conduit. To connect cable (after shoes installed), move cable return spring away from cable end, place cable end in groove in end of brake operating lever, allow return spring to come back against lever to hold cable in place. Lubricate cable ramp with Bendix Lubri-plate. Adjust brakes and connect cables to equalizer bar.

BENDIX HYDRAULIC TYPE. DUO-SERVO, SINGLE ANCHOR (WITH ECCENTRIC ADJUSTMENT)

Used On:

AUBURN 6, 652-X, Y ('34), 653 ('35), 654 ('36-37)

TERRAPLANE, ALL MODELS (1936-37-38)

NOTE:—Buick 1938. New type hand brake cable design. Individual brake cable adjusting clevises have been discontinued and single cable now used for both wheels (cable runs through equalizer at hand lever cable connection and all adjustments now made on hand brake lever cable).

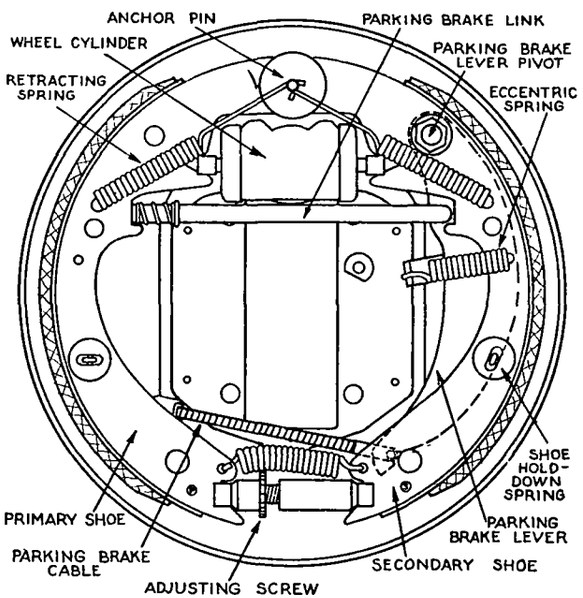
Buick, Cadillac, Oldsmobile, Pontiac 1939 Models. All models not listed above use Bendix Hydraulic Brakes without eccentric adjustment. See following article for complete data on this type.

Cadillac 1937 Models. Special metal brake seals installed on drums of all wheels. Must be removed before drums can be removed. To remove seal, take off nut on clampscrew between seal ends, expand seal, lift off.

Cadillac V16 1937. Bendix Internal Valve type Vacuum Cylinder used. See separate article for complete adjusting directions.

Cadillac 1938. Brake seals (installed on drums to keep out dirt and water) have been discontinued. Vacuum Power unit (used on former V16 models) not used on new 38-90.

Hudson & Terraplane Models. Mechanical follow-up used by which rear wheel brakes are applied by pedal, after hydraulic action, as a reserve. Check setting when brakes adjusted—see section at end. Hill Holder is optional equipment. See separate article for adjustment to insure synchronization of release with clutch engagement.



Hudson & Terraplane 1938. Master cylinder operating lever now has two holes for brake pedal link engagement. For standard adjustment, link is connected to outer hole on lever. Link can be shifted to inner hole on lever for harder brake pedal and less sensitive brakes.

Hudson '112' Models. All Hudson 112 models and Model 90 Utility Coach and Coupe use Bendix Double Anchor Type Hydraulic Brakes. See preceding article for complete data on this type.

Lincoln-Zephyr. These brakes do not have eccentric to centralize shoes and retracting springs for both shoes now of equal weight. Except for these points and new hydraulic actuation, wheel brakes similar to 1938 design.

Nash Models. Lockheed (Wagner) Hydraulic brakes used on some cars. See Lockheed Brake article for data.

Packard Twelve. Bendix internal valve type Vacuum Power Cylinder linked to brake pedal lever. Check setting whenever brakes adjusted. See separate article.

DESCRIPTION AND OPERATION:—Wheel Brakes— Brake shoes used in this type are entirely similar to those used in mechanically operated brakes (see previous article). A rigid type hydraulic cylinder with double opposed pistons is mounted on the backing plate below the anchor bolt. The opposed pistons are connected to the brake shoes through short struts or studs and force the anchor ends of the brake shoes against the drum when the brake fluid, displaced from the master cylinder by depressing the pedal, flows through the lines to the wheel cylinders. The primary shoe applies the secondary shoe in the usual manner. Shoes are returned to the 'off' position by retracting springs hooked to the shoes and the anchor pin in the same manner as mechanical brakes. Adjustments are the same as on mechanical brakes.

Hand Brake:—When incorporated in wheel brakes (rear wheels only), consists of cable actuated lever pivoted on one shoe and linked to other shoe by a strut so that the shoes are expanded against drums at anchor ends when brake is applied. Hand brake adjustment is part of service brake adjustment (see directions below).

Master Cylinder:—Compensating type. See separate article on Hydraulic Brake Servicing for complete master cylinder servicing data.
NOTE—Wheel cylinder must be 'bled' whenever brake line to that particular wheel is disconnected, and entire system (all four wheels) must be bled whenever brake lines are disconnected at master cylinder to remove all air in system and correct springy brake action.

ADJUSTMENT:—Before adjusting, jack up all four wheels, disconnect parking brake (hand lever) cables at intermediate lever, remove adjusting screw hole cover on backing plate and feeler gauge hole cover on drum (remove wheels for access to this hole). Adjust as directed below. CAUTION—If hand brake cables not disconnected, shoes may be held 'on' by cables (if adjusted too tight) so that correct brake adjustment cannot be secured.

Bleeding Brake System. See separate article on Hydraulic Brake Servicing for complete bleeding directions (required when lines disconnected, to remove wrong type fluid which has been used in system, or to remove air from lines caused by allowing master cylinder supply tank to become dry).

Brake Pedal Clearance:—Brake pedal must have 3/8" free travel before master cylinder piston begins to move. To adjust, loosen locknut at outer end of master cylinder boot, change length of brake pedal rod, tighten locknut. By-pass port between master cylinder and supply tank must be uncovered when piston is in 'off' position to provide compensating action.

Buick 1938. Clearance between pedal and underside of toe board should be 1 1/8" (40, 60), 7/8" (80, 90) with master cylinder piston against its stop in the released position. To adjust, loosen locknut and turn master cylinder pushrod (hold pushrod from turning while tightening locknut). Check to see that pedal does not bind and that master cylinder piston is against stop when released. Pedal free travel must be 1/4-1/2".

Hudson & Terraplane 1938. After adjusting brake pedal link for required 1/4" pedal free travel, make certain that link connected in outer hole on master cylinder operating lever. When connected in inner hole, less sensitive brakes are secured but with harder pedal action.

Oldsmobile 1939. Sponge rubber bumper on underside of toeboard must be compressed not more than 1/16" with pedal released and master cylinder piston against its stop. Adjusted in same manner as other cars (above).

Packard Twelve. Vacuum power cylinder and master cylinder linkage must be adjusted together. See preceding article on Bendix Vacuum Cylinder for complete data.

Pontiac Models. Pedal clearance between pedal and underside of felt retainer should be 3/8-5/8" with pedal released and master cylinder piston against its stop.

Minor Adjustment (For Wear):—Adjust at each wheel as follows:
1. (All Models except Lincoln-Zephyr). Loosen eccentric locknut, turn eccentric in direction of forward wheel rotation until .010" feeler is snug between lining and drum at each end of this secondary shoe, hold eccentric from turning, tighten locknut. Clearance at both ends of shoe must be alike within .002" (Cadillac), .003" (all others) with

BENDIX HYDRAULIC SINGLE ANCHOR (WITH ECCENTRIC) Cont.

smaller clearance preferably at anchor end. If variation greater than this amount, anchor must be re-located (See Major Adjustment below). If feeler gauge not used, turn eccentric up until heavy brake drag secured, then back eccentric off until wheel is just free of drag.

Lincoln-Zephyr Note. No eccentric provided and this adjustment not required. Begin adjustment with (2).

2. **(All Models).** Insert special tool, or screwdriver, in adjusting screw hole on backing plate, turn adjusting screw by moving outer end of tool up toward center of wheel to expand shoes until wheel can just be turned (if necessary to turn adjusting screw more than 50 notches or clicks, examine linings for wear and replace if necessary). Adjust and connect hand lever cables (see Hand Brake Adjustment below). Then back off adjusting screw until wheel is just free of drag (approximately 20 notches except Lincoln-Zephyr—see Note following). Check equalization by depressing brake pedal (use pedal jack) until wheel with least drag can just be turned by hand, equalize by backing off adjusting screws on tight wheels not more than 2-3 notches. Do not tighten loose wheels.

Hudson Note. Check mechanical 'follow-up' setting after adjusting brakes (see separate article following).

Lincoln-Zephyr Note. Adjusting screw should be backed off exactly 14 notches which will give .010" clearance.

3. **Hand Brake Adjustment (All Models).** Adjust hand brake cables for each model as follows:

Buick (1937). Disconnect all cables on equalizer bar, take up each wheel cable until clevis pins can just be inserted in plate with tension spring play taken up, hold in this position, insert hand brake cable in center hole, take up nut at rear end until all slack removed from wheel cables with hand lever against stop in off position. Attach releasing springs. Equalize wheels by backing off adjusting screw in tight wheel not more than 2 notches.

Buick 1938. After brake shoes adjusted, jack up rear wheels, see that brake lever released and against stop, expand shoes in both rear drums until wheels can just be turned by hand, tighten adjusting nut at rear end of hand brake cable (at wheel cable equalizer) until cables are taut. Back off adjusting star screw in each rear brake 17-20 notches so that wheels are free of brake drag. Check equalization by pulling hand brake lever on until wheels can just be turned by hand. If rear wheels not balanced, back off adjusting star screw on tight wheel not more than 2 notches. If wheels still not balanced, center equalizer on rear wheel cables.

Cadillac. With rear brake shoes expanded so that rear wheels can just be turned by hand, make certain that hand lever in 'off' position, pull cables taut and adjust clevises so that clevis pins can just be inserted. Connect cables and back off adjustment at shoes 15-20 notches until wheels are just free. Check equalization.

Hudson & Terraplane Models. With brake shoes in rear wheels expanded so that wheels can just be turned by hand, pull hand brake lever on until equalizer bar is ⅛" from stop, adjust clevises at forward ends of cables so that clevis pins just enter holes in equalizer bar with cables pulled tight, connect cables and make certain that rear face of equalizer plate is parallel with face of stop. Release hand brake, back off adjusting screw at each wheel until brakes are just free of any drag. Check equalization. Adjusting screw on tight wheel can be backed off not more than 2-3 notches to balance wheels.

La Fayette-Nash ('36)—Cables cannot be disconnected (equalized by pulley coupling on lever). Loosen bracket-to-frame screws, place hand lever in third notch, move bracket forward until cables are tight, tighten mounting screws, release lever.

Lincoln-Zephyr. Do not expand rear wheel brake shoes. Pull hand lever 'on' one notch, apply brakes by depressing brake pedal with 30 lbs. pressure (use pedal jack, hold pedal in this position while adjusting). Remove slack in cable by adjusting conduit clamp. Release hand lever and brake pedal, see that brakes are free.

Nash. With rear brake shoes expanded tightly against drum, pull hand lever 'on' 2 notches, loosen two bolts on adjusting clamp (connecting lever and wheel cables), pull cables tight and tighten bolts. Return lever to 'off' position. Back off adjusting screw in each wheel to free brakes and check equalization as directed in (2) above. See that hand brake lever on each wheel backing plate has ⅛" free travel with hand lever in off position. Equalize hand brakes by loosening rear bolt in cable adjusting clamp and applying hand brakes (this will allow cable to shift on adjusting clamp). Check position of hand brake cable guide on rear spring. Guide should be exactly 19¾" (Nash 6, Nash-Lafayette), 18¼" (Nash 8).

Oldsmobile Models. With rear wheel brake shoes expanded until heavy drag secured on wheels, pull parking brake cable toward equalizer to remove all slack, adjust clevis at forward end of each cable so that clevis pin can just be inserted through both clevises and hole in equalizer bar link with link held parallel to drive shaft. Install clevis pin with head to top. Back off adjusting screw in each wheel approximately 20 notches until wheel is free of any brake drag. Equalize brakes by backing off adjusting screw in tight wheel slightly.

Packard 120 ('35), 120-B ('36)—With lever in 'off' position, remove all slack in cable connecting lever to cross-shaft (120) or equalizer bar (120-B). Set lever in first notch (on 120-B equalizer bar must be at right angles to propellor shaft and clamped in this position while adjusting cables). Adjust and reconnect cables with all slack removed.

Packard 1937-39. Adjust clevis at equalizer end hand brake lever cable to remove all slack with lever released and equalizer against stop. With rear wheel brake shoes expanded so that wheels can just be turned by hand, place hand lever in first notch, adjust clevis at forward end of each wheel cable so that clevis pin can just be inserted with all slack removed and equalizer bar held at right angles to frame. Back off adjusting screw in each wheel until wheels are just free of any brake drag, equalize brakes by backing off adjusting screw on tight wheel slightly.

Pontiac Models. With brake shoes in rear wheels expanded so that wheels can just be turned by hand, place hand lever in first notch, adjust clevis at forward end of each wheel cable until clevis pin can just be inserted with approximately 25 lbs. pull on cable. Back off adjusting screw at each wheel until wheel is just free of any brake drag, equalize brakes by backing off adjusting screw at tight wheel slightly.

Major Adjustment (For New Shoes or Relined Brakes):—If shoes with new linings being installed, adjusting screw and eccentric adjustment must be backed off to allow drums to be installed. Disconnect parking brake cables, remove adjusting screw cover on backing plate and inspection hole cover on drums. Adjust brakes at each wheel as follows:

1. **Anchor Pin & Eccentric Adjustment (All Models).** Loosen eccentric locknut, turn eccentric in direction of forward wheel rotation until .010" feeler is just snug at adjusting screw end of this secondary shoe, hold eccentric from turning and tighten locknut. Check clearance at anchor pin end (opposite end) of this same shoe. If clearance not .010", adjust anchor pin as follows: Loosen anchor pin locknut one turn, turn anchor pin in direction of forward wheel rotation (eccentric type with slotted end) or tap anchor pin out toward drum (slotted hole type with plain end) until clearance at anchor pin end of shoe is exactly .010", hold anchor pin from moving and tighten locknut securely with 16" wrench. Recheck clearance at adjusting screw end of shoe. Make any necessary readjustments at eccentric and anchor pin until .010" clearance secured at both ends of this shoe. Then proceed with adjustments (2) and (3) as given under Minor (Wear) adjustment above.

RELINING BRAKES:—Manufacturer recommends use of replacement shoes furnished with new linings installed and ground concentrically. If shoes relined, use same type lining as fitted originally (see Car Model article). Lining on primary and secondary shoes may be of different types (woven on primary, moulded on secondary, etc.), or of different lengths. Shoes may be identified by 'P' (primary), 'S' (secondary) stamped on rib at adjusting screw end.

SERVICING:—Linkage—Lubrication of cables same as for mechanical brakes. See previous article on Bendix Mechanical Brakes.

Master Cylinders & Wheel Cylinders:—See separate article on Hydraulic Brake Servicing for complete data.

Brake Drum Grinding. On all Buick, Cadillac, Oldsmobile models, not more than .030" should be removed from drum. Removing of greater amount will weaken drum and may cause distortion. On Pontiac models, manufacturer recommends that drum be replaced if seriously scored (drum may be sanded to remove slight irregularities).

HUDSON MECHANICAL FOLLOW-UP.

Used On:

HUDSON, ALL MODELS (1936 TO 1939)
TERRAPLANE, ALL MODELS (1936-37-38)

DESCRIPTION AND OPERATION:—Consists of overrunning mechanical linkage between brake pedal and hand lever equalizer bar plate by which wheel brakes are set mechanically through hand lever or parking linkage after movement of pedal sufficient to operate brakes hydraulically has taken place. Acts as reserve if hydraulic application fails or when pedal travel excessive.

ADJUSTMENT:—See that master cylinder operating lever is against stop (brake pedal stop) and that rear brake cable equalizer bar plate is against stop on bracket, loosen locknut on threaded follow-up rod below brake pedal, turn adjusting nut until clearance between face of nut and front end of pushrod tube is 1 29/32" (all 1936-37 models), 1 7/16" (1938-39 models), tighten locknut. This will provide correct lag between hydraulic application and mechanical follow-up.

BENDIX HYDRAULIC TYPE DUO-SERVO, SINGLE ANCHOR (WITHOUT ECCENTRIC ADJUSTMENT)

Used On:

BUICK, MODELS 39-40, 60, 80, 90 (1939)
CADILLAC V8, MODELS 39-60S, 61 (1939)
LA SALLE V8, MODEL 39-50 (1939)
OLDSMOBILE SIX '60', MODEL F-39 (1939)
OLDSMOBILE SIX '70', MODEL G-39 (1939)
PONTIAC DELUXE 115 SIX, MODEL 39-25 (1939)
PONTIAC DELUXE 120 SIX, MODEL 39-26 (1939)
PONTIAC DELUXE EIGHT, 39-28 (1939)

NOTE:—Buick Models. First cars provided with eccentric adjustment but eccentric is turned and locked in position so that it is inoperative and short secondary shoe spring (hooked between center of secondary shoe and backing plate—normally used with eccentric adjustment) is not used.

CAUTION—On these models, eccentric must not be disturbed and brakes must be adjusted in special manner as directed below.

Cadillac, Oldsmobile (other Models). These other models have eccentric adjustment and are adjusted differently. See preceding article for data.

DESCRIPTION:—These brakes similar to other Bendix single anchor designs except that secondary shoe eccentric not used (see Buick Note & Caution above) and short spring between secondary shoe and backing plate (used normally to hold shoe against eccentric) is omitted. This design requires special adjustment instructions as given below.

ADJUSTMENT:—Before adjusting, jack up all four wheels, loosen or disconnect parking brake cables at intermediate lever or equalizer, remove adjusting screw hole cover on backing plate. Check brake pedal clearance (see Brake Pedal Adjustment below). Adjust each wheel brake as directed below. CAUTION—If hand brake cables not disconnected, shoes may be held on by cables (if adjusted too tight) so that correct brake adjustment cannot be secured.

Minor Adjustment (For Wear):—At each wheel, make certain that anchor pin nuts are tight, insert special tool or screwdriver through adjusting hole on backing plate, turn notched adjusting screw by moving tool handle up toward center of wheel until brake drum can just be turned by hand. Adjust and connect hand brake cables (see Parking brake adjustment below). Back off adjusting screw approximately 17 notches or 'clicks' (Buick), 14 (Pontiac), 20 (others) until shoes are just free and drum revolves without any brake drag (tapping backing plate may assist in centralizing shoes and eliminating drag). If brakes are not free after making this adjustment, or if shoes drag at anchor pin end, adjust anchor pin as directed in Major Adjustment below.

Parking Brake Adjustment—Before connecting hand brake cables, adjust cable lengths on each model as follows:

Buick. With rear wheel brake shoes expanded so that drums can just be turned, tighten adjuster nut on rear end of hand lever cable (at wheel cable equalizer on torque tube near rear axle) until cables are taut with hand lever in released position, back off adjusting screw in each wheel 15 notches so that wheels free of any brake drag, check equalization by applying brakes with hand lever until drums can just be turned. Equalize wheels by backing off adjusting screw in tight wheel not more than 2 notches (if this does not equalize wheels, check centering of wheel cables in equalizer).

Cadillac, LaSalle. With rear brake shoes expanded so that rear wheels can just be turned by hand, make certain that hand lever in 'off' position, pull cables taut and adjust clevises so that clevis pins can just be inserted. Connect cables and back off adjustment at shoes 15-20 notches until wheels are just free. Check equalization.

Oldsmobile. With rear wheel brake shoes expanded so that drums can just be turned, pull wheel cables forward to eliminate all slack, adjust clevises on forward ends of cables so that clevis pins can just be inserted with equalizer link held parallel to propeller shaft, connect cables (insert clevis pins with head toward top), back off adjusting screw in each wheel approximately 20 notches until wheels are free, check equalization.

Pontiac. Check hand brake cable tension by moving clevis pin at cross lever wheel cable spreader, pin should move up and down with thumb and finger pressure (hand lever in released position, rear wheel brake shoes not expanded), and both rear wheels should lock with hand lever in third notch. To adjust, remove cross lever clevis pin and engage pin in another of the several holes in the cable spreader (approximate setting), remove hand lever clevis pin and turn clevis on cable (exact setting) using extreme care not to twist the cable. To equalize wheel cables after adjusting, loosen clampscrews on wheel cable spreader at cross lever (if necessary pry clamp ears apart with a screwdriver so that cable free in spreader), apply brakes hard by pulling back on hand lever, tighten spreader clampscrews before releasing hand lever.

Brake Pedal Adjustment—On all models, pedal must be adjusted to insure master cylinder piston being back against its stop (within master cylinder) for correct compensating action when brakes released. To adjust, loosen locknut on piston connector rod, turn clevis on rod to secure clearances specified below with master cylinder piston against the stop.

Buick. Clearance between pedal and underside of toeboard should be ⅞" (all models) with brakes released.

Cadillac, LaSalle. Rubber grommet on pedal under toeboard should be compressed to ¾" with brakes released.

Oldsmobile. Spong rubber pedal bumper on underside of toeboard should be compressed not more than 1/16" with brakes released.

Pontiac. Clearance between pedal and lower surface of felt retainer on underside of toeboard should be ¾-1¼" with brakes released.

Major Adjustment (For New Shoes, Relined Brakes or when Minor Adjustment not satisfactory):—Jack up all four wheels, loosen or disconnect parking brake cables at equalizer or intermediate lever, remove adjusting screw hole cover on backing plate and inspection hole cover on drums (remove wheels for access). Check pedal clearance (see Brake Pedal Adjustment above). Adjust each wheel brake as follows. CAUTION—If hand brake cables not disconnected or loosened, shoes may be held on by cables (if adjusted too tight) so that correct brake adjustment cannot be secured.

Anchor Pin & Adjusting Screw Adjustment—Turn drum so that inspection hole is at center of secondary shoe (rear shoe on each wheel), insert screwdriver and pry secondary shoe away from drum so that primary shoe (other shoe) is seated solidly against drum. Insert screwdriver or special adjusting tool in hole on backing plate and turn notched adjusting screw by moving handle of tool up toward center of wheel until .015" feeler is snug between lining and drum at adjusting screw end of secondary (rear) shoe. Check clearance at anchor pin (opposite) end of this same shoe. If clearance not .015", adjust anchor pin by loosening locknut and tapping anchor out toward drum (slotted hole type with plain end) or turn anchor pin in direction of forward wheel rotation (eccentric type with slotted end) until .015" clearance secured, hold anchor pin from shifting and tighten locknut securely with 16" wrench. Recheck clearance at adjusting srew end of shoe. Make any necessary re-adjustments at adjusting screw and anchor pin to secure clearance of .015" at both ends. It is very important that primary shoe be out in solid contact with drum while this adjustment being made. Adjust hand brake cables as directed in Parking Brake Adjustment under Minor Adjustment above.

SERVICING:—All servicing operations including Bleeding of Lines, Brake Shoe Removal & Installation (except eccentric and short secondary shoe spring data which should be disregarded), Master Cylinder & Wheel Cylinder Overhaul are same as on other Bendix brake installations. See preceding article on Bendix Duo-Servo, Single Anchor Type With Eccentric and separate article on Hydraulic Brake Servicing for complete data.

Pontiac Wheel Cylinders—Wheel cylinders of two different lengths are installed at factory and special backing plates (with narrow or wide piston stops to fit each type wheel cylinder) are used with each cylinder. Backing plate with narrow stop dimension only is furnished for service and stops must be filed out 1/16" on each side when service backing plate used with longer wheel cylinder.

LOCKHEED HYDRAULIC DOUBLE ANCHOR TYPE

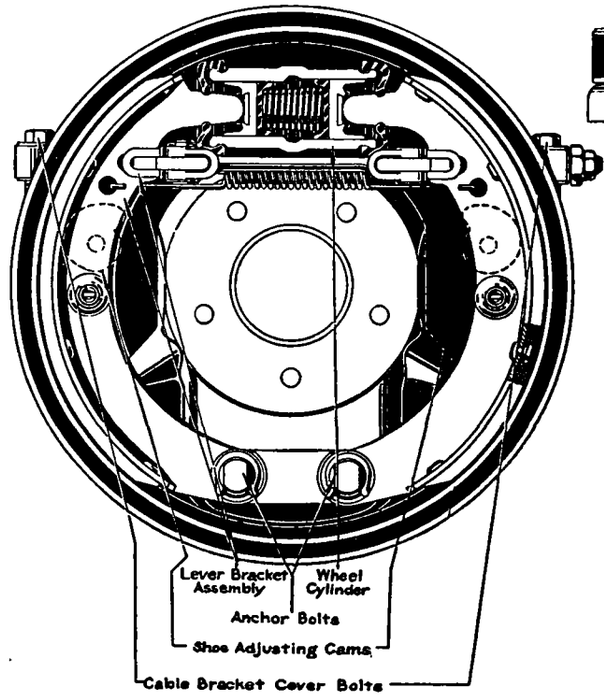
Used On:

CHRYSLER, ALL MODELS (1932 TO 1939)
DE SOTO, ALL MODELS (1932 TO 1939)
DODGE, ALL MODELS (1932 TO 1939)
GRAHAM, ALL MODELS (1933 TO 1939)
HUPMOBILE SIX, 518-D ('35), 618-G ('36)
HUPMOBILE EIGHT, 521-O ('35), 621-N ('36)
HUPMOBILE SIX, 822-E ('38), 922-E ('39)
HUPMOBILE EIGHT, 825-H ('38), 925-H ('39)
HUPMOBILE SKYLARK, MODEL R (1939)
NASH, ALL MODELS (1935-39)
NASH-LAFAYETTE, ALL MODELS (1937-38-39)
PLYMOUTH, ALL MODELS (1933 TO 1939)
REO SIX, S-2, 3 ('33), S-4 ('34), S-7 ('35)
REO FLYING CLOUD, 6-A ('35), 6-D ('36)
STUDEBAKER, DICTATOR MODELS (1935-36-37)
STUDEBAKER, COMMANDER MODELS ('35 to '39)
STUDEBAKER, PRESIDENT MODELS ('35 to '39)

NOTE:—Chrysler Models. Bendix Internal Valve type Vacuum Power Cylinder standard equipment on Imperial & Custom Imperial models (1933-36), Custom Imperial Models C15 ('37), C20 ('38), C24 '39). Optional equipment on Airflow and Imperial models. See separate article for complete data.

Chrysler, DeSoto, Dodge, Plymouth 1939. Anchor pins are marked with an arrow on inner ends (visible with drums removed) so that position of minimum adjustment can be readily secured by turning pins so that arrow heads point toward each other. See special anchor pin adjustment directions below.

Nash Models. Bendix Hydraulic Brakes, Single Anchor type, used on some cars. See Bendix Hydraulic Brake article for data on these cars.

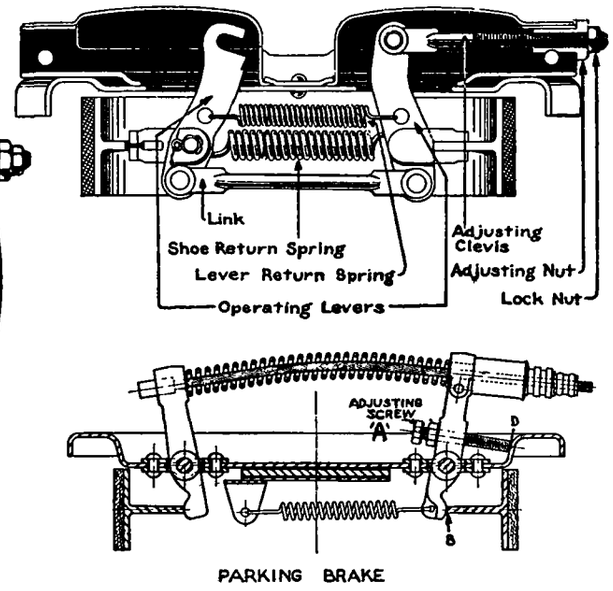


Studebaker Models. Model 7A was called 'Six' in early 1938, 'Commander' for later cars. Model 8A was called 'Commander' in early 1938, 'State Commander' model for later cars.

DESCRIPTION AND OPERATION:—Wheel Brakes— Two shoes per wheel, mounted on independent eccentric anchor pins at the lower or "heel" end and bear directly against the opposed pistons of stationary wheel cylinder at the upper or 'toe' end. Shoes are forced out against drum at toe end by fluid displaced from master cylinder and flowing through brake lines to wheel cylinder when brake pedal is depressed. No self-energizing action is employed and self-energizing effect of forward brake shoe ordinarily offset by using shorter length lining on this shoe or by using 'stepped' wheel cylinders with smaller diameter forward shoe piston and larger diameter piston for rear shoe. Brakes are returned to 'off' position against eccentric stops by retracting spring connected between shoes at toe end.

Wheel Cylinder:—Rigid type mounted on backing plate with opposed pistons bearing directly on toe ends of brake shoes. Pistons sealed by rubber caps held against piston head by central spring.

Master Cylinder:—Compensating type with integral supply tank. Supply tank is directly above master cylinder and is connected to it by two ports (1) by-pass port uncovered when piston is in 'off' position so that fluid may flow freely in or out of master cylinder to compensate for any loss, and to prevent back-pressure due to expansion of fluid in system and (2) supply port by which additional fluid is drawn down and through holes in the piston and past the lip of the piston packing cup when brake pedal is released so that cylinder is always full of fluid and ready for repeated brake action even before fluid in system is returned to master cylinder by retracting wheel cylinder pistons caused by shoe springs. Master cylinder requires no attention other than keeping supply tank more than one half full of fluid at all times. Brake pedal clearance should be checked (see directions below) but will not change in service.



NOTE—Wheel cylinder must be 'bled' whenever brake line to that particular wheel is disconnected, and entire system (all four wheels) must be 'bled' whenever brake lines are disconnected at master cylinder to remove all air in system and correct springy brake action.

Hand Brake:—When incorporated in rear wheels consists of cable operated lever pivoted on one brake shoe and connected to other shoe through link or strut so that toes of both shoes are forced out against drum when hand lever is applied. Adjustment should be checked whenever brake adjustments are made.

ADJUSTMENT:—Before making adjustments, jack up all four wheels, check brake pedal clearance or free travel (See Brake Pedal Adjustment below), release hand brake and see that rear wheels are free. Then adjust brakes at each wheel as directed below.

Bleeding Brake System. Remove cap, fill master cylinder supply tank with genuine brake fluid, remove bleeder capscrew on backing plate directly above hose coupling, screw in standard bleeder drain tube (combination valve wrench and tube connection), allow tube to hang in clear jar, unscrew bleeder connection ¾ turn, depress brake pedal slowly ½ of travel, return slowly to off position, repeat operation until flow of fluid from wheel cylinder is free from all air bubbles, usually six strokes. Keep supply tank filled with fluid (entire system must be 'bled' if supply tank drained). Do not use fluid bled from system. Remove bleeder connection and replace capscrew. Repeat at other wheels to bleed entire system.

PARKING BRAKE

Brake Pedal Clearance:—Pedal clearance or free travel before master cylinder piston begins to move should be aproximately ⅜" to insure piston return to extreme 'off' position with by-pass port uncovered when pedal released. To adjust, hold master cylinder push rod from turning with wrench on hexagonal end, loosen locknut, screw push rod extension pedal link in (to increase free travel), tighten locknut.

NOTE—See article on Bendix Power Unit for lever position when making adjustments on Chrysler Models with Vacuum Power assister.

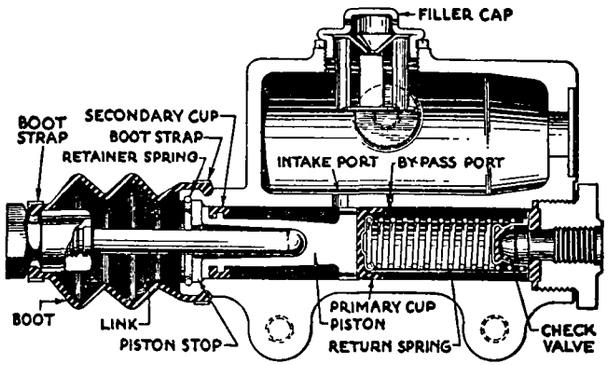
Minor Adjustment (For Wear):—Jack up all four wheels, release hand lever, see that rear wheels are free. At each wheel, turn up eccentric on each shoe (move wrench toward wheel rim when installed on eccentric nut upward) until shoe contacts drum, then back off eccentric slightly until wheel rotates freely in both directions with no drag. Eccentric held in position by spring tension. Check hand brake setting and adjust if necessary.

LOCKHEED HYDRAULIC—CONT.

Major Adjustment (For New Linings):—Dummy drum with cut-away section, ring gauge or other type adjusting tool must be used. Release hand lever and check hand brake clearance or disconnect hand brake cables, install dummy drum or ring gauge, turn so that gauging point is at heel (anchor pin end of shoe), loosen anchor pin locknut on backing plate and turn anchor pin (see special directions below for Chrysler, DeSoto, Dodge, Plymouth 1939 models) until clearance between lining and gauge is .005-.006" (see car model 'M' page for specified clearance for each model) at point 1½" back from heel of shoe, tighten anchor pin locknut. Turn gauge to toe (opposite end of shoe), adjust eccentric cam as directed under Minor Adjustment above until clearance between lining and gauge is .010-.012" (see car model 'M' page). Adjust each shoe in all wheels in same manner, adjust hand brake cables as directed in Hand Brake section following.

1939 Chrysler, DeSoto, Dodge, Plymouth. Inner ends of anchor pins are marked by an arrow and flattened so that adjusting wrench can be applied at this end of pins. Before making adjustment, loosen anchor pin bolt nuts on backing plates, turn each anchor pin so that arrows line up with arrow heads together. Then adjust anchor pins by turning right hand pin counter-clockwise, left hand pin clockwise (pins turned toward each other at top) to secure correct clearance. CAUTION—Shoes will not be centralized in drum (even though set for correct clearance) unless anchor pin arrows lined up first and adjustment made exactly as specified above.

Hand Brake:—Adjust whenever service brakes adjusted or new shoes installed. For all models except as noted below, pull hand lever up three notches. Shorten each brake cable by turning turnbuckle at forward end until slight drag felt on rear wheels. Release hand lever, check to see that wheels rotate freely without drag. Brakes can be equalized by pulling up lever until wheel with least drag can just be turned and then slacking off on cable to tight wheel.



All Chrysler, De Soto, Dodge and Plymouth Models—On these models, when hand lever applies rear wheel service brakes, adjust at each wheel as follows: Place hand lever in released position, loosen support cable bracket cover bolt nut, and adjusting clevis locknut, turn up adjusting nut on clevis (under locknut) until slight drag felt when wheel turned, back off adjusting nut until wheel is free, tighten locknut and support cable bracket cover bolt nut, equalize by setting hand brake so that wheel with least drag can just be turned, slack off adjustment on tight wheeel slightly. With correct adjustment wheels should be free with hand lever released and should have slight drag with lever in second notch.

Graham 80, 80A, 85:—Adjust forward lever at each wheel with hand lever released and cables slack. Loosen locknut and turn adjusting screw 'A' up until clearance between inner end of lever and shoe at 'B' is barely perceptible. Tighten locknut. Then adjust rear levers with hand lever placed in first notch. Loosen locknut and turn up turnbuckle at forward end of cable conduit until all slack is taken up and tension in cable is sufficient to move backing plate end of adjusting screw 'A' away from backing plate at point 'D' slightly. Tension must be same on both rear wheel cables to insure equalization. Release hand lever and check rear wheels.

Hupmobile Models. With the hand brake lever in released position, remove all slack in cable between hand lever and intermediate lever by adjusting turnbuckle at rear end of cable. Then pull hand lever 'on' to second notch, adjust each wheel cable by adjusting turnbuckle at forward end of cable to remove all slack. Release hand lever and check to see that rear wheels rotate freely without any brake drag. Equalize wheels by making slight re-adjustment at wheel cable turnbuckle for tight wheel.

Nash Models. Pull hand lever 'on' to second notch, loosen two bolts on adjusting clamp (connecting hand lever cable and wheel cables), pull cables tight and tighten clamp bolts. Release hand lever and check rear wheels to see that they rotate freely without brake drag. To equalize hand brakes, loosen rear bolt in cable adjusting clamp and apply brakes by pulling on hand lever (this will allow wheel cable to shift in adjusting clamp), tighten adjusting clamp bolt. Check position of hand brake cable guide on each rear spring. Guide should be exactly 19¾" (Nash 6, Nash-Lafayette), 18¼" (Nash 8).

Studebaker Models. With hand lever released, take up slack in hand lever cable by turning turnbuckle brake lever end. Pull hand lever 'on' to second notch. Adjust turn-buckle at forward end of each wheel cable so that slight drag felt at each wheel. Release hand lever and make certain that wheels are free of any brake drag. Equalize brakes by slacking off cable to tight wheel slightly (equalizer link used on former six cylinder models has been discontinued).

RELINING BRAKES:—See car model page for lining type and length and instructions where lining of unequal lengths used on forward and rear shoes in same wheel. Linings should be faced or ground concentrically after installation.

Shoe Removal:—Shoes held in place by coil spring retained by plain washer and 'C' type washer on each shoe. To remove shoes, pull out 'C' washer, disassemble plain washer and spring, take off return spring freeing shoes at toe end (use piston clamp on wheel cylinder and do not depress pedal with shoes disconnected). Remove 'C' washers on anchor pins, slide shoes off.

SERVICING:—**Master Cylinders & Wheel Cylinders.** See separate article on Hydraulic Brake Servicing for complete data.

DUESENBERG (LOCKHEED) TYPE

Used On:
MODELS J AND SJ (1931-37)

DESCRIPTION AND OPERATION:—**Wheel Brakes**—Two shoes per wheel, mounted on anchor pins on lower support bracket at lower end and operated through reducing lever or toggle (linked by toggles to each shoe) by single piston in wheel cylinder. Adjustment provided on toggle lever at toe of shoe. Shoes returned to 'off' position by single retracting spring hooked between shoes.

Wheel Cylinder:—Cylinder mounted vertically (integral with steering knuckle pivot pin casting in front wheels) with single acting piston which is forced up when brake fluid, displaced from master cylinder by pedal operation, flows through lines. Toggle arm lever contacts piston directly.

Master Cylinder:—Compensating type mounted within supply tank and operated through crank on shaft linked to brake pedal. Similar to other Lockheed designs (see Lockheed article) except that secondary piston cup and bleeder holes in piston not used. Compensating action secured by free flow of fluid between master cylinder and supply tank through by-pass port with piston in 'off' position.

Hand Brake:—Independent type mounted at rear of transmission. See adjustment instructions below.

ADJUSTMENT:—**Bleeding Lines**—See Lockheed article for complete instructions.

Pedal Clearance:—With pedal released and against toeboard, disconnect pedal linkage by taking out clevis pins and see that master cylinder piston is in fully returned position. Adjust by shifting position of master cylinder lever (attached to adjusting plate to which pedal links are connected).

Brake Shoe Clearance:—Jack up all four wheels. Remove plates on inside dust cover on front wheels marked 'Adjust Brakes Here', remove upper section of inside dust cover on rear wheels by taking off 2 nuts and removing 2 capscrews for each section.
1—At each wheel, loosen locknut on long toggle link, turn adjusting screw in opposite direction to expand shoes until brake drags slightly. With all wheels set for slight drag, depress foot pedal firmly. This will centralize shoes and wheels should be free. Repeat this operation until slight drag remains after pedal is released. Then back off adjusting nut exactly ½ turn at each wheel, tighten locknut.

Hand Brake Adjustment:—Loosen screw in equalizer sleeve at center of cross-shaft above brake at rear of transmission. Tighten adjusting nut until hand lever locks brakes when placed in fifth notch, tighten equalizer screw before releasing brake.

SERVICING:—**Removing Brake Shoes**—Remove brake drums (rear drums removed as unit with axles), remove inside dust covers, removing toggle pins at both ends of each shoe, disconnect retracting spring.

Wheel Cylinders:—Remove brake drums, use lever and lift toggle arm up and to rear shifting brake assembly slightly. Piston may then be withdrawn from cylinder (removal will be easier if bleed screw opened). Bleed lines when wheel cylinder reassembled.

RELINING BRAKES:—If ring gauge or dummy shoe used to check clearance when shoes with new lining installed, shoe clearance should be .005-.008" at toes.

LOCKHEED HYDRAULIC TYPE SINGLE ANCHOR

Used On:

CORD, MODELS 810 (1936), 812 (1937)
STUDEBAKER CHAMPION, MODEL G (1939)
WILLYS-OVERLAND, MODEL 39 (1939)

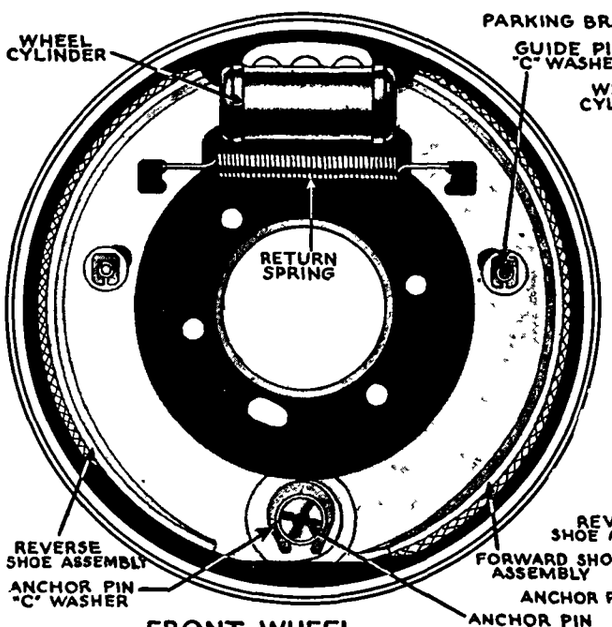
DESCRIPTION:—These brakes similar in design to other Lockheed Hydraulic types except for Anchor Pin.

Anchor Pin—Single anchor pin used with both brake shoes pivoting on this same pin. Anchor pin has double eccentric section so that both shoes are moved out toward drum when pin is turned for major brake adjustment.

ADJUSTMENT:—Before making adjustments, jack up all four wheels, check pedal clearance or free travel (see Brake Pedal Adjustment below), release hand brake. Then adjust brakes at each wheel as follows:

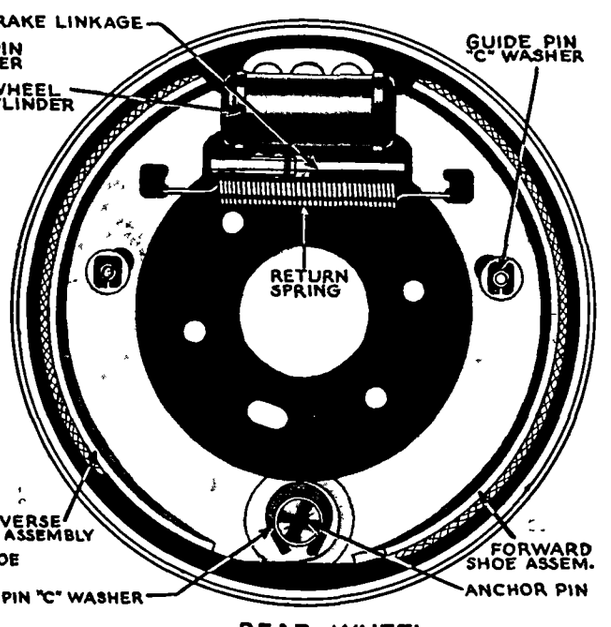
Minor Adjustment (For Wear):—Install wrench on eccentric adjusting cam on backing plate with wrench handle up, turn cam by moving wrench handle out toward wheel until shoe contacts drum (brakes drag when wheel revolved), then turn cam in opposite direction until wheel is just free of any brake drag. Adjust all eccentric cams in this manner (one cam for each shoe, two cams on each backing plate). Cams are held in position by spring tension and no locking nuts are used.

Major Adjustment (For new linings, etc.):—With wheels removed, rotate brake drums so that inspection hole in drum is at heel (anchor pin end) of shoe, loosen eccentric anchor pin locknut, turn anchor pin until clearance between lining and drum is exactly .006" (measured with feeler gauge 1½" from end of lining). Check to see that heel clearance on opposite shoe is likewise .006", tighten anchor pin locknut. Turn drum so that slot is 1½" from end of lining at toe end of shoe, adjust eccentric cam (as directed under Minor Adjustment above) so that clearance is exactly .010". Recheck clearance at anchor pin end and make any necessary re-adjustments to secure correct clearance at both ends of shoe. Adjust eccentric cam on opposite shoe, then repeat adjustment at other wheels.



Brake Pedal Adjustment:—Pedal must have ¼" min., ½" max. free travel to insure master cylinder piston being back against its stop (in cylinder) for correct compensating action when brakes released. To adadjust, loosen locknut and turn large adjusting nut on master cylinder end of connector rod.

Parking Brake Adjustment:—Adjust whenever brakes adjusted for wear or new shoes installed. To adjust, pull hand lever 'on' three notches. Adjust yoke on forward end of each wheel cable to eliminate all slack, re-connect cables, release hand brake lever, check rear wheels to see that they rotate freely without any drag. Equalize wheels by making slight re-adjustment at wheel cable yoke for tight wheel.



SERVICING:—Except for shoe removal and installation, all service operations including Bleeding of Lines, Master Cylinder & Wheel Cylinder Overhaul are same as for other Lockheed Brakes. See preceding article on Lockheed Double Anchor Type Hydraulic Brakes and separate article on Hydraulic Brake Servicing for complete data.

Brake Shoe Removal & Installation. To remove brake shoes for relining or servicing, remove anchor pin locknut on backing plate, free 'C' washer and remove plain washer on guide pin at center of each shoe, pull toe end of shoe free of wheel cylinder piston slot and boot. Remove 'C' washer on anchor pin, remove shoe. Reassemble shoes in same manner.

Wheel Cylinder Installation. Wheel cylinder on front wheels has greater diameter than rear wheel cylinder. Use extreme care not to interchange cylinders which would cause badly unbalanced brake action.

FRONT WHEEL

REAR WHEEL

HYDRAULIC BRAKE TROUBLE SHOOTING

TROUBLE SHOOTING:—Brake Pedal goes down to floor.

1—Excessive shoe clearance due to wear—Adjust brakes. If adjusting screw must be turned up more than 50 clicks or notches, examine lining for replacement.

2—Leaks in system. Minor leaks evident by gradual slacking off of brakes when applied with pedal depressor. Examine lines and wheel cylinders. When caused by contraction of piston cups due to extreme cold, correct by installing special expanders (between cup and spring) and special springs (shorter than standard).

3—Air in Brake System—when present in considerable quantity (smaller amount evidenced as 'springy' pedal). Bleed system.

4—No fluid in supply tank. Lines must be bled if supply tank allowed to become empty.

Brakes drag at all wheels:—

1—Mineral oil in system—causes rubber piston cups to expand. Wash out master cylinder, lines and wheel cylinders with alcohol, replace rubber piston cups, refill with genuine brake fluid.

2—By-Pass port in master cylinder clogged or covered by piston. See that port is uncovered with piston in extreme off or outer position to allow fluid return to supply tank (see brake pedal adjustment directions in each brake article

Brakes drag at one wheel:—

1—Weak or broken return spring. Replace springs. See that stronger spring is attached to secondard shoe.

2—Improper adjustment (shoe clearance too small).

3—Cylinder cups distorted or incorrectly installed. Lip of cup must point in.

4—Loose front wheel bearings.

Car pulls to one side:—

1—Oily linings. Replace shoes or reline.

2—Improper adjustment (shoe clearance too small).

3—Loose backing plate, loose front spring U bolts.

4—Incorrect lining type or length. See specifications in Car articles.

5—Incorrect or uneven tire inflation pressures.

6—Brake drums out-of-round or scored.

7—Brake lines kinked, hose plugged.

Brake Pedal Springy:—

1—Air in system. Bleed lines.
2—Brakes shoes incorrectly adjusted.

Brake Pedal 'Hard':—

1—Improper adjustment.
2—Incorrect lining type.
3—Oily linings—replace or install new shoes.
4—Partial contact—high spots. Linings should be ground concentrically.

Brake Pedal 'Soft':—

1—Improper adjustment.
2—Dust shield or backing plate loose.
3—Oily linings.

SERVICING NOTE:—See following article for directions for bleeding lines and servicing of master and wheel cylinders. See separate brake articles for brake shoe and brake pedal adjustment directions.

HYDRAULIC BRAKE SERVICING

BLEEDING BRAKE LINES:—Remove master cylinder supply tank filler cap, fill tank with genuine brake fluid, keep tank filled with fluid during entire bleeding operation (air will be drawn into brake lines if tank allowed to become dry). Remove screw in bleeder valve on wheel backing plate, install special fitting and hose connection. Submerge free end of hose in brake fluid in clean glass container. Unscrew bleeder valve ½-¾ turn, press brake pedal down by hand approximately half of travel, allow pedal to return slowly. Repeat operation until fluid flow from tube is completely free from any air bubbles, then close bleeder valve, remove hose connection and replace dustscrew. Bleed lines at each wheel in same manner.

CAUTION—Use extreme care not to allow supply tank to become dry during bleeding operation. If automatic refiller unit not used, supply tank should be filled after every 6-10 strokes of the brake pedal (automatic refiller will maintain level in supply tank without attention during bleeding operation).

SERVICING:—Wheel Cylinders—To disassemble wheel cylinders, remove brake shoes, take out wheel cylinder mounting screws, withdraw cylinder through backing plate. Disconnect brake line, remove piston boots, withdraw pistons. Examine cylinder bore. If corroded or scored, cylinders can be lapped or honed and oversize pistons fitted. Piston clearance (metal piston) in cylinder should be .001-.003" and must never exceed .005". In assembling wheel cylinder, wash all parts in alcohol, dip rubber piston cups in Brake Fluid, and insert ahead of piston with lip in. Central return spring in stepped cylinders is tapered and should be installed with small end toward piston in smaller bore. Reconditioned cylinders should be tested for leakage in fixture under alcohol with 8 lbs. and 80 lbs. air pressure. Wheel must be bled when wheel cylinder reinstalled.

Piston Cup Expanders—Can be used with special return spring in wheel cylinders to correct leakage caused by piston cup contraction in extreme cold temperatures. Expander should have .005" clearance in cylinder and should fit into open end of piston cup with slight clearance. Install expanders with cupped face in and use special return spring which is ½ turn shorter than standard spring.

Master Cylinder:—To disassemble master cylinder, remove rubber boot and push rod or link, take out retainer spring and piston stop, withdraw piston. Examine cylinder. If corroded or scored, cylinder can be lapped or honed and oversize piston fitted. Clearance should be .001-.003". In reassembling, wash all parts in alcohol, dip in Brake Fluid, see that check valve is installed correctly and that thin washer is in place between piston and primary piston cup. Insert piston with lips on both primary and secondary cups in. Test for leaks in same manner as for wheel cylinders and bleed entire system when installed on car.

By-pass Port Note—By-pass or compensating port connecting supply tank and master cylinder must be uncovered with the master cylinder piston against its stop. When installing master cylinder piston assembly, hold piston against stop and make certain that this port is not covered by lip of primary cup.

CAUTION—When master cylinder installed on car, brake pedal must be adjusted for correct pedal clearance or free-travel to insure this by-pass port being uncovered with pedal released and master cylinder piston against its stop. Brakes will drag if this port is not open.

HILL-HOLDER

Std. or Optl. Equipment On:

HUDSON, STUDEBAKER, TERRAPLANE & OTHER CARS

DESCRIPTION:—Hill-holder consists of a ball check valve connected in the brake line at the master cylinder and controlled by the clutch pedal.

OPERATION:—The valve cage with the rubber seal orifice is normally held away from the valve seat by the clutch pedal controlled camshaft (with the clutch engaged) so that the valve is open and brake operation is conventional. When the clutch is disengaged, the rotation of the camshaft permits the spring behind the valve cage to force the cage back so that the rubber seal seats against the valve seat. If the car is pointed uphill, the ball within the valve cage rolls down against the rubber seal, closing the orifice within the seal so that the brake fluid in the lines is prevented from returning to the master cylinder and brakes are held 'on' even though brake pedal is released. When the clutch is engaged, the valve cage is pulled away from the valve seat uncovering the return passage to the master cylinder and releasing the brakes. If the car is on a level road or pointing downhill, the ball will not close the rubber seal orifice.

ADJUSTMENT:—Operating lever position must be checked (to insure correct timing of brake release when clutch is engaged) whenever clutch pedal is adjusted. See Clutch pedal adjustment instructions on car model 'M' pages or adjust as follows:

Adjustment:—Check setting by applying brake on slight incline with clutch disengaged, then shift into low gear, engage clutch slowly and note point at which brakes release. If brakes release too soon and car has tendency to roll backward, loosen locknut and turn adjusting nut on end of control rod away from pedal to lengthen rod. If brakes release late and engine has tendency to stall, turn nut in to shorten rod. Tighten locknut and check setting.

Mounting:—Hill Holder must be mounted in level position on car frame. **To check, place spirit level on bosses on top of hill-holder body casting with car** standing on level floor. Unit must be leveled lengthwise (place spirit level on two bosses on top of unit), and crosswise (place spirit level crosswise on one boss).

Hudson & Terraplane 1937 Model. When leveling the unit on these models, place .052" shim stock between spirit level and boss on forward end of Hill Holder unit (no shim used at rear end), adjust unit until spirit level is horizontal. Level unit crosswise by placing spirit level on forward boss.

NOTE—Do not use this shim when leveling unit on 1938 Hudson and Terraplane models.

SERVICING:—Before dismantling unit mark shaft and lever and replace in same position. Remove ball chamber head plug and spring, withdraw camshaft being careful not to lose camshaft spring, withdraw ball cage assembly. In reassembling unit, see that ball cage is installed with two large ball rail rods underneath camshaft, and that camshaft spring is in place at inner end of camshaft.

NOROL

Optional Equipment On:

BUICK, CHEVROLET, NASH & OTHER CARS.

DESCRIPTION & OPERATION:—Similar to Hill Holder (see following article). NoRol unit is mounted on brake master cylinder and controlled by lever linked to clutch pedal.

INSTALLATION:—Disconnect tubes from outlet connection on master cylinder, remove bolt and outlet fitting, assemble bolt and fitting to outlet connection on NoRol valve housing (use new gaskets). Attach unit to master cylinder using new bolt and gaskets. Attach NoRol lever to clutch pedal lever using rod and fittings supplied with unit. Adjust as directed below.

ADJUSTMENT:—NoRol unit position must be checked (see below) when installed, and lever setting must be checked whenever clutch pedal adjusted (see instructions on car model 'M' pages or adjust as follows:

Adjustment:—Check setting by applying brake on slight incline with clutch disengaged, then shift into low gear, engage clutch slowly and note point at which brakes release. If brakes release too soon and car has tendency to roll backward, loosen locknut and turn adjusting nut on end of control rod away from pedal to lengthen rod. If brakes release late and engine has tendency to stall, turn nut in to shorten rod. Tighten locknut and check setting.

NoRol Mounting:—Unit must be level (crosswise and lengthwise of car) when installed. Check with spirit level on bosses provided on top of NoRol housing. Adjust by loosening mounting bolts and shifting unit slightly. Car must be placed on level floor and all tires inflated to correct pressure when making this check.

SERVICING:—Mark shaft and lever to insure replacement in same relative positions. Remove plug on head of unit, and withdraw spring, valve cage assembly, shaft and spring. Assemble in same positions and check lever setting.

MIDLAND STEELDRAULIC TYPE

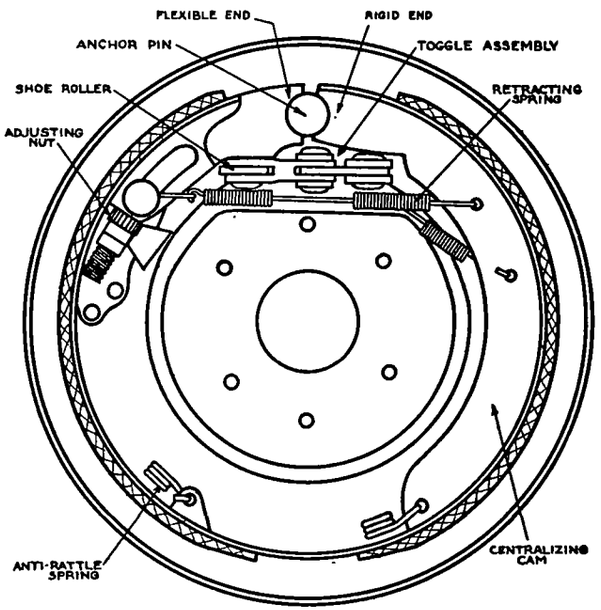
Used on:

AUBURN, MODELS 8-100, 8-100A (1932).
HUPMOBILE, MODELS 216, 222, 226 (1932).
HUPMOBILE, MODELS 321 (1933), 421, A (1934).
HUPMOBILE, MODELS 322 (1933), 422 (1934).
HUPMOBILE, MODELS 326 (1933), 426 (1934).
HUPMOBILE, MODELS 417-W (1934), 517-W (1935).
HUPMOBILE, MODELS 421-J (1934), 521-J (1935).
HUPMOBILE, MODELS 427-T (1934), 527-T (1935).
NASH, BIG SIX MODEL 1120 (1933).
NASH, EIGHTS STD. 1130, SPEC. 1170 (1933).
STUDEBAKER, DICTATOR MODEL A (1934).

NOTE:—Bendix Vacuum Power Unit on Studebaker Dictator Yr. Ahead model (after June 26, 1934). Midland Vacuum Power Unit used on Hupmobile 521-J, 527-T (1935). See separate articles for data on these units.

DESCRIPTION & OPERATION:—One shoe per wheel. Shoe is semi-flexible type extending in complete circle around drum with both ends bearing against single anchor pin at top. Forward end of shoe is flexible and contacts drum first when brakes applied, furnishing self-energizing action to apply remainder of band. Rear end of shoe is strengthened by web forming 'T' section and this end of shoe bears against anchor pin for brake application when car moving forward. Brake actuated by toggle type levers linked between shoes at anchor pin end operated by cable control from cross-shaft on frame. Shoes returned to off position by return spring connected between ends of shoe at anchor pin end and additional return spring hooked to backing plate and shoe web near centralizing cam.

Brake Linkage:—Cable control from cross-shaft on frame. Cables adjustable at cross-shaft clevises.



Hand Brake:—Hand lever linked to cross-shaft and applies all four service brakes.

ADJUSTMENT:—Jack up all four wheels. Check brake pedal to cross-shaft linkage, see that cross-shaft against stop with brakes released (see special instructions for Studebaker pedal linkage adjustment below), lubricate all parts of brake linkage. Make following adjustment in order.

1. With hand lever and brake pedal in released position and cross-shaft against stops, loosen locknut on adjusting rod at cross-shaft end of each cable, hold ferrule from turning and adjust cable length by turning rod in or out of ferrule until clearance between anchor pin and flexible end of brake shoe is 1/16" (check through inspection hole in brake drum). This clearance must be uniform at each wheel.

2. At each wheel, loosen centralizing cam locknut on backing plate, turn cam until slight drag evident, back off cam until wheel is free, tighten locknut. More exact adjustment can be made by turning wheel until inspection hole in drum is opposite cam, and turning cam until clearance as measured by feeler gauge is approximately .020". Hold cam from turning while tightening locknut.

3. Apply brakes, by depressing pedal with pedal jack halfway to floor. At each wheel, remove adjusting screw cover on backing plate, turn adjusting screw until heavy drag felt when wheel rotated by hand in forward direction. Drag must be equal on all wheels. Equalize by backing off adjusting screw on tight wheel slightly. Release pedal and check for drag. Wheels should revolve freely without drag.

Studebaker Pedal Linkage Adjustment:—On this model brake pedal is connected to cross-shaft lever by double links (non-adjustable link at rear, adjustable link at front). Pedal travel should be 6" and is controlled by length of rear non-adjustable link. Three types used: Part No. 182526—3 5/64", 182527—3 9/64", 511403—3 13/64". Shortest link provides greatest pedal travel. On first cars with less than 6" pedal travel, new shorter link may be substituted for original link. To adjust links, depress pedal slightly until tension placed on clevis pins in rear link. Loosen locknut and turn clevis at lower end of forward link until slight compression placed on clevis pins in this link when connected.

NOTE—Two sets of holes provided in pedal and cross-shaft for link connection. These holes marked '1' (inner or short radius), '2' (outer or long radius) in pedal and lever. Both links must be connected to same numbered holes at top and bottom. No. 2 provides standard pedal pressure. No. 1 will provide softer action and lower pedal pressures.

RELINING BRAKES:—Molded lining used on all brakes. Lining applied in two pieces with cutaway section diametrically opposite anchor pin.

NOTE—On Studebaker model, different type lining used on each end of shoe. Factory recommendations are Manhatten DV-2320 for rigid end of shoe, Raybestos 453-R for flexible end of shoe.

SERVICING:—When replacing brake shoe assemblies, see that long end of toggle (attached to rigid end of shoe) is assembled next to the backing plate and that the toggle attached to the brake cable is assembled with the yoke away from the backing plate.

MIDLAND BRAKE BOOSTER VACUUM POWER TYPE

Used on:

HUPMOBILE, MODEL 521-J (1935).

HUPMOBILE, MODEL 527-T (1935).

DESCRIPTION & OPERATION:—Vacuum cylinder mounted on left frame side rail and connected to linkage between right and left brake levers on frame 'X' member center plate. Piston type vacuum control valve mounted on bracket built in forward end of brake pedal pull rod with valve lever pivoted on bracket and linked to pedal pull rod clevis pin. Clevis pin hole in pull rod provided with slight clearance to permit valve operation when brakes applied (movement of pedal to take up free play before brakes applied operates valve).

ADJUSTMENT:—Brake pedal linkage must be adjusted so that clearance between pull rod clevis hole and clevis pin is ahead of the pin with brakes released and pedal and brake levers against stops. Adjust valve by loosening locknut and turning valve piston rod until valve piston is all the way forward (out) and against stop with brakes released. Adjust vacuum cylinder piston rod length so that piston is bottomed in cylinder with brakes released.

TROUBLE SHOOTING:—Control Valve—To check control valve for leaks, first check setting and see that valve piston is against its stop with brakes released (heavy pedal return spring may hold brake pedal away from stop and move valve piston from off position), connect vacuum gauge to control valve outlet or vacuum cylinder end of hose. Gauge should register '0' with brakes released and register approximately 18" when brakes applied (engine must be idling when making this test). Oil valve piston by injecting one or two drops light engine oil in cylinder.

Vacuum Cylinder—To check vacuum cylinder for leaks, disconnect hose coupling, pull piston all the way out, seal vacuum inlet, push piston back into cylinder. Piston should hold out. If piston can be moved, piston seal is leaking. Inject one ounce light oil, work piston back and forth to distribute oil on piston and walls, repeat test.

Used On:

PIERCE ARROW EIGHTS, MODELS 836, 39 ('33), 836A, 40A ('34), 845 ('35), 1601 ('36).
PIERCE ARROW TWELVES, MODELS 1236, 42, 47 ('33), 1240A, 48A ('34), 1245, 55 ('35), 1602, 3 ('36).
PIERCE ARROW 8, 1701 ('37), 1801 ('38)
PIERCE ARROW 12, 1702, 3 ('37), 1802, 3 ('38)

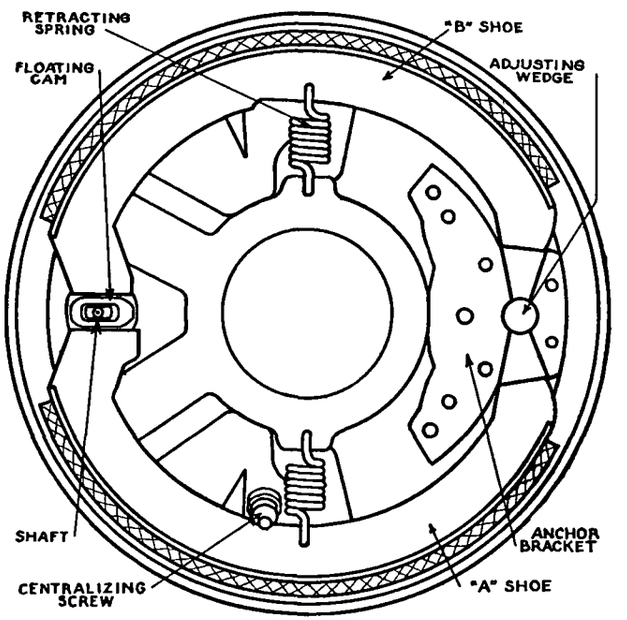
NOTE:—Stewart-Warner Power Unit (mechanical servo or power take-off mounted at rear of transmission) used on 1933-34-35 models but superseded by Bendix Vacuum Power Unit on 1936 and later models. See separate article for data on Bendix unit.

DESCRIPTION AND OPERATION:—Wheel Brakes—Two shoes per wheel anchored at adjusting screw end (heel) and operated by floating cam on brake shaft at opposite end (toe). Front brake shoes released proportionally to turning angle when turned from straight-ahead position. Shoes held in off position by short retracting spring hooked to shoe at center. Adjustments consist of centralizing screw (set angularly on backing plate so that tapered head contacts web of one shoe) and adjusting nut at anchor end which expands shoe.

Linkage:—Consists of single cable in conduit from brake lever forward to front brake cross-shaft and rearward to rear brake cross-shaft. Brake operating cams float on ends of cross-shafts. Cables require adjustment only when chassis units serviced.

Hand Lever:—Applies all four service brakes. Provided with 'overrun' which provides automatic take-up in service. Overrun must be reset in lower position when brakes are adjusted.

ADJUSTMENT:—For Wear—Set hand lever in off position, see that pin is engaged in lower slot of brake rod overrun and that pin does not contact forward end of slot. Set front wheels in straight-ahead position (important). Jack up all 4 wheels, at each wheel, turn hexagonal adjusting screw clockwise until wheel can just be turned by hand, then back off adjusting nut 9 notches (front wheels), and 12 notches (rear wheels), tap nut snugly toward backing plate. One notch on nut moves shoe .001" (measured at center) and there are 6 notches per revolution of the nut. If wheel does not turn freely after adjusting, turn centralizing screw on backing plate in or clockwise until brake drags appreciably, then back screw off until wheel is free. Road test car and equalize wheels. Braking force is 54% front wheels, 46% rear wheels.



Treadle Adjustment (Stewart-Warner Power Unit Only):—Treadle height adjustable by removing clevis pin under toe of treadle and turning clevis up or down on rod as desired. Treadle pressure adjustable by changing location of clevis pin in pedal shank and in input yoke shaft lever on power unit. Holes marked as follows: 'A' pedal upper hole, 'B' pedal lower hole, 'C' power unit lever upper hole, 'D' power unit lever lower hole. Use combination A-D for highest, A-C medium, B-D low, B-C lowest treadle pressure. Readjust power unit when treadle rod changed.

Stewart-Warner Power Unit Adjustment:—Turnbuckle at rear end of treadle-to-power unit rod should be adjusted to maintain treadle free movement of 1½" (measured at toe of treadle from extreme off position to point where definite resistance felt when treadle depressed). To adjust, loosen locknuts at end of turn-buckle and turn turn-buckle (rod threads are right and left handed).

NOTE—If treadle free movement is insufficient or heavy lubricant is used in transmission and power unit in cold weather, brakes may drag when car is first started cold. Correct by checking power unit adjustment and by draining transmission and power unit case and filling with correct lubricant.

Hand Lever Adjustment:—After adjusting brakes (above), loosen locknut and adjust clevis at rear of hand lever brake rod until only slight clearance remains between lever pin and end of lower slot in overrun at forward end of brake rod.

Linkage Adjustment:—When cable adjustment required, see that cable conduit support springs are in place and fastened so that cable does not sag, place hand lever in 'off' position with pin engaging lower slot of rod overrun, set front wheels in straight-ahead position, loosen both cable adjustment locknuts and adjusting nuts at brake lever, turn up adjusting nut at each wheel until wheel can just be turned by hand, back off nut 2 notches, tap nut against backing plate. Tighten cable adjustment nuts until wheel can just be turned, tighten cable

adjustment locknuts. Adjust wheel brakes as directed above.

RELINING BRAKES:—Manufacturer recommends installation of factory-lined shoes which are accurately ground. Shoes interchangeable in pairs.

SERVICING:—Removing and Installing Shoes—Use special spring tool to extend retracting spring permitting removal of shoe. If tool not used, pull 'A' shoe out radially until it hooks over two embossed shoe rests on backing plate, repeat with 'B' shoe, slide cam off shaft. Pull 'B' shoe away from backing plate to free it from rests, pull anchor end out of anchor bracket, holding cam end out so that it is free to overlap 'A' shoe, swing cam end against spindle, unhook spring, remove 'B' shoe.

Pull adjusting nut and wedge assembly out of anchor bracket, wipe all parts clean, lubricate bearing surfaces with graphite grease. See that tapered grooves in adjusting wedge assembly lines up with openings in anchor bracket when reassembling.

STEWART-WARNER POWER UNIT

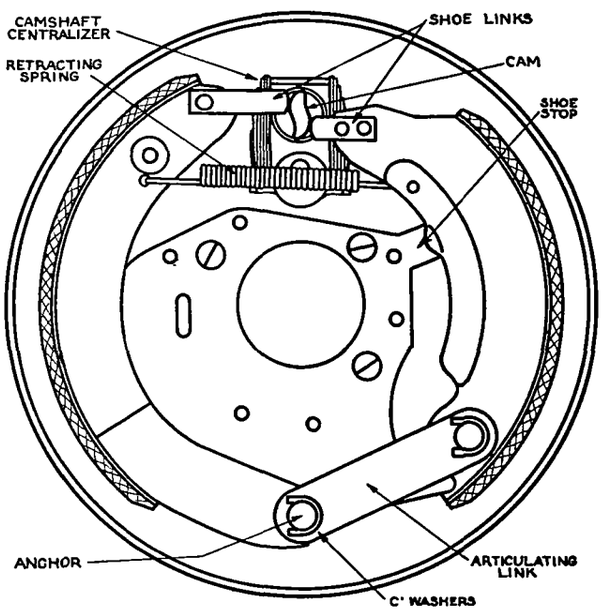
DESCRIPTION & OPERATION:—Power unit consists of a small single plate disc clutch controlled by the input yoke and mounted on the splines on the actuator unit. Actuator unit consists of two sleeves threaded together so that either sleeve is free to move endwise by rotating on the other. Outer or forward actuator is splined in clutch disc and inner or reverse actuator is splined on shaft. Output yoke on which levers for front and rear brakes are located is mounted directly in front of actuator unit on shaft. Treadle pressure to apply brakes moves clutch pressure plate backward causing clutch or friction disc (which rotates with shaft) to drag between pressure plate and machined face at rear of housing. This slowing down of the friction disc causes one actuator (outer if car moving forward, inner if car moving backward) to screw forward applying pressure to the output yoke and rotating the output shaft to apply the brakes.

SERVICING:—Replacement of friction disc should be only service operation required and unit need not be dismantled further than required to remove disc. Manufacturer recommends installation of new disc.

Disassembling Power Unit:—Disconnect brake rods on levers, take out cotter pin and pull conduit and cable out of power unit cover, disconnect front universal joint, drop propellor shaft, remove universal joint companion flange. Take out power unit housing cover screws, remove cover, remove three presure plate springs, splined spacer, thrust washer assembly, friction disc, actuators, pressure plate, and actuator thrust bearing. Remove screw and spring washer on output shaft lever at left side, remove lever and washer on cork seal, hold output yoke and pull shaft out of housing. Remove input lever clamp screw, remove input lever and key, take out two screws in oil seal cap, remove cap and cork oil seal, tap out flanged bushing from inside of case.

Servicing:—Wash all parts in gasoline. Thoroughly oil thrust bearings, actuators, input yoke, output yoke shaft and brake lever hub before reassembling.

Reassembling Power Unit:—Install input yoke and lever assembly (use new cork oil seal if necessary). Place steel washer on output shaft against brake lever, use new oil seals in housing, hold output yoke in position and install shaft, engaging splines so that yoke and brake lever are both vertical when lever rotated back on shaft (slot in yoke positions it over guide pin in housing). Assemble washer on oil seal and return spring lever on end of output shaft. Install actuator thrust bearing so that lettering on face **"Important—Worm Actuators must bear against this face"** can be read with bearing in place. Damage will result if this bearing is reversed. Install inner and outer actuator assembly on splined shaft **with shouldered end to rear (visible after assembly).** Install pressure plate on guide pins with machined surface to rear, install friction disc **with spokes of disc to rear (visible after assembly).** Place thrust washer in position on shoulder of actuator with flanged edge of thrust washer casing to rear so that assembly fits over shoulder on actuator. Assemble splined spacer on shaft, install pressure plate springs, replace cover. Adjust power unit.



Adjustment:—With output yoke in extreme off position (normal position with return spring connected) and treadle rod connected, tighten turn-buckle until slight drag felt when universal joint flange turned by hand, back off turn-buckle until drag eliminated, then back off one-half turn additional.

BUICK (OWN) MECHANICAL TYPE

Used on:
BUICK, MODELS 50, 60, 90 (1932-33-34-35).
BUICK, MODEL 80 (1932-33).

DESCRIPTION & OPERATION:—Wheel Brakes—Two shoes per wheel. Shoes are self-energizing with upper shoe mounted on articulated link at anchor pin end. Shoes actuated through segmental links by cam at opposite end. Shoes returned to off position by single retracting spring linked between shoes at cam end.

Brake Linkage:—Brakes operated by pull rods from single cross-shaft on frame. Flexible cables used at wheel ends of pull rods (except for rear wheels on 1932-33 models with rods connected directly to brake levers on backing plates). Brake pedal connected to cross-shaft by adjustable pull rod with optional connection at pedal to provide hard or soft pedal.

Hand Lever:—Connected to cross-shaft by adjustable pull rod and operates all four service brakes. Adjusted as part of service brake adjustment.

Power Unit:—Vacuum power unit used on 1934-35 models. Plain type vacuum cylinder mounted on frame and linked to cross-shaft. Control valve connected in brake pedal linkage. See separate article on Bendix Vacuum Power cylinder for complete adjustment data.

ADJUSTMENT:—Adjust brakes when pedal reserve (distance to floor with brakes on) decreases to 2" or 3" for high speed driving. Adjustments must be made with drums cold. Make adjustments in following order.

Linkage—Adjust pedal stopscrew so that pedal is against rubber pad on under side of toeboard (50 '32-33; 60, 80, 90 '33), or pedal clearance is 3/16" (60, 80, 90 '32), 3/8" (all models '34-35). See that pedal pullrod is connected to lower hole in pedal (50 '32-33-34-35; 60, 80, 90 '32) or upper hole (60, 80, 90 '33-34-35). With cross-shaft in released position against stop pin, adjust length of pedal pullrod by loosening locknut and turning pedal end clevis until clevis pin can just be entered (on 1934-35 models vacuum cylinder valve must be in fully released position). See that hand lever is fully released, adjust length of hand lever pull rod to remove all slack. Disconnect all wheel pull rods at cross-shaft levers, see that each wheel brake operates freely and is in off position (levers against stops on backing plates). Adjust each pull rod to remove all slack. On 1934-35 models with vacuum power, pull power cylinder piston back to released position and adjust power cylinder pull rod to remove slack.

Brake Shoes—Jack up all four wheels. Loosen cam centralizer clamp bolt nuts on backing plate at each wheel (nuts must be free on lockwashers to allow cam to centralize). Turn up adjusting nut on adjusting levers at each wheel so that heavy drag secured and wheel can just be turned by hand. Tighten centralizer clamp bolt nuts. Back off adjusting nut at each wheel exactly 14 flats (for new lining), or 12 flats (after lining has been run in). Slight drag permissible with new lining. Apply brakes firmly to seat adjusting nuts against adjusting levers and see that spring locks engage adjusting nuts so that they will not loosen in service. Equalize brakes by slacking off adjusting nut on tight wheel slightly. This setting equal to approximately 1¾" pedal travel.

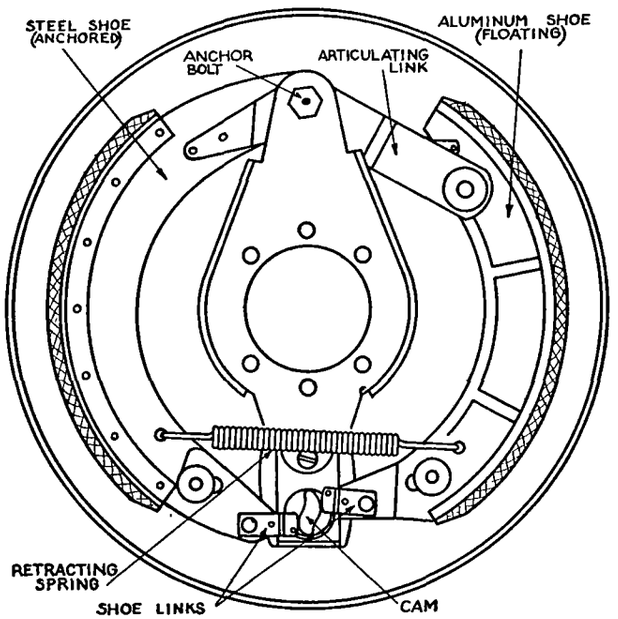
NOTE—Slightly harder pedal pressure is secured with pedal pull rod connected in upper hole on pedal. See linkage adjustment above for standard connection on each model.

SERVICING:—Brake Shoes—To remove brake shoes, unhook retracting spring and take out 'C' washers on anchor pin and articulating link pin. When replacing shoes see that washers clinched to prevent their dropping out into drum. Friction spring at end of articulated shoe must have 50 lbs. pressure when assembled to prevent movement of shoe due to road shock. Guides on shoe and anchor plate must not bind but must prevent shoe play. See that centralizer springs are parallel so that they bear on both the centralizer casting and stamping.

Brake Linkage—Lubricate brake cables twice each year using SAE. #160 lubricant. Special fittings necessary to inject lubricant into cable conduits.

CADILLAC (OWN) MECHANICAL TYPE

Used on:
LA SALLE V8, 345-B ('32), 345-C ('33).
CADILLAC V8, 355-B ('32), 355-C ('33), 355-D ('34-35).
CADILLAC V12, 370-B ('32), 370-C ('33), 370-D ('34-35).
CADILLAC V16, 452-B ('32), 452-C ('33), 452-D ('34-35).
CADILLAC V16, SERIES 90 (1936).



DESCRIPTION:—Wheel Brakes—Two shoes per wheel, Shoes mounted on articulating links at anchor (forward) end and actuated by cam through links pivoted on shoes at rear end. Upper (self-energizing) shoe does major portion of forward car braking and is aluminum with thicker lining than lower (steel) shoe. Shoes returned to 'off' position by single retracting spring hooked between shoes. Adjustment provided at cam lever on backing plate at each wheel.

Linkage (All Models 1932-33):—Front brakes operated by pull rods and cables (cable at wheel end protected by armored conduit) from one cross-shaft. Rear brakes operated by pull rods connected between second cross-shaft and short individual shaft for each wheel on rear axle housing. Brake pedal linked to equalizer between cross-shafts for 60% front, 40% rear braking.

Linkage (All Models 1934-36):—Front and rear brakes operated by pull rods and cables (cables at wheel end in conduit). Front wheel pull rods connected to rear cross-shaft, rear pull rods to front cross-shaft with pedal linked to equalizer between shafts for 60% front, 40% rear braking.

Hand Brake:—Hand brake lever linked to front cross-shaft and applies rear service brakes.

Power Unit:—Bendix internal valve type linked to brake pedal lever. See separate article for complete adjustment data (adjustments on La Salle and Cadillac V8 not the same as on other models due to differences in linkage).

ADJUSTMENT:—Check linkage if not known to be OK. before adjusting brakes at each wheel.

Linkage Adjustment (1932-33 Models):—See separate article on Bendix internal valve type Vacuum Power Unit for adjustment of brake pedal lever and valve lever. With cross-shafts against stops, see that clearance between pedal and underside of toeboard is 3/8-5/8". Adjust by loosening locknut and turning pedal stopscrew under pedal shaft. Adjust length of pedal pull rod so that clevis pin at pedal end of rod is at forward end of slot. Check cam lever positions by measuring distance from nearest face of cable clamp bracket to center of cable link pin in auxiliary lever (front wheels) or lever spring length from spring hole in lever to hole in backing plate (rear wheels). Adjust by changing length of pull rods so that these distances are 3 5/8" (front wheels), 4 15/16" (rear wheels).

(1934-36 Models):—See separate article on Bendix self-contained type Vacuum Power Unit for adjustment of brake pedal and lever, and valve lever. With pedal position correct and 1/32" clearance between end of clevis and pin at forward end of pedal pull-rod, and cross-shaft levers against stops, check

CADILLAC (OWN) MECHANICAL CONT.

cam lever position on each wheel by measuring distance from nearest face of cable clamp bracket to center of cable link pin in cam lever (rear wheels) or auxiliary lever (front wheels). Adjust clevises at cross-shaft ends of cables so that these distances are 3⅝" (front), 3 13/16" (rear).

Brake Adjustment:—
1—At each wheel, loosen cam bracket locking nut, apply brakes firmly to centralize cam bracket, tighten nuts before releasing brakes.

2—Check brake equalization between wheels. If braking action equal in all wheels, turn down all 4 cam lever adjusting nuts equal number of turns until pedal travel to apply brakes is 2¼"(1 1/6 turns of adjusting screw equal to 1" pedal travel). If braking action not equal, turn down each cam lever adjusting nuts until brakes drag, then back off all nuts same number of turns for correct pedal travel of 2¼". Recheck equalization.

Hand Brake Adjustment:—With hand lever in 'off' position, brakes released, and cross-shaft levers against stops, adjust length of hand brake cable at hand lever to allow 1/16-⅛" free travel of lever (1932-33 models) or adjust at cross-shaft end to eliminate all slack (1934-36 models).

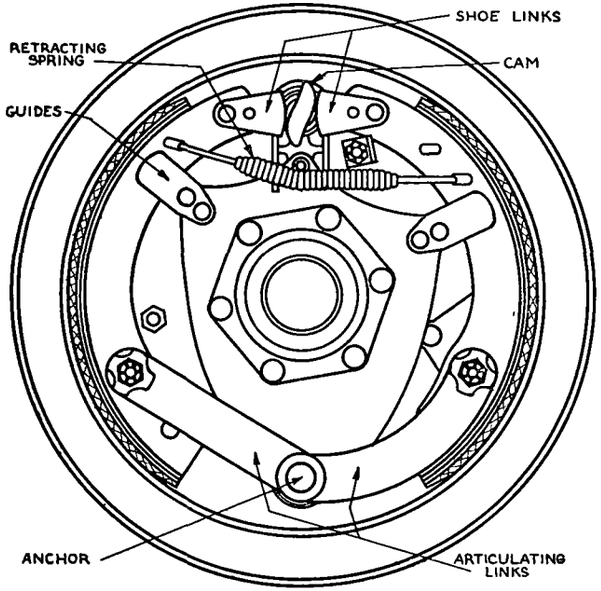
RELINING BRAKES:—See Car Model article for special lining specifications for each shoe. New linings should be chamfered 1/32" for distance of ¾" back at each end of shoe and rivet hole burrs removed.

SERVICING:—Brake Cables—Fittings provided for lubrication of cable conduits.
Brake Cams:—Lubricated by removing cotter pin in cam lever, withdrawing cam, packing the bearing behind cam with grease.

CHEVROLET (OWN) MECHANICAL TYPE

Used on:

STANDARD MODEL CC ('33), DC ('34), EC ('35).
MASTER MODEL CA ('33), DA ('34), EA, ED ('35).
TRUCK MODELS CB,O ('33), DB,P ('34), EB,Q ('35).



DESCRIPTION & OPERATION:—Wheel Brakes—Two shoes per wheel. Shoes are self-energizing type mounted on articulating links at anchor end and operated through segmental links by cam at opposite end. Guides for each shoe are mounted on mounting plate. Shoes returned to off position by retracting spring between shoes at cam end.
NOTE—Two additional shoes used in rear wheels on 1½ ton truck models. These shoes operated by hand lever which also applies all service brakes through cut-in linkage at cross-shaft.

Brake Linkage:—Brakes operated by rods, with flexible cable ends at wheels, from cross-shaft on frame. On all models (1933) and 1½ ton truck models (1934-35) cables not used for rear wheels and rods connected directly to cam levers on backing plate. Cross-shaft and linkage must be adjusted when brakes adjusted.

Hand Brake:—Hand lever linked to cross-shaft and operates all service brakes. On 1½ ton truck, hand lever also operates two additional shoes in each rear wheel. See separate section below for adjustment of this model.

ADJUSTMENT:—Service Brakes—Adjustments on all models must be made in the following order: 1. Linkage, 2. Centralizing Shoes, 3. Shoe Clearance, 4. Hand Brake (1½ ton truck only).

Linkage Adjustment (all cars 1933, 1½ ton trucks 1933-34-35)—Disconnect pedal return spring and all pull rods on cross-shaft, loosen cross-shaft bracket nuts (passenger cars only), adjust cross-shaft to pedal brace so that cross-shaft is free (trucks only). Install brake gauge on cross-shaft (special type for each model), see that pedal is against stop, adjust pedal pull rod by loosening locknut and turning rod until clevis pin at pedal end of rod is in extreme forward position. Place hand lever in off (forward) position, adjust pull rod length by loosening locknut and turning clevis until rod end pin is in extreme forward position (passenger cars) or at extreme rear end of slot (trucks). Adjust pull rods to front and rear wheels to remove all slack with cam levers on backing plate against stops. On front wheel pull rods, remove slack from cables by pulling on cable until cam lever on backing plate does not quite move (lever must remain against stop), and adjust by loosening locknut and turning rod into

cable end connector. Remove gauge, see that shaft is in center of hand lever cross-shaft bracket, tighten cross-shaft bracket nuts (pass. cars only).

Linkage Adjustment (all 1934-35 models except 1½ ton truck)—Disconnect all pull rods and return spring on cross-shaft. Set hand lever in extreme forward position, adjust pull rod by loosening locknut and turning rod until length from rear of hole at forward end to rear end of slot at back is 15¾" (DA), 15⅝" (EA, ED), 11½" (DB, EB), 9⅜" (DC, EC), assemble pull rod. Adjust brake pedal stop so that pedal clears floor board by ¼". With brake pedal against stop, adjust pedal pull rod by loosening locknut and turning rod until clevis pin can just be inserted in cross-shaft lever, connect pull rod. Adjust pull rods to front and rear wheels to remove all slack by pulling on cables until cam levers on backing plate do not quite move (levers must be against stops), loosening locknut and turning rod in cable end connector until pull rod clevis pins can just be inserted in cross-shaft levers, connect pull rods.

Centralizing Brake Cams—See that front wheel bearings properly adjusted, loosen cam centralizer clamp bolts on each wheel, make sure that centralizers are free by tapping adjuster lever hub nut. Apply brakes with quick hand pressure on pedal, hold brakes on, tighten all centralizer clamp bolts.

Brake Shoe Clearance—Jack up all four wheels, loosen adjusting screw locknuts on brake adjuster lever at each wheel, turn adjusting screw clockwise until shoes drag very lightly on drums, tighten locknuts. Equalize brakes by backing off screw on tight wheel. If slight pull to right or left develops when new linings installed, make final equalization after linings have worn in.

Hand Brake Adjustment (1½ ton truck):—Adjusted in same manner as service brakes. Disconnect all pull rods and return spring on cross-shaft, place hand lever in extreme forward position, install special brake gauge on right hand end of cross-shaft. Adjust length of hand lever pull rod by loosening locknut and turning rod until clevis pin can just be inserted in lever, connect pull rod and remove brake gauge. Adjust length of each rear wheel pull rod so that eyes of cam operating levers are exactly 3 5/16" from front face of rear axle banjo housing, connect pull rods and return spring. Loosen centralizer clamp bolts (directly to rear of cam operating shaft), apply hand brake firmly, then place lever in normal braking position and tighten centralizer clamp bolts. Release hand lever, loosen locknuts on brake adjuster lever at inner end of each cam operating shaft, turn adjusting screw clockwise until shoes drag very lightly on drums, tighten locknuts. Equalize by slacking off on tight wheel slightly. Adjust length of pull rod connecting hand lever to service brake cross-shaft so that clevis pin at cross-shaft end is at extreme rear end (this rod not used on 1933 model).

RELINING BRAKES:—Factory replacement lining furnished in sets (different type lining for upper and lower shoes for Master and half ton truck). Lining for upper shoe Dark Gray (1934), Yellow (1935), lower shoe Light Gray (1934-35).
NOTE—At Buffalo, Tarrytown and Bloomfield plants (serial number prefix 12, 2, or 27) special type lining (black) used on Master model.

CHEVROLET (OWN) HYDRAULIC TYPE

Used On:

ALL PASS. CAR & TRUCK MODELS (1936 to 1939)

NOTE:—Brake design for 1939 models changed from previous models as follows:
Hand Brake (Passenger Car Models). Hand brake lever is mounted under cowl and is linked to bell-crank lever on left frame side-rail by non-adjustable rod. Bell-crank is linked to idler lever on second frame cross-member by non-adjustable rod with anti-rattle clip on rod at engine tie bar. This idler lever is linked to rear wheel hand brake cables by rods with adjusting clevises at cable connections. Free end of lever is guided by slotted guide plate.
Master Cylinder Piston Primary Cup (all Models). New type rubber primary cup used which has brass support ring vulcanized in base to prevent cup imbedding in bleeder holes in piston. This new type primary cup can be used on previous car and truck models. NOTE—Old design truck primary cups cannot be used on 1939 truck models.

DESCRIPTION AND OPERATION:—Wheel Brakes—Two shoes per wheel similar to previous design in that shoes are mounted on articulating links at anchor pin end with upper end bearing directly on wheel cylinder piston adjusting screws. Rigid type hydraulic wheel cylinder mounted on backing plate between shoes Shoes are forced out in contact with drum by piston movement when fluid displaced from master cylinder by pedal application flows through lines to wheel cylinder. Articulating links result in uniform shoe contact with drum and only one adjustment (at piston) provided. Shoes returned to off position when pedal released by single retracting spring linked between shoes.

Hand Brake:—Hand lever applies rear wheel service shoes through cable actuated lever pivoted on one shoe and linked to other shoe by strut (passenger cars) or lever and link (1½ ton truck).

Master Cylinder:—Compensating type similar in design to type used on Lockheed Brakes See Lockheed Brake article.

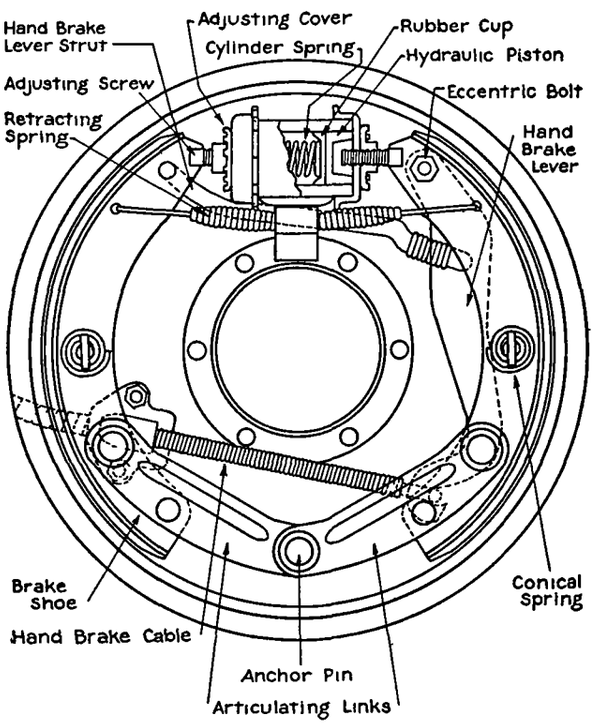
ADJUSTMENT:—Jack up all four wheels, remove front wheels on Passenger Cars, ½ Ton, ¾ Ton & ¾ Ton Special, 1 Ton, and rear wheels also on ¾ Ton Special & 1 Ton Models. Disconnect hand brake rods at cable connectors, remove adjusting hole covers on backing plate at each end of master cylinder (except rear wheels on 1½ Ton truck) Adjust each wheel as directed below. If brake drums have been removed previously, articulating pins should be aligned by applying brakes firmly before adjustments are made

Bleeding Brake System. See separate article on Hydraulic Brake Servicing for complete bleeding directions (required when lines disconnected, to remove wrong type fluid whenever it has been used in system, or to remove air from lines caused by allowing master cylinder supply tank to become dry or by disconnecting lines

CAUTION—Hand brake rods must be disconnected to eliminate any possibility of shoes being held on by cables which would make it impossible to secure satisfactory brake adjustment.

Brake Pedal Clearance:—Clearance between pedal and underside of toeboard must be ¼" to insure master cylinder piston being back against its stop for correct compensating action when brakes released. Adjust each model as follows:

Passenger Cars. Loosen locknut on eccentric bolt (linking pedal and master cylinder piston rod), turn bolt until correct toeboard clearance secured, tighten locknut.



Truck Models. Loosen locknut at clevis on rear end of master cylinder pushrod, turn pushrod until correct toeboard clearance secured, tighten locknut.

Adjustment (Except 1½ Ton Rear Wheels):—Insert screwdriver in slot on backing plate at each end of wheel cylinder so as to engage notched adjusting covers on cylinder (adjusting cover on each end of cylinder controls one shoe), turn adjusting covers until shoe has slight drag on drum, then back cover off exactly 4 notches (all models except 1½ Ton Truck front wheels), 5 notches (1½ Ton Truck front wheels) to provide correct clearance. Adjust all wheels in this manner, then adjust parking brake (see below) and check brake pedal clearance.

Adjustment (1½ Ton Truck Rear Wheels). Wheel cylinder adjusting covers turned by means of hexagonal-headed pinion shafts on backing plates. Turn each pinion shaft clockwise until shoe has slight drag on drum, then turn pinion shaft back ¾ turn for correct clearance, adjusting parking brake (see below) and check brake pedal clearance.

Parking Brake Adjustment (Passenger Cars):—Place hand lever in fully released position. Pull on forward end of each wheel cable to remove all slack, turn adjusting clevis on rear end of each brake rod until holes in clevis and end of cable line up, install clevis pins (hold clevis while tightening locknuts to prevent twisting of rods and cables. Check equalization and make any necessary re-adjustment by loosening adjusting clevis on rod to tight wheel (do not change wheel cylinder adjusting cover setting).

Adjustment (Truck Models). Place hand lever in fully released position. Pull wheel cable end fitting (at front of rear frame cross-member) forward until a definite stop is felt, hold cable in this position, turn nut on forward rod down until it contacts (turn by hand only, do not use wrench), lock cable by turning rear nut up securely. Check equalization and make any necessary re-adjustment by loosening wheel cable to tight wheel slightly (do not change wheel cylinder adjusting cover setting).

Toggle Lever Adjustment—This adjustment must be made whenever new rear brake shoes installed. After adjusting service (hydraulic) brakes, remove brake drum, loosen eccentric bolt locknut (lever pivot on shoe web below right end of hydraulic cylinder), hold toggle lever against shoe, turn eccentric bolt until only slight clearance between lever and bottom of slot in hand brake extension link, tighten locknut, recheck clearance. Adjust hand brake as directed above.

NOTE—Whenever brake drums removed, see that drain hole in drum is lined up with notch in axle flange when drums replaced.

RELINING BRAKES:—Manufacturer recommends installation of new replacement shoes furnished with linings. Hard (semi-moulded or moulded) lining used which will have glazed appearance when burnished. See Car Model page for specifications for each model. Wheel cylinder piston clamp should be installed on piston when shoes removed.

To Remove Shoes:—Remove brake shoe return spring and conical hold-down springs. On rear brakes only remove toggle lever eccentric bolt and nut from rear brake shoe. Remove articulating link friction spring pin lock, pin and spring. Take out pin lock and pin on each shoe and remove articulating links.

NOTE—In assembling toggle lever on new shoes, see that high side of eccentric bolt is toward shoe in minimum adjustment position (high side indicated by flat ground in bolt head). Toggle lever adjusted as directed above under Hand Brake.

1½ Ton Truck Models. The wheels and brake drums with wheel hubs must be removed to get at brake shoes. Wheel bearings must be adjusted when wheels replaced (see car model page). Brake shoes on rear wheels have individual anchors.

Brake Shoe Installation. When installing shoes, see that they contact all pads on anchor plate (3 pads for each shoe) by checking clearance at each pad with .002" feeler gauge. If shoes do not touch all pads, bend anchor plate.

SERVICING:—Brake Linkage—Brake cables on passenger cars and 1½ ton truck must not be lubricated. Rear brake cables on Master Model identical (left and right. Cables on the ton-and-a-half truck not interchangeable and identified by string tracer woven under cable wire shield in left hand cable. Cables should be set for tire clearance as follows:

1½ Ton Truck—Wind up cables ½ turn (counter-clockwise for left hand, clockwise right hand) before clamping cable in frame bracket.

Standard Model—Each rear brake cable should have spring, Part No. 592681 with clip installed 1 7/8" from front of flange plate bracket to hold cable away from wheel. Install spring on cars not equipped.

Brake Drum Removal—Rear brake drums held on axle shaft flange by wheel mounting nuts and two screws. To remove drums, remove wheel and then take out screws. Extra hole in drum and gaskets should be lined up with notch in axle shaft flange for oil drain from deflector.

Hand Brake Lever (1938 Models). Double tooth pawl and sector plate pivoted on hand brake lever and linked to mounting bracket so that sector plate moves in opposite direction when hand lever pulled to apply brakes (allows finer lever setting)

Master Cylinder:—Piston clearance in cylinder must be .001-.005". When reassembled clearance between lip on primary piston cup and center of compensating by-pass port should be .035".

Master Cylinder (HD, HE, T Only):—Special 'Vee' shaped ring installed on face of piston under primary cup to prevent cup imbedding in bleeder holes when brakes applied. See that this ring installed when assembling master cylinder.

Wheel Cylinders:—To disassemble wheel cylinders, with brake line disconnected and return spring on shoes removed, take out two mounting screws on backing plate. Remove cylinder, lift off adjusting cover and screw assemblies, withdraw pistons, piston cups and return spring. Examine bore. Piston clearance in cylinder should be .002-.004". Line must be bled when reinstalled.

NOTE—Wheel cylinders for front and rear wheels are of different bore and must be replaced in same wheel. No part of assembly interchangeable (see Car Model page for specifications).

HAWLEY TYPE

Used On:

CROSLEY, MODEL A (1939-40)

TYPE:—Hawley Neutral Shoe type with floating brake lining. Lining consists of a single piece of sufficient length to reach entirely around shoes with gap of 1/16" at ends. Lining is centered on shoes by rib on backing plate and conical retainer on wheel side.

DESCRIPTION & OPERATION:—Wheel Brakes. Two shoes per wheel, anchored at adjusting screw end and operated by cam at opposite end. Shoes are held against adjusting screw and cam by small coiled spring hooked between shoes at each end.

Linkage:—Wheel brakes operated by cables from main cross-shaft on frame. Cables enclosed in conduits at wheel ends and provided with adjusting clevises at cross-shaft.

Hand Brake:—Hand lever is linked to main cross-shaft on frame. Cables enclosed in conduits at wheel ends and provided with adjusting clevises at cross-shaft.

Hand Brake:—Hand lever is linked to main cross-shaft and applies all four wheel service brakes.

ADJUSTMENT:—Jack up all four wheels, remove clevis pins and disconnect all four wheel cables at cross-shaft. At each wheel, loosen locknut and tighten brake adjusting screw on backing plate (turn screw counter-clockwise) until slight drag noticed when wheel turned by hand, then back adjusting screw off (turn screw clockwise) until wheel is just free, tighten locknut.

Linkage Adjustment—Depress brake pedal 1" and hold in this position. Adjust clevis on cross-shaft end of each wheel cable so that brakes barely drag when cable connected to cross-shaft. Release pedal. Road test car and equalize brakes by turning adjusting screw on tight wheel slightly (turn screw clockwise to loosen brakes).

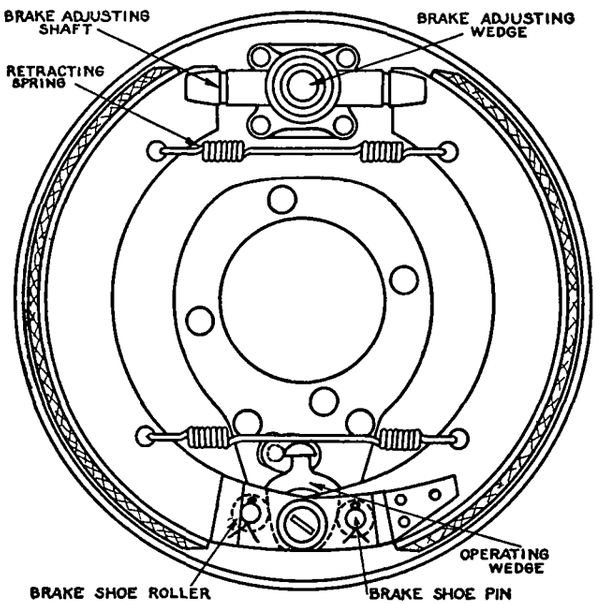
SERVICING:—Brake Lining Replacement—To remove and renew brake linings, jack up wheel, remove hub cap, wheel, and hub assembly. Remove conical brake lining retainer. Take out old lining. Insert new lining and re-install wheel.

Brake Lining Note—Use only genuine Crosley lining—furnished in correct length to fit around shoe with 1/16" gap at ends. Lining is not riveted on shoes and is installed loosely in drum.

Brake Cable Lubrication:—Whenever brake cables adjusted, fill cable conduits with grease. When connecting cables use care not to twist or buckle cables excessively.

FORD (OWN) MECHANICAL TYPE

USED ON ALL MODELS (1932-33-34-35-36).



DESCRIPTION & OPERATION:—Wheel Brakes—Two shoes per wheel, anchored at adjusting wedge end and actuated by brake operating wedge at other end (front brakes for all models, rear brakes on 1935-36 models) or brake cam (rear brakes on 1932-33-34 models). Shoe wedges or cams actuated by cranklevers on backing plate (rear wheels) or by lever on spring hanger through operating pin extending down through hollow kingpin (front wheels). Shoes returned to off position by retracting springs hooked between shoes at both ends.

Linkage:—Rod to each wheel from cross-shaft mounted on rear of 'X' member center connector. Linkage adjustment (clevis and locknut) at wheel end of each rod.

Hand Brake:—Hand lever connected to cross-shaft and actuates all service brakes (passenger and commercial cars) or connected to second cross-shaft and actuates independent internal expanding brake bands in each rear wheel (trucks). Hand brake must be adjusted separately on trucks (instructions below).

ADJUSTMENT:—For Wear—Jack up all four wheels, check front wheel bearings, spindle bearings, spring shackle studs, shock absorber links, and radius mountings for looseness. Release hand lever, disconnect brake rods by taking out clevis pins at each wheel.

1—At each wheel, screw in adjusting screw all the way then back off until wheels are just free of drag. Brakes must be cold.

2—See that hand lever is full released. Cross-shaft levers on 1932-34 models should be vertical (passenger cars) or 1" behind vertical (trucks). Disconnect brake pedal rod, adjust length of rod by turning clevis until pedal rests against rubber stop on floor (1932-34 models), or until clearance between rear end of hand lever rod clevis slot and rear face of cross-shaft lever pin is 1/8" (1935-36 passenger cars), or rear face of pedal rod lever on service brake cross-shaft is 1 29/32" in front of cross-member (1935-36 trucks). Reconnect pedal.

3—Adjust length of each brake rod at wheel so that rods are 1/32" short (levers must be pulled in 1/32" to insert clevis pins). Reconnect brake rods.

4—Set hand lever in first notch (passenger and commercial cars) or apply brakes with pedal jack (trucks). Turn each wheel at least one revolution and equalize by backing off adjusting screw on tight wheels. When brakes equalized, back off adjusting screw on each rear wheel exactly 2 notches on 1932-33-34 models (to equalize action on front wheel wedge-operated brakes and rear wheel cam-operated brakes). On 1935-36 models with all brakes operated by wedges this setting not necessary and all screws should be backed off evenly.

New Shoes or Relined Brakes:—When installing shoes, use brake gauge to check shoe clearance. Clearance at all points (except chamfered ends) must be .010" minimum and must not exceed .030" at any point. Turn up adjusting screws until clearance at adjusting screw end is .010". Check wedge end clearance. If less than .020", install new brake shoe pins with oversize heads which raise shoe .010" and increase clearance by this amount. Adjust brakes as directed above.

Hand Brake (Trucks):—Take up brake rods to rear wheels equal amount so that wheels are just free of drag with hand lever released. Equalize by applying brakes and slacking off rod to tight wheel

RELINING BRAKES:—New lining should be ground concentrically on special fixture and linings should be chamfered for distance of 1¼" back from each end.

FORD (OWN) MECHANICAL TYPE

Used On:

FORD V8 '60', MODELS 73, 74, 75 (1937)
FORD V8 '85', MODELS 77, 78, 79 (1937)
'60' MODELS 82A, 82C, 82Y (1938)
'85' MODELS 81A, 81C, 81Y, 81T, 81U, 817T (1938)

NOTE:—75, 79, 81T, U, 817T Trucks. Hand brakes on these models are entirely independent, hand lever applying separate internal-expanding brake band in each rear wheel brake drum.

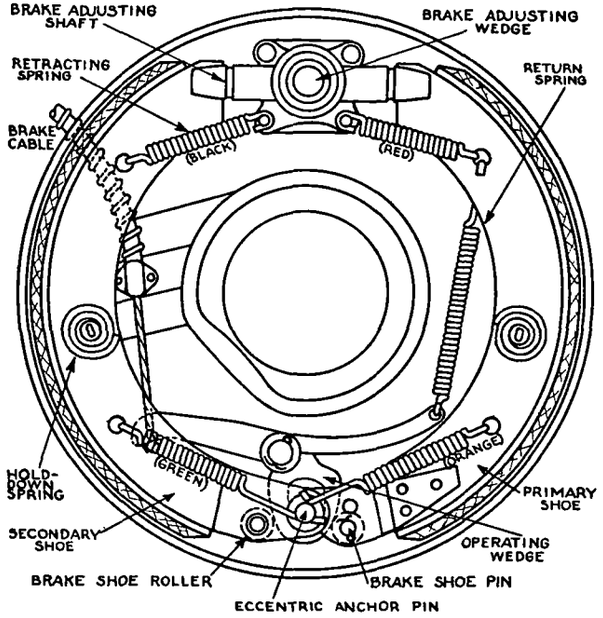
DESCRIPTION & OPERATION:—Wheel Brakes—Two shoes per wheel, anchored at adjusting screw end and actuated by wedge at opposite end. Shoes returned to off position by retracting spring at either end (see illustration).

Linkage:—Wheel brakes operated by cable from cross-shaft at rear of 'X' member on frame. Cables enclosed in conduit between frame and wheel. Hand lever linked to cross-shaft by conduit enclosed cable, brake pedal by adjustable rod.

Hand Brake:—Hand lever, under the instrument panel linked to cross-shaft by cable in conduit and applies all four service brakes.

ADJUSTMENT:—For Wear—Jack up all four wheels, check front wheel bearings, spindle bearings, spring shackle studs, shock absorber links, and radius rod mountings for looseness. Release hand lever. See that lower or front brake cable lever is against bottom of cross-shaft bracket (cars), operating lever against frame cross-member (trucks); if not, Major Adjustment required. At each wheel, turn adjusting screw in until shoes are tight in drum, then back screw off until all drag just removed. Hold brake pedal 'on' with pedal jack, check wheels for even drag. Equalize by backing off tightest wheels. Check tire inflation. Test brake action on Brake Tester or by road testing car.

Major Adjustment (New Shoes, Relined Brakes etc):—Jack up all four wheels, check for looseness (see Wear Adjustment above). Remove clevis pins in front and rear brake cables at cross-shaft, remove wheel and hub assemblies. Adjust as follows:



1—At each wheel, install concentricity gauge and check shoes for distortion (clearance should be uniform around shoe, if not shoes should be replaced—See Overhaul data below). Re-install wheel and hub assemblies.

FORD MECHANICAL TYPE CONT.

2—Check cross-shaft lever position. Front brake cable lever (lower) must be against bottom of cross-shaft bracket (cars), operating lever against cross-member (trucks). To adjust, remove pedal rod clevis pin at cross-shaft, loosen locknut and turn clevis until pin can be installed with lever against stop (pin must be at rear end of pedal rod slot).

3—Check hand lever cable length. Cable must not hold cross-shaft lever away from stop with hand lever released. To adjust, place hand lever in released position, loosen locknut and clevis pin at hand lever end of cable, turn clevis until pin can be inserted without disturbing levers.

4—At each wheel, turn up adjusting screws until shoes are tight in drums. Adjust each wheel brake cable clevis at cross-shaft end so that pin can just be installed with 25 lbs. pull on cable (use special

Ford SV-207 brake cable puller to apply tension to cables). NOTE—On trucks (81Y, 82Y rear brakes; 75, 79, 81T, U, 817T all brakes), eccentric anchor should be adjusted at same time by loosening anchor pin locknut and turning anchor pin slightly in both directions, while adjusting screws are being tightened, until shoes have been expanded to maximum. Then hold anchor pin from turning and tighten locknut securely using wrench with 20" handle. On all other models, new Carrier Plate Assemblies should be installed if eccentric anchor pin requires adjustment.

5—At each wheel, back off adjusting screw until wheel is just free of drag. Hold brake pedal on with pedal jack and check wheels for even drag. Equalize by backing off tightest wheels. Check tire inflation. Test brake action on Brake Tester or by road testing.

SERVICING:—Brake Shoes—To remove shoes, disconnect retracting spring at each end of each shoe. Take out pin, remove plain washer on hold-down spring at center of shoe web. Pull shoes free at adjusting wedge end, lift off.

Cable Conduits—Whenever cable conduit clamps are loosened, to replace conduits, tighten clamp capscrews and then back off one half turn. Turn up adjusting screw until brake shoes are tight in drum. Use brake cable puller SV-207 and apply 300 lb. pull on cable, maintain this pull by tightening adjusting screw on tool, shake conduit vigorously to insure its seating in clamps, tighten clamp screws at carrier plate and frame. Readjust wheel brake.

CARRIER PLATE ASSEMBLIES:—When installing new carrier plate assemblies, disconnect all brake cables at cross-shaft, check spindle bearings, spring shackles, shock absorber links, and front radius rod mountings. Replace if looseness caused by wear is excessive. Examine brake drums and replace if scored or eccentric (maximum runout .010"). Check brake cross-shaft lever position. Adjust pedal rod if front brake cable lever not against bottom of cross-shaft bracket (see above). Install new brake carrier assembly and connect ball end of cable to lever. Tighten conduit clamp on backing plate securely then loosen both screws one half turn. Loosen conduit clamp screw at frame bracket one half turn. Adjust conduits as directed above (Servicing Cable Conduits). Then adjust brakes.

FORD-LOCKHEED TYPE

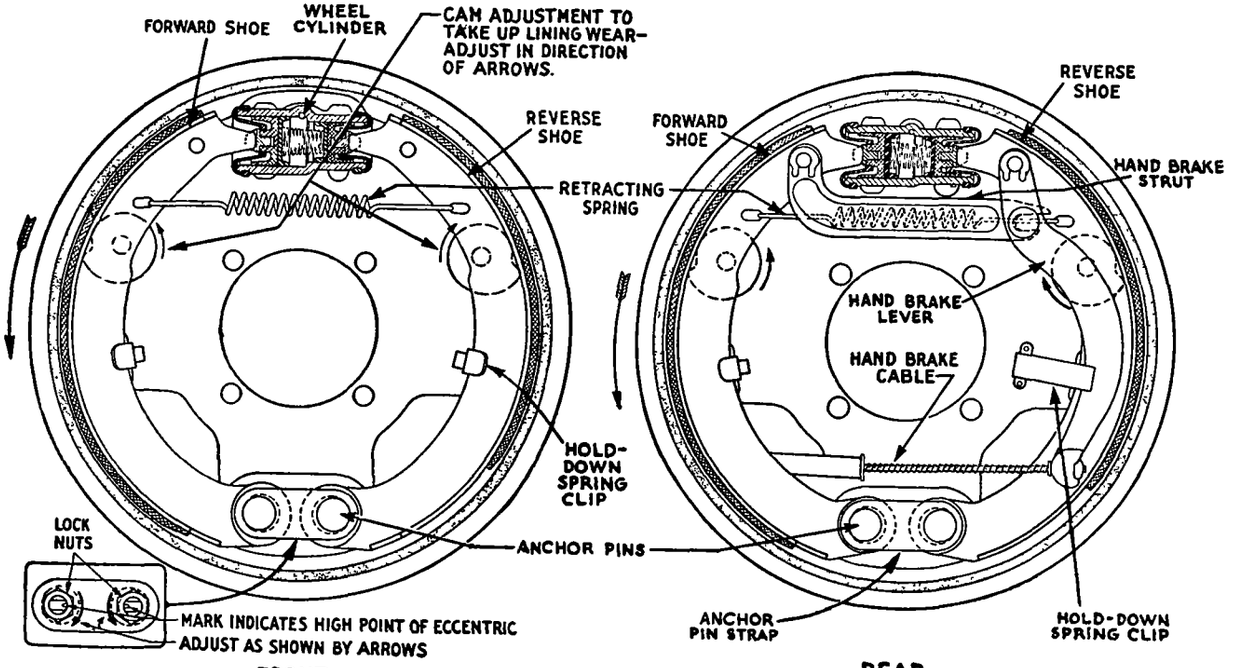
Used On:

FORD, ALL PASS. CAR & TRUCK MODELS (1939)
MERCURY, MODEL 99-A (1939)

LINCOLN-ZEPHYR NOTE:—Hydraulic brakes on this model are Bendix Single Anchor type. See Bendix Brake article for data on Lincoln-Zephyr brakes.

DESCRIPTION & OPERATION:—Lockheed two-shoe, double anchor type. Two shoes per wheel, each mounted on individual eccentric anchor pin at lower or 'heel' end and bearing directly against opposed pistons of stationary wheel cylinder at upper or 'toe' end. Shoes are held against eccentric adjusting cams (wear adjustment) in 'off' position by a single retracting spring hooked between the two shoes at the toe end.

Wheel Cylinders:—Rigid type mounted on backing plate with opposed pistons which bear directly against toes of brake shoes. Pistons are sealed by rubber cups held against piston heads by central spring and dirt is excluded from cylinder by rubber boot fitting over end of cylinder and brake shoe.



Passenger Car & 1 Ton Truck—Cylinders are stepped or two-stage bore type with larger end of cylinder toward front and actuating forward shoe. Front wheel cylinders larger than rear wheel.

Truck Models. Cylinders not stepped (both ends same size). Larger cylinders used on rear wheels.

NOTE—Wheel cylinder not interchangeable from right to left sides of car or from front to rear wheels.

Master Cylinder:—Compensating type with integral supply tank. Similar in design to type used on other Lockheed Hydraulic Brake applications.

Parking (Hand) Brake:—On Passenger Cars & 1 Ton models, hand lever applies rear service brakes through cables connected to a strut and lever linkage on the brake shoes. On other truck models, hand lever applies an independent internal-expanding brake band in the rear wheel brake drums.

SERVICING:—Bleeding Brake Lines. Fill master cylinder supply tank with genuine Ford Brake Fluid (keep tank filled during bleeding operation, bleeding must be repeated if fluid level low enough so that air enters cylinder and lines). Remove dustscrew on bleeder valve at wheel cylinder, install rubber tubing in bleeder valve and immerse other end of tubing in brake fluid in a container. Open bleeder valve and pump brake pedal with slow even strokes until only clean fluid flows from wheel cylinder (no trace of air or bubbles) being careful that fluid level maintained in master cylinder supply tank. Close bleeder valve, remove tubing, replace dustscrew. Bleed other wheels in same manner.

ADJUSTMENT:—Before adjusting, jack up all four wheels, remove one front wheel and inspect lining (to determine if new linings required), re-install wheel. Check front wheel bearing adjustment, spring shackles, shock absorber links, and radius rod mountings, tighten steering connections. Place hand lever in released position. Adjust each wheel as follows:

Minor Adjustment (For Wear):—Install wrench on eccentric adjusting cam on backing plate with wrench handle upward, turn cam by moving wrench handle out toward wheel rim until shoe is tight in drum, then turn cam back until wheel just turns freely without drag (do not turn cam back more than enough to free wheel, desired setting is with least possible amount of clearance). After adjusting forward shoe, repeat adjustment on rear shoe, then adjust all other wheels in same manner. Check pedal reserve, if reserve less than half total travel, repeat adjustment (if pedal is 'spongy', bleed lines). Check brake pedal clearance and adjust hand brake (see instructions below).

Major Adjustment (For relined brakes, etc.):—NOTE—Before installing brake drums, loosen eccentric anchor pin locknuts and turn each anchor pin so that marks on flatted ends of pins are together (marks indicate 'high' side of eccentric and in this minimum position will allow drums to be installed over new linings). Adjust eccentric adjusting cam for each shoe (see Minor Adjustment above), then adjust anchor pins as follows: Depress brake pedal with 25-35 lbs. pressure (hold in this position while making adjustments), use wrench with 3" handle and turn eccentric anchor pin so that mark moves down until brake shoe is felt to contact drum, hold anchor pin from turning and tighten locknut securely. Release brake pedal, check wheel to see that it turns freely without any drag, repeat adjustment if wheel drags. This setting designed to secure less clearance at anchor pin or heel end of shoe than at toe with only slight clearance for entire shoe. Adjust both shoes in each wheel in this manner, check brake pedal clearance and adjust hand brake as directed below.

Brake Pedal Adjustment:—Brake pedal must have **¼-½" free movement (measured at pedal pad) to** insure master cylinder piston being against its stop for correct compensating action when brakes released. To adjust, loosen locknut on pedal rod, turn rear section of rod (integral with large adjusting nut—not necessary to disconnect clevis pins), tighten locknut.

Parking (Hand) Brake Adjustment (Passenger Cars & 1 Ton Truck):—Place hand brake lever in first notch 'on'. Depress brake pedal with 30 lbs. pressure and hold in this position while adjustment being made. Pull cables to remove all slack, adjust conduit so that cables are exactly right length. Release hand lever and brake pedal, check rear wheels to see that they are free.

Trucks (others). Hand lever linked to cross-shaft by non-adjustable rod, cross-shaft linked to hand brake lever on each rear wheel backing plate by adjustable rods. To adjust, remove clevis pin in forward end of each rod at cross-shaft, loosen locknut, turn clevis on rod.

OVERHAUL:—Note—Factory recommends installation of factory reconditioned brake shoes (with new lining installed) whenever lining worn so that replacement required. Before removing brake shoes, install clamp on wheel cylinders (to retain wheel cylinder pistons) and be careful not to depress brake pedal with shoes off. This will eliminate necessity of bleeding lines when shoes installed.

Brake Shoe Installation:—Assemble retracting spring to shoes (and hand brake lever and link parts for rear wheels). Turn eccentric adjusting cams to minimum position. Hold shoes so that anchor pin ends overlap and upper ends spread sufficiently to enter wheel cylinder pistons, engage shoes in piston slots, spread lower ends of shoes until they are engaged under flat lip of hold-down springs. Install anchor pins making certain that eccentric is in place in hole in brake shoe and that anchor pin engages eccentric. Turn anchor pins so that notch in flatted end of each pin is lined up with notch in opposite pin, install anchor pin locknuts, connect hand brake cable to lever. Adjust shoes as directed in Major Adjustment above.

***Master Cylinder & Wheel Cylinder* Disassembly and Overhaul:**—All service operations same as on other Lockheed Brakes. See article on Lockheed Double Anchor Hydraulic Brakes and separate article on Hydraulic Brake Servicing for complete data.

BENDIX MECHANICAL TYPE SINGLE ANCHOR

Used On:

LINCOLN, V12 MODEL (1940)

WILLYS, 440 PICK-UP, 440P PANEL DELIVERY (1940)

This Brake same design as used on preceding models.

NOTE:—Lincoln Brake Power Cylinder—Bendix plain type vacuum cylinder (with separate control valve) used on all cars. See Bendix Vacuum Cylinder in manual for complete data.

Willys Passenger Cars—These cars equipped with Lockheed Hydraulic, Double Anchor brakes. See separate article for data on Lockheed brakes.

ADJUSTMENT & SERVICING:—Adjustments same as for corresponding preceding models. See 'Bendix Mechanical—Duo-Servo, Single Anchor Type' brake article in Mechanical Equipment Section of manual for complete data.

BENDIX HYDRAULIC, SINGLE ANCHOR (WITH ECCENTRIC ADJUSTMENT)

Used On:

CADILLAC V8, SERIES 40-75 (1940)

CADILLAC V16, SERIES 40-90 (1940)

HUDSON SIX, MODELS 41, 43 (1940)

HUDSON EIGHT, MODELS 44, 47 (1940)

NASH EIGHT, MODEL 4080 (1940)

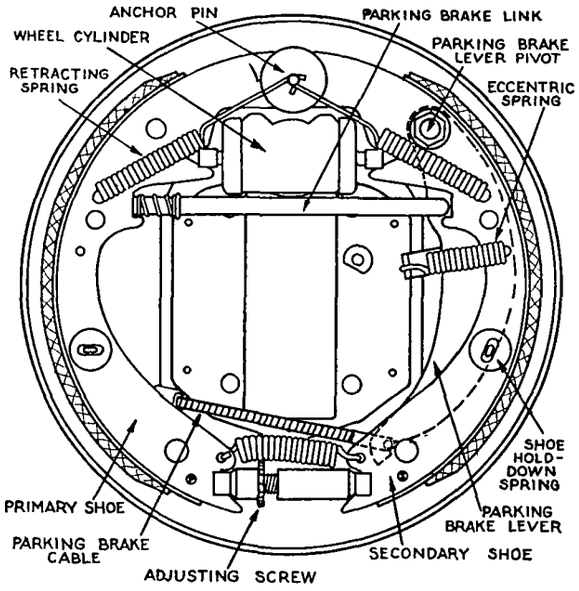
PACKARD COMM'L., 1801A, 1803A (1940)

PACKARD SUPER 8, '160' 1804, 5 (1940)

PACKARD CUST. SUPER 8, '180' 1807,8 ('40)

These brakes same design as used on corresponding 1939 car models.

NOTE:—Cadillac, Nash, Packard (other models)—These other models with Bendix Hydraulic Brakes do not have eccentric adjustment and are adjusted differently. See preceding article for data.



Hudson (other Models)—Hudson Models 40P & 40T have Bendix Hydraulic Double anchor brakes. See separate article for data on this type.

ADJUSTMENT:—Before making adjustments, jack up all four wheels, loosen or disconnect parking brake (hand lever) cables at intermediate lever, remove adjusting screw hole covers on backing plates and feeler gauge hole cover on drum (remove wheels for access). Check brake pedal clearance (see Brake Pedal Adjustment below), then adjust at each wheel as follows. CAUTION—If hand brake cables not disconnected, shoes may be held 'on' by cables (if adjusted too tight) so that correct brake adjustment cannot be secured.

Minor Adjustment (For Wear):—Adjust at each wheel as follows:

1. (All Models). Loosen eccentric locknut, turn eccentric in direction of forward wheel rotation until .010" feeler is snug between lining and drum at each end of this secondary shoe, hold eccentric from turning, tighten locknut. Clearance at both ends of shoe must be alike within .002" (Cadillac), .003" (all others) with smaller clearance preferably at anchor end. If variation greater than this amount, anchor must be re-located (See Major Adjustment below). If feeler gauge not used, turn eccentric up until heavy brake drag secured, then back eccentric off until wheel is just free of drag.

2. (All Models). Insert special tool, or screwdriver, in adjusting screw hole on backing plate, turn adjusting screw by moving outer end of tool up toward center of wheel to expand shoes until wheel can just be turned (if necessary to turn adjusting screw more than 50 notches or clicks, examine linings for wear and replace if necessary). Adjust and connect hand lever cables (see Hand Brake Adjustment below). Then back off adjusting screw until wheel is just free of drag (approximately 20 notches). Check equalization by depressing brake pedal (use pedal jack) until wheel with least drag can just be turned by hand, equalize by backing off adjusting screws on tight wheels not more than 2-3 notches. Do not tighten loose wheels.

Hudson Note. Check mechanical 'follow-up' setting after adjusting brakes (see separate article following).

3. Hand Brake Adjustment (All Models). Adjust hand brake cables for each model as follows:

Cadillac. With rear brake shoes expanded so that rear wheels can just be turned by hand, make certain that hand lever in 'off' position, pull cables taut and adjust clevises so that clevis pins can just be inserted. Connect cables and back off adjustment at shoes 15-20 notches until wheels are just free. Check equalization.

Hudson—With rear brake shoes expanded tightly against drum, pull hand lever 'on' two notches so that clearance between hand brake cable lever and end of slot in guide plate is ⅛", pull cables tight, adjust clevis at forward end of each cable so that clevis pins just enter holes in toggle on lever, connect cables, back off adjusting screw in each wheel until wheels are free, check equalization.

Nash. With rear brake shoes expanded tightly against drum, pull hand lever 'on' 2 notches, loosen two bolts on adjusting clamp (connecting lever and wheel cables), pull cables tight and tighten bolts. Return lever to 'off' position. Back off adjusting screw in each wheel to free brakes and check equalization as directed in (2) above. See that hand brake lever on each wheel backing plate has ⅛" free travel with hand lever in off position. Equalize hand brakes by loosening rear bolt in cable adjusting clamp and applying hand brakes (this will allow cable to shift on adjusting clamp). Check position of hand brake cable guide on rear spring. Guide should be exactly 18¼" to rear of center-line of spring front eye bolt.

Packard. Expand rear wheel brake shoes tightly against drums. Eliminate slack in cable linking hand lever to equalizer by turning clevis at equalizer end of cable. Pull hand lever 'on' one notch, pull cables forward to eliminate slack, adjust clevises at equalizer link end of cables so that clevis pins can just be inserted, connect cables. Back off adjusting screw in each wheel and check equalization as directed in (2) above.

4. Brake Pedal Adjustment. Brake pedal must have ¼" minimum free travel or play in released position to insure master cylinder piston being back against its stop for correct compensating action with brakes released. To adjust, loosen locknut on piston rod, turn rod or clevis making certain that piston is against the stop.

Cadillac Models—Rubber grommet on pedal under toeboard should be compressed to overall length of ¾" with brakes released.

Hudson Models—Clearance between pedal shank and underside of toeboard should be ¼" with brakes released. To adjust, remove clevis pin at forward end of connecting link (between pedal and master cylinder bellcrank), loosen locknut and turn link.

Major Adjustment (For New Shoes or Relined Brakes):—If shoes with new linings being installed, adjusting screw and eccentric adjustment must be backed off to allow drums to be installed. Disconnect parking brake cables, remove adjusting screw cover on backing plate and inspection hole cover on drums. Adjust brakes at each wheel as follows:

1. Anchor Pin & Eccentric Adjustment (All Models). Loosen eccentric locknut, turn eccentric in direction of forward wheel rotation until .010" feeler is just snug at adjusting screw end of this secondary shoe, hold eccentric from turning and tighten locknut. Check clearance at anchor pin end (opposite end) of this same shoe. If clearance not .010", adjust anchor pin as follows: Loosen anchor pin locknut one turn, turn anchor pin in direction of forward wheel rotation (eccentric type with slotted end) or tap anchor pin out toward drum (slotted hole type with plain end) until clearance at anchor pin end of shoe is exactly .010", hold anchor pin from moving and tighten locknut securely with 16" wrench. Recheck clearance at adjusting screw end of shoe. Make any necessary readjustments at eccentric and anchor pin until .010" clearance secured at both ends of this shoe. Then proceed with adjustments (2), (3), and (4) as given under Minor (Wear) adjustment above.

SERVICING:—All servicing operations including Bleeding of Lines, Brake Shoe Removal & Installation, Master Cylinder and Wheel Cylinder Overhaul are same as previous models. *See 'Bendix Hydraulic Type, Single Anchor, Rigid Cylinder' brake article in Mechanical Equipment Section of manual for complete data.*

BENDIX HYDRAULIC, SINGLE ANCHOR (WITHOUT ECCENTRIC ADJUSTMENT)

Used On:

BUICK, SERIES 40-40, 50, 60, 70, 80, 90 (1940)
CADILLAC V8, SERIES 40-60S, 62, 72 (1940)
LA SALLE V8, SERIES 40-50, 52 (1940)
LINCOLN-ZEPHYR, MODEL 06H (1940)
NASH-LAFAYETTE, MODEL 4010 (1940)
NASH SIX, MODEL 4020 (1940)
OLDSMOBILE 6, '60' F-40, '70' G-40 (1940)
OLDSMOBILE 8, '90' MODEL L-40 (1940)
PACKARD SIX, '110' MODEL 1800 (1940)
PACKARD EIGHT, '120' MODEL 1801 (1940)
PACKARD SUPER 8, '160' 1803, '180' 1806 (1940)
PONTIAC 6, MODELS 40-25, 40-26 (1940)
PONTIAC 8, 40-28, TORPEDO 40-29 (1940)

These brakes same design as used on corresponding 1939 car models.

NOTE:—Cadillac (other models)—V8 Model 75 and V16 Model 90 have Bendix hydraulic brakes with Eccentric Adjustment and are adjusted differently (see following article for data).

Nash (other models)—Model 4080 Eight has Bendix hydraulic brakes with Eccentric Adjustment (see following article for data).

Packard Super Eight—Models 1804, 5 (160) and 1807, 8 (180) have Bendix Hydraulic brakes with Eccentric Adjustment (see following article).

DESCRIPTION:—These brakes same design as used on 1939 cars and are similar to other Bendix single-anchor brakes except that the eccentric adjustment is omitted and all adjustments are made at the adjusting screw and the anchor pin as given below.

ADJUSTMENT:—Before making adjustments, jack up all four wheels, loosen or disconnect parking brake cables at intermediate lever or equalizer bar, remove adjusting hole screw covers on backing plate (see Pontiac Note below), check brake pedal clearance (See Brake Pedal Adjustment below), adjust brakes at each wheel as follows. CAUTION—If hand brake cables not disconnected, shoes may be held 'on' by cables (if adjusted too tight) so that correct brake adjustment cannot be secured.

Pontiac Adjusting Hole Covers—Covers are rubber and have lip on inner edge to engage slot in backing plate. To remove, insert screwdriver under lip of cover and pry out. To install, moisten cover with water or brake fluid, start one end in adjusting hole slot, strike cover with hammer to seat it in slot.

Minor Adjustment—For Wear (Except Cadillac, La Salle, Packard):—At each wheel, make certain that anchor pins are tightened (check with 16" wrench, if anchor pins loose, adjust as directed under Major Adjustment below). Insert special tool or screwdriver through adjusting hole in backing plate, turn notched adjusting screw by moving tool handle up toward center of wheel until brake drum can just be turned by hand. Adjust and connect hand brake cables (see Parking Brake Adjustment below), then back off adjusting screw 17 notches or 'clicks' (Buick), 14 notches (Lincoln-Zephyr, Nash, Pontiac), 20 notches (others) until shoes are just free and drum revolves without any drag. If brakes are not free after making this adjustment, or if shoes drag at anchor pin end, adjust anchor pin as directed under Major Adjustment below.

Parking Brake Adjustment—Before connecting hand brake cables, adjust cable lengths on each model as follows:

Buick. With rear wheel brake shoes expanded so that drums can just be turned, tighten adjuster nut on rear end of hand lever cable (at wheel cable equalizer on torque tube near rear axle) until cables are taut with hand lever in released position, back off adjusting screw in each wheel 15 notches so that wheels free of any brake drag, check equalization by applying brakes with hand lever until drums can just be turned. Equalize wheels by backing off adjusting screw in tight wheel not more than 2 notches (if this does not equalize wheels, check centering of wheel cables in equalizer).

NOTE—Parking brake lever has two holes for attachment of brake cable. Standard setting is with cable attached to upper hole but cable can be attached to lower hole for less lever movement (results in harder operating brake).

Lincoln-Zephyr. Do not expand rear wheel brake shoes. Pull hand lever 'on' one notch, apply brakes by depressing brake pedal with 30 lbs. pressure (use pedal jack, hold pedal in this position while adjusting). Remove slack in cable by adjusting conduit clamp. Release hand lever and brake pedal, see that brakes are free.

Nash. With rear brake shoes expanded tightly against drum, pull hand lever 'on' 2 notches, loosen two bolts on adjusting clamp (connecting lever and wheel cables), pull cables tight and tighten bolts. Return lever to 'off' position. Back off adjusting screw in each wheel to free brakes and check equalization. See that hand brake lever on each wheel backing plate has ⅛" free travel with hand lever in off position. Equalize hand brakes by loosening rear bolt in cable adjusting clamp and applying hand brakes (this will allow cable to shift on adjusting clamp). Check position of hand brake cable guide on rear spring. Guide should be exactly 19¾" to rear of center-line of spring front eye bolt.

Oldsmobile. With rear wheel brake shoes expanded so that drums can just be turned, pull wheel cables forward to eliminate all slack, adjust clevises on forward ends of cables so that clevis pins can just be inserted with equalizer link held parallel to propeller shaft, connect cables (insert clevis pins with head toward top), back off adjusting screw in each wheel approximately 20 notches until wheels are free, check equalization.

Pontiac. Check hand brake cable tension by moving clevis pin at cross lever wheel cable spreader, pin should move up and down with thumb and finger pressure (hand lever in released position, rear wheel brake shoes not expanded), and both rear wheels should lock with hand lever in third notch. To adjust, remove cross lever clevis pin and engage pin in another of the several holes in the cable spreader (approximate setting), remove hand lever clevis pin and turn clevis on cable (exact setting) using extreme care not to twist the cable. To equalize wheel cables after adjusting, loosen clampscrews on wheel cable spreader at cross lever (if necessary pry clamp ears apart with a screwdriver so that cable free in spreader), apply brakes hard by pulling back on hand lever, tighten spreader clampscrews before releasing hand lever.

Minor Adjustment—For Wear (Cadillac, LaSalle, Packard Models):—Manufacturer recommends that adjusting screw and anchor pin be adjusted as directed in 'Major Adjustment' below. Then adjust parking brake as follows:

Cadillac, LaSalle. With rear brake shoes expanded so that rear wheels can just be turned by hand, make certain that hand lever in 'off' position, pull cables taut and adjust clevises so that clevis pins can just be inserted. Connect cables and back off adjustment at shoes 15-20 notches until wheels are just free. Check equalization.

Packard. Expand rear wheel brake shoes tightly against drums. Eliminate slack in cable linking hand lever to equalizer by turning clevis at equalizer end of cable. Pull hand lever 'on' one notch, pull cables forward to eliminate slack, adjust clevises at equalizer link end of cables so that clevis pins can just be inserted, connect cables. Back off adjusting screw in each wheel and check equalization.

Major Adjustment (For New Shoes, Relined Brakes or when Minor Adjustment not satisfactory):—Jack up all four wheels, loosen or disconnect parking brake cables at equalizer or intermedate lever, remove adjusting screw hole cover on backing plate and inspection hole cover on drums (remove wheels for access). Check pedal clearance (see Brake Pedal Adjustment below). Adjust each wheel brake as follows. CAUTION—If hand brake cables not disconnected or loosened, shoes may be held on by cables (if adjusted too tight) so that correct brake adjustment cannot be secured.

Anchor Pin & Adjusting Screw Adjustment—Turn drum so that inspection hole is at center of secondary shoe (rear shoe on each wheel), insert screwdriver and pry secondary shoe away from drum so that primary shoe (other shoe) is seated solidly against drum. Insert screwdriver or special adjusting tool in hole on backing plate and turn notched adjusting screw by moving handle of tool up toward center of wheel until .015" feeler is snug between lining and drum at adjusting screw end of secondary (rear) shoe. Check clearance at anchor pin (opposite) end of this same shoe. If clearance not .015", adjust anchor pin by loosening locknut and tapping anchor out toward drum (slotted hole type with plain end) or turn anchor pin in direction of forward wheel rotation (eccentric type with slotted end) until .015" clearance secured, hold anchor pin from shifting and tighten locknut securely with 16" wrench. Recheck clearance at adjusting screw end of shoe. Make any necessary readjustments at adjusting screw and anchor pin to secure clearance of .015" at both ends. It is very important that primary shoe be out in solid contact with drum while this adjustment being made. Adjust hand brake cables as directed in Parking Brake Adjustment under Minor Adjustment above.

Brake Pedal Adjustment:—On all models, brake pedal must be checked and adjusted to insure master cylinder piston being back against its stop in the master cylinder for correct compensating action with brakes released. To adjust, loosen locknut on piston connector rod, turn clevis or rod to secure clearances specified below with master cylinder piston against the stop.

Buick—Clearance between pedal and underside of toeboard should be 1 1/16" (40,60), ⅞" (50,70,80, 90).

Cadillac & LaSalle—Rubber grommet on pedal under toeboard should be compressed to overall length of ¾" with brakes released.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Nash—Brake pedal should have ¼-½" free movement or play in released position.

Oldsmobile—Sponge rubber pedal seal on underside of toeboard should be compressed not more than 1/16" with brakes released.

Packard—Brake pedal should have ¼-½" free movement or play in released position.

Pontiac—Pedal height should be adjusted so that brake pedal is even with clutch pedal. Distance from floor to top of pedal should be 5⅛" (Special 6), 4¾" (Deluxe 6 & 8), 5" (Torpedo 8).

SERVICING:—All service operations (Bleeding Brake Lines, Brake Shoe Removal & Installation—except eccentric and short secondary shoe spring data which should be disregarded, Master Cylinder and Wheel Cylinder Overhaul) are same as for other Bendix Hydraulic Brakes except as noted below. *See 'Bendix Hydraulic Rigid Cylinder Type' brake article in Mechanical Equipment Section of manual for complete instructions and note following new data:*

Lincoln-Zephyr Springs—Brake shoe retracting springs are now same weight on both primary and secondary brake shoes.

Oldsmobile Wheel Cylinder Stops—Stops are formed on backing plate which prevent pistons being forced out of wheel cylinder for any reason. These stops make it unnecessary to use piston clamps to retain pistons when brake drums and shoes are removed but wheel cylinder must be removed from backing plate before it can be dismantled or pistons taken out.

Packard Springs—Brake shoe retracting springs on Model 1800 are same for both shoes (Blue color). On Models 1801, 1A, spring on primary shoe (front) is Aluminum, spring on secondary (rear shoe) is heavier and is Yellow.

HILL-HOLDER & NOROL

Optl. Equipment On:

CAR MODELS WITH HYDRAULIC BRAKES (1940)

These units same design as used on 1939 car models.

DESCRIPTION:—Same design as units used on previous car models. Both units consist of a gravity and clutch pedal controlled check valve in the hydraulic brake line so that brakes are held 'on' with car heading uphill on grade and clutch disengaged. Brakes are released through clutch pedal connection when clutch is engaged.

ADJUSTMENT:—Adjust whenever clutch pedal adjusted or when linkage disconnected. Mounting of unit should be checked whenever unit removed or disturbed in any manner.

Adjustment:—Check adjustment by operating car and noting point at which brakes release (brakes should release just before clutch engages). To adjust, loosen locknut on operating rod (linking unit and clutch pedal), turn adjustment so as to shorten rod for earlier release, lengthen rod for later release, tighten locknut after adjusting and check operation.

Mounting:—Unit must be level (crosswise and lengthwise of car) when installed for correct operation. To check mounting, use spirit level placed on bosses on top of housing with car standing on level floor and all tires inflated to correct pressure. Adjust by loosening mounting bolts and shifting entire unit slightly (this adjustment not provided on all models).

BENDIX HYDRAULIC, DOUBLE ANCHOR

Used On:

HUDSON 6, 40T TRAVELER, 40P DELUXE (1940)

These brakes same design as used on previous '112' models.

NOTE:—Hudson (other models)—Bendix Hydraulic Single Anchor Brakes (with eccentric adjustment) used on other models. See separate article for data.

ADJUSTMENT:—Jack up all four wheels, remove wheels, take off adjusting hole covers on backing plates and inspection hole covers on drums. Disconnect hand brake cables from cable lever toggle by taking out clevis pins at forward ends of cables. CAUTION—If hand brake cables not disconnected, brake shoes may be held 'on' by cables (if adjusted too tight) so that correct brake adjustment cannot be secured.

Adjustment (For Wear):—Adjust at each wheel as follows:

1. Insert .010" feeler between brake drum and lining at upper (anchor end) of primary or forward shoe, loosen eccentric locknut, turn eccentric on this shoe in direction of forward wheel rotation until feeler gauge is just snug, hold eccentric in this position and tighten locknut securely.
2. Adjust secondary shoe (rear shoe) in same manner as primary shoe using same .010" feeler.
3. Use special adjusting tool or screwdriver inserted through hole in backing plate and turn notched adjusting screw (move outer end of tool up toward center of wheel) to expand shoes until drum can just be turned by hand, adjust and connect parking brake cables (see Parking Brake Adjustment below), back off adjusting screw until drum is free of any drag. Install wheels and road test car to check equalization.

Mechanical Follow-up Note—Setting should be checked after brakes adjusted. See separate article for adjustment instructions.

Parking Brake Adjustment:—With brake shoes expanded so that drums can just be turned, pull hand brake lever 'on' two notches so that clearance between hand brake cable lever and end of slot in guide plate is ⅛", pull cables tight and adjust clevis at forward end of each cable so that clevis pins just enter holes in toogle on lever, connect cables, back off adjusting screws until wheels are free, check equalization.

Brake Pedal Clearance:—Clearance between pedal shank and toeboard must be ¼" to insure master cylinder piston being against its stop in released position for correct compensating action. To adjust, remove clevis pin at forward end of connecting link (between pedal and master cylinder bellcrank), loosen locknut and turn link.

SERVICING:—All service operations same as for previous models. See 'Bendix Hydraulic Double Anchor' brake article in Mechanical Equipment Section of manual (or 1938 Supplement) for complete instructions.

HUDSON MECHANICAL FOLLOW-UP

Used On:

ALL MODELS (1940)

DESCRIPTION:—Same design as used on previous models. Consists of linkage connecting brake pedal and hand brake cable lever so that rear wheel brakes applied mechanically by brake pedal with additional pedal travel (beyond point where brakes applied by hydraulic system).

ADJUSTMENT:—See that brake pedal properly adjusted and that hand brake cable lever is against its stop (end of slot in guide plate). Loosen locknut on brake pedal pushrod (linking pedal and idler lever), turn rod until distance from rear face of lug on rod to forward end of pushrod tube is exactly 1¼", tighten locknut.

BENDIX VACUUM CYLINDER INTERNAL VALVE TYPE

Std. Equipment On:

CHRYSLER CROWN IMPERIAL, MODEL C27 (1940)

This Vacuum Cylinder same design as used on 1939 and previous Chrysler Custom Imperial Models.

ADJUSTMENT:—**Note**—Adjustment required only when master cylinder or vacuum power cylinder removed from car or disassembled (setting not disturbed by minor brake adjustment). CAUTION—Do not readjust vacuum cylinder linkage to compensate for normal brake wear—see Lockheed brake articles for brake adjustment instructions.

Adjustment:—Make following adjustments in order:

1. Adjust brake pedal stopscrew so that pedal shank just clears underside of toeboard.
2. Remove clevis pin connecting power cylinder operating lever and pullrod, disconnect power unit at point where it attaches to base of lever, loosen two studs holding valve operating lever to pedal so that pedal is free.
3. Hold operating lever so that clearance between lever and brake pedal shaft is at front side of shaft (hole in lever larger than shaft and clearance must be at front with brakes released to balance power cylinder against brake pedal), check master cylinder pushrod length to make certain that piston is against its stop. To adjust, disconnect master cylinder pushrod at point where it is connected to power lever (piston will then come back against stop), adjust pushrod length so that clevis pin enters hole in lever without disturbing piston or lever position, re-connect pushrod.
4. Without disturbing position of operating lever (clearance at front of pedal shaft), pull on power cylinder pullrod to make certain that piston against its stop, loosen frame bracket mounting bolt and shift bracket until pullrod clevis pin can be entered in operating lever without disturbing position of lever or piston pullrod. Connect pullrod and lever making certain that pin goes through ferrule on end of power cylinder valve operating rod (do not adjust this valve operating rod, rod is correctly adjusted at factory and setting does not change in service). See that hooked valve operating lever is hooked over ferrule.
5. Make certain that valve operating rod in correct position (rod will be pushed out of cylinder by spring so that ferrule will be against clevis pin), tighten two studs holding valve operating lever on pedal.

SERVICING:—**Lubrication**—At 6000 mile intervals, lubricate power cylinder by removing plug on front of cylinder and inserting one ounce of shock absorber fluid, transformer oil, or ice machine oil. At the same time, disconnect vacuum line connection at rear end of cylinder and insert an additional ounce of oil at this point.

LOCKHEED HYDRAULIC DOUBLE ANCHOR TYPE

Used On:

CHRYSLER 6, C25 ROYAL & WINDSOR (1940)
CHRYSLER 8, C26 & C27 ('40)—SEE NOTE
DE SOTO, S7 CUSTOM & DELUXE (1940)
DODGE, D14 DELUXE, D17 SPECIAL (1940)
GRAHAM, 107 SPECIAL, 108 SUPERCHARGER ('40)
HUPMOBILE, SKYLARK MODEL (1940)
PLYMOUTH, P9 ROADKING, P10 DELUXE (1940)
STUDEBAKER COMMANDER, MODEL 10A (1940)
STUDEBAKER PRESIDENT, MODEL 6C (1940)
WILLYS, MODEL 440 PASS. CARS (1940)

These brakes same design as used on corresponding 1939 car models except as noted below.

NOTE:—**Chrysler C26 & C27**—Rear brakes are double anchor type with new type wheel cylinder. Front wheel brakes are new Two-cylinder type (see following article for data on this type).

Willys—Brakes on this model are double anchor type (not same as Single Anchor brake used on 1939 Willys-Overland). Brakes on 440 Pick-up and 440P Panel Delivery are Bendix Single Anchor mechanical type (see separate article for data).

DESCRIPTION:—Same design as used on previous models except as follows:

Chrysler C26, C27 Wheel Cylinders—Wheel cylinder pistons have rubber 'piston ring' installed in groove in each piston. Separate piston cups are not used and no piston cup spring is required.

Chrysler, De Soto, Dodge, Plymouth Brake Anchor Pins—Marked by arrow on inner end to indicate point of minimum adjustment (same as for 1939). See special anchor pin adjustment under Major Adjustment below.

ADJUSTMENT:—Before making adjustments, jack up all four wheels, check brake pedal clearance or free travel (See Brake Pedal Adjustment below), check pedal travel (Chrysler—see below), release hand brake and make certain that rear wheels are free. Then adjust at each wheel (see following article for adjustment of Chrysler C26, C27 front wheels) as follows.

Chrysler, De Soto, Dodge, Plymouth Note—Total pedal travel on these models should be 1⅞-2¼" (except C26, C27), 1⅝-2" (Chrysler C26, C27). If Minor Adjustment does not correct pedal travel, check Brake Pedal Adjustment also.

Minor Adjustment (For Wear):—On Willys only, loosen eccentric cam locknut, on all models turn eccentric cam adjustment on backing plate out until brake shoe contacts drum solidly (install wrench on cam adjuster with handle up, move wrench handle toward rim of wheel), then back eccentric cam off until wheel is just free of any drag, tighten locknut (Willys only). Adjust all eccentric cams in this manner (one cam for each shoe, two cam adjusters on each wheel backing plate. On all models except Willys, cams are held in position by spring tension and no locking nuts are used.

Major Adjustment (For New Linings, etc.):—On Willys model slot provided in brake drum so that feelers can be inserted to check shoe clearance. On all other models special adjusting fixture or gauge (or cutaway drum) must be used to check setting. With gauge installed in place of brake drum and turned so that gauging is at heel (anchor pin end) of shoe approximately 1½" back from end of lining (do not gauge relieved or chamfered end of lining), loosen anchor pin locknut on backing plate, turn anchor pin (see special directions for Chrysler, De Soto, Dodge, Plymouth models below) until clearance between lining and drum is correct (see table below), tighten anchor pin locknut. Turn gauge to toe (wheel cylinder end) of shoe, adjust eccentric cam as directed in Minor Adjustment above until clearance is correct (see table below). Adjust each shoe in all wheels in same manner. Check Parking Brake Adjustment as directed below.

Brake Shoe Clearances

Car Model	Heel (Anchor end)	Toe (Cyl. end)
Chrysler C25	.006"	.012"
Chrysler C26, 27 (frt. shoe)	.006"	.007"
Chrysler C26, 27 (rear shoe)	.007"	.007"
De Soto, Dodge	.006"	.012"
Graham	.006"	.010"
Hupmobile	.005"	.010"
Plymouth	.006"	.012"
Studebaker 10A, 6C	.005"	.010"
Willys 440	.005"	.010"

Chrysler, De Soto, Dodge, Plymouth Note—Inner ends of anchor pins are marked by an arrow and flattened so that adjusting wrench can be applied at this end of pins. Before making adjustment, loosen anchor pin bolt nuts on backing plates, turn each anchor pin so that arrows line up with arrow heads together. Then adjust anchor pins by turning right hand pin counter-clockwise, left hand pin clockwise (pins turned toward each other at top) to secure correct clearance. CAUTION—Shoes will not be centralized in drum (even though set for correct clearance) unless anchor pin arrows lined up first and adjustment made exactly as specified above.

Brake Pedal Adjustment:—Brake pedal must have sufficient free travel or play to insure master cylinder piston being back against its stop with brakes released so as to provide correct compensating action. To adjust, loosen locknut on master cylinder end of pedal rod, turn large adjusting nut until pedal free travel is ¾-1 1/16" (Chrysler, De Soto, Dodge, Plymouth), ¼-⅜" (Studebaker), ½" (others), tighten locknut.

Chrysler C27 Note—See Bendix Vacuum Power Cylinder article for master cylinder pushrod adjustment (power cylinder adjustment will be disturbed unless adjustments made exactly as directed).

Parking Brake Adjustment:—Adjust hand brake cables on models where hand lever applies rear wheel service brakes as follows (On Chrysler, De Soto, Dodge, Graham, Plymouth models, independent hand brake located on propeller shaft at rear of transmission. See car model 'M' page for adjustment).

Hupmobile, Studebaker, Willys Models—With hand lever in released position, remove all slack in cable between hand lever and intermediate lever by adjusting turnbuckle at rear end of cable (on Willys, cross-shaft levers to which wheel cables are attached should be 23½° to rear of vertical with brakes released). Then pull hand lever 'on' to second notch (Hupmobile, Studebaker), third notch (Willys), adjust each wheel cable by turning turnbuckle or adjusting clevis at forward end of cable until slight drag felt at rear wheels, connect cables and release hand lever. Wheels should be free of any brake drag. Equalize by making slight adjustment on wheel cable for tight wheel.

SERVICING:—All servicing operations (Bleeding of lines, brake shoe removal and installation, master cylinder and wheel cylinder overhaul) same as for previous models except as noted below. *See 'Lockhead Hydraulic Type' brake article in Mechanical Equipment Section of manual for complete instructions and note following new data:*

Chrysler C26, C27 Wheel Cylinders—No piston cup spring used and pistons will not spring out of wheel cylinder when released as on other models. To remove pistons, blow through brake tube connection. With pistons out, rubber piston ring can be removed by rolling it off the end of the piston. Install piston ring with lip toward inner end of piston.

LOCKHEED HYDRAULIC SINGLE ANCHOR TYPE

Used On:

STUDEBAKER CHAMPION, MODEL 2G (1940)

This brake same design as used on 1939 Champion.

ADJUSTMENT:—Before making adjustments, jack up all four wheels, check pedal clearance or free travel (see Brake Pedal Adjustment below), release hand brake. Then adjust brakes at each wheel as follows:

Minor Adjustment (For Wear):—Install wrench on eccentric adjusting cam on backing plate with wrench handle up, turn cam by moving wrench handle out toward wheel until shoe contacts drum (brakes drag when wheel revolved), then turn cam in opposite direction until wheel is just free of any brake drag. Adjust all eccentric cams in this manner (one cam for each shoe, two cams on each backing plate). Cams are held in position by spring tension and no locking nuts are used.

Major Adjustment (For new linings, etc):—With wheels removed, rotate brake drums so that inspection hole in drum is at heel (anchor pin end) of shoe, loosen eccentric anchor pin locknut, turn anchor pin until clearance between lining and drum is exactly .006" (measured with feeler gauge 1½" from end of lining). Check to see that heel clearance on opposite shoe is likewise .006", tighten anchor pin locknut. Turn drum so that slot is 1½" from end of lining at toe end of shoe, adjust eccentric cam (as directed under Minor Adjustment above) so that clearance is exactly .010". Recheck clearance at anchor pin end and make any necessary re-adjustments to secure correct clearance at both ends of shoe. Adjust eccentric cam on opposite shoe, then repeat adjustment at other wheels.

Brake Pedal Adjustment:—Pedal must have ¼" min., ½" max. free travel to insure master cylinder piston being back against its stop (in cylinder) for correct compensating action when brakes released. To adjust, loosen locknut and turn large adjusting nut on master cylinder end of connector rod.

Parking Brake Adjustment:—Adjust whenever brakes adjusted for wear or new shoes installed. To adjust, remove pin linking brake cable to parking brake lever on rear wheel backing plate, pull on cable to eliminate slack and press forward on lever to take up play, install pin through holes in lever and cable end which line up. Adjust both wheels in same manner, check for brake drag and equalization after adjustment completed.

SERVICING:—All service operations including Bleeding of Lines, Master Cylinder and Wheel Cylinder Overhaul are same as for other Lockheed Brakes. *See Lockheed Hydraulic Type brake article in Mechanical Equipment Section of manual for complete data.*

LOCKHEED HYDRAULIC TWO-CYLINDER TYPE

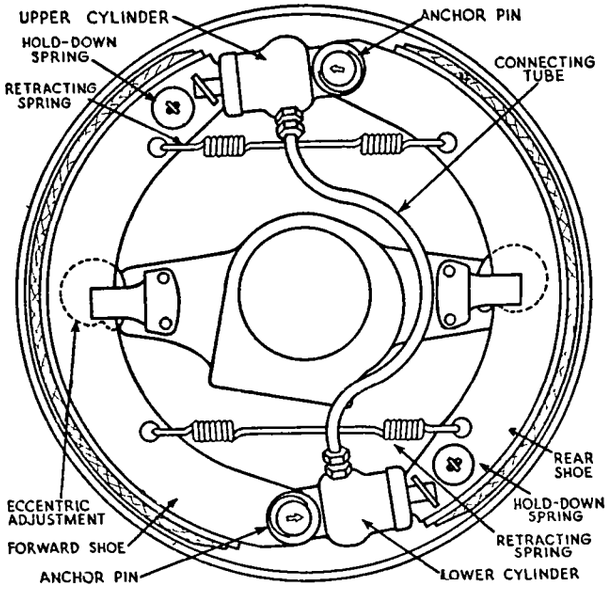
Used On:

CHRYSLER 8, C26, C27 ('40) FRONT WHEELS ONLY

NOTE:—These brakes used on front wheels only. Rear brakes are conventional Lockheed Double Anchor Type with single double-acting wheel cylinder (see preceding article for rear brake data).

Chrysler C27 Power Brake—This model has Bendix Vacuum Power Cylinder (internal valve type). See separate article for adjustment and servicing data.

DESCRIPTION:—Each brake shoe actuated by individual wheel cylinder with single acting piston (forward shoe anchored at lower end and operated by upper cylinder, rear shoe anchored at upper end and operated by lower cylinder) the effect being similar to that of two 'forward' shoes on other Lockheed brakes. Brake cylinders are connected in tandem with a connecting tube extending from one cylinder to the other within the brake drum (brake line is connected to upper cylinder in usual manner), the principal difference being an additional bleeder connection on the backing plate at the lower cylinder. Double retracting springs are used (hooked between shoes at each end).
CAUTION—When bleeding brake lines, **both** wheel cylinders must be bled—see directions below.



ADJUSTMENT:—Before making adjustments, jack up all wheels, check brake pedal free travel (should be ¾-1 1/16"—see Brake Pedal Adjustment below). Then adjust each front wheel as follows.

Pedal Travel Note—Total pedal travel should be 1⅝-2" and should be correct after Minor Adjustment if brake pedal free travel is correct.

Minor Adjustment (For Wear):—Turn eccentric cam adjuster on backing plate out until shoe is solid against drum and wheel is locked, then back eccentric off until wheel is free. Adjust each eccentric in this manner (one eccentric for each shoe, two on each wheel backing plate). Eccentric is held in position by spring tension and no locknuts are used. Adjustments should be made with brakes at room temperature (will drag when cold if adjusted hot).

Major Adjustment (For New Linings):—Special adjusting gauge (MT-19-C) or cutaway drum must be used to check shoe clearance. Before making adjustments, set both anchor pins in minimum position by loosening locknuts on backing plate and turning anchor pin until arrow on inner end points toward adjacent wheel cylinder. Install gauge and turn so that gauging point is at heel (lower end) of forward shoe. Turn anchor pin in clockwise direction (right hand side of car), counter-clockwise direction (left hand side of car) to move shoes out toward drum until clearance is exactly .006", tighten anchor pin locknut. Rotate gauge to toe (wheel cylinder end) of shoe, adjust eccentric cam adjuster on backing plate until clearance is exactly .007". Repeat these adjustments for rear shoe (keeping in mind that anchor pin end and wheel cylinder end of shoe reversed from those on forward shoe), then adjust wheel on opposite side of car in same manner (anchor pin must be turned in opposite direction as directed above).

CAUTION—Anchor pins must always be turned to minimum adjustment position (with arrow on inner end pointed toward adjacent wheel cylinder) before adjustments are made. If this is not done, shoes will not be centralized in drum even though clearances are correct. Anchor pin inner ends are flattened so that wrench can be applied at this point and arrows checked while pins are being turned.

Brake Pedal Adjustment:—Brake pedal must have ¾-1 1/16" free travel to insure master cylinder piston being back against its stop and compensating port uncovered when brakes released in order to provide for correct compensating action (brakes will drag if this port blocked). To adjust, loosen locknut on master cylinder end of pedal rod, turn large adjusting nut.

Chrysler C27 Note—See Bendix Vacuum Power Cylinder article for master cylinder pushrod adjustment (power cylinder adjustment will be disturbed unless adjustments made exactly as directed).

SERVICING:—Bleeding Brake Lines—Fill master cylinder supply tank with fresh fluid, attach bleeder hose to bleeder screw in center of **upper** wheel cylinder, submerge end of hose in fluid in clean glass container. Loosen bleeder screw ½-¾ turn, bleed line by pumping brake pedal slowly through one-half of pedal travel until fluid flow from hose is continuous and no air bubbles are evident. Then close upper bleeder screw. Connect hose to lower cylinder bleeder screw in center of **lower** wheel cylinder, open bleeder screw ½-¾ turn and bleed line between two brake cylinders in same manner. This is important.

Wheel Cylinders—Wheel cylinders (two per wheel) are single acting type with one piston. Pistons have rubber 'piston ring' in groove on piston and separate piston cups and piston cup spring are not used. To remove piston from cylinder, after wheel cylinder has been taken off car, blow through brake line connection. Remove piston ring from piston by rolling it off the end of the piston. When installing this rubber ring, make certain that lip is in toward inner end of cylinder.

Master Cylinder—Same as for other Lockheed types. See Lockheed Brake article in Mechanical Equipment Section of manual for servicing data.

HAWLEY TYPE

Used On:

CROSLEY, MODEL A (1939-40)

TYPE:—Hawley Neutral Shoe type with floating brake lining. Lining consists of a single piece of sufficient length to reach entirely around shoes with gap of 1/16" at ends. Lining is centered on shoes by rib on backing plate and conical retainer on wheel side.

DESCRIPTION & OPERATION:—Wheel Brakes. Two shoes per wheel, anchored at adjusting screw end and operated by cam at opposite end. Shoes are held against adjusting screw and cam by small coiled spring hooked between shoes at each end.

Linkage:—Wheel brakes operated by cables from main cross-shaft on frame. Cables enclosed in conduits at wheel ends and provided with adjusting clevises at cross-shaft.

Hand Brake:—Hand lever is linked to main cross-shaft on frame. Cables enclosed in conduits at wheel ends and provided with adjusting clevises at cross-shaft.

Hand Brake:—Hand lever is linked to main cross-shaft and applies all four wheel service brakes.

ADJUSTMENT:—Jack up all four wheels, remove clevis pins and disconnect all four wheel cables at cross-shaft. At each wheel, loosen locknut and tighten brake adjusting screw on backing plate (turn screw counter-clockwise) until slight drag noticed when wheel turned by hand, then back adjusting screw off (turn screw clockwise) until wheel is just free, tighten locknut.

Linkage Adjustment—Depress brake pedal 1" and hold in this position. Adjust clevis on cross-shaft end of each wheel cable so that brakes barely drag when cable connected to cross-shaft. Release pedal. Road test car and equalize brakes by turning adjusting screw on tight wheel slightly (turn screw clockwise to loosen brakes).

SERVICING:—Brake Lining Replacement—To remove and renew brake linings, jack up wheel, remove hub cap, wheel, and hub assembly. Remove conical brake lining retainer. Take out old lining. Insert new lining and re-install wheel.

Brake Lining Note—Use only genuine Crosley lining—furnished in correct length to fit around shoe with 1/16" gap at ends. Lining is not riveted on shoes and is installed loosely in drum.

Brake Cable Lubrication:—Whenever brake cables adjusted, fill cable conduits with grease. When connecting cables use care not to twist or buckle cables excessively.

FORD-LOCKHEED TYPE

Used On:

FORD, ALL '60', '85', '95' PASSENGER CAR & TRUCK MODELS (1940)

MERCURY, MODEL 09A (1940)

These brakes same design as used on 1939 models.

LINCOLN-ZEPHYR NOTE:—Lincoln-Zephyr brakes are Bendix Hydraulic Single Anchor Type (without eccentric adjustment). See separate article for data on Bendix brakes.

DESCRIPTION:—Same design as used on 1939 models except for new type parking brake on truck models as follows:

All Trucks except ¾ & 1 Ton—Parking brake consists of an independent drum and brake band on the propeller shaft directly back of the transmission. For hand brake adjustment on these models, see Ford Truck 'M' page.

¾ & 1 Ton—Hand lever actuates rear wheel service brakes (same as 1939). Adjustment instructions given below.

ADJUSTMENT:—Before adjusting, jack up all four wheels, remove one front wheel and inspect lining (to determine if new linings required), re-install wheel. Check front wheel bearing adjustment, spring shackles, shock absorber links, and radius rod mountings, tighten steering connections. Place hand lever in released position. Adjust each wheel as follows:

Minor Adjustment (For Wear):—Install wrench on eccentric adjusting cam on backing plate with wrench handle upward, turn cam by moving wrench handle out toward wheel rim until shoe is tight in drum, then turn cam back until wheel just turns freely without drag (do not turn cam back more than enough to free wheel, desired setting is with least possible amount of clearance). After adjusting forward shoe, repeat adjustment on rear shoe, then adjust all other wheels in same manner. Check pedal reserve, if reserve less than half total travel, repeat adjustment (if pedal is 'spongy', bleed lines). Check brake pedal clearance and adjust hand brake (see instructions below).

Major Adjustment (For relined brakes, etc.):—NOTE—Before installing brake drums, loosen eccentric anchor pin locknuts and turn each anchor pin so that marks on flatted ends of pins are together (marks indicate 'high' side of eccentric and in this minimum position will allow drums to be installed over new linings). Adjust eccentric adjusting cam for each shoe (see Minor Adjustment above), then adjust anchor pins as follows: Depress brake pedal with 25-35 lbs. pressure (hold in this position while making adjustments), use wrench with 3" handle and turn eccentric anchor pin so that mark moves down until brake shoe is felt to contact drum, hold anchor pin from turning and tighten locknut securely. Release brake pedal, check wheel to see that it turns freely without any drag, repeat adjustment if wheel drags. This setting designed to secure less clearance at anchor pin or heel end of shoe than at toe with only slight clearance for entire shoe. Adjust both shoes in each wheel in this manner, check brake pedal clearance and adjust hand brake as directed below.

Brake Pedal Adjustment:—Brake pedal must have ¼-½" free movement (measured at pedal pad) to insure master cylinder piston being against its stop for correct compensating action when brakes released. To adjust, loosen locknut on pedal rod, turn rear section of rod (integral with large adjusting nut—not necessary to disconnect clevis pins), tighten locknut.

Parking (Hand) Brake Adjustment (Passenger Cars):—Place hand lever in fully released position. Use pedal jack to depress brake pedal so that rear brake shoes applied firmly against drums (leave in this position while adjusting). Pull forward on cables to remove all slack, adjust clevis on end of hand brake cable. Release pedal jack and check adjustment. End of hand brake lever should move ½" before all slack in cable is taken up and wheels should be free with hand brake lever released.

¾ & 1 Ton Models—Place hand lever in fully released position, use pedal jack to depress brake pedal so that rear brake shoes applied firmly against drums (leave in this position while adjusting). Disconnect both wheel cables at intermediate lever on frame, loosen locknut and adjust clevis on forward end of each cable so that all slack removed when cables re-connected. Release pedal jack, adjust clevis at intermediate lever end of hand lever so that ½" movement of hand lever tip required to remove all slack from cables and that bolt on intermediate lever bracket is in center of slot with hand brake applied.

Other Trucks—These models have independent hand brake on propeller shaft. See Ford Truck 'M' page for data.

SERVICING & OVERHAUL:—Same as for 1939 models. ***See 'Ford-Lockheed Type' brake article in Mechanical Equipment Section of manual (or 1939 Supplement) for complete instructions.***

CHEVROLET (OWN) HYDRAULIC TYPE

Used On:

ALL PASSENGER CAR & TRUCK MODELS (1940)

These brakes same design as used on corresponding 1939 models except as noted below.

DESCRIPTION:—Same as 1939 types except as follows: **Front Brake Adjustment Slots**—Slots provided in front wheel backing plates (closed by snap covers) on Passenger Cars and Trucks so that brakes can be adjusted without removing front wheels (as was necessary on 1939 models).

Hand Brake (Passenger Cars)—New type idler lever mounted on bracket welded to second cross-member (at rear of transmission) and linked to each rear wheel by cable with adjustment on each cable at idler lever end (see adjustment data below).

ADJUSTMENT:—Jack up all four wheels (not necessary to remove front wheels as in 1939). Disconnect hand brake cables at idler lever (Pass. Cars), hand brake rods at cable connectors (Trucks). Adjust each wheel as follows.

CAUTION—Hand brake rods must be disconnected to eliminate any possibility of shoes being held on by cables which would make it impossible to secure satisfactory brake adjustment.

Adjustment (Except 1½ Ton Rear Wheels). Insert screwdriver in slot on backing plate at each end of wheel cylinder so as to engage notched adjusting covers on cylinder (adjusting cover on each end of cylinder controls one shoe), turn adjusting covers until shoe has slight drag on drum, then back cover off exactly 4 notches (all models except 1½ Ton Truck front wheels), 5 notches (1½ Ton Truck front wheels) to provide correct clearance. Adjust all wheels in this manner, then adjust parking brake (see below) and check brake pedal clearance.

Adjustment (1½ Ton Truck Rear Wheels). Wheel cylinder adjusting covers turned by means of hexagonal-headed pinion shafts on backing plates. Turn each pinion shaft clockwise until shoe has slight drag on drum, then turn pinion shaft back ¾ turn for correct clearance, adjusting parking brake (see below) and check brake pedal clearance.

Parking Brake Adjustment (Passenger Cars):—Place hand lever in fully released position. Loosen both check nuts on each wheel cable at idler lever on frame cross-member at forward end of cables, pull cables forward out of conduit until definite stop is felt, hold cable in this position and tighten both check nuts on each cable so that cable is locked to idler lever toggle. Check to make certain that rear wheels are free.

Adjustment (Truck Models). Place hand lever in fully released position. Pull wheel cable end fitting (at front of rear frame cross-member) forward until a definite stop is felt, hold cable in this position, turn nut on forward rod down until it contacts (turn by hand only, do not use wrench), lock cable by turning rear nut up securely. Check equalization and make any necessary re-adjustment by loosening wheel cable to tight wheel slightly (do not change wheel cylinder adjusting cover setting). **Cab-over-Engine Note**—Adjusted in same manner as other trucks but Front Cowling Assembly and Left Front Fender must be removed for access to hand lever mounting and pull rod clevis pin.

Toggle Lever Adjustment (When new Shoes Installed). With brake drum removed, loosen eccentric bolt locknut (on web of one shoe), hold toggle lever against shoe, turn eccentric bolt until there is only slight clearance between lever and bottom of slot in hand brake extension link, tighten eccentric bolt locknut and recheck clearance.

NOTE—This toggle arrangement not used on 1½ Ton truck models.

Brake Pedal Clearance:—Clearance between pedal and underside of toeboard must be ¼" to insure master cylinder piston being back against its stop for correct compensating action when brakes released (clearance between edge of master cylinder piston primary cup and center of compensating port must be .035" min.). Adjust each model as follows:

Passenger Cars. Loosen locknut on eccentric bolt (linking pedal and master cylinder piston rod), turn bolt until correct toeboard clearance secured, tighten locknut.

Truck Models. Loosen locknut at clevis on rear end of master cylinder pushrod, turn pushrod until correct toeboard clearance secured, tighten locknut.

SERVICING:—All service operations including Bleeding of Brake Lines, Brake Shoe Removal & Installation, Master Cylinder & Wheel Cylinder Overhaul same as for previous models. ***See 'Chevrolet (Own) Hydraulic Type' brake article in Mechanical Equipment Section of manual for complete instructions and note following data:***

Brake Shoe Installation (Pass. Cars, ½ & ¾ Ton Models)—When installing shoes, make certain that they contact pads on anchor plate (3 pads for each shoe) by checking clearance between shoe and each pad with .002" feeler gauge. If shoes do not contact all pads, bend anchor plate.

BENDIX VACUUM TYPE

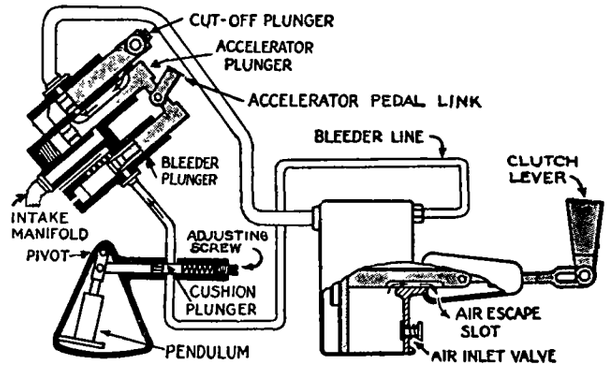
Standard or Optional Equipment on:

BUICK, ALL MODELS (1933-34-35).
CADILLAC ,ALL MODELS (1932-33).
CHRYSLER, DE SOTO, DODGE, PLYMOUTH (1932-36).
HUDSON, ESSEX, TERRAPLANE MODELS ('33-36).
LA SALLE, ALL MODELS (1932-33).
PACKARD EIGHTS & TWELVE (1932-34)
STUTZ, ALL MODELS (1933-36).

NOTE:—Buick 'Wizard Control' used on 1932 models was same general design as on later models but used transmission-controlled valve assembly to control clutch engagement. See separate article on Buick Wizard Control following for data on this equipment.

DESCRIPTION & OPERATION:—Bendix Clutch Control consists of a Vacuum Power Cylinder linked to the clutch throw-out shaft lever so that clutch is drawn out of engagement whenever vacuum admitted to one end of cylinder, and clutch is engaged when the vacuum is cut off and air is admitted to the cylinder. Rate of engagement is controlled by inserting a check-valve in the air intake to the opposite end of the cylinder and controlling or 'bleeding' air from the cylinder as the clutch is engaged. Vacuum power cylinder operation is controlled by a two or three plunger valve assembly in the vacuum and bleeder lines as follows:

Accelerator Pedal Plunger—Linked to accelerator pedal so that groove near end of plunger lines up with vacuum passage in valve body opening vacuum line to cylinder when pedal is fully released. Vacuum port from manifold is cut off when pedal is depressed and air is admitted to cylinder through slot in plunger stem.



Bleeder Plunger—Linked to accelerator pedal plunger and moves in conjunction with it. Taper on plunger controls air escape from opposite end of vacuum cylinder when piston moves back during clutch engagement (clutch movement is rapid during first part of stroke while air is escaping through slot or valve in piston rod, this port being cut off at 'cushion point' so that air remaining in cylinder is forced to escape through bleeder line and bleeder plunger slot during final stage of clutch engagement). On some models separate bleeder plunger not used and bleeder action is controlled by additional slot in accelerator plunger stem.

Cut-Off Plunger—Used to cut out automatic clutch operation when desired. On Chrysler and Hudson models, cut-off plunger linked to free-wheeling control so that automatic clutch inoperative when free-wheeling locked out. On 1933 Buick and all Cadillac models, cut-off valve connected to 'Free-wheel' control button and operative only when button is depressed. On 1934-35 Buick models, separate control button on instrument panel is used. On Packard models, a control lever on the steering wheel is used.

Cushion Control—Not used on 1932 models. Consists of second control valve in vacuum cylinder bleeder line controlled by pendulum weight which prevents surging during high speed clutch engagement. Movement of pendulum when car surges causes plunger type valve to close momentarily delaying clutch engagement until car speed can be brought up to engine speed.

ADJUSTMENT:—Clutch pedal clearance and free movement, accelerator pedal linkage, and carburetor idling speed adjustments must be correctly made before automatic clutch is adjusted. Adjust automatic clutch whenever clutch pedal adjustment is made. Instructions for each model given below:

Buick (All Models):—On 1933 models, adjust trunnion on cut-off plunger rod so that plunger does not quite bottom in housing when control button fully depressed (determine bottoming point, then turn trunnion in two full turns). On 1934-35 models with cable control, push button in toward instrument panel, loosen cable control lockscrew on cut-off plunger, push plunger in until it bottoms in housing, tighten lockscrew. Adjust trunnion at forward end of accelerator rod so that tip of accelerator pedal is exactly 4⅛" (50 '33), 4⅜" (60 '33), 4⅝" (90 '33, 50 '34-35), 4⅞" (60, 90 '34-35) above the toeboard (measured at right angle to floor) with pedal fully released. Adjust trunnion on lower end of plunger connecting rod so that plungers are fully down in valve housing with accelerator pedal released. Ring on bleeder plunger must be in line with front edge of valve cover plate in this position. Adjust by turning plunger on stem. Adjust throttle lever adjusting screw (controlling over-run between

accelerator linkage lever and valve plunger rod lever) so that free play is taken up and ring on accelerator plunger is flush with cover plate just as carburetor throttle begins to open (operate engine to check throttle opening point). Operate engine to check settings and make final adjustments as follows: Use control button to engage clutch for low gear start. Car should start smoothly without jerking or excessive clutch slippage. Loosen locknut and turn compensator valve (piston rod valve) adjustment out as much as possible without interfering with smooth starting. If clutch engagement is rough, turn compensator in slightly. Then start car in low and reverse with small throttle opening. If engagement severe and rough, turn bleeder plunger out slightly. If engagement slow, turn bleeder in slightly. Plunger must not be turned more than 3 turns either way from initial setting. With final compensator or piston rod and bleeder plunger settings, clutch slippage should be normal with part throttle and engine speeds below 20 M.P.H. Check Cushion Control plunger setting by starting with wide open throttle in low gear. If car jerks or surges, back plunger adjusting screw off slightly. If clutch slippage is excessive, turn screw in slightly.

Cadillac and La Salle Models:—Adjust cut-off plunger linkage so that plunger contacts lever with button released and in outer position (plunger is spring-loaded). Adjust throttle linkage so that tip of accelerator pedal is ⅝" from top of toeboard with throttle wide open and against its stop. Check throttle linkage free movement. Groove on accelerator pedal plunger stem should be flush with face of valve housing cover plate when throttle begins to open (17/32" travel at tip of accelerator pedal). See that linkage does not bind. Adjust bleeder plunger by loosening locknut and turning stem out until center of hole in stem eye is 1-1 1/16" from face of plunger.

Operate engine to check final adjustments as follows: Start car in low gear by releasing control button to engage clutch without using accelerating pedal. Car should start immediately and engagement should be smooth. Lengthen vacuum cylinder piston rod if clutch engagement rough or jerky, shorten rod slightly if start is delayed. Check bleeder plunger setting by starting car in low gear in normal manner (keep control button pressed down, use accelerator pedal to engage clutch). If clutch engagement is rough or jerky, shorten length of bleeder plunger stem slightly; if clutch slippage excessive, lengthen arm slightly. Check high speed starting by operating engine at 25 M.P.H. speed, use accelerator pedal to disengage and engage clutch. If clutch slippage excessive, lengthen bleeder plunger stem slightly. Final setting should not be much greater than 1 1/16".

Chrysler, De Soto, Dodge, Plymouth Models:—Depress clutch pedal enough to take up pedal free movement (stop at point where throw-out bearing contacts release levers), check clearance between screw on power cylinder lever and operating lever on throw-out shaft. Loosen locknut and turn screw until clearance at this point ¼" (Dodge '33), ⅛" (all others). Check clearance between accelerator plunger linkage and throttle valve linkage and set so that plunger travel is ¼" (all '32 models and Dodge '33), 5/32" (all other '33 models), 3/16" ('34 and after) before throttle valve begins to open. Separate bleeder plunger not used on these models and bleeder adjustment not necessary. Check and adjust piston rod length on 1932 models so that distance from center of hole in rod to face of stem (locknut seat) is 3½" (Chrysler, De Soto, Dodge Sixes), 4½" (Chrysler Eight), 3⅝" (Chrysler Imperial and Custom Imperial). On 1933 models piston rod length checked by measuring from rod eye center to center of mounting hole on opposite end of cylinder with piston at outer end of stroke. Distances should be 13 3/16" (Chrysler, De Soto Six), 13½" (Chrysler Eights), 14 13/16" (Dodge), 14 3/16" (Plymouth). On 1934 and later models, compensator valve in piston rod used instead of slot and adjustment made by checking performance (see below). Check settings by road testing car using normal accelerator pedal operation. If engine stalls, decrease accelerator plunger travel or linkage clearance so that throttle valve opens sooner. If clutch engagement is delayed or engine speeds up, increase travel. If clutch engagement is rough or jerky with small throttle openings, shorten piston rod slightly (early models) or loosen locknut and turn compensator adjusting nut on piston rod in slightly (later models). If clutch engagement is delayed, lengthen piston rod or turn compensator adjusting nut out slightly. Check starting in low gear with wide open throttle. If engagement is rough or jerky, loosen

locknut and turn Cushion Control adjusting screw out. If clutch slippage excessive, turn adjusting screw in. Cushion Control not used on 1932 models.

Hudson, Essex, Terraplane Models:—Adjust accelerator plunger rod length so that plunger is out against its stop with ⅜" clearance between plunger rod lever and toe board. Depress accelerator pedal, pull vacuum cylinder piston out to end of stroke, adjust cable length by turning clevis out until pin will just enter hole in lever, then turn clevis out 7 additional turns (1932-33 models). On later models, clearance between back of slot in cable yoke and clevis pin hole in lever should be ½" (1934), ⅞" (1935). Operate engine and check setting by using control button to engage clutch without depressing accelerator pedal. If clutch engagement is rough or jerky, shorten piston cable slightly. If engagement is delayed, lengthen cable slightly. Use accelerator pedal to start car in normal manner. Clutch should begin to engage just as throttle valve begins to open. If clutch grabs, shorten accelerator plunger slightly. If clutch slips and engine speeds up before engagement, lengthen rod. On later models with Cushion Control, check operation by engaging and disengaging clutch with engine operating faster than normal. If engagement is rough or jerky, turn plunger adjusting screw out. If clutch slippage excessive, turn screw in.

Packard Models:—Accelerator plunger adjusted by changing position of unit on steering column. With tip of accelerator pedal 2½" above floor board and accelerator plunger connected to throttle shaft, locate unit on steering column so that accelerator and bleeder plungers are all the way out, clamp in this position. Check distance from hexagonal nut on bleeder plunger stem to face of housing cover plate. Adjust by turning nut until this distance is ¾". See that accelerator pedal operates freely and can be depressed sufficiently to open throttle wide after these adjustments. Play or lost motion in accelerator pedal linkage should be ¼" (⅜" maximum play provided for by elongating slot in link on end of connector rod). Adjust by loosening locknuts and turning rod. This adjustment determines idling speed at which clutch will be disengaged (car will idle at 10 M.P.H. without clutch disengagement with this setting). Check cut-off plunger setting by pulling control lever on steering wheel all the way down and noting if cut-off plunger all the way out. Adjust by disconnecting connecting rod and adjusting length of rod. Operate car to check settings. Start car in low gear by operating cut-off plunger control lever to engage clutch (do not depress accelerator pedal). Car should start immediately and smoothly. If engagement rough or jerky, shorten vacuum cylinder piston rod. If start is delayed, lengthen piston rod. Start car in low gear by manipulating accelerator pedal to engage clutch. If engagement is rough or jerky, shorten bleeder plunger stem length slightly. If clutch slips, lengthen plunger stem.

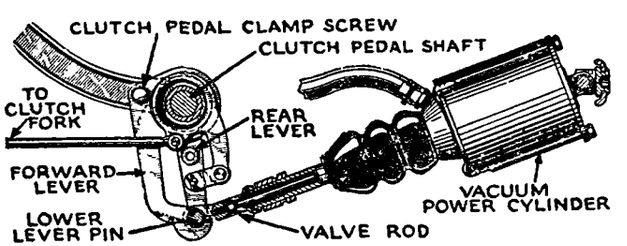
REO TYPE

Reo Models:—Vacuum cylinder on this model is diaphragm type mounted on the dash and connected directly to the clutch pedal by a cable. Valve assembly mounted directly on top of diaphragm cylinder. Consists of main valve (cut-off plunger) connected to control button on toe board, control valve (corresponds to accelerator plunger), and bleeder valve. Control valve and bleeder valve are spring-loaded and operated by manifold vacuum variations without external connections. Adjusting screw which controls spring tension provided for each of these valves. Adjust each valve in order as follows:

Control Valve Adjustment—Loosen locknut and back off bleeder valve adjusting screw so that all spring tension on bleeder valve removed while control valve being adjusted. This is important. Operate engine at 12-15 M.P.H. speed (hold at this speed by setting hand throttle while making adjustment). Shift into low gear and engage clutch by releasing control button (do not depress accelerator pedal). Clutch should move rapidly to point where engagement begins, slip momentarily and car should then start slowly and smoothly. If engagement too rapid or rough, loosen locknut and turn control valve adjusting screw in one turn at a time, repeating test after each adjustment. If engagement too slow, with excessive clutch slippage, turn screw out.

Bleeder Valve Adjustment—Operate engine at regular idling speed (5 M.P.H.) with throttle closed. Shift into low gear and start car in usual manner (release control button and depress accelerator pedal for desired acceleration). Start should be smooth but will be slow until bleeder valve adjusting screw turned in. Turn screw in enough to give desired performance, tighten locknut after adjustment completed.

Linkage Adjustment—Adjust vacuum cylinder cable length to remove slack. This adjustment has no effect on performance except that excessive slack may prevent complete clutch disengagement.



Servicing—Wire mesh type air cleaner under cover on top of valve assembly should be cleaned in gasoline and re-oiled occasionally (accessible by taking out four screws in pressed steel cover).

PACKARD CLUTCH CONTROL

Used On:

TWELVE, 1507,8 ('37), 1607,8 ('38), 1707,8 ('39)

DESCRIPTION:—Power cylinder is 'internal valve' type with control valve located within piston rod and actuated by pushrod extending out through piston rod to clutch lever clevis.

ADJUSTMENT:—Remove the front floor boards, depress clutch pedal several times, see that pedal is against toe board spring with clutch engaged. Loosen pedal clampscrew, press lower end of rear lever back and forward lever front at bottom until all clearance on pin at lower end of levers and on clutch pedal shaft at upper end of levers is at front, hold levers in this position, tighten clampscrew. Depress clutch pedal exactly 1 13/16", hold in this position, loosen locknut and turn adjusting nut on forward end of connecting rod at clutch fork until release bearing just contacts clutch release levers, tighten locknut. With correct adjustment, power cylinder valve will open just as release bearing contacts levers with pin at the lower end of the clutch pedal levers at front (clearance at rear).

BUICK WIZARD CONTROL

Used On:

MODELS 50, 60, 80, 90 (1932)

DESCRIPTION AND OPERATION:—Similar to other Bendix units in that Cut-off plunger linked to control button and accelerator plunger linked to accelerator pedal used to control vacuum line to cylinder. Additional valve assembly on transmission consisting of three bleeder plungers linked to clutch lever and barrel-type valve linked to transmission shift mechanism used to control rate of engagement for each gear ratio. The barrel type valve selects the correct bleeder plunger for each ratio. Bleeder plunger controls rate of air admission regulating speed of power cylinder return stroke and clutch engagement.

ADJUSTMENT:—Power Cylinder Travel—With clutch pedal properly adjusted, press pedal down to toeboard, loosen locknuts on power cylinder rod turnbuckle, adjust rod length so that piston just touches the back end of the cylinder. Locknut on cylinder end of turn-buckle must be loosened first and tightened last to avoid damaging piston diaphragm.

Control Valve Linkage—Adjust trunnion on rear end of control valve rod so that cut-off plunger is all the way out with shoulder on plunger against cover plate when control button is pressed all the way down to the floor. See that cotter pin at forward end of rod inserted from bottom to prevent interference with accelerator valve plunger.

Accelerator Valve—Close hand throttle, adjust throttle rod by turning trunnion at carburetor end of rod so that clearance between accelerator pedal lever and underside of toeboard is ⅜" (50, 80, 90), 3/16" (60) with spring loaded trunnion at rear end fully extended and accelerator plunger rod disconnected. Adjust trunnion on accelerator pedal rod so that spring loaded trunnion on throttle rod is 1/16" from shoulder on rod with accelerator plunger out all the way. Check adjustment by idling engine and noting whether clutch mechanism starts to move slowly just as throttle begins to open. Shorten accelerator plunger rod until this action secured.

Selector Valve—Depress clutch pedal to point where all free movement taken up, check distance from back face of valve body (cover removed) to slotted end of bleeder plungers. Should be ⅜". Adjust by turning wing nut on connector rod at clutch pedal. Check setting by noting clutch engagement when car started in all gears. If engagement too severe or rough, turn wing nut counter-clockwise. If clutch slips, turn nut clockwise. If clutch grabs or slips in one gear only, adjust bleeder plunger for that gear separately by removing cover plate, inserting screwdriver and turning plunger counter-clockwise to correct too severe engagement or clockwise to correct excessive slipping. Plungers and case marked '1'(low and reverse—lower plunger), '2'(second—middle plunger), '3' (high—upper plunger).

Optional Equipment On:

HUDSON SIX, MODEL 73 (1937).

HUDSON EIGHT, MODELS 74, 75, 76, 77 (1937).

TERRAPLANE, MODELS 70, 71, 72 (1937).

DESCRIPTION:—Bendix Vacuum Cylinder type with accelerator pedal control and Cushion (pendulum) Valve. Similar to type used previously except that Cut-off Plunger has been discontinued and a solenoid operated valve installed instead. Valve solenoid is controlled by 1) Dash Control Switch, 2) Governor switch (on speedometer take-off at transmission), 3) Electric Hand Selector Switch, and 4) High Gear Ground Switch (on transmission) to prevent clutch being disengaged by the release of the accelerator pedal at speeds above 15 M.P.H. with transmission in high gear. These controls operate as follows:

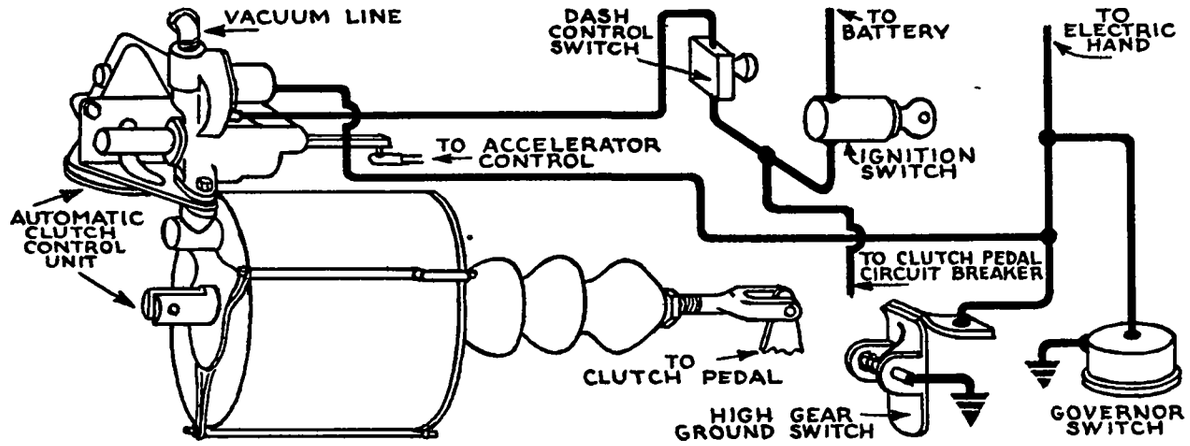
Dash Control Switch—Main switch for valve solenoind circuit. With switch button pulled out, solenoid circuit is broken and valve is closed (Clutch Control inoperative). Allows Automatic Clutch to be cut in or out as desired.

Governor Switch—This switch is closed with car standing or moving less than 15 M.P.H. completing solenoid circuit to ground so that Automatic Clutch is operative. At speeds above 15 M.P.H., this switch is held open so that solenoid circuit is broken and Automatic Clutch cannot operate unless circuit is completed by the Electric Hand Selector Switch or the High Gear Ground Switch.

High Gear Ground Switch—At forward end of transmission and operated by high gear shifter rail. Closed in all gear positions except high gear. Switch is opened when transmission shifted into high gear so that Automatic Clutch is inoperative and will not disengage clutch at speeds above 15 M.P.H.

Electric Hand Selector Switch—Consists of a ground strap which completes solenoid circuit to ground in all switch positions except high gear. With Selector switch in high gear, flat on switch shaft is directly under ground strap and bakelite button on strap holds it away from shaft so that solenoid circuit is open and Automatic Clutch inoperative. Moving Selector switch to neutral or any other position completes solenoid circuit to ground so that Automatic Clutch is operative and shifts can be made at any car speed.

ADJUSTMENT:—Adjustments similar to those for preceding model and must be made in order as directed below. Before adjusting, see that engine idles smoothly and idling speed is set for 7 M.P.H. (engine must be run to supply vacuum and operate clutch while adjustments being made).



Accelerator Valve Plunger Adjustment:—See that accelerator valve plunger is back against its stop when accelerator pedal released. To check, disconnect throttle pull rod and check clearance between accelerator pedal bell-crank and toeboard. Adjust length of accelerator valve plunger rod (loosen locknut and turn clevis at rear end) so that bell-crank clearance is ½". NOTE—Cars not equipped with Clutch Control at factory have rubber bumper on accelerator pedal rod to act as stop for pedal lever. This bumper must be removed when Clutch Control installed (accelerator valve plunger must act as stop for pedal lever).

Piston Rod Adjustment:—Check distance from rear end of piston rod (not face of locknut) to center of piston rod clevis pin. Should be exactly 1⅞". To adjust, loosen locknut, turn clevis in or out of piston rod, tighten locknut.

Centering Piston Travel:—To check piston position in cylinder, push accelerator control valve plunger forward and pull piston rod backward to limit of travel with engine not running. Check clearance between front end of slot in piston rod lever and clevis pin of rod attached to this lever. Distance should be ⅛".

Throttle Rod Adjustment:—With engine idling and clutch disengaged by automatic control, pull back on carburetor throttle rod until piston rod begins to move backward, hold throttle rod in this position, turn clevis on forward end until clevis pin can just be inserted through clevis and extreme rear end of slot in throttle lever. With this setting, any additional throttle opening after piston rod begins to move will increase engine speed.

Cushion Valve Adjustment:—Remove fitting on right side of valve housing and check plunger position. With pendulum in extreme forward position, grooved section of plunger should be exactly in line with port in housing. To adjust (on first models with adjusting screw on forward face of pendulum housing), loosen locknut and turn screw. On later models with stop on forward face of housing which contacts rubber washer on bottom of pendulum, spring pendulum arm slightly. NOTE—Some first units not equipped with a stop (Install stop on these models by drilling through boss on housing and tapping hole for 10/32" by 1½" machine screw). Remove plunger spring and check free length, stretch spring to correct free length of 1⅝". Replace spring, turn spring adjusting screw in flush with face of locknut, tighten locknut.

Final Test & Adjustment:—Shift transmission into low gear, depress accelerator pedal ¼ or less (more than this throttle opening will bring cushion valve into action). If clutch engagement is harsh, piston rod should be shortened. If engine races before clutch engages, piston rod should be lengthened. When making these adjustments, change piston rod length by turning clevis ½ turn and repeat test until satisfactory operation secured. If satisfactory setting cannot be secured, see Trouble Shooting and special recommended changes to be made on early 1937 cars.

Early 1937 Cars. If engine races with half throttle before clutch engages, remove accelerator valve plunger, disconnect vacuum line from cushion valve to accelerator valve, file square port in accelerator valve body (in line with connection removed) 1/16" longer toward front of body. Use extreme care not to remove metal from the other three sides of the port and remove all burrs and filings. Increase width of tapered traverse slot located midway of plunger length by grinding off 1/16" of each of the tapered sides.

TROUBLE SHOOTING:—Clutch Disengagement slow when pedal released (at speeds below 15 MPH, in high gear, all speeds in other gears). Check accelerator pedal, throttle linkage, and accelerator valve plunger linkage for free movement and see that accelerator valve plunger snaps out against stop when pedal is released. Check carburetor throttle slow closing-device (carburetor throttle dashpot which prevents throttle closing until gasoline in cylinder escapes through check-valve in dashpot plunger), check for leaking or blocked vacuum lines and fittings, check solenoid valve for restriction caused by swollen head or sticking plunger. Check power cylinder for piston leakage by removing control valve assembly and holding finger over vacuum port on front of cylinder while piston rod is pulled out. If piston can be pulled out, cylinder must be dismantled and piston rebuilt.

Clutch Engagement too Rapid. Check for power cylinder piston leakage (see paragraph above), check cylinder head gasket for leaks. Check for leakage at atmospheric valve and around piston rod by placing finger over bleed line fitting in cylinder head and pulling out on piston rod. If piston moves out after 'dump slot' in piston rod reaches cushion point, leaks exist at one of these points. Check for leaks in bleed line from cylinder head to cushion valve, and from cushion valve to accelerator plunger valve housing.

ELECTRIC CONTROL TESTING:—On-Off Switch & Valve Solenoid. If clutch not disengaged with engine running and switch in 'on' position, connect jumper wire from hot terminal (relay or regulator 'B' terminal) to red-wire terminal on solenoid. If clutch operates, check wiring between ignition switch, On-Off switch, and solenoid; check switch

1937 TYPE CONT.

for poor contact. If clutch does not operate, leave jumper wire in place, ground the other (yellow-wire) terminal. If clutch operates, check all ground switches (Shift rail switch, Governor switch, Electric Hand ground switch). If clutch does not operate, check solenoid for open-circuit and see that valve is not sticking.

Shift Rail Switch:—Disconnect Electric Hand jack (at lower end of steering column), disconnect yellow-wire at Governor Switch. Operate clutch by idling engine and depressing accelerator pedal. Clutch should operate in all gears except High Gear. If clutch does not operate in any gear, ground shift rail switch terminal. If clutch operates, replace switch. If clutch does not operate check or replace wire. If clutch operates in high gear, replace switch.

Wiring Harness:—After checking Shift Rail Switch, and with Governor Switch wire and Electric Hand Jack disconnected, shift transmission into High Gear. Insert one test prod connected to voltmeter or ammeter (ground other meter lead) in center socket of lower harness jack. Meter reading should be 6 volts (voltmeter), 3 amperes (ammeter). No reading indicates open-circuit in yellow-wire from solenoid ground terminal to jack. Leave transmission in high gear, shift meter test prod to Shift Rail Switch terminal. If 6 volt (voltmeter), 3 ampere (ammeter) reading not obtained, check yellow-wire connection at jack center terminal and at shift rail switch. Repeat this test at Governor Switch terminal. If these tests do not give satisfactory results, lower wiring harness should be replaced.

Selector Ground Switch:—To check ground switch in Electric Hand Selector, connect voltmeter or test lamp lead to hot terminal ('B' terminal of relay or regulator), connect other lead to center prong of upper wiring harness jack (do not use ammeter for this test). Lamp should light or voltmeter show reading of 5-6 volts with selector in all positions except High Gear. If reading not obtained, check selector ground to steering post and contact between ground strap and selector shaft. If reading obtained in high gear, remove selector and check thickness of bakelite button on ground strap and shape of strap.

Governor Switch:—Check by road testing or with rear wheels jacked up. Place selector in high gear, see that transmission high gear engaged, connect yellow-wire to governor switch. Operate engine. Clutch should operate when accelerator pedal depressed and released. If not, replace Governor Switch. Depress accelerator pedal until speedometer reads 25 MPH., release pedal. Clutch should remain engaged with speedometer reading above 20 MPH. but should disengage before speedometer drops to 16 MPH. If disengagement does not occur within this speed range, replace Governor Switch.

SERVICING:—Piston Lubrication. At 15000 mile intervals, remove piston rod guard, and with engine running and accelerator pedal depressed so that clutch is engaged, use oil can to squirt 1 ounce of Hudson Shock Absorber fluid in piston rod slot. Release accelerator pedal at same time so that piston rod movement as clutch is disengaged will draw fluid into cylinder. Remove piston rod clevis pin, work piston back and forth and rotate piston at same time to distribute fluid evenly on piston seal. When reconnecting piston rod, rotate piston one-half turn so that wear on piston seal will be uniform.

1938-39 TYPE

Optional Equipment On:
HUDSON '112', MODELS 90, 98 (1939)
HUDSON SIX, 83 ('38), 91, 2, 3 ('39)
HUDSON EIGHT, 84,5,7 ('38), 95,7 ('39)
TERRAPLANE, MODELS 80, 81, 82, 88 (1938)

IMPORTANT NOTE:—Power Cylinder Tension Spring—Should be installed on first cars not equipped with this spring at the factory. Spring acts as support for part of power cylinder weight at rear end. To install, mount clip (Part No. 33539) under nut on lower tripod clamp bolt, hook small end of spring (Part No. 155839) in clamp, drill ⅛" hole ⅝" in from, and slightly below, adjusting screw on lug of bell crank bracket and hook other end of spring in this hole. Spring installed in this manner at factory on later cars.

TYPE:—New design not similar to type used on 1937 models. Vacuum Cylinder is Internal Valve Type (control valve located within piston rod, operated by lever on piston rod bell-crank). Solenoid valve mounted on forward end of cylinder controls High-Gear lock-out operation and special open-throttle rapid-engagement only (see description below) and does not have any effect on normal clutch control operation. When engine is started, vacuum line to forward end of cylinder will be open (solenoid valve open), control valve within piston rod will be drawn forward admitting air to rear end of cylinder and piston will move forward to disengage clutch. When accelerator pedal is depressed, first motion of linkage moves control valve lever forward (rapid motion permitted by clearance between cushion point stop-screw and valve lever cam) pulling control valve to rear so that vacuum admitted to rear end of cylinder, piston spring then engages clutch rapidly until cushion point is reached when piston overtakes control valve and seals off rear end of cylinder. Further movement then possible only as valve lever cam is rotated under cushion point stop-screw so that very soft cushioning action or initial clutch engagement is secured. As soon as accelerator linkage play is taken up and carburetor throttle begins to open, final clutch engagement takes place rapidly (valve lever cam has special contour to secure this action). Clutch control designed to modify this normal engagement for special conditions as follows:

Compensator (For Initial Engagement)—When clutch disengaged manually (necessary to start engine), the end of the bell-crank yoke strikes a pin on the end of the intermediate lever (on which valve lever is mounted) swinging lever so that valve lever pivot is moved forward permitting clutch to engage deeper at the cushion point to compensate for oil on clutch disc cork inserts. As soon as clutch engages automatically, trip lever on piston rod yoke rotates compensator lever back to normal driving position. No adjustment is required but compensator must be in normal driving position when other clutch control adjustments are made.

Accelerator Switch (For wide-open throttle Engagement)—Consists of a switch on the dash operated by the accelerator pedal which controls vacuum cylinder solenoid valve circuits. With throttle closed, circuit completed through switch to both Governor Switch (left hand terminal—RW wire) and to High Gear Shift Rail Switch and Selector switch (right hand terminal—Y wire). When throttle opened sufficiently to rotate accelerator switch lever 5-10°, circuit to Governor Switch is broken (eliminating Governor control). When throttle opened approximately 1/2, circuit to Shift Rail Switch and Selector ground switch is broken. With all solenoid circuits to ground broken, solenoid valve cuts off vacuum and admits air to vacuum cylinder so that clutch engages rapidly (which is desirable when car started with throttle more than half open).

High Gear Lock-out (At speeds above 20 MPH)—This devoce operates in same manner as on 1937 models and prevents clutch disengaging when accelerator pedal is released at speeds above 20 MPH. with transmission and selector lever in High Gear. Electrical circuits are new (Governor, Shift Rail Switch, and Selector ground contact connected through Accelerator Switch—see paragraph above).

ADJUSTMENT:—Before making adjustments, engine must be properly tuned and warmed up so it idles smoothly at correct idle speed with vacuum reading of 18-21" of mercury (see Tune-up data on car model 'T&E' page). Car should be driven sufficiently to bring clutch units to normal operating temperatures. See that Compensator is in normal running position (see Compensator above) and make all Clutch, Throttle, and Automatic Clutch linkage adjustments listed below in order before adjusting 'Cushion Point' which controls clutch performance.

Clutch Pedal Adjustment—Remove clevis pin at lower end of clutch pedal connecting link, loosen locknut and turn clevis so that center of pedal shank clamp bolt is 1½" from toeboard with clutch fully engaged.

Accelerator Linkage—See that all linkage operates freely without binding. Adjust clevis at upper end of throttle rod connected to accelerator pedal bell-crank so that upper arm on bell-crank is ¼" from toeboard with accelerator pedal released and accelerator switch lever against its stop (this switch lever must act as stop for accelerator linkage). NOTE—On cars not factory equipped with Automatic Clutch control (no Accelerator Switch), rubber bumper is installed on accelerator pedal rod to act as stop for pedal bell-crank. This bumper must be removed when Accelerator Switch installed so that switch lever controls accelerator pedal position. **Important—Valve Cam Linkage**—Connecting rod on accelerator pedal bell-crank which operates valve cam linkage must be connected in third hole from end of bell-crank lower arm. On early cars, this rod connected in second hole and should be changed before adjustments are made.

Vacuum Cylinder Bell-crank Yoke—With engine not running, and vacuum cylinder piston in extreme rear position, take out cotter pin in valve lever pivot and hairpin at valve-rod-and-lever link. remove valve lever, adjust yoke at bell-crank end of operating rod so that clearance between front edge of clevis pin on bell-crank and front end of slot in yoke is ⅛". This setting will provide clearance at clutch throw-out bearing (with clutch engaged) without excessive play in operating linkage.

Piston Travel (Valve Linkage)—Make certain that valve cam lever operating rod guide block is mounted in rear (end) hole of cam lever (see Note below), and compensator pin in extreme rear position, operate engine to provide vacuum. With clutch disengaged, screw threaded sleeve (on operating rod at valve cam lever guide block) toward dash until piston rod just reaches its extreme forward position, then screw threaded sleeve away from dash until piston moves ¼" toward rear.

HUDSON CLUTCH CONTROL CONT.

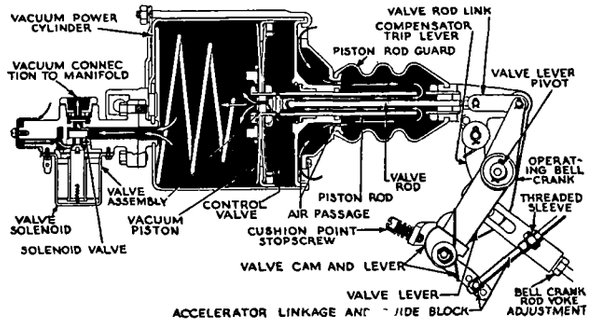
Important Note—On some early cars, guide block was located in center hole of cam lever. Guide block should be changed to rear hole during adjustment (allows for slightly faster throttle opening for same clutch engagement). On Models 84, 85, 87 it may be necessary to cut ⅛-¼" additional thread length on rod to permit sleeve adjustment (10-32 thread).

Cushion Point Adjustment:—With all linkage adjustments correctly made (above), block wheels and start engine (do not set brakes). Accelerate engine and manually engage and disengage clutch to dry clutch disc corks. Swing compensator lever to rear (normal running position), turn cushion point stopscrew clockwise or in until it contacts valve cam. With transmission in low gear, hold cam against stopscrew by pressing on back of cam lever, slowly turn stopscrew counter-clockwise or out until car tends to move forward (clutch beginning to drag against flywheel). Check carburetor throttle rod and then make final adjustment.

Throttle Rod Adjustment—See that accelerator rod engaged in correct hole in lever on dash (82, 83—Top Hole; 80, 81, 88—Bottom Hole; 84, 85, 87—Center Hole). Hold accelerator pedal down so that valve lever cam just touches cushion point stopscrew—**Important**—Use wedge behind accelerator pedal bell-crank at toeboard to secure this throttle opening, pressure applied to any other point of accelerator linkage will prevent correct adjustment being secured. Adjust clevis at carburetor end of accelerator rod so that all lost motion is taken up and any additional pedal travel will open throttle. Check this adjustment whenever governor removed or carburetor setting is changed.

Final Adjustment:—Shift transmission into second gear, depress accelerator pedal slowly with engine running. Car should begin to move slightly upon initial throttle opening. If clutch engagement slow and engine speed excessive, turn cushion point stopscrew counter-clockwise or out slightly. If clutch engagement too rapid (engine stalls), turn screw clockwise or in slightly. Do not turn screw more than 1/2 turn without rechecking performance.

TROUBLE SHOOTING:—If Automatic Clutch operation slow or erratic, check vacuum lines for leaks, tighten connections, check gaskets, solenoid for sticking plunger, all linkage for excessive friction or binding (operate accelerator and watch operation of entire linkage system). To check vacuum cylinder for piston leaks, slide piston rod guard forward until 4 ports in piston rod are exposed, start engine and allow clutch to disengage automatically, close off piston rod ports by covering with fingers, excessive leakage will cause a perceptible suction at the ports (see Piston Lubrication under Servicing below).



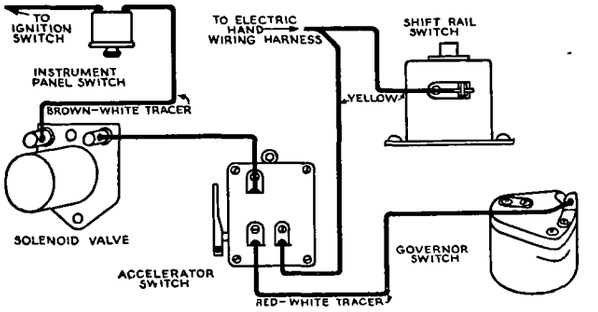
SERVICING:—Vacuum Cylinder Piston Lubrication—At 15000 mile intervals, remove pipe plug in end of cylinder, inject exactly one ounce of Hudson Shock Absorber fluid. Take out piston rod bolt at bell-crank and disconnect valve-rod-to-lever link, rotate piston to spread lubricant over entire piston and oil wick. Place 2-3 drops of oil in bell-crank bracket oil hole every 1000 miles.

Piston Rod Guard Replacement:—To remove rubber boot or guard on piston rod, take out cotter pin in valve lever pivot and hairpin in valve rod trunnion at upper end of valve lever, remove lever. Take out piston rod bolt in bell-crank, remove guard from groove in piston rod end, hold piston rod from turning with drift in bell-crank bolt hole, loosen locknut against rod end, remove piston rod end, remove guard. Install guard in same manner, adjust piston rod length, adjust cushion point stopscrew when valve lever reassembled (see Adjustment above).

Piston Rod Adjustment:—Whenever piston rod end removed or disturbed, position end on rod so that distance from center of tripod mounting hole to center of bell-crank bolt hole in rod end is exactly 13 11/16", lock setting with locknut.

TESTING:—Where test lamp required in making following tests, use 'Valve Solenoid' test lamp (H87 Lead, G87 Prod) of the 1938 Electric Hand Test Lamp Kit or make up test lamp using 15 cp. Mazda No. 87 bulb and suitable leads. Make tests in order given below.

Valve Solenoid:—Disconnect Blue-White (BLW) wire from valve solenoid terminal and connect this wire to one test lamp lead. Ground the other solenoid terminal to which Brown-White (B-W) wire attached. Touch the second test lamp lead to the solenoid terminal from which BLW wire removed. With ignition turned on and dash 'Off-On' switch on, lamp should show dull glow. If lamp does not light, solenoid is open. If lamp burns brightly, solenoid is shorted. If circuit is normal, remove vacuum pipe connection, bushing, and bakelite valve disc.



Insert narrow scale in opening and check plunger travel under light pressure. If plunger does not move 1/16-3/32" freely, check valve disc rubber and plunger interference. Tighten vacuum connections tightly.

Dash 'Off-On' Switch & Upper Wiring Harness:—If clutch does not disengage with fully closed throttle, valve lever rod in fully forward position, and dash switch 'on' (pushed in), connect jumper wire from battery cable terminal to solenoid BLW terminal. If clutch operates, check dash switch for poor contact, check wiring from dash switch to gas gauge to ignition switch for open-circuit.

Accelerator Switch:—Disconnect Governor Switch Red-White (RW) wire at accelerator switch terminal, shift transmission into High Gear (Electric Hand selector lever must also be in High Gear position), see that ignition switch and dash 'off-on' switch turned on and accelerator pedal in idle position. Ground one test lamp lead, touch other lead to accelerator switch terminal from which RW wire removed. With 5° step of No. J-1190 test gauge between switch lever and its stop, lamp should show red glow. When 10° step of gauge inserted between lever and stop, lamp should go out. Transfer test lamp lead from RW terminal to Y terminal on switch. Lamp should show red glow until throttle half open and then go out. Replace switch if defective.

Shift Rail Switch & Lower Wiring Harness:—Disconnect connector between Automatic Clutch lower harness and Electric Hand lower harness, disconnect Red-White wire from Governor Switch. Automatic Clutch should operate in all gears except High. If it does not, ground Second-and-High Shift Rail Switch (left hand switch on transmission). If operation satisfactory, check switch for sticking operating ball or replace switch. If Automatic Clutch does not operate, replace Yellow wire between Accelerator switch, Shift Rail Switch, and Electric Hand harness. If Automatic Clutch operates in High Gear replace Shift Rail Switch.

Testing Wiring Harness—After testing switch for correct operation, and with Red-White wire disconnected from Governor switch, and connector between Automatic Clutch and Electric Hand lower wiring harnesses disconnected, shift transmission to high gear, turn on ignition, ground one test lamp lead, connect other lead to lower harness connector. Test lamp should show red glow. If lamp does not light, wiring is defective. Repeat test at Shift Rail and Governor Switch terminals. Recheck Accelerator switch before replacing wiring harness.

Selector Ground Switch:—Connect voltmeter or test lamp clip to battery cable terminal (do not use ammeter), connect other test lead to 'Y' prong of Electric Hand upper harness jack. Test lamp should light, or voltmeter read 5-6 volts with selector in any gear position except high gear. If no light or reading secured, check selector for poor contact between ground finger and shaft or poor ground connection between selector and steering column. If lamp lights or reading obtained in high gear, dismantle selector and check for short-circuit between selector finger and shaft (check thickness and shape of bakelite insulating button).

Governor Switch:—Check by road-testing or operating car with rear wheels blocked up so that engine can be run with transmission in gear. See that Red-White wire connected to Governor switch, operate engine, engage high gear. Check to see that Automatic Clutch operates when accelerator pedal is depressed and released. If it does not, replace Governor Switch. With high gear engaged, increase engine speed until speedometer reading is 25 M.P.H., release accelerator and note when clutch disengages. Clutch should be engaged at 20 M.P.H. but should disengage before speed decreases to 15 M.P.H. If clutch disengagement is not within this 15-20 M.P.H. speed range, replace Governor Switch

MODELS 9A1, 10A1, 11A1, 11A2

Used On:

9A1—DE SOTO 6, MODEL SC (1932).
DODGE 6, MODEL DP (1933).
OLDSMOBILE 6, MODEL F-32 (1932).
PLYMOUTH 6, MODELS PC, PD (1933).
STUDEBAKER, DICT. A & Yr. Ah'd. A ('34)
10A1—CHRYSLER 6, MODEL CO (1933).
CHRYSLER, ROYAL 8 CT, IMPERIAL CQ ('33).
DE SOTO 6, MODEL SD (1933).
DODGE 6, MODEL DL (1932).
HUPMOBILE, 216 ('32), 321 ('33), 421, A ('34).
HUPMOBILE, 222 ('32), 322 ('33), 422 ('34).
NASH, BIG 6 1120, STD. 8 1130, SPEC. 8 1170, ADVANCED 8 1180 (1933).
OLDSMOBILE 6, MODEL F-33 (1933).
11A1—STUDEBAKER PRES. 91 (1932), 92 (1933).
11A2—CHRYSLER, CST. IMP, CH, CL ('32), CL* ('33).

NOTE:—Manufacturer recommends use of Borg-Warner UF-300 universal fixture in servicing clutch.

DESCRIPTION:—Single plate, dry disc type. Similar in design to other Borg & Beck models except that lever struts not used and release levers contact pressure plate lugs directly.

SERVICING:—All service directions same as for other Borg & Beck clutch models except that directions for removal and installation of release lever struts may be disregarded. Release lever design on Model 11A2 different (instructions below).

Clutch Springs (all models):—Release springs should check with table below. Replace springs if burned or weak.

Part No.	Color	Press. & Length
2958	Black or White	160 lbs. @ 1 11/16"
2994	Yellow or Brown	140 " " "
3031	Red or Blue	180 " " "
3534	Pink or Grey	200 " " "

Release Lever Adjustment (all models):—Special lands should be used under pressure plate when clutch mounted on fixture. Adjusting arm setting on sleeve should be 1 11/16" (all models).

RELEASE LEVERS (11A2):—Release levers mounted on roller bearings (loose rollers) in cover eye-bolt and pressure plate. Care must be taken in dismantling clutch not lose the loose rollers (14 at each point).

Disassembling Release Levers:—Take out locking pins (first type—pins are clinched at center and may need to be broken before they can be removed), or locking wires (later type) in each end of release lever pin in pressure plate lugs, remove washer, push pin out. Pin will carry out rollers at one end and rollers at opposite end will fall out. Lift out release lever and eye bolt assembly.

Assembling Release Lever Bearing in Eye Bolt:—Coat bearing race in eye bolt with high melting point grease, install lever pin, insert 14 rollers around pin, withdraw pin vertically so that rollers are retained in eye bolt by grease, insert eye bolt in release lever lug, insert pin being careful that rollers are not lost out. Pin is held in place by pressure plate lugs when lever installed. Assemble lever in position in pressure plate.

Assembling Release Lever Pin in Pressure Plate:—Roller outer race is press fit in pressure plate lugs and should be replaced only if worn or loose. To assemble bearings, coat race in lugs with high melting point grease, insert pin (pin must be above end of release lever), install lever pin, insert the 14 rollers at each end of pin, install washer on pin, insert locking pin or install hairpin type locking wire. Locking pins must be clinched by inserting punch through hollow end of lever pin and bending locking pin.

DRIVEN MEMBER:—Manufacturer recommends installation of new driven member with new clutch facings rather than relining clutch. Driven plate hub (Spring Dampener) cannot be serviced in the field. See following article on Borg & Beck Models 9A6, 10A6, 11A6 for complete driven member data.

MODELS 9A3; 10A3, 4; 11A3, 5

Used On:

9A3 —OLDSMOBILE 6 MODEL F-34 (1934).
LAFAYETTE, MODEL 110 (1934)
PLYMOUTH 6 PF, PG, PE (1934).
STUDEBAKER 6, A & YR. AH'D (1934).
10A3—CHRYSLER 6, AIRST'M CA, CB ('34).
DE SOTO AIRFLOW SE (1934).
DODGE 6 DR, DS (1934).
HUPMOBILE 417-W ('34), 517-W ('35); 421-J ('34), 521-J ('35).
NASH 1220 ('34), 1280 ('34).
OLDSMOBILE 8, L-32 ('32), L-33 ('33).
10A4—LA SALLE 350, SERIES 50 ('34-35), 35-50 ('35), 36-50 ('36).
OLDSMOBILE 8, L-34, 35, 36 (1934-36).
11A3—NASH AMB. 8, 1290 (1934).
11A5—CHRYSLER AIRFLOW CU, CV (1934).

NOTE:—LaSalle ('34-36). Long Type 10CF-CI driven plate used on this model. See article on Long Model 'CF' clutch for driven plate data.

NOTE—Manufacturer recommends use of Borg-Warner UF-300 fixture for servicing clutch. Fixture consists of surface plate, which duplicates driving surface of flywheel, clamp screws to clamp clutch cover against plate, arbor press to compress springs in dismantling clutch, and gauge standard for use in setting up release levers.

DESCRIPTION:—Single plate, dry disc type. Three release levers mounted on bolts piloted in pressure plate and held in clutch cover, actuate clutch through struts which provide 'knife-edge' action. Servicing directions below apply to pressure plate assembly. See Driven Member Section if pressure plate not to be dismantled and rebuilt.

SERVICING:—Mark all parts before dismantling clutch and reassemble in same position (necessary to maintain balance). Replace grooved, checked or warped pressure plates. Replace springs when pressure plate discolored from heat (test springs as directed below).

Dismantling:—Place clutch on fixture or arbor press support pressure plate under release levers), place block across cover resting on spring bosses, compress cover slightly, remove metal staking in adjusting nuts by running hacksaw blade through slot, remove nuts, release pressure slowly, remove cover and springs. Remove release levers by grasping lever and eyebolt between thumb and forefinger, so that inner end of lever and upper end of eyebolt are pressed together. Lift strut over ridge in end of lever (press lower end back against lug), lift lever and eyebolt out.

Clutch Springs:—Release springs should check with table below. Replace springs if weak or burned or if clutch has been subjected to excessive heat.

Part No.	Color	Pressure (at 1 11/16")
2958	Black or White	160 lbs.
2994	Yellow or Brown	140 lbs.
3031	Red or Blue	180 lbs.
3534	Pink or Gray	200 lbs.
3814	Purple	135 lbs.
3817	Green	110 lbs.
3951	No Color	155 lbs.

Assembling:—Place pressure plate on fixture or arbor press, supporting plate under release lever lugs. Install lever, eyebolt and strut assemblies by reversing removal procedure. Place pressure springs in seats on plate, install anti-rattler springs (see note) in cover, place cover on pressure plate. Make certain that pressure springs are seated and that anti-rattler springs are in place on release levers. Compress cover slowly guiding eyebolts through bolt holes in cover. If assembly made on fixture use clamps to clamp cover flange to plate at mounting holes. Assemble eyebolt nuts, turn nuts down until flush with head of bolt. Compress and release clutch levers several times to seat all working parts. Then adjust release lever heights.

Release Lever Adjustment (without Fixture):—Use Borg & Beck A1 type gauge plate, assemble plate in clutch on flywheel in place of driven plate, positioning gauge lugs under release levers. Place short scale or straightedge on edge on boss in center of gauge, adjust release levers by turning adjusting nuts on eyebolts in or out until release levers just contact edge of scale. All levers must be even within .005". Lock adjusting nuts by peening metal of nut into bolt slot. Recheck settings.

Release Lever Adjustment (On Fixture)—Install special lands (3J) on fixture under pressure plate, install lever indicating plate (3X) on levers (except Models 11A3, 5 where plate should not be used), set adjusting arm at correct figure as shown in table below, install arm and sleeve assembly on fixture, swing arm over each release lever in turn, turn release lever eyebolt nut until tip of lever just contacts indicating plate, lock nut by peening metal of nut into bolt slot, recheck setting.

Clutch Model	Lever Setting
9A3, 10A3	2 5/16"
10A4	2 5/32"
11A3, 11A5	1 13/16"

DRIVEN MEMBER:—Manufacturer recommends installation of new driven member with new clutch facings rather than relining clutch. Driven plate hub (Spring dampener) cannot be serviced in the field.

Two types of plates used: (1) cushioning secured by slotting plate into concave and convex segments, (2) Separate cushioning springs under one facing. Type used can be determined by inspection. See following article on Borg & Beck Models 9A6, 10A6, 11A6 for complete driven member data.

MODELS 8A7; 9A6, 7; 10A6, 7; 11A6

931—CHRYSLER, DE SOTO, DODGE, PLYMOUTH TAXICAB MODELS (1939)

NOTE:—Assembly No. This number is stamped on each clutch cover and can be used to identify each installation.

Buick 40 (1934-36). Borg & Beck driven member used on this model (with Own Make clutch). Driven member data given below applies to this model.

Hupmobile 6 (1935-36). Clutch Assembly Nos. 877 and 878 also used on these models.

Nash 6 & 8 (1934-35-36). Clutch Assembly No. 878 also used on these models.

Oldsmobile (1937-38)—A special clutch release plate and steel spacer assembled on release levers as part of clutch assembly. Held in place by special release lever return springs (anti-rattler springs and separate bearing plate retainers not used). See special instructions, in Assembling section below, for spacer servicing and release plate assembly.

Oldsmobile 8 (1938)—Release lever spring ends hooked over cover rim and must be installed in cover before it is placed on pressure plate assembly. Release levers are guided on rectangular guide pins riveted to cover (see that guide pins enter lever slots when installing cover). Release levers on L-38 are ⅛" higher than F-38 (special lever setting). Special grooved facings used on models with Self-Shifting Transmission (not interchangeable with standard driven member).

Willys 77, 37. Driven plate on this model is Borg & Beck type. Driven plate data below applies. NOTE—Manufacturer recommends use of Borg-Warner UF-300 fixture for servicing clutch. Fixture consists of surface plate, which duplicates driving surface of flywheel, clamp screws to clamp clutch cover against plate, arbor press to compress springs in dismantling clutch, and gauge standard for use in setting up release levers.

DESCRIPTION:—Single plate, dry disc type. Three release levers mounted on bolts piloted in pressure plate and held in clutch cover, actuate clutch through struts which provide 'knife-edge' action. Servicing directions below apply to pressure plate assembly. See Driven Member Section if pressure plate not to be dismantled and rebuilt.

Pressure Plate Baffle. Used on 1938-39 Chrysler, DeSoto, Dodge, Plymouth, 1939 Oldsmobile. Consists of a thin cupped steel disc assembled on pressure plate to prevent oil working in on facings. When baffle plate used, release levers must be set 1/16" higher (9" & 10" clutches with Std. Driven Member, 11" Clutches with Borglite Driven Member), ⅛" higher (9" & 10" clutches with Borglite Driven Member). See Service data below for baffle plate installation.

Duckbill Type Release Levers. Used on 1939 Oldsmobile. Throw-out bearing ends of release levers are widened and flattened to increase bearing contact area so that no separate bearing plate required.

Borglite Driven Members. Used on 1939 Chrysler, DeSoto, Dodge, Oldsmobile models. New type light weight driven member (see description below). Release levers must be set ⅛" higher (9" & 10" clutches), 1/16" higher (11" clutches) when this new type driven member used in conjunction with pressure plate baffle. See Servicing data below for lever setting and gauge data.

SERVICING:—Mark all parts before dismantling clutch and reassamble in same position (necessary to maintain balance). Replace grooved, checked or warped pressure plates. Replace springs when pressure plate discolored from heat (test springs as directed below).

Dismantling:—Place clutch on fixture or arbor press support pressure plate under release levers), place block across cover resting on spring bosses, compress cover slightly, remove metal staking in adjusting nuts by running hacksaw blade through slot, remove nuts, release pressure slowly, remove cover and springs. Remove release levers by grasping lever and eyebolt between thumb and forefinger, so that inner end of lever and upper end of eyebolt are pressed together. Lift strut over ridge in end of lever (press lower end back against lug), lift lever and eyebolt out.

Clutch Springs:—Note spring color and install in same relative position (groups of two different springs used on some clutch models). Springs should check with table below. Replace springs if weak or burned or if clutch has been subjected to excessive heat.

Spring Specifications

Part No.	Pressure (@ 1 11/16")	Color
2994	140 lbs.	Yellow or Brown
3814	135 lbs.	Purple
3817	110 lbs.	Green
3951	155 lbs.	No Color
4039	165 lbs.	Light Blue
4190	160 lbs.	Tan
4211	170 lbs.	Orange
4214	175 lbs.	Light Green

Assembling:—Place pressure plate on fixture or arbor press supporting plate under release lever lugs. Install baffle plate (some models only—see Note below), install lever, eyebolt, and strut assemblies by reversing removal procedure. Place pressure plate springs on plate, install anti-rattler springs (see Note below) in cover, place cover on pressure plate. Make certain that springs are seated in cover recesses and anti-rattler springs in place on release levers. Compress cover slowly and guide eyebolts through holes in cover. If assembly made in fixture, use clamps to clamp cover flange to plate at mounting holes. Install eyebolt nuts and turn nuts down flush with head of bolt. Compress and release clutch several times to seat all working parts. Then adjust release lever heights.

NOTE—On Oldsmobile 1937 models where release lever springs used instead of anti-rattler springs, install these springs with cross-wire straddling lever tip and coils at either side of pressure plate lug. Free ends of springs will extend up so as to contact clutch cover when installed.

Oldsmobile (1937-38)—To replace the steel spacer on the cast-iron release plate, place plate face down on bench, install spacer engaging the 3 prongs in the release plate holes, place a wooden block on the spacer lugs, tap spacer down until it is firmly seated on release plate bosses. Use extreme care not to distort spacer or mar spacer lugs which engage release lever slots. To install this assembly, place assembly on release levers with spacer down and lugs engaging release lever slots, lift lever return spring cross-wires and snap in place in release plate lug grooves.

Baffle Plate Installation Note (9A6, 9A7, 10A6, 10A7 Clutches):—Place baffle plate on pressure plate with baffle plate ears on special low spring seat ribs (adjacent to release lever lug on plate in counter-clockwise direction) so that flanged edge of baffle fits depressions in pressure plate at base of each lug and baffle is retained by springs (which seat on ears) when installed. See that baffle plate ears are flat on spring seat ribs and that baffle seats fully in machined recess in plate (straighten ears if bent by handling).

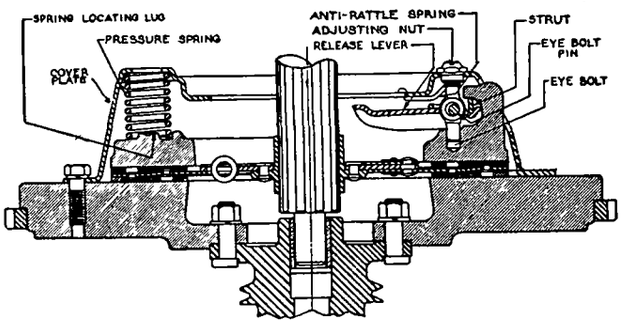
(Model 11A6 Clutch)—Install baffle in same manner as above except that baffle ears must be seated on spring seats adjacent to lugs in clockwise direction.

MODELS 8A7; 9A6, 7; 10A6, 7; 11A6 CONT.

Release Lever Adjustment (Without Fixture):—Use Borg & Beck A1 type gauge plate, assembling gauge in clutch on flywheel in place of regular driven member so that lugs on gauge are under release levers. Place short scale or straightedge on edge on boss in center of gauge (see special directions below for types with baffle plate or new Borglite driven member which require special lever heights). Adjust levers by turning adjusting nuts on eyebolts until levers just contact edge of straightedge. Lever heights must be equal within .005". Lock adjusting nuts by peening metal into bolt slot and recheck settings.

Release Lever Adjustment (With Pressure Plate Baffle & Borglite Driven Member):—Use special gauge plate No. 4234 (Borglite driven member is thinner and requires special setting—do not use regular gauge plate No. 3525). Install gauge plate on flywheel in place of regular Borglite driven member, install clutch cover assembly. On Models 9A6, 9A7, 10A6, 10A7, adjust levers in usual manner by placing short straightedge on top of gauge plate hub and turning nuts on adjusting screws until lever tips contact edge of straightedge. Lock screws by peening nut into slot in adjusting screws (except 10A7), peening nut against flat notches on side of adjusting screws (8A7, 9A7). On Model 11A6, levers must be set 1/16" higher than hub of this #4234 gauge plate and straightedge with 1/16" step, 5/16" long, cut in one corner should be used. Set levers so that tips contact straightedge at bottom of this step.

Release Lever Adjustment (With Pressure Plate Baffle & Standard Driven Member):—Use regular gauge plate No. 3525 assembled on flywheel in place of regular driven member. On Models 9A6, 9A7, 10A6, 10A7 (except #897—Oldsmobile), release levers must be set 1/16" higher than hub of gauge and straightedge with 1/16" step, 5/16" long, cut in one corner should be used. Set levers so that lever tips contact straightedge at bottom of step. On Models 10A7 #897 (Oldsmobile) and all 11A6 clutches, levers must be set ⅛" higher than gauge hub. Adjust in same manner as above using straightedge with ⅛" step.



Release Lever Adjustment (Chrysler, DeSoto, Dodge, Plymouth Models) using Chrysler Clutch Fixture: If special Chrysler Clutch Fixture used to set levers on these models, adjust levers so that the special "A" feeler gauge (.005" thick) will just pass between lever tips and underside of gauge plate (all 1935-36-37 models).

1938 Chrysler, DeSoto, Dodge, Plymouth Models—These models require higher lever settings and special extension 'U' spacer must be installed under gauge plate as follows: 1/16" (Chrysler C18, DeSoto S5, Dodge D8, Plymouth P5, P6), 3/16" (Chrysler, DeSoto, Dodge, Plymouth Taxicabs; Chrysler C19). Do not use spacer on Chrysler C20. Adjust levers as directed above with .005" feeler "A".

1939 Chrysler, DeSoto, Dodge Models—These clutch models equipped with baffle plate and Borglite Driven Member and require new 'Y' shaped extension gauge and new thicker feeler gauge (Tool Part No C-411-37A) for release lever adjustment. Install 'Y' extension gauge directly over release lever, tighten extension gauge locknut. Use 'D' end of feeler gauge (Chrysler C22, C24, DeSoto, Dodge except Taxicabs), 'C' end of feeler gauge (Chrysler C23, and all Chrysler, DeSoto, Dodge, Plymouth Taxicabs). Turn release lever adjusting screw nut until feeler gauge is just snug between lever tip and extension gauge, lock adjusting screw nut by peening nut into adjusting screw slot. Check to make certain that clearances for all levers is uniform after completing adjustment.

1939 Plymouth—On all models except Taxicab (see Taxicab note below), use new 'Y' shaped extension gauge (part of C-411-37A tool—do not use new thicker feeler gauge furnished for use on other models). Install 1/16" spacer on clutch fixture, place 'Y' extension gauge on spacer, tighten gauge locknut. Adjust release levers so that the regular 'A' feeler gauge is snug between the lever tips and the 'Y' extension gauge.

1939 Plymouth Taxicab—Adjust in same manner as other Taxicabs using "D" end of new thicker feeler gauge. See 1939 Chrysler, DeSoto, Dodge above.

Release Lever Adjustment (On Borg-Warner Universal Clutch Fixture UF-300):—Special lands must be installed on fixture under pressure plate lever lugs (all models with 3 levers—space lands equally on 4 lever types). Set adjusting arm on adjusting sleeve so that height of lower side of arm above bottom of sleeve is correct for each model (see table below), install indicating plate on levers (see special note below on Models 9A7, 10A7 with new duckbill release levers). Adjust each lever so that it just contacts indicating plate or adjusting arm, lock lever adjusting nuts by peening metal of nut into slot of screw (on 8A7, 9A7 peen nut against screw flats). IMPORTANT NOTE—Indicating plate "3X" should not be used on some 11A6 models as noted in table below. Use indicating plate for all other clutches.

Number	Lever Height
Model 8A7	
925	2⅛"
Model 9A6	
869, 873, 876, 894, 895, 906, 911, 932	2 5/16"
918	2⅜"
Model 9A7	
924	See Note
Model 10A6	
870, 874, 877, 878, 880, 883, 886, 890	2 5/16"
901, 904, 907, 923	2 5/16"
933	2 3/16"
Model 10A7	
897	2 7/16"
898, 899, 902, 905, 922	2 5/16"
913, 914, 919, 920, 924	2⅜"
927	See Note
928, 930	2 5/32"
Model 11A6	
871, 879, 882, 884, 900 (See Note)	1 13/16"
908, 910, 915, 916, 917, 921	2 7/16"
929, 931	2¼"

9A7, 10A7 Note—These models with 'duckbill' type release levers must be adjusted in special manner (longer length of levers makes it impossible to install height sleeve on fixture). With clutch mounted on fixture, install three height blocks '3K10' touching spindle and equally spaced around it with part number on blocks up. Install '3V' sleeve on height blocks with flange down. Install calibrated adjusting sleeve on sleeve and set adjusting arm flush with bottom of sleeve, install indicating plate on levers with counterbored side up and adjust levers.

11A6 Note—Do not use indicating plate "3X" when adjusting levers on these models.

DRIVEN MEMBER:—Manufacturer recommends installation of new driven member with new clutch facings rather than relining clutch. Driven plate hub (Spring Dampener) cannot be serviced in the field. Two types of plates used: (1) Cushioning secured by slotting plate into concave and convex segments, (2) Separate cushioning springs under one facing. Type used can be determined by inspection. Servicing directions for each type are as follows:

New Borglite Type Driven Member:—New type composite plate consisting of a small diameter disc with separate clock-spring type cushion segments (to which facings are riveted) riveted to outer rim. Segments are dished to provide soft engagement. This type of construction results in less weight at rim of driven member (which reduces spinning and allows quiet, fast gear shifting) without loss of strength in plate. Plate is balanced by additional rivets placed at rim of disc. Facings are riveted individually on cushion segments by one or two rivets in each segment.

Segmented Type Plate:—Driven plate slotted radially and segments alternately convex and concave. Tongue formed in each section by 'U' shaped cutaway. Each facing riveted individually at outer holes on convex side of segments (alternate segments) and to inner point of tongue on intervening concave segments.

To Remove Facings—Drill out rivets to remove old facings. Do not punch out rivets as this will distort disc and damage tongues.

Installing Facings—Insert rivets on facing side (head in countersunk hole of facing). Roll rivets on plate side—do not use split rivets. Each facing must be riveted individually with facing drilled to permit working through facing to head rivets for facing in opposite side.

Installing Driven Member—Plate marked 'Flywheel side'. Install with this side toward flywheel.

Cushion Spring Type Plate:—Facing on pressure plate side riveted only to series of individual cushion springs by two short rivets at tongue end of each spring. Cushion springs riveted to plate together with facing for flywheel side with two long rivets.

To Remove Facings—Drill out rivets when removing old facings to avoid danger of distorting disc and damaging cushion springs.

Installing Facings—Use complete new set of cushion springs if necessary to replace any of the springs. Install lining of flywheel side, inserting long rivets with heads in countersunk holes in facing, place cushion springs on opposite side of plate concave side down lining up springs so that tongue of one spring enters notch in next, roll rivets on spring side. If properly installed, holes in spring for pressure plate facing will line up with slot in plate. Install facing on cushion springs inserting short rivets with head in countersunk holes in facing, roll rivets on cushion spring side (work through holes in flywheel facing).

Installing Driven Member—Plate marked 'Flywheel Side'. Install with this side toward flywheel.

ILLINOIS (GRAHAM).

Used on:

GRAHAM, STD. 6 MODEL 74 (1935).
GRAHAM, CRUS. MODELS 80, 80-A (1936).
GRAHAM, CAVAL. MODELS 90, 90-A (1936).
GRAHAM, SUPERCH'D MODEL 110 (1936).
GRAHAM CRUSADER, MODEL 85 (1937)

DESCRIPTION:—Single plate dry disc type. Three release levers pivoted on eccentric pins in pressure plate lugs at flywheel brackets actuate clutch. Single large spiral clutch spring located between release lever plate and pressure plate. Pressure plate is heavy ribbed casting and is mounted on flywheel by three lugs engaging brackets bolted on flywheel independently (no conventional clutch cover used). NOTE—Mounting bolts are special type and no other type bolt should be used for replacement. One 5/16" lockwasher 3/32" thick must be used under each bolt head.

ADJUSTMENT:—When range of clutch pedal engagement has been used up, bracket mounting bolts on flywheel should be loosened one or two turns and the bracket shim pulled out from between the bracket and the face of the flywheel (shim holes slotted, not necessary to completely remove bolts). Adjust one bracket at a time, tighten bracket bolts before loosening next bracket. Shims can be discarded (new shims furnished with new lined clutch plates).

SERVICING:—Disassembly. Drill out riveted end of each eccentric pin (at outer end of each release lever) using ¼" drill. **Important**—Any attempt to drive out pins without first drilling riveted end will break or distort pressure plate. Place assembly on arbor press, compress release lever plate and spring slightly, remove eccentric pins and release levers, back off press to release spring, lift off plate and spring.

Assembly:—New clutch spring and new eccentric pins must always be used. See that release levers and retaining plate are not worn and that ends of levers are free in plate Place pressure plate on arbor press, install spring and retaining plate, compress spring, install release levers and eccentric pins turning nuts on pins up loosely, remove assembly from press and adjust release levers.

Release Lever Adjustment:—Mount pressure plate assembly on standard flywheel with three pieces of 5/16" key stock 1½" long between plate and face of flywheel midway between release levers (these pieces must be exactly same thickness, do not install driven member). Turn eccentric pins so that release levers are thrown in toward center of assembly as far as possible. Install special gauge ('U' shaped metal bar which forms parallel surface above retaining plate) over retaining plate, turn each eccentric pin so that face of retaining plate is parallel with underside of gauge in all positions, tighten locknuts securely

Installation:—When installing clutch with new driven member or new facings, see that shims furnished with new plate are installed on flywheel under each mounting bracket (these shims are discarded to secure second range of adjustment as facings wear). NOTE—Long type driven member used on Model 90 after Eng. No 207437, 110 after Eng. No 109174, and furnished for replacement on these models and also Model 90A after May 15, 1936. See Long data below. When installing Long driven member on these cars, see that flywheel bolts are tight and do not extend beyond face of nuts, install driven member with dampener toward flywheel

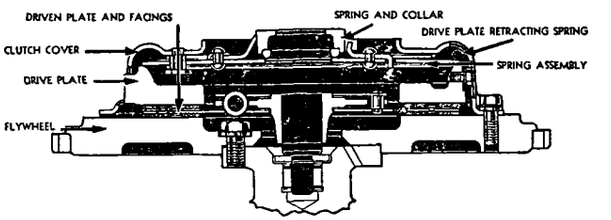
DRIVEN MEMBER:—Spring dampening device incorporated in driving plate hub. Driving plate segmented and facings riveted to plate individually. Manufacturer recommends use of new driven member with lining selected to maintain even thickness at all points under pressure.

Illinois Type Driven Member:—Iron rivets used for one facing, copper or brass for other (facings riveted individually). Iron rivets must be drilled out, plate will be distorted if rivets driven out. See that new facings contact plate at all points, driven member must be of exact same thickness at all points.

Long Type Driven Member:—See article on Long Type 9CF clutches for complete driven member data Facings as furnished by manufacturer have cushion springs installed. Install plain facing on flywheel side (dampener side when used with Illinois clutch, on models with Long Clutch when dampener installed away from flywheel, plain facing is installed on opposite side) Use brass tubular rivets Install cushion spring facing last using soft iron rivets with heads in clearance holes in facing. Special riveting fixture available with locating pins to insure correct positioning.

INLAND MODELS

Used On:



PONTIAC QUALITY SIX, MODEL 39-25 (1939)
PONTIAC DELUXE SIX, MODEL 39-26 (1939)
PONTIAC DELUXE EIGHT, MODEL 39-28 (1939)
STUDEBAKER PRESIDENT, MODEL 5C (1939)

DESCRIPTION:—Single plate dry disc type with diaphragm spring disc which takes the place of both pressure plate springs and release levers. Diaphragm spring is shaped like dished washer with inner rim slotted to form 18 segments or release fingers and is pivoted on inner and outer pivot rings assembled on inner surface of clutch cover by nine rivets. Diaphragm and pressure plate are linked by three tension or retracting springs mounted on edge of pressure plate by capscrews (springs and mounting screws visible through slots in cover). When diaphragm spring fingers depressed to release clutch, diaphragm pivots on inner pivot ring and resulting flexing action causes outer rim to move out relieving pressure on pressure plate and withdrawing plate from driven member. When diaphragm released to engage clutch, diaphragm flexs in opposite direction (pivoting on outer pivot ring). Pressure plate driving torque taken by three lugs on outer rim of plate which engage slots in clutch cover.

Pontiac Models. On all Pontiac models, an anti-rattle spring is installed between the cover and the rim of the pressure plate at one of the cover holes adjacent to the balance-marked lug hole and a release bearing plate (used with special graphite-composition release bearing) is mounted on the center of the clutch diaphragm.

SERVICING:—Caution. Do not allow pressure plate to hang on retracting springs in clutch cover. When handling clutch cover assembly, support pressure plate by hand or invert assembly so that pressure plate is up.

Disassembly. On Pontiac models, wire anti-rattle spring (flat tension spring in hole on side of clutch cover adjacent to balance marked pressure plate lug slot) to cover so that it will be retained when pressure plate is removed—**shifting spring to any other position will upset clutch balance.** Working through holes in clutch cover, take out retracting spring mounting screws, withdraw three retracting springs, lift pressure plate out. This completes disassembly (cover, diaphragm, and release bearing plate serviced as an assembly only and should not be dismantled).

Assembly. Place cover and diaphragm assembly over pressure plate making certain that pressure plate lug marked '0' is engaged in cover slot which is similarly marked (mark on cover will be found on mounting flange below slot), install retracting springs and tighten mounting screws. On Pontiac models, make certain that anti-rattle spring is in place in cover in hole adjacent to balance-marked slot and that it bears on pressure plate edge. No release lever setting etc. required.
NOTE—Manufacturer recommends that new retracting springs be used with clutch whenever a new or relined driven member is installed.

DRIVEN MEMBER:—Long 'CF" type driven members used on all models as follows:

Car Model	Driven Member Type
Pontiac Six 39-25, 26	9CF-CS
Pontiac Taxicab	10CF-CS
Pontiac Eight 39-28	9½CF-CS
Studebaker Pres. 5C .	9½CF-CS

See Long Model 9CF Clutch article for complete driven member data and note following points:

Pontiac Models—Special fixture available for facing installation (J-1043 riveting anvil, J-846-8 rivet set) on all models. When using this fixture, place guide pins in 'P6' holes for all six cylinder models (lower set of holes on rim near nameplate) and place rivet in center 'P' hole (diametrically across rim from nameplate) On eight cylinder models place guide pins in 'P8' holes (upper set of holes on rim near nameplate) and use same rivet hole as for six cylinder cars. On Taxicabs, place guide pins in 'A' holes (approx. 45° around rim from P6 & P8 holes), place rivets in center 'A' holes (directly below part no. of nameplate). Facing and driven member should be rotated on anvil as rivets are installed.

Studebaker—Reconditioned driven member assemblies (with facings installed) are available.

STUDEBAKER PRES. MOD. 3C (1937)

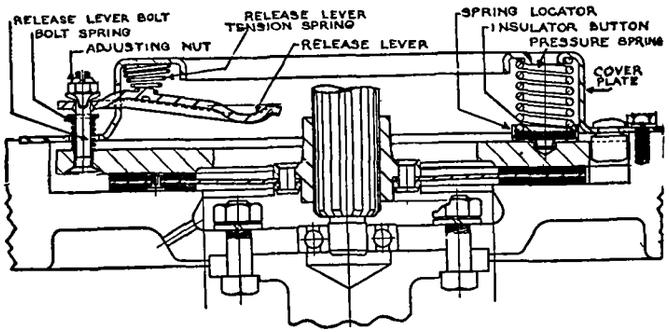
11A —PACKARD 8, 901, 902 (1932).

NOTE:—Manufacturer recommends use of Borg-Warner UF-300 fixture for servicing clutch. Fixture consists of surface plate, which duplicates driving surface of flywheel, clamp screws to clamp clutch cover against plate, arbor press to compress springs in dismantling clutch, and gauge standard for use in setting up release levers.

DESCRIPTION:—Single plate, dry disc type. Six release levers pivoted on release bolts at rim of pressure plate with edge of cover at lever hole serving as fulcrum to actuate clutch. Servicing directions below apply to pressure plate assembly. See Driven Member Section if pressure plate not to be dismantled and rebuilt.

SERVICING:—Mark all parts before disassembling and reassemble in same position. Replace grooved, warped, or checked pressure plates. Replace springs when pressure plate discolored from heat (see Spring Testing below).

Dismantling:—Break release lever bolt nut locks by running hacksaw blade through bolt slots. Place clutch in fixture or arbor press, compress cover slightly, take off release lever bolt nuts, release pressure slowly, lift off cover plate. This will expose all parts of pressure plate assembly. Remove and test clutch springs.



Clutch Springs:—Pressure springs should check with table below. Replace springs if weak or burned or if clutch has been subjected to excessive heat. Twelve springs used on all models.

Spring Specifications

Spring No.	Pressure @ 1 9/16"	Free Length	No. Coils
C-1965	90-100 lbs.	2¼"	8¾
C-2045	110-120 lbs.	2¼"	8¾
C-2096	120-130 lbs.	2½"	8½
C-2141	130-140 lbs.	2¾"	8½
C-3097	110-120 lbs.	2¼"	8¾
C-3098	110-120 lbs.	2¼"	8¾
C-3410	120-130 lbs.	2 15/32"	8½

Release Lever Assembly:—Place cover plate upside down on bench, place lever tension springs on cover, install levers forcing springs into place under lever. Make certain that springs are seated within cover and that small end of spring engages lug on lever. Cover assembly can then be installed on pressure plate.

Assembling:—Place pressure plate on fixture or arbor press, insert release lever bolts through plate, install springs on bolts, assemble spring locators, locator buttons and pressure springs on pressure plate. Install cover, compress cover about ½ until release bolts are just short of entering holes in levers, place flat washers on release lever bolt springs (washers must not be placed on springs before cover is installed or cover will bind and be distorted). Place #5 (9AB), #4 (11A), #8 (11AB) height sleeves on fixture under cover edge at levers, compress cover until it rests on height sleeves, guiding release lever bolts through holes in levers, use clamps to hold cover plate down on height sleeves. Assemble the washers and nuts in release lever bolts turning nuts down until they are flush with tops of bolts. Compress and release clutch several times to seat all parts (use weight on release levers). Then adjust release lever heights.

Release Lever Adjustment (on Fixture):—Assemble lever adjusting arm and sleeve setting bottom of of adjusting arm 1 17/32" (9AB except all Fords), 1 19/32" (Ford Pass. Cars), 1⅝" (Ford Truck and Coach), 1 17/32" (11A), 1 23/32" (11AB) above bottom of sleeves and lock with thumbnut. Swing arm over each lever in turn, set lever by turning release lever bolt until lever tip contacts arm. Lock adjustment by peening metal of nut into bolt slot.

Release Lever Adjustment (without Fixture):—Use aligning shaft and adjustment sleeve (Studebaker Parts HMJ-278, 278-2). Insert shaft in splined hub of driven member (clutch installed in flywheel) place sleeve on shaft so that it contacts hub, place straightedge across top edge of sleeve, turn adjusting screws up until they contact straightedge. Lever heights must be equal within .020". Lock adjusting screws by peening metal into slots.

DRIVEN MEMBER:—Manufacturer recommends installation of new driven member with new clutch facings rather than relining clutch. Driven plate hub (Spring dampener) cannot be serviced in the field. Cushioning springs are used under facing on pressure plate side of driven plate.

To Remove Facings:—Drill out twelve iron rivets mounting cushion springs on plate (two rivets radially at center of each spring), remove spring and facing assembly, drill out rivets to remove springs from facing (replace springs as complete set). Then drill out rivets mounting other facing on plate. Do not punch out rivets.

To Install Facings:—Install facing on flywheel side of driven plate, inserting brass rivets with heads in countersunk holes in facing and rolling rivets on plate side. Rivets are staggered in inner and outer rows around plate. Place cushion springs on second facing with clearance between spring and plate at center. Insert brass rivets with head in countersunk holes in facing, roll rivets on spring side (rivets installed in inner and outer holes alternately around plate in opposite order to those on other facing). Brass rivets must not extend through plate or springs more than 1/32" (plate end spring cutaway to provide clearance). Place facing and cushion spring assembly on plate, insert iron rivets through holes in plate and cushion springs, roll rivets (working through holes in facings). Driven member should be balanced after new facings installed.

Installing Driven Member:—Install with hub bolt nuts on flywheel side and cushioned facing toward transmission.

MODELS 8½CB, 11CB

Type — Used On:

8½CB-CS6—FORD '60' PASS. CAR, MODELS 74 (1937), 82A (1938), 922A (1939)
WILLYS-OVERLAND, MODEL 39 (1939)

11CB—PACKARD EIGHT, 1001, 2 (1933)

NOTE:—Manufacturer recommends use of Borg-Warner UF-300 fixture for servicing clutch. Fixture consists of surface plate, which duplicates driving surface of flywheel, clamp screws to clamp cover against plate, arbor press to compress springs in dismantling clutch, and gauge standard for use in setting up release levers.

DESCRIPTION:—Single plate, dry disc type. Release levers pivoted on studs in outer rim of pressure plate with edge of cover at lever holes serving as fulcrum to actuate clutch. Servicing directions below apply to Pressure Plate and Cover Assembly (need not be followed if driven member only being replaced).

SERVICING:—Mark all parts before disassembling (reassemble in same positions to preserve balance). Replace grooved, warped, or cracked pressure plates, replace springs if pressure plate discolored from excessive heating.

Dismantling:—Free release lever stud nut locks by running hacksaw blade through slots. Place assembly on fixture or in arbor press, compress cover slightly, remove lever stud nuts, release pressure slowly, lift off cover plate and lever assembly. Free release lever tension springs, lift out levers. Lever studs are pressed in pressure plate and pinned in place (need not be removed unless pressure plate or studs being replaced—see servicing directions below).

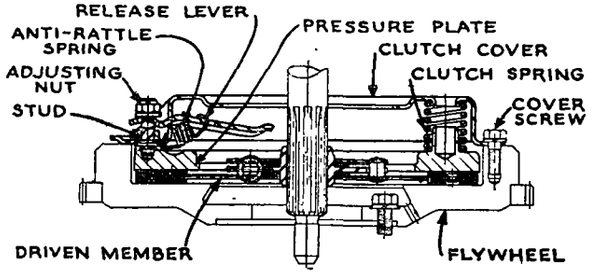
Release Lever Studs:—Replacement studs furnished without drilled hole for lock pin. To install studs, start stud in pressure plate hole, use vise jaws as press to force studs in until end of stud is 13/16" plus or minus 1/32" above finished surface of pressure plate, drill studs through pressure plate hole (use No. 22 drill), drive lockpins in from inside (rounded end first).

MODELS 8½CB, 11CB CONT.

Clutch Springs:—Replace springs if weak or burnt, or if pressure plate indicates clutch has heated excessively.

Model 8½CB Springs

Spring No.	Pressure & Length	Color
C-287 (Ford)	130-140 lbs. @ 1 9/32"	Blue
C-4784 (Overland)	140-150 lbs. @ 1 19/64"	White



Model 11CB Springs

C-2096 (Packard) ....120-130 lbs. @ 1 9/16" .... Red

NOTE—Spring pressure for Model 8½CB was 120-130 lbs. @ 1 9/32" (spring with 7 coils).

Release Lever Assembly:—Invert cover, insert levers through slots in cover from inside, hook tension springs over levers and in spring holes in cover below lever slots. Cover is then ready to install on pressure plate.

Pressure Plate Assembly:—Place pressure plate and stud assembly on fixture (see release lever stud servicing above), install springs on spring bosses on pressure plate, place cover in position on springs, compress cover until it is tight against #2 (8½CB), #8 (11CB) height sleeves placed under cover edge at clamps, guide lever studs through holes at outer ends of levers, install lockwashers and tighten lever nuts flush with ends of studs. Use clamps at height sleeves to hold cover, compress and release clutch several times (use weight on levers) to seat all parts, adjust lever heights.

Release Lever Adjustment (On Fixture):—Use lever adjusting arm and sleeve, setting lower face of lever exactly 1¼" (8½CB—Ford 60), 1 7/16" (8½CB Overland—with "3J" lands under pressure plate), 1 23/32" (11CB—Packard) above the bottom of the sleeve, tighten thumbnut. Swing arm over each release lever in turn, turn release lever nut until lever tip just contacts arm. Lock adjustment by peening nut into stud slot, recheck lever setting.

Release Lever Adjustment (Dial Indicator):—If dial indicator used, install indicator plate on lever tips, set indicator bracket at 1¾" (8½CB), 1 23/32" (11CB), set all levers for zero reading on dial indicator.

DRIVEN MEMBER:—Manufacturer recommends installation of replacement driven member (clutch disc) with new facings installed. See car model Mechanical Page for facing specifications.

Driven Member (Willys Overland)—Borg & Beck type (same as Willys) used on some cars. See Borg & Beck clutch article for data.

CLUTCH INSTALLATION:—Manufacturer recommends that cover be compressed on clutch fixture or in arbor press and ¼" tapered wooden blocks be installed between inside edge of cover and levers to hold levers in released position while installing clutch on flywheel. This will prevent cover distortion when cover bolts are tightened (remove blocks after clutch installed).

MODEL 12CB.

PIERCE ARROW 12, 1802, 3 (1938)

12CB-11½C—CADILLAC V16, SERIES 90 (1938-39)

NOTE—Manufacturer recommends use of Borg-Warner UF-300 fixture for servicing clutch.

DESCRIPTION:—Single plate, dry disc type. Six release levers pivoted on pressure plate lugs with fulcrum on yoke on cover. Needle bearings used at both pivot points. Servicing directions below apply to pressure plate assembly. See Driven Member Section if pressure plate not to be dismantled and rebuilt.

SERVICING:—Mark all parts before dismantling, and reassemble in same position. Replace grooved, warped, or checked pressure plates. Replace springs when pressure plate discolored from heat (see Spring Testing below).

Dismantling:—Break release lever yoke bolt nuts by running hacksaw blade through bolt slots. Place clutch in fixture or arbor press, supporting pressure plate on special lands under release levers, compress cover slightly, take off release lever yoke bolt nuts, release pressure slowly, lift off cover plate. This will expose all parts of assembly. Remove and test clutch springs.

Clutch Springs:—Double release springs used in some models (Type C-2727 springs inside heavier outer spring). Check springs separately, replace all springs which do not test up to figures below or which appear burned or warped.

Spring Specifications

Spring Number	Pressure @ 1 9/16"	No. of Coils	Color Markings
C-2727	50-54 lbs.	14	Dark Green
C-2096	120-130 lbs.	8½	Red
C-2972	100-105 lbs.	10¼	Dark Green
C-3347	112-118 lbs.	8¾	Purple
C-3431	150-160 lbs.	8½	Pink

Release Lever Assembly:—Use lever pin sawed off to lever width as a guide, install needle bearings in inner hole of lever, install adjusting yoke, insert short lever pin (pushing guide pin out as pin inserted) install pin locks. First type pins locked by hair-pin type lockwire at each end. Later type has head on one end and is held by cotter pin at other. First type pins should be replaced by later type whenever encountered. Repeat operation above at outer lever hole and install lever in pressure plate lugs using long lever pin.

Assembling:—Place pressure plate on fixture or arbor press supporting on special lands under release levers, assemble pressure spring locators, locator buttons and springs on plate, place cover on plate, compress slowly guiding lever yoke adjusting bolts through holes in cover, see that springs seat properly, clamp cover down placing clamps at cover clamp bolt holes. Assemble release lever bolt nuts and turn nuts down flush with tops of bolts. Compress and release clutch several times (using weight on release levers) to seat all parts. Then adjust release levers.

Release Lever Adjustment (on Fixture):—Assemble lever adjusting arm and sleeve, set bottom of arm 2 13/32" above bottom of sleeve, lock with thumbscrew. Swing arm over each release lever in turn, turn adjusting nut until lever just contacts arm, lock nuts by peening metal of nut into bolt slot.

Release Lever Adjustment (without Fixture):—If gauge plate or dial indicator used to set up release levers, lever heights must be equal within .005". Lock adjustment by peening metal of nut into bolt slot.

DRIVEN MEMBER:—Manufacturer recommends installation of new driven member with new clutch facings rather than relining clutch. Driven plate hub (Spring dampener) cannot be serviced in the field. Cushioning springs are used under facing on pressure plate side of driven plate.

To Remove Facings:—Drill out iron rivets mounting cushion springs on plate, remove spring and facing assembly, drill out rivets to remove springs from facing (replace springs as complete sets). Then drill out rivets mounting other facing on plate. Do not punch out rivets.

To Install Facings:—Install facing on flywheel side inserting brass rivets with heads in countersunk holes in facing and roll rivets on plate side. Place cushion springs on second facing with clearance at center between spring and facing, insert brass rivets with heads in countersunk holes in facing and roll on spring side. Brass rivets must not project more than 1/32" when rolled (plate and spring cutaway to provide clearance). Place cushion spring and facing assembly on plate, insert iron rivets through holes in plate and spring, roll rivets (work through holes in facing). Driven member should be balanced after new facings installed.

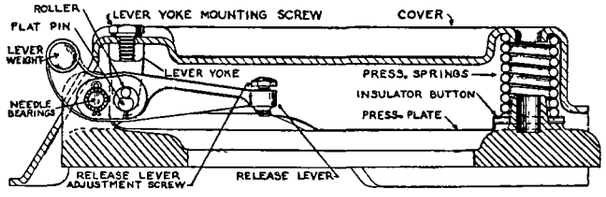
Pontiac 8 (1939)	9½CF-CS
Pontiac Taxicab (1939)	10CF-CS
Studebaker Pres. (1939)	9½CF-CS

Clutch Fixture Note:—Manufacturer recommends use of Borg-Warner Universal Clutch Fixture UF-300 for all servicing and rebuilding operations

DESCRIPTION:—Single plate, dry disc type. Release levers formed with weight on outer end which increase pressure on driven member as engine speed increases. Levers pivoted on pressure plate on needle bearings with fulcrum located in yoke support on cover plate. Hardened-steel screw contact provided on lever tips. These screws staked in place and should be disturbed only when release lever adjustment (for new or relined driven plate) is to be made. Servicing directions below apply to pressure plate assembly. See Driven Member Section below if pressure plate not to be dismantled and rebuilt.

SERVICING:—Mark all parts before dismantling and reassemble in same position. Replace grooved, warped, or checked pressure plates. Replace springs when pressure plate discolored from heat (see Spring Testing below).



Dismantling:—Place clutch on fixture (supporting pressure plate on special lands under lugs) or arbor press. Compress cover plate slightly, take out assembly screws (lever yoke mounting screws) on cover, release pressure on cover plate slowly, lift off plate. Note whether washers used on yokes under assembly screws (these washers must be reinstalled if old pressure plate used again). See special directions below on removing and reinstalling release levers. Remove and test clutch springs.

Clutch Springs:—Pressure springs should check with table below. Replace springs if weak or burned or if clutch has been subjected to excessive heat. Six springs used on 9CF, nine springs on 10CF, 11CF.

Spring Specifications

Spring Number	Pressure @ 1 9/16"	No. of Coils	Color Marking
C-1445	130-140 lbs.	8¾	Green
C-1965	90-100 lbs.	8¾	Light Green
C-2045	110-120 lbs.	8¾	Gray
C-2096	120-130 lbs.	8½	Red
C-2141	130-140 lbs.	8½	Black
C-2686	145-150 lbs.	8¾	Yellow
C-2717	100-110 lbs.	8½	Dark Green
C-3431	150-160 lbs.	8½	Pink
C-4188	170-180 lbs.	7.4	Pink

Pressure Plate:—Pressure plate refacing by grinding or turning down on lathe will throw release levers

out of adjustment. If pressure plate being refinished, remove .020" from face and install spacer washer .015" thick on release lever yoke under cover. NOTE—If washers are found on release lever yokes under cover when clutch disassembled, replace these washers (if old pressure plate used) or discard washers (if new pressure plate installed).

Release Lever Assembly:—Mount lever yoke on release lever, fasten by inserting flat-sided lever pin (flat side out or toward cover) and roller (place roller on flat side of pin). Insert lever in pressure plate lug, use roller pin sawed off to length of lever width as a guide and insert needle bearings, insert roller pin, pushing guide pin out, lock both lever pins with cotter pins. Thread release lever adjusting screws in ends of levers, turning screws down completely.

Assembling:—Place pressure plate on fixture or arbor press. Assemble pressure springs, locator washers or insulator washers on plate, place washers on lever yokes (if washers used previously and old pressure plate being used). Place cover plate in position (lining up marks made before dismantling), compress cover slowly guiding lever weights through holes in cover and lining up yokes under cover plate holes. See that pressure springs are seated, insert cover screws in yokes, using lockwasher under screw head, tighten screws down securely. Compress and release clutch several times (using weight on release levers) to seat all parts. Then adjust release lever heights.

Release Lever Adjustment (on Fixture):—Place special lands on fixture under pressure plate lugs, assemble lever adjusting arm and sleeve setting bottom of adjusting arm correct distance as shown in table below (all figures plus or minus 1/32") above bottom of sleeve and lock the adjusting arm with the thumbscrew. Swing arm over each release lever in turn, back off adjusting screw on tip of lever until rounded screw head just contacts arm, lock screws by inverting clutch so that screw head is supported and stake or peen lever into adjusting screw slot. Do not disturb lever yoke screws when making this adjustment.

Clutch Model	Lever Setting Height
9CF	2 3/32"
9½CF	2"
10CF	2⅛"
11CF	2 7/32"

Release Lever Adjustment (without Fixture):—Assemble lever setting disc or gauge (Cadillac No. J-685) on flywheel in place of driven member, placing gauge so that lugs are under release levers and gauge is centered in clutch. Tighten all clutch cover bolts evenly. Place short straightedge on edge on top of gauge shoulder, turn adjusting screws at tips of release levers up or down until they contact straightedge, lock screws by peening metal of lever into screw slot. Lever heights must be equal within .005".

Release Lever Adjustment (Dial Indicator):—When using dial indicator to set release levers on Model 9½CF, special indicating plate must be installed on levers and lever setting with this plate in place should be 2½" (plus or minus 1/32") and lever heights equal within .005". This indicating plate is not used on other models.

DRIVEN MEMBER:—Manufacturer recommends installation of new driven member with new clutch facings rather than relining clutch. Driven plate hub (Spring dampener) cannot be serviced in the field. Cushioning springs used under facing on pressure plate side of disc only.

To Remove Facings:—Drill out 12 iron rivets mounting cushion springs on plate (two rivets radially at center of each spring), remove spring and facing assembly, drill out rivets to remove springs from facing (replace springs as complete sets). Then drill out rivets mounting other facing on plate. Do not punch out rivets.

To Install Facings:—Install facings on flywheel side inserting brass rivets with heads in countersunk holes in facing and roll rivets on plate side (rivets staggered in inner and outer holes alternately around facing or placed two in a row radially). Place cushion springs on second facing with clearance at center between spring and facing, insert brass rivets with head in countersunk holes in facing and roll on spring side. Rivet layout same as for first facing except that rivets staggered in opposite direction or radial rows offset from rivets for first facing. Brass rivets must not project more than 1/32" when rolled (plate and spring cutaway to provide clearance). Place cushion spring and facing assembly on plate, insert iron rivets through holes in plate and spring, roll rivets (work through holes in facing). Driven member should be balanced after new facings installed.

Installing Driven Member:—Install with hub nuts on flywheel side and cushioned facing toward transmission (plate on Cadillac V12 is solid hub type with no dampening device).

MODEL 11CFS SPECIAL TYPE

Type **Used On:**

11CFS-CI—PACKARD SUPER 8, 1703, 3A, 5 (1939)

NOTE:—This clutch is a special type of riveted construction and cannot be dismantled. See description and servicing directions below.

DESCRIPTION:—Single plate, dry disc type of same design as other Long 'CF' semi-centrifugal clutches except for added spring segments installed as follows:

Spring Segments—Consist of three flat springs located between release levers which are riveted to lugs on pressure plate at inner ends and clutch cover flange at outer ends so that all clutch parts are permanently joined in one assembly (one clutch spring of each group extends through clearance hole in center of each spring segment).

SERVICING:—Cover assembly cannot be dismantled without removing spring segments (riveted to pressure plate and cover) and is serviced on an exchange basis.

WARNING—Clutch will not operate satisfactorily with spring segments removed.

DRIVEN MEMBER:—Long 'CF' Type. See Long 'CF' Clutch article (preceding page) for data.

MODELS 29A, 31A

Type **Used On:**

29A—LINCOLN, V-12 (1932), V-12-136, 145 (1933).

PACKARD SUPER EIGHT, 903, 4 (1932).

PACKARD TWELVE, 905, 6 (1932).

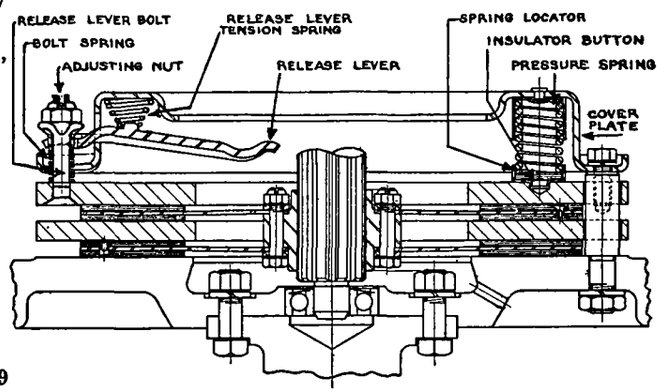
PIERCE ARROW EIGHT, MODELS 53 ('32), 836, 9 ('33), 836-A, 840-A ('34), 845 ('35).

PIERCE ARROW TWELVE, MODELS 51, 2 ('32), 1236, 42, 47 ('33), 1240-A, 48-A ('34), 1245, 55 ('35),

STUTZ, MODELS SV-16, DV-32 (1932-34)

31A—DUESENBERG, MODELS J, SJ (1931-37)

NOTE:—Manufacturer recommends use of Borg-Warner UF-300 universal fixture for servicing clutch.



DESCRIPTION:—Double plate, dry disc type. Driven member consists of two discs bolted to hub on opposite sides of front driving plate so as to form an assembly. Driven discs clamped between flywheel and forward driving plate (front disc), between forward driving plate and rear driving plate or pressure plate (rear disc) when clutch engaged. Driving plates mounted loosely on studs in flywheel which serve as mounting posts for clutch cover plate. Six release levers pivoted on edge of slot in cover actuate pressure plate through bolts at outer end on which adjusting nuts located. Center plate actuated by three adjusting screws in rim of pressure plate. Twelve clutch springs used and mounted in groups of two between adjacent release levers.

SERVICING:—Mark all parts before dismantling so that clutch parts can be reassembled in same position. Driven member must be dismantled to remove driven discs for replacement or refacing. Pressure plate assembly need not be dismantled unless springs are to be checked or parts replaced (release levers will not require readjustment when clutch assembled unless pressure plate assembly disturbed).

Dismantling Driven Member:—Take off nuts on bolts in driven member hub holding driven discs, remove discs. On types with spring dampener in hub, be careful not to disturb dampener assembly. Nuts must be locked on bolts when driven member reassembled.

Dismantling Pressure Plate Assembly:—Take out three center plate adjusting screws in rim of pressure plate, break release lever bolt nut locks by running hacksaw blade through slot in nut. Place assembly in fixture or on arbor press, compress cover slightly, take off release lever bolt nuts, release pressure slowly, lift cover off. This will expose all parts of assembly.

Clutch Springs:—Check springs and replace if weak or if burned or warped. Replace springs if pressure plate warped or discolored indicating excessive heating.

Spring No.	Press. & Length	Free Length	No. Coils
C-1675	120-130# @ 1⅝"	2⅜"	8
"	130-140# @ 1 9/16"	2⅜"	8
C-1846	110-120# @ 1⅝"	2 13/32"	8¼
"	120-130# @ 1 9/16"	2 13/32"	8¼
C-1930	105-115# @ 1⅝"	2½"	9
C-1965	90-100# @ 1 9/16"	2¼"	8½
C-2141	130-140# @ 1 9/16"	2¾"	8½

Release Lever Assembly:—Place cover plate upside down on bench, install lever tension springs in cover with large end against cover (see illustration), install levers forcing springs into place under levers. Cover is then ready to install on pressure plate.

Pressure Plate Assembly:—Insert lever bolts through plate, place plate on fixture or arbor press, install springs on lever bolts, assemble spring locators, locator buttons and springs on plate. Install cover on pressure plate making certain that center plate adjusting screw holes (9/16") in rim of plate line up with holes in cover. Place #2 (29A), #4 (31A) height sleeves under edge of cover, compress cover about ½ until release lever bolts are just short of entering levers, install flat washers on top of lever bolt springs (washers must not be installed before cover assembled or cover will be distorted), compress cover all the way guiding lever bolts through holes in levers, install rockerwashers and nuts on lever bolts, turn nuts down until flush with tops of bolts. Compress and release clutch several times (use weight on release levers) to seat all parts. Then adjust lever heights.

Release Lever Adjustment (On Fixture):—Assemble lever adjusting arm and sleeve, setting bottom of arm exactly 1⅜" (29A), 1½" (31A) above bottom of sleeve, lock with thumbscrew. Swing arm over each release lever in turn, turn adjusting nut on release bolt until lever just contacts arm, lock nuts by peening metal of nut into slot in bolt.
NOTE—These settings correct with #2 (29A), #4 (31A) height sleeves under cover flange.

Release Lever Adjustment (Without Fixture):—If dial indicator used to set up release levers, lever heights must be equal within .005". Lock lever adjusting nuts by peening metal of nut into bolt slot.

DRIVEN MEMBER:—Manufacturer recommends installation of new driven member with new clutch facings rather than relining clutch. Driven plate hub (Spring Dampener) cannot be serviced in the field. Cushioning springs are used under facing on pressure plate side of driven plate.

INSTALLING CLUTCH:—Driving plates must be free sliding fit on mounting studs in flywheel. Center (front) driving plate must be installed with separator springs (small leaf springs on rim of plate) against flywheel. These springs release forward driven member by moving driving plate back when clutch disengaged. Center plate adjusting screws must be adjusted after clutch installed in flywheel.

Center Plate Adjusting Screw Setting:—Turn each screw in or clockwise until it bottoms on center driving plate, then back each screw off 3 or 4 notches (see car page for each model). Screws are assembled with springs under head and locking plates which hold the adjustment.

ROCKFORD (CROSLEY) TYPE

Used On:

CROSLEY, MODEL A (1939-40)

DESCRIPTION:—Single plate dry disc type. Clutch assembly consists of three fulcrum brackets (mounting brackets) which are bolted individually on the flywheel. Release levers are pivoted on pins in fulcrum brackets and engage lugs on pressure plate with pressure spring mounted on pressure plate under each lever (3 springs used).

SERVICING:—Disassembly. Take out cotter pin and remove pin linking release lever to fulcrum bracket, remove release lever and spring. Repeat this operation at each of the three fulcrum brackets.

Assembly—Install fulcrum bracket on pressure plate lug, install spring, place release lever in position with hole in lever and fulcrum bracket lined up, install pin and secure with cotter pin.

DRIVEN MEMBER:—Consists of a steel disc with slotted rim on which linings are riveted in four separate segments. Each lining segment retained by three rivets with rivet heads reversed on alternate segments (rivet heads toward flywheel on adjacent segments).

Servicing—Facings not furnished separately and driven member should be serviced by replacement.

ROCKFORD TYPE

Used On:

Assembly No. MODEL 8½ SP.
UCLA-2-1748—AMERICAN AUSTIN (1932-35)
UCLA-3-1748—BANTAM, MODEL 60 (1937-39)

MODEL 8 II

UCLA-5-1098 —WILLYS, MODEL 77 (1933-36)
UCLA-9-1098 —WILLYS, 37 ('37), 38 ('38), 48 ('39)
UCLA-13-1098—WILLYS, TRUCKS (1938-39)

NOTE:—Assembly Number—This is the part number of the Cover Assembly which consists of all parts except Driven Member. See Driven Member data below.

Willys 48 (1939)—Long Model 8½CB Clutch used on some cars. See article on Long Clutch for data on this type (same as used on Willys-Overland Model 39).

DESCRIPTION:—Willys—Single plate, dry disc type, mounted in recess in flywheel with flat cover bolted to flywheel rim. Actuated by three release levers pivoted on steel ball in lever post on cover plate and linked to lever stud mounted on pressure plate by pin (lever stud extends through hole in cover plate).

Bantam—Release levers have fulcrum lug which engages cover and are linked to studs inserted through pressure plate (facing riveted on face of pressure plate and must be removed to remove these studs). Twelve short springs (¾" working height) are mounted in pockets in pressure plate and cover.

SERVICING:—Pressure plate assembly need not be dismantled when replacing driven member unless pressure springs are to be tested or replaced or other service work performed.

Dismantling:—Place cover assembly in arbor press with pressure plate down, compress cover slightly, remove cotter pins, lever pins, unhook lever springs, remove levers, release pressure slowly, lift off cover.

Clutch Springs:—Check springs and replace if weak or burnt. Springs should check with following figures:

Clutch Model	Spring Pressure & Height
UCLA-2-1748 & 3-1748	23-27 lbs. @ ¾"
UCLA-5-1098 & 9-1098	140-150 lbs. @1 13/16"
UCLA-13-1098	160-170 lbs. @ 1 13/16"

Assembling (Willys):—Place pressure plate on press or fixture, install pressure springs on plate and place spring cups on springs. Install cover plate, guiding spring cups through holes in cover and making certain that stud holes are lined up. Compress cover slightly. See that steel balls on which levers pivot are in place in recess in end of each lever post. Hook lever springs on levers, then hook opposite end of springs under cover rim (springs must be engaged before levers installed, if springs installed later they may be stretched beyond limits and distorted). Force lever in position in slot in lever stud, insert lever pin and cotter pin. Check lever heights.

Bantam. Place pressure plate and release lever stud assembly on arbor press or clutch fixture (studs must be installed before facing riveted on pressure plate). Install clutch springs (12 used), install cover plate with lever studs extending through plate. With release lever springs in place, install levers and insert lever pins.

Release Lever Adjustment (Willys):—Levers adjusted by turning knurled adjusting screw which contacts steel post on lever post. Adjusting screws locked in position by end of lever spring which engages the serrations in the screw head. Levers must be equal so that all levers contact release bearing simultaneously and should be set so that lever tips are exactly 1 3/16" above top surface of clutch cover. Clearance between lever tips and release bearing should be 1/16" with clutch engaged.

Bantam. Levers not adjustable but lever tips should be exactly 1" above outer surface of facing on pressure plate (check with facing installed). Clearance between lever tips and face of release bearing should be 1/16" with clutch engaged.

DRIVEN MEMBER:—Bantam Models. Driven plate on this model consists of an unlined steel disc. Facings are riveted separately to face of flywheel and pressure plate.

Willys Models. Driven member is Borg and Beck type. See Borg & Beck Clutch article for data.

BUICK (OWN) SINGLE PLATE TYPE

Used On:

MODEL 40 (1934-35-36).
MODEL 50 (1932-33-34-35).
MODEL 60 (1932-33-34-35-36).
MODELS 80, 90 (1936).
MODEL 37-40 (1937), 38-40 (1938)
MODELS 37-60,80,90 ('37), 38-60,80,90 ('38)
MODELS 39-60,80,90 (1939)

NOTE:—Double plate clutch used on Models 80 (1932-33), 90 (1932-35). See separate article for data.

1938 Models. Heavier clutch spring pressures used (approximately 5 lbs. per spring) but pedal pressure less than on previous models due to use of new over-center return spring.

1939 Models. Pressure plate assembly may be installed on earlier car models provided release lever heights correctly set (adjusting nuts not locked on new assemblies, levers should be correctly set and nuts then locked). Lever height increased on 1939 models due to use of new Borglite driven member.

DESCRIPTION:—Single plate, dry disc type. Clutch mounted in slight recess in face of flywheel with pressure plate lugs in grooves cut in flywheel rim so that drive transmitted directly from flywheel to plate. Clutch is actuated by three release levers pivoted on adjusting bolts in cover plate and linked to pressure plate by pins in lugs on plate. Servicing directions below apply to pressure plate assembly and need not be followed unless pressure plate, springs, or release levers to be examined or replaced.

SERVICING:—Mark all parts before dismantling and replace in same position to maintain balance.

Dismantling:—Place pressure plate assembly on arbor press, place block on cover (clearing release lever adjusting nuts) to take pressure, compress cover slightly, remove adjusting nuts, release pressure slowly. Lift off cover. This will expose all parts for inspection. Replace worn parts, check clutch springs.

Clutch Springs:—Check pressure springs and replace if weak or burned. Nine springs (3 groups of 3) used on Model 40, 50 and 60 (1932-35); Twelve springs (4 groups of 3) used on Models 60, 80, 90 1936). Springs for 60 '32 marked by daub of red paint. Springs on 50 identical with 60 for 1933-34-35.

Spring Specifications

Model	Pressure	Length
All Models '32-35	140-150 lbs.	1 13/16"
40 1936-37	140-150 lbs.	1 13/16"
40 1938	152 lbs.	1 11/16"
60, 80, 90 1936-37	135-145 lbs.	1 3/4"
60, 80, 90 1938-39	139 lbs.	1 3/4"

Assembling:—Place pressure plate on arbor press. Install pressure springs on plate. Place cover in position on springs, install guide pins on release lever adjusting bolts. Compress cover slightly guiding adjusting bolts through holes in cover, install adjusting nuts on bolts, remove assembly from arbor press.

Release Lever Height Adjustment:—Assemble gauge plate (see table below for type for each model) in flywheel in place of driven member, centering gauge in clutch with lugs on plate under release levers. Place short straightedge on top of gauge hub, turn adjusting nut until release lever just contacts straightedge, lock adjusting nut by peening metal into slots. Remove gauge plate and install driven member. Release lever heights must be equal within .005". Check runout with clutch installed in flywheel and see that it does not exceed this figure.

NOTE—On 1938-39 models, lever screws flattened on one side and adjusting nuts should be locked by crimping flanged edge of nut against this flat.

Gauge Plate

Model	Gauge Plate No.
40 (1934-38)	J-285 (See Note).
50, 60 (1932-35)	J-285
60, 80, 90 (1936-38)	J-685
60, 80, 90 (1939)	J-1036

Model 40 Note—On 1934-35 models, use Adapter No. J-285-1 assembled on top of gauge plate. On 1938 model, use Adapter No. J-285-4. No adapter used on 1936-37 models.

DRIVEN MEMBER:—Spring dampener type hub used on all models. Drill out old rivets to avoid distorting clutch disc when removing facings. Install new facings as follows:

1932-33—Rivets installed with heads in opposite direction alternately around disc (rivet heads in outer row in one direction, inner row oposite). Driven member on 50 and 60 not interchangeable.

1934-35—Split type facing laced at joint. Two rivets installed on each side of joint. Rivets installed from one side for one half of disc, and from opposite side for other half (heads of rivets at facing joint).

40 1934-35—Single row of rivets around disc. Rivet heads alternated from one side to the other.

1936—Borg and Beck driven member (with separate cushioning springs) used on Model 40, Long type driven member on Models 60, 80, 90. See article on Borg and Beck or Long Clutches.

1937 Models:—Long type driven member used on all models (see list below). Type used on Model 40 may be used for replacement on earlier models but old type driven member must not be used on 1937 cars (greater torque on new models). Type used on Models 60, 80, 90 same as previous type except that plate weight has been reduced by stamping holes in the plate. New type driven member is interchangeable with 1936 Models 60, 80, 90.

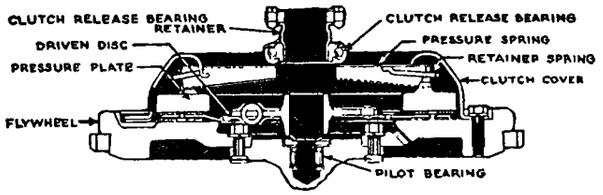
Model	Long Driven Member
40	10CF-CI
60, 80, 90	11CF-CI

See article on Long Model 'CF' clutches for complete data on these driven members.

1938 Models. Long Model 10-CF-CS driven member used on Model 40 (see Long 10-CF article for data). On Models 60, 80, 90 driven member is new Borg & Beck type balanced by weights installed on disc. Parts not furnished separately for this driven member.

1939 Models. Driven Member is new Borglite type. See Borg & Beck Clutch article for complete data on this type driven member. NOTE—This new type driven member may be installed on 1938 cars if the release levers are set for the new 2" height (J-1036 gauge).

BUICK 40 (OWN MAKE) 1939 TYPE



Used On:

MODEL 39-40 (1939)

TYPE:—Single plate, dry disc type of entirely new design with corrugated spring disc which replaces both pressure springs and release levers used on former clutch. Corrugations on disc engage ears on inner rim of clutch cover and lugs on pressure plate. Disc pivots on cover plate ears when it is flexed to release clutch, relieving pressure on pressure plate which is then pulled away from driven member by hairpin type retainer springs which pass through holes in pressure plate lugs and are hooked over cover ears.

SERVICING:—Mark pressure plate, spring disc and cover before disassembling clutch to insure reassembling in same positions (do not prick-punch spring disc, use paint or chalk for marking).

Disassembly. Use special tools J-1039-1 and J-1039-2 to unhook retainer springs from clutch cover ears working springs slightly toward center to permit tool engagement (do not hammer on tool which will distort cover), lift clutch cover off. Unhook retainer springs from spring disc by working one leg of each spring in through pressure plate lug toward center of clutch and other leg out, lift off spring disc, remove retainer springs from pressure plate lugs.

Assembly. Install retainer springs in pressure plate lugs with curved legs of springs up toward spring disc (push one leg of each spring in toward center of clutch and other leg out, lift off spring that it is just entered in hole in lug). Apply 'Lubriplate' lightly on spring disc at points where it contacts pressure plate and retainer springs (excess will ruin clutch facings), place spring disc on pressure plate, maneuver retainer spring loops over disc by turning springs so that they are properly aligned. Install cover, use special tools to engage retainer spring loops on cover ears. Make certain that marks on pressure plate, spring disc, and cover are lined up. This completes clutch assembly (no release lever adjustment, etc. required).

DRIVEN MEMBER:—New Borg & Beck 'Borglite' type with spiral grooved facings. Parts not furnished separately. Driven member assembly lighter than 1938 type and requires .005" additional release clearance. New type driven disc has nine separate cushion spring segments (to which facings are riveted) mounted individually on disc rim by two rivets each (center hole rivet found on some segments is balance weight).

Driven Member Installation on 1938 Cars. May be installed on 1938 Model 40 (without self-shifting transmission) provided that release levers are set higher than usual to secure additional release clearance (use J-285 gauge without adapter). **Do not install this type Driven Member on 1938 Model 40 cars with Self-shifting Transmission.**

BUICK—CADILLAC (OWN MAKE) DOUBLE PLATE TYPE

Used On:

BUICK MODELS

80, 90 (1932-33), 90 (1934-35).

CADILLAC MODELS

V8, 355-B ('32), 355-C ('33), 355-D ('34-35).

V12, 370-B ('32), 370-C ('33), 370-D ('34-35).

V16, 452-B ('32), 452-C ('33), 452-D ('34-35).

V16, SERIES 90 (1936). SERIES 37-90 (1937)

LA SALLE MODELS

V8, 345-B (1932), 345-C (1933).

DESCRIPTION:—Double plate, dry disc type. Three driving plates mounted as an assembly (center plate bolted on flywheel rim by 4 studs and nuts, front and rear plates mounted on 4 pins which are press-fit in center plate and free sliding fit on others). Driven member consists of two driven discs mounted on opposite ends of clutch hub so that each disc clamped between two pressure plates when engaged. Twelve pressure springs (mounted in 4 groups of 3 on rear driving plate) under spring pressure plate which is mounted on eight studs (one at each side of each release lever) extending through center driving plate to forward driving plate with nuts on front face of front plate. Release levers are single type (all Buick models, Cadillac 355-D, 370-D) or double type (all other Cadillac, La Salle models) and actuate clutch as follows:

Single Type Release Lever—Mounted on yoke bolt in spring pressure plate with outer end engaging bracket on rear driving plate. Pivots on lug which contacts driving pin in center driving plate so that rear driving plate drawn backward and front plate pushed forward (through spring pressure plate mounting studs) when clutch disengaged.

Double Type—Double type lever consists of short outer lever pivoted on yoke on rear end of driving plate pin (yoke bolt extends through pin with nut on forward end) and actuating spring pressure plate through yoke bolt extending through plate (forward motion of spring plate when clutch disengaged transmitted to front driving plate by stud at each side of each release lever) and an inner long lever which actuates rear pressure plate (lever contacts bracket bolted on plate). The two levers are pinned together at a point near the throw-out bearing end.

SERVICING:—No adjustment for wear required. On Cadillac models, condition of plates can be checked by measuring from spring pressure plate ridge to tip of release levers. Replace driven discs if less than 1 15/32" (355-D, 370-D), 1 13/32" (452-D, 90).

Driven Discs (Buick):—New facings can be installed. See car model page for specifications. Discs with new facings should be balanced within ¼ inch ounce by grinding at outer edge.

Driven Discs (Cadillac):—Manufacturer recommends that new driven discs be installed in matched pairs. Other parts not furnished separately. Driven discs thickness (with facings) and worn limit (when discs should be replaced) as follows:

Model	Thickness (new)	Worn Limit
355-D	.295"	.220"
370-D	.285"	.210"
452-D, 90	.335"	.260"

INSTALLING NEW DRIVEN DISCS:—Clutch Removal—Take off 4 nuts mounting center driving plate on flywheel rim (these nuts accessible through holes in rim of rear driving plate). Remove entire unit.

Dismantling Clutch (all models):—Place clutch assembly in arbor press, compress spring pressure plate slightly, take off nuts on spring pressure plate studs on front driving plate, release spring tension. Lift off front driving plate. Take off nuts on release lever pivot bolts at forward end of center plate driving pins (double release lever types only). Lift off rear driving plate. Take off 6 nuts on driven member hub bolts (on Buick models take out bolts carefully so that spring hub assembly does not come apart),

Assembling Driven Member:—Assemble discs on center driving plate entering hub bolts from flywheel side (Cadillac) or transmission side (Buick). Check clearance by supporting assembly on blocks on bench placing blocks under lower driven disc so that all clearance is between plate and upper disc. Clearance should be .030" and must be within .020-.045" (Buick), .025-.040" (Cadillac). Correct by installing spring washer, Cadillac Part No. 873860 (.010" thick) between disc and clutch hub. If more than one disc used, total should be divided between both discs and hub. On Buick models, if clearance not uniform around disc, install special shims .003" thick on hub bolts between disc and hub at low points. Lock hub bolts by punching nut down on bolt flat.

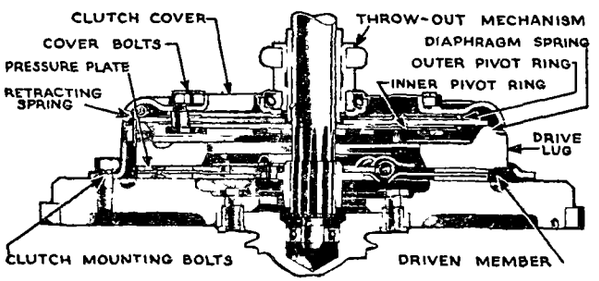
Assembling and Installing Clutch:—Clearance between driving pin and driving plates should be .001-.0025" (new) and must not exceed .008" (worn limit). Center plate driving pin heights at release lever end must be alike within .0005". Replace center driving plate if outside this limit. Install driven member with bevel on hub to rear (Buick models). On Cadillac V-12 models with curved disc spokes, spokes must lead out from hub in clockwise direction viewed from flywheel side. Balance marks on Cadillac driving plates (circle which may have letter inside) must be lined up on all plates.

Release Lever Adjustment (Buick Models):—Tighten all release lever yoke nuts until clearance between lever lug and top of driving pin is .001" (measure by inserting feeler gauge under lever bracket). Install release bearing on levers, use dial gauge to check runout. Must be less than .005". Correct by grinding off release lever clip slightly (lever ratio is 5:1 and .001" ground off clip will change lever height .005").

Cadillac Models—Manufacturer recommends that release lever yoke nuts not be disturbed when clutch dismantled.

CHEVROLET (OWN MAKE)

Used On:



MASTER DELUXE, HA (1938), JA (1939)
MASTER, HB (1938), '85' JB (1939)
HALF-TON, HC (1938), JC (1939)
¾ TON, HD ('38), JD, SPECIAL JE ('39)
ONE TON, MODEL HE (1938)
1½ TON, T (1938), VA TO VH (1939)

IMPORTANT 1939 SERVICE NOTE:—On all 1939 clutches, Clutch Cover, Diaphragm Spring, and Pivot Rings are a permanent assembly (rivets used instead of bolts) and cannot be disassembled and serviced as separate parts. Disassembly directions given below apply only to 1938 type.

CLUTCH TYPES:—Two sizes used—9" on Passenger Cars and Half Ton, 11" on all other trucks. Both types are same design and serviced in same manner but must not be interchanged.

DESCRIPTION:—Single plate, dry disc type of entirely new design with diaphragm spring which serves as clutch spring and release levers. Diaphragm spring is shaped like dished washer with inner rim slotted to form 18 release fingers and is pivoted on inner and outer pivot rings mounted on 9 bolts in clutch cover. When clutch engaged, diaphragm spring pivots on outer pivot ring and exerts pressure on pressure plate rim. When diaphragm spring fingers are depressed to disengage clutch, spring pivots on inner pivot ring and this dishing action causes outer rim to move out, relieving pressure on plate and pulling plate away from driven member (pressure plate linked to diaphragm spring by three small retracting springs bolted to pressure plate rim). Pressure plate drive taken through three lugs on rim which engage slots in cover. Throw-out bearing is a sealed ball bearing (permanently lubricated) and throw-out mechanism is positively actuated by release fork so that no pull-back spring required.

SERVICING:—Manufacturer recommends use of Clutch Pilot Tool K-411, to support clutch during disassembly, and Clutch Assembling Fixture J-1113, to compress diaphragm spring when disassembling and assembling pressure plate and cover assembly.

Retracting Spring Replacement. Does not require dismantling clutch. Remove clutch housing underpan, crank engine over until retracting spring bolt appears in lower opening, remove bolt, withdraw retracting spring, install new spring in same manner. Replace other retracting springs (3 used) in same manner.

Clutch Fork Removal. Can be removed without disturbing transmission. Remove flywheel underpan, disconnect clutch fork from pedal, use ⅞" and ¾" wrench to remove fork mounting, withdraw fork, remove ball retainer spring, ball retainer, ball. Pack ball seat in fork with high-melting point grease. NOTE—Install ball retainer spring with upturned ends down in ball retainer opening (will not seat in machined groove in fork if incorrectly installed).

Disassembly:—Take out screws and remove three retracting springs through slots in cover (screws accessible through holes in side of cover), make certain that one pressure plate lug and cover marked to insure correct reassembly, remove pressure plate. Place assembly on Clutch Fixture J-1113 (make certain that pivot bolt heads seat in recesses in fixture), compress diaphragm spring until all pressure relieved from bolts. Remove nuts and lockwashers on nine cover bolts, tap cover lightly to free it and lift off, remove outer pivot ring and special washers on bolts, release diaphragm spring tension slowly, lift off diaphragm spring, second set of special washers and inner pivot ring.

Servicing:—Wash all parts except throw-out bearing in gasoline (see Caution below), examine pressure plate and flywheel face for scored or rough surface, check pressure plate drive lugs for burrs, see that lugs move freely in cover slots and that clearance in slots is .004-.010" (replace pressure plate or cover if clearance exceeds .010"). Check diaphragm spring and pivot rings for distortion or cracks. See that throw-out bearing is not rough and moves freely on clutch shaft sleeves, check transmission pilot hole in housing for runout (must be less than .008"). Check clutch fork ball seat and ball fit, check driven disc and clutch shaft splines (replace disc if splines worn).
CAUTION—Throw-out bearing permanently lubricated and must not be soaked in gasoline which may dissolve lubricant on balls.

Assembly:—Reverse disassembly directions. Coat special washers with graphite grease before installing. Make certain that lugs on pivot rings engage bolts (three pairs of lugs on each ring which must be placed at three of the bolts to prevent ring rotating). Install diaphragm spring with convex side up and compress spring so that it is flat while tightening bolt nuts on cover. Line up marks on pressure plate lug and cover when installing plate in cover assembly. See that cover plate nuts and retracting spring screws are tightened securely.

DRIVEN MEMBER:—Rivets must be drilled out from head side to remove old facings (driving out rivets will distort clutch disc). When riveting new facings, use special rivets, reverse rivets in pairs (install two each way). Special riveting fixture recommended and should be set to flatten rivets exactly 7/32".

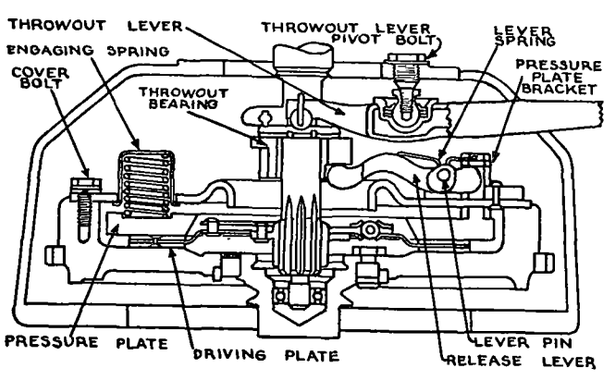
INSTALLATION:—Remove and repack clutch bearing before installing clutch (see instructions below). Line up 'x' marks on flywheel and clutch cover, install cover bolts and tighten all bolts evenly, one turn at a time, to prevent distorting cover. Pack recess within clutch throw-out collar with high melting point lubricant and coat throw-out fork groove with lubricant before installing throw-out assembly. Make certain that throw-out fork ball is snug fit in fork without endplay (install new ball if scored or worn), pack seat with high melting point grease, make certain that upturned ends of ball seat retainer spring point down in ball retainer opening (retainer will not seat in groove in fork if spring installed incorrectly), install fork and tighten ball retainer securely.

Clutch Pilot Bearing—Special oil seal type. Use puller to remove bearing, clean and repack bearing with high temperature grease, use special driver (with centering collar which engages pilot hole) to install bearing to insure alignment with transmission mounting pilot hole.

TROUBLE SHOOTING:—To correct clutch rattles at idling speed with clutch released, replace retracting springs, check clearance between drive lugs on pressure plate and slots in cover (if clearance exceeds .010", replace pressure plate or cover), check throw-out fork for loose fulcrum ball. See Retracting Spring and Clutch Fork data under Servicing above.

CHEVROLET & PONTIAC (OWN MAKES)

Used On:



CHEVROLET MODELS

STANDARD, CC ('33), DC ('34), EC ('35), FC ('36).
MASTER, CA ('33), DA('34), EA,ED('35), FA,FD('36)
COMMERCIAL, CB('33), DB('34), EB('35), FB('36).
TRUCK, (1½ TON), O('33), P('34), Q('35), R('36).
MASTER DELUXE GA, MASTER GB (1937)
HALF TON TRUCK GC (1937)
TON AND A HALF TRUCK SA, SB, SC, SD (1937)

PONTIAC MODELS

EIGHT, MODEL 601 (1933). MODEL 603 (1934).

DESCRIPTION:—Single plate, dry disc type. Clutch assembled in flywheel recess with flat cover bolted to flywheel rim by 3 bolts at each release lever. Three release levers pivoted on cover plate actuate pressure plate by engaging brackets bolted on pressure plate bosses extending through holes in cover.

NOTE—On 1933 clutch, release levers mounted beneath cover plate (instead of on top) and pressure plate lever brackets do not extend through cover. Cover is cutaway at brackets so that lever plates can be installed from top as on later models. Pressure plate drive taken by three guide pins in flywheel rim which must engage slots in pressure plate when installed.

CHEVROLET-PONTIAC TYPE CONT.

SERVICING:—Mark all parts before disassembling clutch, replace in same position to maintain balance. Servicing directions below apply to pressure plate assembly when dismantled for inspection or overhaul.

Dismantling:—Take out six capscrews mounting lever plates on pressure plate bosses, turning all screws out evenly to relieve pressure spring tension. Lift off cover and lever assembly. This will expose all parts for inspection. To remove levers, take off lever springs, pull out lever pivot pins, lift levers out.

Clutch Springs:—Replace weak or burned springs. Special colored springs assembled in center of each spring group on Standard models. All center springs must be same color on this model.

Model	Pressure	Length
Chevrolet CA, CB, O ('33)	140-150 lbs.	1⅜"
Chevrolet CC ('33), DC ('34)	70- 80 lbs.	1 13/16"
Chevrolet (all others)	90-100 lbs.	1 13/16"
Pontiac '33-34	140-150 lbs.	1⅜"
Pontiac '34 (#993377 Up)	90-100 lbs.	1 13/16"

Release Lever Assembly:—Install levers in place in cover plate brackets, insert lever pivot pins. Install hairpin shaped lever spring with loop on lever, engage spring eyes in lever pin grooves (push pin through and loop spring under pin, repeat at opposite end).

Assembling:—Place pressure plate on arbor press, assemble nine pressure springs on plate (see Springs above), place spring cups on springs, place cover plate in position guiding spring cups through holes in plate and pressure plate bosses through holes in lever brackets. Compress cover slightly, place lever plates over levers and start plate screws in pressure plate bosses. Turn all screws up evenly.

Release Lever Adjustment:—After clutch assembled to flywheel with driven member in place (use pilot shaft to center plate), mount dial indicator on clutch housing and check lever and bearing plate runout. If runout exceeds .020", install shims under lever plate of high lever, using shim of equal thickness at mounting screw at each end of plate.

DRIVEN MEMBER:—On Chevrolet, different type facings used on 1933 Standard and Master. Driven members on these models should not be interchanged (both 9"). Driven member on 1½ ton truck is larger (10") and should not be interchanged with passenger car types.

To Remove Facings:—Drill out old rivets from head side. Do not punch out rivets or plate will be distorted.

To Install Facings:—Rivets must be reversed in pairs (install two each way). Use special rivets furnished by manufacturer.

HUDSON (OWN MAKE)

Used On:

TERRAPLANE, MODELS 70, 71, 72 (1937).
TERRAPLANE, MODELS 80, 81, 82, 88 (1938)

DESCRIPTION:—Single plate, cork insert type, operating in oil. Mounted on flywheel face by 16 capscrews in cover flange. Gasket used under cover flange to secure oil-tight joint and oil seal mounted on throwout collar to retain clutch lubricant. Clutch actuated by 3 clutch fingers pivoted on retainers bolted to cover and linked to pressure plate by pins at outer end.

SERVICING:—Clutch assembly need not be dismantled when replacing driven member unless springs are to be tested or replaced, pressure plate replaced, or other service work performed.

Dismantling:—Check punch marks near outer edge of pressure plate in line with mark on cover flange or make new marks to insure reassembly in same position. Place clutch assembly on special clutch fixture (#J-298-H) or in arbor press supporting pressure plate so that cover is free. Compress cover slightly, take off 3 nuts on clutch finger retainer bolts on cover, release pressure slowly, lift cover off.

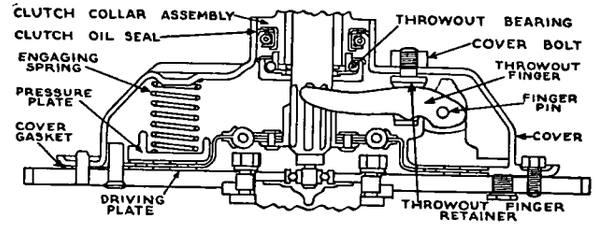
Pressure Plate:—Examine plate, replace if scored. Check for warping (particularly if plate 'blued' due to overheating). Replace if warped more than .010".

Clutch Springs:—Twelve springs on Hudson models, nine large springs and six inner springs on Terraplanes. Replace springs if pressure plate 'blued' indicating overheating. Check springs and replace if pressure less than service limit shown below.

	Pressure (new)	Service Limit	Length
Large Springs	120 lbs.	110 lbs.	1⅝"
Small (inner)	75 lbs.	60 lbs.	1⅝"

1938 Clutch Springs. Two different types of main springs (#45148, #45149) and one type of inner spring (#155224) used in various combinations on different car models as follows:

Car Model	Inner Spr. No.	Inner Spr. Type	Main Spr. No.	Main Spr. Type
80 Utility Coach & Coupe	6	155224	9	45148
80 Cab Pick-up, Panel Delivery, Station Wagon			9	45149
81	6	155224	9	45148
82, 88			9	45149
83, 84, 85, 87	3	155224	9	45149
89 (112)	3	155224	9	45148



Spring No.	Pressure
45148	170 lbs.
45149	185 lbs.
155224	140 lbs.

1939 Springs. Combinations of outer (main) and inner (auxiliary) springs used on various models as follows:

Model	Inner Spring	Outer Spring
90 '112'	3	9
91, 92	6	9
93, 95, 97	3	12
98 (except Sedan)	3	12
98 Sedan	3	9

Spring Specifications

	Pressure	Length
Outer—90, 91, 92, 98 Sedan	170 lbs.	1¾"
Outer—93, 95, 97, 98 others	150 lbs.	1⅝"
Inner—All models	80 lbs.	1⅝"

Assembling:—Check clutch throw-out fingers, see that they are straight and do not show wear at tip or retainer lug. Replace retainer washers if necessary. Place pressure plate on fixture with face down. Assemble springs, clutch fingers, retainers and retainer washers on plate. Place cover on top of pressure plate assembly (lining up marks on cover and plate), compress cover slowly, guiding retainer bolts through holes in cover, install nuts on retainer bolts, tighten securely. Check clutch finger heights after clutch installed on flywheel.

INSTALLATION & ADJUSTMENT:—Shellac new gasket on face of cover flange, see that flywheel face smooth and clean, use clutch aligning arbor (#J-384) inserted through clutch cover and driven plate to align driven plate, mount clutch assembly on

HUDSON (OWN MAKE) CONT.

flywheel (engaging two locating dowel pins on flywheel), install 16 cover screws, tighten screws evenly and securely (draw down screws diametrically opposite together to avoid distorting cover). Then align clutch fingers.

Clutch Finger Alignment:—Use special clutch finger adjusting gauge (#J-774) resting gauge on clutch cover so that pin is directly above clutch finger tip. Turn thumbscrew down until pin contacts finger. Repeat at other clutch fingers to secure final gauge setting equal to lowest finger. Turn gauge to higher finger, strike end of retainer bolt with soft hammer until gauge bar rests squarely on cover hub. With final setting, gauge bar should rest squarely on hub over all fingers and clearance between pin and end of thumbscrew must be less than .005" (all fingers equal within this amount—check with feeler gauge).

Throw-out Bearing & Oil Seal:—Insert 1/3 pint Hudsonite through clutch hub before installing throw-out collar assembly. Oil seal is pressed on collar behind throw-out bearing. When installing new oil seal, press firmly near inner diameter (pressure at point near rim may distort outer stamping and allow inner stamping and oil seal leather to revolve with shaft, this will cause noise similar to noisy throw-out bearing). Use arbor press to install throw-out bearing (do not drive on). See that bearing revolves smoothly and that oil seal inner stamping is tight in outer stamping before installing collar in clutch cover.

DRIVEN PLATE:—Driven plate has spring-dampener type hub and facing consisting of cork inserts. Examine driven member, see that plate runs true and is not warped or distorted, and that springs in hub do not have appreciable free play. See that hub splines are not worn and are free from burrs. Corks must be in good condition. Black glaze indicates use of wrong lubricant. Soak driven plate in Hudsonite and clean corks, or replace driven member.

1938-39 **Driven Plate.** Heavier damper springs used on driven disc hub and disc is cupped. Two types of discs (with different number of cork inserts) used as follows:

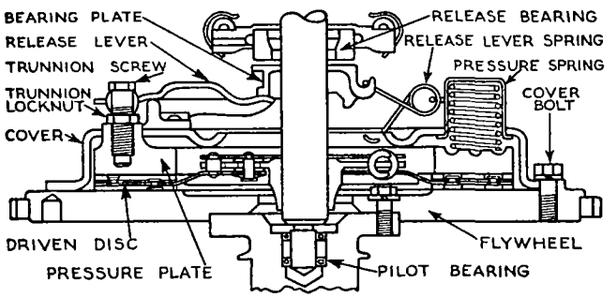
Car Model	No. of Cork Inserts
80, 88 Sedan, Utility Coach & Coupe	90
Terraplane 81, Hudson '112' 89	90
Terraplane 82, Hudson 83, 84, 85, 87	108
Hudson '112', 90, 98 Sedan	90
Hudson 91, 92	90
Hudson 98 Bus. Cars (except Sedan)	108
Hudson 93, 95, 97	108

PONTIAC (OWN MAKE)

Used On:

SIX, MODELS 701A, B (1935), 36-26A, B (1936).
EIGHT, MODELS 605 (1935), 36-28 (1936).
SIX, MODEL 37-26CA (1937)
EIGHT, MODEL 37-28CA (1937)
SIX, MODEL 38-26DA (1938)
EIGHT, MODEL 38-28DA (1938)

NOTE:—Driven member on these models is Long Model 10CF-CI (1935-36), 10CF-CS (1937-38). See article on Long Model 'CF" clutches for driven plate data.



DESCRIPTION:—Single plate, dry disc type. Clutch mounted in recess in flywheel with cover bolted to flywheel rim. Clutch actuated by 3 release levers pivoted on lug or ridge on cover and linked to pressure plate by adjustable trunion screws (release lever height adjustment).

SERVICING:—Pressure plate assembly need not be dismantled when replacing driven member unless pressure springs are to be tested or replaced or other service work performed.

Dismantling:—Place pressure plate in arbor press, compress cover (not levers) slightly, unhook release lever springs, lift off bearing plate, loosen locknut, unscrew release lever trunion screw, lift off levers, release cover pressure slowly, lift off cover.

Clutch Springs:—Check springs and replace weak or burned. Spring pressure should be 145-150 lbs. compressed to 1 9/16".

Assembling:—With pressure plate on arbor press, place nine pressure springs in spring seats on plate, see that spring cups in place on cover, put cover on springs, compress cover slightly. Insert trunion screws in holes in ends of lever, thread locknut on screw, position levers on cover, turn screw into screw holes in pressure plate, turning all screws down evenly (do not tighten locknut) place release

lever plate on levers, engage center loop of release lever springs on lever plate lugs, hook free ends of springs in holes in rim of cover plate.
NOTE—Release lever springs are double coil type. Coils are held together by tie wire. Measurement along tie wire from outside of spring coils should be 1 13/16".

Release Lever Adjustment:—Use gauge plate J-285B and adapter, assembling gauge plate on flywheel in place of driven member with gauge plate centered so that adapter does not contact bearing plate and turned so that lugs are under release levers (in mounting clutch in flywheel, turn all cover screws down to avoid distorting cover). Loosen release lever trunion screw locknut, turn trunion screw until clearance between adapter lug and bearing plate is exactly .009-.011" ('35-36), .040" ('37-38). Hold adapter down while checking clearance with feeler gauge. Tighten locknut and recheck clearances (must be uniform for all levers).

944—PACKARD SUPER 8, 1803,4,5,6,7,8 (1940)

These Clutches same design as used on corresponding 1939 car models except as noted below.

NOTE:—Assembly Number—This number stamped on each clutch cover and may be used to identify each installation.

Borg & Beck Driven Members—Used with clutches of other makes on the following car models: Buick 40, 50 (part production only, other cars have Long 'CF' type); Buick 60, 70, 80, 90; and Willys (Cars & Commercial models). Buick driven members are Borglite type. See driven member data below.

PRODUCTION CHANGE NOTES:—Cadillac, LaSalle Models—These clutches used on first cars only. See Long 'CF' Clutch for later cars.

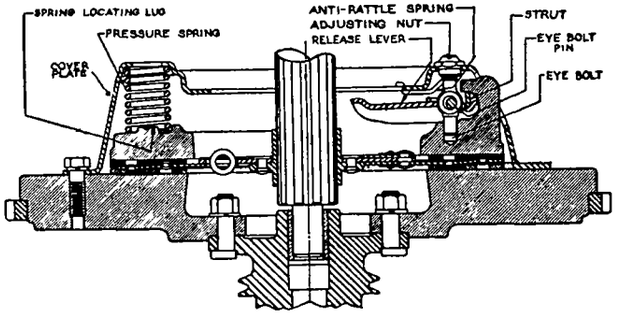
Nash & Nash-Lafayette—First type (1939 equipment) used on cars before December 15th. (4010, 4020), February 1st. (4080). Later type clutch with Borglite driven member used after these dates.

Oldsmobile 6 & 8—These clutches used only on cars with conventional transmission. No clutch used on cars with Hydra-matic Drive which has a Fluid Coupling.

Packard Models—These clutches used on first cars only. See Long 'CF' and 'CFS' Clutches for type used on later cars.

Studebaker Champion—*Driven member with grooved facings used on this model (used also on 1939 cars after Engine No. 17804).*

DESCRIPTION:—Same design as used on 1939 car models except as follows:



Chrysler C25, C26 (Without Fluid Drive), De Soto, Dodge, Plymouth & Taxicab Models—These clutches have Pressure Plate Baffle, and Borglite Driven Members. Baffle plate installation directions and special release lever settings given below. NOTE—Plymouth clutch is new type and release lever settings are not same as 1939.

Chrysler C26, C27 (With Fluid Drive)—Driven member has solid hub (no spring dampener) and has oil deflector discs on plate at inner rim of facings (baffle has inner rim cupped in deflector).

Nash & Nash-Lafayette—Later type clutches (see Production Change Note above) have Borglite driven members and require special release lever settings. Pressure plate baffle used on Nash clutches only.

Oldsmobile—These clutches same as 1939 types and have Pressure Plate Baffle, Borglite Driven Member, and special 'duck-bill' type release levers (lever ends flattened so that no release bearing plate required). Baffle plate installation directions and release lever settings are given below.

Studebaker Models—New type Driven Member used on Champion (see Production Change Note above). Commander clutch is new type and has Borglite driven member. This clutch requires special lever setting as given below.

SERVICING:—All service operations same as for previous Borg & Beck clutch models except as noted below.

See Borg & Beck clutch article in Mechanical Equipment Section of manual for complete data and note following new data:

Baffle Plate Installation (9A7, 10A7 Clutches):—Install baffle plate on pressure plate with baffle plate ears on special low spring seat ribs (adjacent to release lever lug on plate in counter-clockwise direction) so that flanged edge of baffle fits depressions in pressure plate at base of each lug and baffle is retained by springs when installed (spring seat on baffle plate ears). See that baffle plate ears are flat on spring seat ribs and that baffle seats fully in machined recess in plate (straighten baffle ears if bent by handling).

Model 11A6 Clutch—Install baffle in same manner as above except that baffle ears must be seated on spring seats adjacent to lugs in **clockwise** direction.

Release Lever Adjustment (On Borg-Warner Universal Clutch Fixture UF-300):—Except when rebuilding clutches, lever adjustment should not be changed unless levers are out of parallel more than .030". Place clutch on fixture with special lands under pressure plate lever lugs (all models with 3 levers, on models with 4 levers space lands equally). Set adjusting arm on sleeve so that height of lower face of arm above bottom of sleeve is correct for each model (see table below), install indicating plate on levers (except as noted), adjust each lever so that it just contacts indicating plate or adjusting arm, lock lever adjustment by peening nut into slot of adjusting screw (on 8A7 and 9A7, peen nut against two flats on screw).

Lever Settings

Clutch Model & No.	Lever Height
8A7—925	2⅛"
9A6—932	2 5/16"
9A7—924	See Note
9A7—926, 937, 943, 951	2 3/16"
10A6—939	2 3/16"
10A7—898, 922, 948	2 5/16"
10A7—919, 934	2⅜"
10A7—927	See Note
10A7—928, 938, 940, 949, 950	2 5/32"
11A6—931, 941	2¼"
11A6—944, 945, 946	2½"

9A7, 10A7 Note—These models have 'duck-bill' type release levers and must be adjusted in special manner (longer length of levers makes it impossible to install height sleeve on fixture). With clutch installed on fixture, place special extension sleeve '3Z' on spindle (this sleeve correct height for lever adjustment), place indicating plate on levers with counterbored side up. Set adjusting arm flush with bottom of calibrated adjusting sleeve, install sleeve on spindle and adjust release levers in usual manner.

Release Lever Adjustment (Chrysler, De Soto, Dodge, Plymouth Models—Using Chrysler Clutch Fixture) These models have baffle plate and Borglite driven members and require same C-411-37A gauge set used on 1939 cars ('Y' shaped extension gauge and double ended 'C' and 'D' feeler gauge). Install 'Y' extension gauge directly over release lever, tighten extension gauge locknut. Use 'D' end of feeler gauge (Chrysler C25, C26 with Fluid Drive, C27, De Soto, Dodge, Plymouth), 'C' end of feeler gauge (Chrysler C26 without Fluid Drive, and all Chrysler, De Soto, Dodge, Plymouth Taxicabs). Turn release lever adjusting screw nut until feeler gauge is just snug between lever tip and extension gauge, lock adjusting screw nut by peening nut into adjusting screw slot. Check levers for uniform setting after completing adjustment.

Release Lever Adjustment (Without Fixture)—Types with Borglite Driven Member:—Use special gauge plate, Borg-Warner #4234 (see note on car manufacturer's gauge nos. below), and install clutch on flywheel with gauge plate in place of regular driven member with machined lugs on gauge directly under release levers on 3 lever types (on 4 lever types, place lugs in any position). Use short straightedge placed on edge on gauge plate hub and adjust release lever adjusting screw nuts until levers just contact edge of straightedge for all models marked 'flush' in table below (if lever setting marked 'high', a cut-out or step must be made in the edge of the straightedge at one end so that levers can be set higher than hub; if lever setting marked 'low', recess or step should be cut in straightedge at gauge hub so that end of straightedge extends below hub), lock adjustment by peening nut into screw slot or against flat on screw.

Lever Settings

Clutch Model	Lever Height
8A7 (not Borglite)	⅛" Low
9A7 (except Oldsmobile)	1/16" Low
9A7 (Oldsmobile)	Flush
10A6, 10A7	Flush
11A6	1/16" High

Gauge Part No. Note—Gauge plates furnished by car manufacturers as follows: Nash—No. SE-505, Oldsmobile—No. J-1048, Studebaker—No. J-1307.

Release Lever Adjustment (Without Fixture)—Types with standard driven member (not Borglite):—The

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

#4234 gauge plate can be used on these models and levers should be set ⅛" lower than gauge hub (8A7), 3/16" higher than gauge hub (9A6, 9A7, 10A7 models with pressure plate baffle), ¼" higher than gauge hub (11A6 model with pressure plate baffle). On models without baffle (except 8A7), use regular #3525 gauge plate and set levers flush with top of gauge hub.

CAUTION—This #3525 gauge plate should not be used on clutches with Borglite driven member or on Model 8A7.

Clutch Springs:—Spring type and pressure should agree with table below. NOTE—Number shown thus (8) indicates number of each type of spring used when several types used together.

Car Model	Spring Part No.
Cadillac V8	3814 (6) & 3951 (6)
Chrysler C25	4039 (9)
Chrysler C25 Taxicab	3951 (6) & 3814 (6)
Chrysler C26 (11A6)	3951 (6) & 3814 (6)
Chrysler C26, C27 (10A6)	4039 (12)
De Soto S7	3951 (9)
DeSoto Taxicab	3817 (4) & 3814 (8)
Dodge D14, D17 (928)	3951 (6) & 3814 (3)
Dodge D14, D17 (938)	3951 (9)
Dodge Taxicab	3817 (4) & 3814 (8)
Hupmobile	3814 (9)
LaSalle	3814 (12)
Nash-Lafayette (9A6)	3951 (9)
Nash-Lafayette (9A7-937)	4308 (9)

Spring Specifications

Part No.	Pressure (at 1 11/16")	Color
3814	130 lbs.	Purple
3817	105 lbs.	Green
3951	150 lbs.	No Color
4039	160 lbs.	Light Blue
4190	155 lbs.①	Tan
4211	165 lbs.①	Orange
4214	170 lbs.	Light Green
4308	145 lbs.①	Lavender
4331	135 lbs.①	Yellow

①—Spring length 1½".

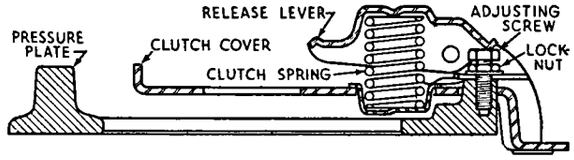
Driven Member (Borglite Type):—New type composite plate consisting of a small diameter disc with separate clock-spring type cushion segments (to which facings are riveted) riveted to outer rim. Segments are dished to provide soft engagement. This type of construction results in less weight at rim of driven member (which reduces spinning and allows quiet, fast gear shifting) without loss of strength in plate. Plate is balanced by additional rivets placed at rim of disc. Facings are riveted individually on cushion segments by one or two rivets in each segment. **Manufacturer recommends that driven member not be relined and that replacement driven member (with new facings installed) be used.**

Driven Member (Other Types)—Same as used on previous models with separate cushioning springs or spring tabs on plate. See Borg & Beck Clutch article in manual for data on these types.

ATWOOD TYPE

Model TP 28-7

WILLYS, 440 SPEEDWAY & DELUXE PASS. CARS (1940)



NOTE:—Pick-up & Panel Delivery Models. These models equipped with Rockford Clutch. See separate article for data on this type.

TYPE:—New design, single plate, dry disc type. Clutch cover consists of a three-legged spider with channel section legs in which the clutch springs and release levers are mounted. Release levers pivot on pins riveted in cover legs and actuate pressure plate through adjustable screws in pressure plate under outer end of each lever. Springs are mounted in cups on cover under each lever. Hairpin type retracting springs are mounted on each adjusting screw and are retained by the adjusting screw locknut.

SERVICING:—Disassembly—Release lever pivot pins need not be removed for pressure plate servicing. To remove pressure plate, back off adjusting screw under outer end of each release lever until screws are free from pressure plate, remove pressure plate from beneath clutch cover spider.

Clutch Springs:—Three springs used (one spring under each release lever). Spring pressure should be 195 lbs. compressed to 1 9/16".

Release Lever Adjustment:—Lever height should be checked with special ring gauge (hardened, ground ring .310"±.010" assembled in clutch (or under

pressure plate if clutch mounted on servicing fixture) in place of regular driven member. Loosen locknut on adjusting screw under outer end of each lever, and adjust each screw so that lever height (from face of flywheel or top face of servicing fixture to upper contact point on inner end of lever) is 1 15/16"±1/64". All levers must be set exactly alike.

Reassembly:—When reassembling pressure plate, thread adjusting screws through locknut and retracting spring, and into pressure plate hole. Adjust release levers (above) before tightening locknuts.

DRIVEN MEMBER:—Borg & Beck type. See Borg & Beck Clutch article for driven member data.

INLAND MODELS

Used On:

PONTIAC SIX, 40-25, 40-26 (1940)
PONTIAC EIGHT, MODEL 40-28 (1940)
PONTIAC TORPEDO EIGHT, 40-29 (1940)
STUDEBAKER, PRESIDENT MODEL 6C (1940)

These clutches same design as used on corresponding 1939 car models (see Pontiac Note).

PRODUCTION CHANGE NOTE:—Pontiac Eight—Beginning with Engine No. 8-217982, clutch with heavier 1400 lb. clutch spring was used (first type clutch spring was 1200 lb.). This new clutch, Part No. 753615 marked 'New Style', should be installed to correct damage resulting from slipping caused by starting in second gear and gunning engine.

SPECIAL SERVICE NOTE:—Poor Release Complaints—May be caused by anti-rattle spring wearing into plate and binding at end of spring. To correct this condition, examine pressure plate and spring for indication of interference. Smooth up pressure plate to provide good bearing surface for face of spring. See that spring does not have end thrust on pressure plate lug (shorten end of spring if necessary). Lubricate spring with Lubriplate when reassembling. CAUTION—Driving lug slots must not be widened to correct poor release. Clearance in excess of .005" at either side of lug will cause clutch noise and roughness. When installing clutch, make certain that dowel in flywheel engages hole in cover (cover will be distorted and clutch out-of-balance result from installation in any other position).

SERVICING:—Same as for 1939 car models. ***See 'Inland Model' clutch article in Mechanical Equipment Section of manual (or 1939 Supplement) for complete data and note following points:***

Pontiac Anti-Rattle Spring—Consists of a flat spring installed between the pressure plate and the clutch cover in one of the cover holes adjacent to the '0' balance marked lug hole. This anti-rattle spring should be wired in place before pressure plate is removed and must not be installed in any other position. CAUTION—Changing position of anti-rattle spring will upset clutch balance.

Driven Members—Driven members are Long 'CF' type. See Long 'CF' clutch article for driven plate data.

LONG MODEL 12CB

MODEL 12CB-11½C

CADILLAC V16, MODEL 40-90 (1940)

MODEL 12CB-CL

LINCOLN, V12 MODEL (1940)

These clutches same design as used on corresponding 1939 car models.

SERVICING:—All service operations same as for previous models. ***See 'Long Model 12CB' clutch article in Mechanical Equipment Section of manual for complete data and note following specifications:***

Clutch Springs—Twelve springs used on each model. Springs should check with specifications given below. Replace springs which do not test up to specifications or which appear burned or warped.

Spring Specifications

Car Model	Spring Part No.	Pressure @ 1 9/16"	Spring Color
Cadillac	C-2096	120-130 lbs.	Red
Lincoln	C-3431	150-160 lbs.	Pink

LONG MODEL 11CFS SPECIAL TYPE

MODEL 11CFS-CI

PACKARD SUPER 8, '160' 1803, 4, 5 (1940)

PACKARD SUPER 8, '180' 1806, 7, 8 (1940)

This clutch same design as used on 1939 models.

IMPORTANT NOTE:—This model has special riveted construction and cannot be dismantled.

Borg & Beck Clutch on Early Cars—See Borg & Beck Clutches for data on Model 11A6 used on early cars.

DESCRIPTION:—Same design as other Long 'CF' type semi-centrifugal clutches except for added spring segments as follows:

Spring Segments—Consists of three flat springs located between release levers. Springs are riveted

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

to pressure plate at inner end and on clutch cover flange at outer end so that all clutch parts are permanently joined in one assembly (one clutch spring of each group extends through clearance hole in each spring segment).

SERVICING:—Cover assembly cannot be dismantled and is serviced on exchanged basis (spring segments must be removed first and will be damaged if any attempt made to remove clutch cover).

WARNING—Clutch will not operate satisfactorily with spring segments removed.

DRIVEN MEMBER:—Long 'CF' type. See Long 'CF' clutch article in Mechanical Equipment Section of manual for driven member data.

LONG 9CF, 9½CF, 10CF, 11CF MODELS

MODEL 9CF-CS

FORD '60' & '85', PASS. CARS & COMM'L. ('40)
FORD '60' TRUCK, ¾ & 1 TON MODELS (1940)
MERCURY, MODEL 09A (1940)

MODEL 9½CF-CS

GRAHAM, STD. & SPC. MODEL 107 (1940)
GRAHAM, SUPERCHARGER MODEL 108 (1940)
PACKARD SIX, '110' MODEL 1800 (1940)

MODEL 10CF-CI

PACKARD 8, '120' MODELS 1801 (1940)

MODEL 10CF-TI

LA SALLE V8, MODELS 40-50, 52 (1940)
LINCOLN-ZEPHYR, MODEL 06H (1940)

MODEL 11CF-CI

FORD '85' & '95', TRUCK MODELS (1940)

MODEL 11CF-10½CI

CADILLAC V8, MODELS 40-60S, 62 (1940)

MODEL 11CF-TI

CADILLAC V8, MODELS 40-72, 75 (1940)

These Clutches same design as used on corresponding 1939 car models except as noted below.

NOTE:—**Cadillac & LaSalle Early Cars**—See Borg & Beck Clutches for data on Model 11A6 Clutch used on early cars.

Ford '60'—Clutch used on this model is same as type used on Ford '85' in 1940 and previous years. Type used on 1937-39 Ford 60 (8½CB-CS) has been discontinued.

Packard 6 & 8 Early Cars—See Borg & Beck Clutches for data on Model 10A7 Clutch used on early cars.

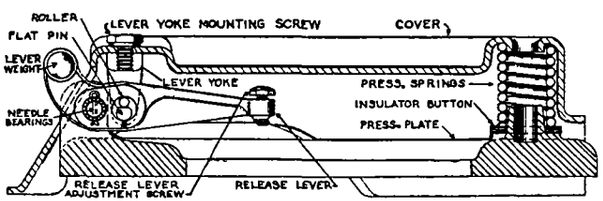
Long Driven Members (on other cars)—Long driven members used with clutches of other makes on the following 1940 car models:

Car Model	Long Driven Member
Buick 40, 50 (Part Production)	10CS-7S
Pontiac 6, 40-25, 40-26	9CF-CS
Pontiac 8, 40-28, 40-29	9¼CF-CS
Studebaker Pres. 6C	9½CF-CS

See Driven Member data below. Borg & Beck 'Borglite' driven member also used on Buick 40, 50 (see Borg & Beck Clutch article for data).

DESCRIPTION:—Same design as used on previous car models except for new type driven member on some cars. See driven member data below.

SERVICING:—All service operations same as for previous models. ***See 'Long 9CF, 9½CF, 10CF, 11CF' Clutch article in Mechanical Equipment Section of manual for complete data and note following specifications for 1940 types:***



Release Lever Adjustment (On Borg-Warner Universal Clutch Fixture UF-300):—Install special lands on fixture under pressure plate, set lever adjusting arm on sleeve so that distance from bottom end of sleeve to bottom of arm is correct for each model (allowable variation plus or minus 1/32") as given in table below. Adjust levers by turning lever adjusting screw in each lever tip in or out, lock adjustment by peening lever into slot on screw.

CAUTION—Support screw on metal surface when peening lever to prevent distorting lever and screw.

Release Lever Settings

Clutch Model	Lever Height
9CF (all)	2 3/32"
9½CF (all)	2"
10CF (La Salle)	1 15/16"
10CF (Lincoln-Zephyr)	2"
10CF (Packard)	2⅛"
11CF (Cadillac)	1⅞"
11CF (Ford Truck)	2 7/32"

Release Lever Adjustment (without Fixture):—When using dial indicator to set release levers, on Model 9½CF install special Borg-Warner indicating plate on levers and lever setting should be 2½" plus or minus 1/32" with this plate in place. On other models this indicating plate is not used and lever settings are same as above. Lever heights must be equal within .005".

Pressure Plate Servicing:—Regrinding or resurfacing pressure plate will throw levers out of adjustment and this must be compensated for by installing washers between lever yoke and clutch cover. Manufacturer recommends that when .020" removed from plate, washer thickness of .015" be used (washers should be approximately same size as end of lever yoke). CAUTION—If washers are found installed at this point when clutch is disassembled, make certain that these washers re-installed when clutch is assembled (if old pressure plate re-used), or discarded (if new pressure plate installed).

Cadillac Models—Manufacturer recommends that adjusting gauge J-285-C be installed on flywheel in place of regular driven member and short straightedge used as guide on gauge boss. Release lever mounting clevis screw heads should be bumped lightly with 8 oz. hammer to bend cover slightly until lever tips contact edge of straightedge.

Clutch Springs:—Springs should check with table below. NOTE—Number shown thus (9) indicates number of springs used on each model.

Clutch Springs

Car Model	Spring Part No.
Cadillac V8 (all)	C-2686 (9)
Ford (9CF)	C-1445 (6)
Ford Truck (11CF)	C-1965 (9)
Graham	C-4905 (6)
La Salle	C-2686 (9)
Lincoln-Zephyr	C-2096 (9)
Mercury (9CF)	C-4873 (6)
Packard 6	C-4905 (6)
Packard 8	C-2045 (9)

Spring Specifications

Spring Number	Pressure @ 1 9/16"	No. of Coils	Color Marking
1445	130-140 lbs.	8¾	Green
1965	90-100 lbs.	8¾	Lgt. Green
2045	110-120 lbs.	8¾	Gray
2096	120-130 lbs.	8½	Red
2686	145-150 lbs.	8¾	Yellow
4873	147-153 lbs.	8¼	Brown
4905	158-168 lbs.	8¼	.....

DRIVEN MEMBER:—Manufacturer recommends that driven member not be relined and that replacement driven member (with new facings installed) be used. See Car Model 'M' Page for facing specifications and Long Clutch article in 'ME' section of manual for driven member and cushion spring data.

ROCKFORD MODELS

Assembly Number	Used On: MODEL 8½SP
UCLA-3-1748	BANTAM, 63 & SUPER FOUR 65 ('40)

MODEL 8II

UCLA-13-1098	WILLYS, 440 PICKUP, 440P PANEL DELIVERY (1940)

These clutches same design as used on 1939 cars.

NOTE:—**Bantam Production Change**—On engines before No. 65-500, front facing is riveted to flywheel, rear facing riveted to pressure plate. On Engines after No. 65-500, front facing is free and floats between driven disc and flywheel.

DESCRIPTION:—**Willys**—Single plate, dry disc type, mounted in recess in flywheel with flat cover bolted to flywheel rim. Actuated by three release levers pivoted on steel ball in lever post on cover plate and linked to lever stud mounted on pressure plate by pin (lever stud extends through hole in cover plate).

Bantam—Release levers have fulcrum lug which engages cover and are linked to studs inserted through pressure plate (facing riveted on face of pressure plate and must be removed to remove these studs). Twelve short springs (¾" working height) are mounted in pockets in pressure plate and cover.

SERVICING:—Pressure plate assembly need not be dismantled when replacing driven member unless pressure springs are to be tested or replaced or other service work performed.

Dismantling:—Place cover assembly in arbor press with pressure plate down, compress cover slightly, remove cotter pins, lever pins, unhook lever springs, remove levers, release pressure slowly, lift off cover.

Clutch Springs:—Check springs and replace if weak or burnt. Springs should check with following figures:

Spring Specifications

Car Model	Spring Pressure & Height
Bantam	23-27 lbs. at ¾"
Willys	160-170 lbs. at 1 13/16"

Assembling (Willys):—Place pressure plate on press or fixture, install pressure springs on plate and place spring cups on springs. Install cover plate, guiding spring cups through holes in cover and making certain that stud holes are lined up. Compress cover slightly. See that steel balls on which levers pivot are in place in recess in end of each lever post. Hook lever springs on levers, then hook opposite end of springs under cover rim (springs must be engaged

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

before levers installed, if springs installed later they may be stretched beyond limits and distorted). Force lever in position in slot in lever stud, insert lever pin and cotter pin. Check lever heights.

Bantam. Place pressure plate and release lever stud assembly on arbor press or clutch fixture (studs must be installed before facing riveted on pressure plate). Install clutch springs (12 used), install cover plate with lever studs extending through plate. With release lever springs in place, install levers and insert lever pins.

Release Lever Adjustment (Willys):—Levers adjusted by turning knurled adjusting screw which contacts steel post on lever post. Adjusting screws locked in position by end of lever spring which engages the serrations in the screw head. Levers must be equal so that all levers contact release bearing simultaneously and should be set so that lever tips are exactly 1 3/16" above top surface of clutch cover. Clearance between lever tips and release bearing should be 1/16" with clutch engaged.

Bantam. Levers not adjustable but lever tips should be exactly 1" above outer surface of facing on pressure plate (check with facing installed). Clearance between lever tips and face of release bearing should be 1/16" with clutch engaged.

DRIVEN MEMBER:—Bantam Models. Driven plate on this model consists of an unlined steel disc. Facings are riveted separately to face of flywheel and pressure plate (see Production Change Note above for floating facing used on Eng. No. 65-500 up).

Willys Models. Driven member is Borg and Beck type. See Borg & Beck Clutch article for data.

ROCKFORD (CROSLEY) TYPE

Used On:

CROSLEY, MODEL A (1939-40)

DESCRIPTION:—Single plate dry disc type. Clutch assembly consists of three fulcrum brackets (mounting brackets) which are bolted individually on the flywheel. Release levers are pivoted on pins in fulcrum brackets and engage lugs on pressure plate with pressure spring mounted on pressure plate under each lever (3 springs used).

SERVICING:—Disassembly. Take out cotter pin and remove pin linking release lever to fulcrum bracket, remove release lever and spring. Repeat this operation at each of the three fulcrum brackets.

Assembly—Install fulcrum bracket on pressure plate lug, install spring, place release lever in position with hole in lever and fulcrum bracket lined up, install pin and secure with cotter pin.

DRIVEN MEMBER:—Consists of a steel disc with slotted rim on which linings are riveted in four separate segments. Each lining segment retained by three rivets with rivet heads reversed on alternate segments (rivet heads toward flywheel on adjacent segments).

Servicing—Facings not furnished separately and driven member should be serviced by replacement.

BUICK 40, 50 (OWN MAKE)

Used On:

BUICK, SERIES 40-40, 50 (1940)

This clutch same design as used on 1939 Series 40.

SERVICING:—Same as for 1939 type. *See 'Buick 40 Own Make' clutch article in Mechanical Equipment Section of manual (or 1939 Supplement) for complete data and note new driven member data as follows:*

Driven Member—Borglite type or Long Model 10CS-TS (each type used on part production). Parts not furnished separately and driven member should be replaced as an assembly. Grooved facings used on both types. CAUTION—Install driven member with large driving washer toward transmission.

BUICK 60, 70, 80, 90 (OWN MAKE)

Used On:

BUICK, SERIES 40-60, 70, 80, 90 (1940)

This clutch same design as used on corresponding 1939 models.

SERVICING:—Same as for previous models except as noted below. *See 'Buick (Own) Single Plate Type' clutch article in Mechanical Equipment Section of manual for complete data and note following new data:*

Release Lever Adjustment—Borglite driven member requires special lever setting and gauge plate J-1036 (same as for 1939) should be used. Assemble gauge plate in flywheel in place of regular driven member. Use service tool J-1013 and dial indicator, set all release levers equal within .005", lock adjustment by crimping flange on nut against flat on adjusting screw.

Driven Member—Borglite type (see Borg & Beck clutch article for data). Parts not furnished separately and driven member should be replaced as an assembly. Facings are grooved. CAUTION—Install driven member with large driving washer toward transmission.

CHEVROLET (OWN MAKE)

Used On:

ALL PASS. CAR & TRUCK MODELS (1940)

This clutch same design as used on 1938-39 models.

NOTE:—Clutch is same as 1939 type in that Clutch Cover, Diaphragm Spring, and Pivot Rings are riveted together in a permanent assembly. This assembly cannot be dismantled and parts are not furnished separately (furnished as an assembly only).

SERVICING:—All service data same as for previous models except that cover assembly cannot be dismantled. *See 'Chevrolet (Own Make)' clutch article in Mechanical Equipment Section of manual (or 1938 Supplement) for complete data and note following points:*

Clutch Balance Marks—When installing pressure plate make certain that '0' marks on one lug of plate and on clutch cover flange are lined up. When installing clutch in engine, line up 'X' marks on clutch cover and flywheel. This is necessary to maintain clutch balance.

Clutch Rattles at idling speed (released)—Can be corrected by renewing retracting spring without removing clutch from engine by removing clutch housing underpan and turning flywheel until retracting springs are at the bottom (3 springs used). Remove spring bolt, withdraw spring, install new spring in same manner. Renew all three springs in same way. If new springs do not correct rattles, check clearance between pressure plate lugs and edge of clutch cover slot. Clearance should be .002-.008" and clutch cover assembly or pressure plate should be replaced if clearance exceeds .010".

Clutch Fork Installation—If retainer in groove in fork is worn, install new retainer being certain that high side of retainer is up (away from bottom of ball opening), and open end of retainer on the horizontal.

Driven Member—Two types used—9⅛" diameter on Pass. Cars & ½ Ton, 10¾" on all other trucks. To install new facings, drill old rivets out from head side. Use riveting fixture to install new facings (fixture will flatten rivets exact correct amount of 7/32"), and reverse rivets in pairs (two each way). Facings are grooved type.

HUDSON (OWN MAKE)

Used On:

ALL MODELS (1940)—SEE NOTE

This clutch same design as used on 1939 models.

NOTE:—Cars with Overdrive—All cars with Overdrive are equipped with new heavier 10" clutch (cover is 10" type and is of new type welded construction has added strengthening ribs and thicker mounting bolt bosses). Driven member used with this clutch (spring dampener on this type has six heavy dampener springs instead of the eight smaller springs used on regular driven member). This clutch is serviced in same manner as other models (see special Clutch Spring data below).

SERVICING:—All service operations same as for previous types. *See 'Hudson (Own Make)' clutch article in Mechanical Equipment Section of manual for complete data and note new specifications as follows:*

Clutch Springs—Two types of outer (main) springs used and inner springs used on some models as shown in table below. Replace springs if pressure less than that shown in table.

Model	Inner Spring No. Used	Inner Spring Part No.	Outer Spring No. Used	Outer Spring Part No.
40	3	155224	9	45148
40 (41 Eng.)	6	155224	9	45148
41	6	155224	9	45148
48			12	45148
40, 41, 48 (O.D.)			12	45148
43			12	45149
44, 45, 47	3	155224	12	45149
43,44,45,47 (O.D.)	3	155224	12	45149

O.D.—Cars with Overdrive Transmission.

Spring Specifications

Spring No.	Pressure	Length
45148	155 lbs. ± 5 lbs.	1¾"
45149	135 lbs. ± 5 lbs.	1⅝"
155224	80 lbs. ± 5 lbs.	1⅝"

Clutch Aligning Arbor—Use J-449 arbor to center driven member when installing clutch on flywheel.

Driven Member—Cork insert type. See car model 'M' page for specifications. NOTE—Special driven member used on cars with Overdrive. May be identified by six larger dampener springs in hub assembly (standard driven member has 8 smaller springs).

HUDSON CLUTCH CONTROL

Optl. Equipment On:

ALL MODELS (1940)

This equipment same design as used on 1939 cars.

ADJUSTMENT, SERVICING, TESTING:—All data same as for 1938-39 cars. *See 'Hudson Automatic Clutch Control' article in Mechanical Equipment Section of manual (or 1938 Supplement) for complete data.*

BUICK FIRST TYPE

USED ON MODELS 50, 60, 90 (1934-35).

CHECKING & ADJUSTING:—Check following points first before changing settings:

Tire Inflation—26 lbs. (50), 24 lbs. (60), 28 lbs. (90).

Frame Height—Frame should be level crosswise of car. Check springs for sag and replace spring if necessary (see spring table below).

Toe In:—Check distance between center of tire tread at rear, roll car ahead ½ revolution, check distance between same marks. Should be 5/32-7/32" or ⅛-3/16" if measured on tire sidewall.

To Adjust—Change length of each tie rod equally. Intermediate steering arm must be on center line of car or midway between rear lower support arm bolts with wheels turned straight ahead. Correct by increasing length of one tie rod and decreasing length of second rod equally.

Caster:—Should be 1¾-2¼° (50), 1-1¼° (60, 90).

To Adjust—Jack up front wheels, loosen nuts on upper and lower support yokes one turn, tap nuts to free bolts in yoke, loosen knuckle support upper clamp bolt, turn upper support bolt (head of bolt at rear) clockwise to increase, or counter-clockwise to decrease caster. One complete turn of the bolt changes caster 1/3 degree.

Camber:—Should be ½-1¼° (all models). If camber checked by measuring from vertical line at wheel, felloe at top of wheel should be 9/64-23/64" outside felloe at bottom. Should be same for both wheels within ¼° or 1/16".

To Adjust—Jack up car so that weight is off wheel. Disconnect tie rod at wheel end. Remove nut on upper control arm yoke (if camber to be increased), or lower control arm yoke (if camber to be decreased, pull yoke out of arm, install special washer on yoke bolt between yoke and arm, reinstall yoke and tighten nut. Washers furnished 1/16" thick and change camber 1/3°.

CONTROL ARM ASSEMBLY:—Lower Knuckle Support—Pin is .0015-.0030" press fit in knuckle support and should be installed in an arbor press with 1-2 tons pressure. Pin locked by clamp bolt. Pin holes in lower support arm bronze-bushed and pin should have .0005-.002" clearance. End thrust taken by hard bronze washers fitted to .0015" end play.

Upper Knuckle Support:—Threaded pin screwed in upper end of knuckle support and carried in bronze bushings in upper support arm. Clearance in bushings .0005-.002" and endplay .0015" (steel thrust washer at front, bronze thrust washer at rear).

Lower Control Arm:—Mounted at inner end on individual threaded studs screwed in bushing in arms and bolted to anchor plate by special capscrews. Studs should be turned in or out of bushings until control arm bosses centered in clearance pockets in anchor plate with mounting bolt holes in studs and anchor plate lined up.

SPRINGS:—Springs are paired and same type must be installed on both sides of car. Standard types for each model as follows:

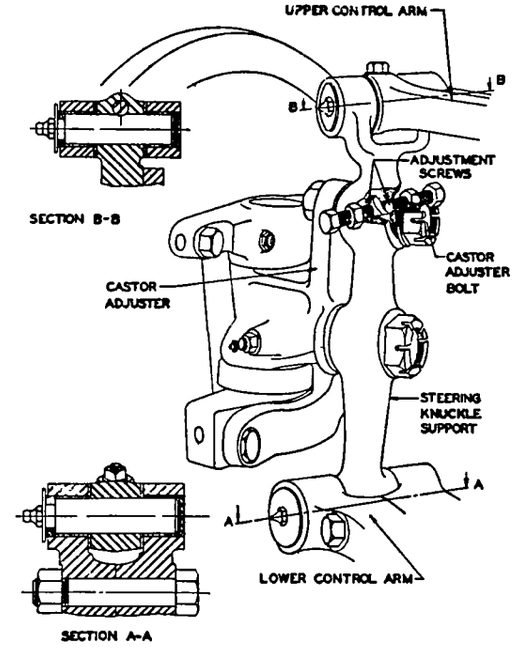
Car Model	(Spare at Rear)	(Fender Wells)
50	1284763	1284764
60	1284206	1284760
90	1284761	1284762

SHOCK ABSORBERS:—Front shocks mounted on frame by special heat treated bolts and located by reaming two bolt holes to provide .001-.0075" clearance.

BUICK 80, 90 TYPE

Used on:

MODEL 40 (1934-35-36), 60, 80, 90 (1936).



ROADMASTER, 37-80 ('37), 38-80 ('38), 39-80 ('39)

LIMITED, 37-90 ('37), 38-90 ('38), 39-90 ('39)

CHECKING AND ADJUSTMENT:—Check following points first:

Tire Inflation—26 lbs. (40), 28 lbs. (60, 80, 90).

Frame Height—Measured on each side of car from lower face of rubber bumper flange (40) or cross member at side of bumper flange (60, 80, 90) to top surface of lower control arm. Should be 4 9/16" (40), 4¾" (60), 4 9/16" (80,90 '36), 4 27/32" (80,90 '37-39). If difference greater than ¼", disconnect one stabilizer link. If this does not level car, remove and check front springs, install shims or replace springs (see Springs below).

Toe In:—Roll car on floor one full revolution, then check by measuring to marks in center of tire tread at rear, roll car ½ wheel revolution, reapeat measurement to same marks. Correct toe in determined by 'average' camber (½ sum of camber for both wheels) and should be 7/32" for camber of 2° decreasing 1/32" for each ¼° to 0" for 0° camber (except ½°-1/16" and ¼°-1/32" (1934-36) or 3/32" (1° camber), 1/16" (¾°-½° camber), 1/32" (¼° camber), 0" (0-Neg. ¼° camber) for 1937-39 models.

To Adjust—Turn each tie rod equally. Tie rod lengths should be equal and intermediate steering arm must be on center-line of car (equidistant from rear lower control arm inner brackets) when wheels straight-ahead (except 40 when steering arm thrown off center to correct steering wheel spoke location—see Steering Gear article). Correct steering arm position by increasing length of one tie rod and decreasing other.

Caster:—Machined bosses provided on each end of steering knuckle bosses (40) or caster adjuster (60, 80, 90) for protractor mounting when measuring caster. Should be 2¾-3¼° (40 '34-35), 3-3½° (40 '36), 1¾-2¼° (60, 80 '36), ¾-1¼° (90 '36), 0° (60, 80, 90 '37), **Negative** ⅞° (kingpin tilts forward at top) for 80, 90 '38-39. Allowable variation plus or minus ⅜°.

To Adjust—Jack up front end, loosen nuts on caster adjuster bolt and pivot bolt (on inner surface of steering knuckle support) one turn, loosen locknuts on adjusting screws which locate caster adjuster bolt in slotted hole. Back off one screw and turn up other screw an equal amount so that caster bolt is held tight (turn front screw in to increase or rear screw in to decrease caster). One turn of the screw changes caster 1°. Total range of adjustment 6° Tighten adjusting screw locknuts and caster adjuster bolt nuts securely, recheck caster with car weight on wheels.

Camber:—Can be checked with protractor held against machined surface of bearing hub (with hub cap and dustcap removed. Should be ½-1¼° (40 '34-35), negative ¼° to positive ¾° (all others).

NOTE—Camber for 1937-39 models can also be checked by measuring distance from mark on center of tire tread on each wheel at top and bottom (see table below).

Model	Camber	Top—Distance—Bottom
80	Neg. ¼°	59 59/64" — 60 11/64"
80	Pos 1°	60 37/64" — 59 9/16"
90	Neg. ¼°	59 59/64" — 60 11/64"
90	Pos. 1°	60 13/32" — 59 35/64"

CONTROL ARM ASSEMBLY:—Lower Knuckle Support—Pin is .0005-.002" (40), .0005-.0015" (60, 80, 90) press fit in knuckle support and is locked by clamp bolt. Use arbor press to remove and install pins—do not drive pins in or out. Pin clearance in control arm bushings should be .001-.0025". Side thrust of knuckle support taken by hardened bronze thrust washers on each side selected to give .000-.006" side clearance.

Upper Knuckle Support:—Pin clearance in support is .0015-.004" and pin should assemble easily by hand. Pin locked by clamp bolt. Pin clearance in control arm bushings should be .0015-.003" (40), .001-.0025" (60, 80, 90). Side thrust washers and clearance same as above.

Lower Control Arm:—Pivots on shaft bolted to cross member. Control arm carried on bushing threaded on shaft (front) and threaded on both shaft and in control arm end (rear). To assemble place control arm on shaft so that distance from center of shaft bracket bolt to outer face of rear control arm is 2 7/16" (40), 2 15/16" (60, 80, 90), thread rear bushing in arm and on shaft. Turn up tight and recheck distance. Thread front bushings on shaft, turn up until shoulder contacts face of arm, tighten clamp bolt.

NOTE—On Model 40 (1934-35), check control arm location by measuring from hole in center of shaft to rear face of rear boss on arm. Should be 6 3/16".

Entire assembly should move up and down freely (with spring not in place). Faulty alignment may be corrected by turning control arm shaft one turn in either direction to throw lower arm backward or forward. More than one turn will be in excess of caster adjustment.

SPRINGS:—Springs are paired and should have same free height. If not equal install ⅛" thick service washer and insulating washer on top of coil spring. Do not use more than two washers. If this does not correct car sag (unequal frame heights), check rear springs and frame alignment. Standard springs (identified by color) as follows:

	(Spare at rear)		(Fender wells)	
Car Model	**Part No.**	**Color**	**Part No.**	**Color**
41,46,46S '34-'35	1286634	Red	1286635	Yellow
47, 48 '34-'35	1286634	Red	1286635	Yellow
41 ('36)	1286635	Yellow	1292367	Green
46, C, S, 48 ('36)	1286635	Yellow	1293210	White
61, 66C, 66S, 68	1294664	Red	1294663	Yellow
81, 81C	1293553	Orange	1284760	Blue
90, 90L, 91			1293663	Green
80 ('37)	1298405	Orange	1298406	Blue
90 ('37)			1298407	Green

NOTE—Springs on 40 are smaller diameter and can be readily identified.

1938 Spring Specifications

	Spare at Rear		Fender Wells	
Model	**Color**	**Free Lgth.**	**Color**	**Free Lgth**
80 (All)	Orange	14¾"	Blue	14¾"
90 (All)	Blue	14⅝"	Green	14⅝"

1939 Spring Specifications.

	(Spare at Rear)		(Fender Wells)	
	Part No.	**Color**	**Part No.**	**Color**
80 (all)	1309916	Orange	1309917	Blue
90 (all)	1309917	Blue	1309918	Green

FRONT STABILIZER SHAFT (1939):—Serviced in same manner as Series 40 & 60 (see preceding article). **Stabilizer Links**—Same as Series 40 & 60 except that spacer not used on link bolt (grommet assem blies positioned by collars on bolt) and nut provided at each end of bolt for grommet assembly adjustment.

SHOCK ABSORBERS:—Front shocks mounted on frame by 4 special heat treated bolts and located by reaming out two bolt holes to close limits.

BUICK 40, 60 TYPE

Used On:

SPECIAL, 37-40 ('37), 38-40 ('38), 39-40 ('39)
CENTURY, 37-60 ('37), 38-60 ('38), 39-60 ('39)

NOTE:—This type suspension used on Models 40, 60 is the same for 1937-38 except as noted below:

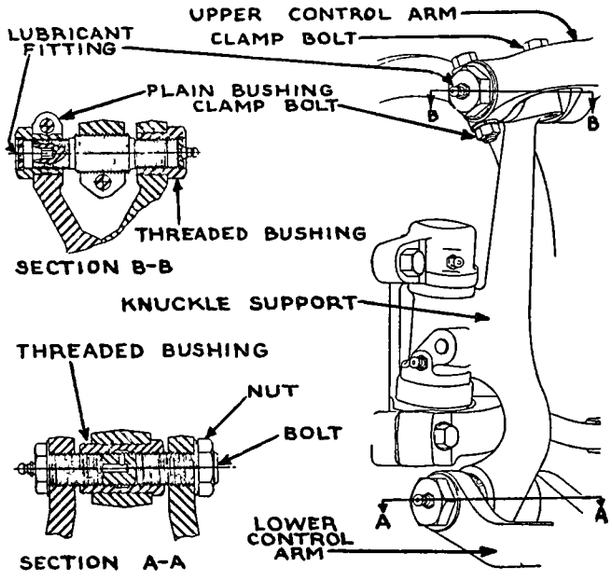
1938 Type Lower Control Arms:—Hardened bushings are threaded in inner ends of lower control arms and on bracket shaft (arms broached so that threads are cut by bushing when first installed). Bushings will not ordinarily require removal.

1939 Type:—Design same as for 1938 except as follows:

Lower Control Arm—One piece rubber bushings used at inner ends of control arms (frame connection) and retained by extension of lower control arm shaft bracket (inner end), flat washer and self-locking nut (outer end). Spring seat riveted to control arms and rivets must be removed to dismantle assembly.

Upper Control Arm (Shock Absorber)—Interchangeable on right and left side of car. Caster adjustment located at rear of control arm (left side) front of arm (right side).

NOTE—Upper and lower control arms and shaft not interchangeable with 1938 because of these changes. Knuckle Support and Steering Knuckle are interchangeable with 1938 parts.



CHECKING & ADJUSTMENT:—Car weight must be on wheels. Adjust front wheel bearings and check following points first:

Tire Inflation—(40,60) 23 lbs. frt., 28 lbs. rear.

Kingpin Inclination—3½-4½° (40, 60).

Frame Height—4¾" ('37-38), 4" ('39) measured from lower face of frame cross-member to upper surface of lower control arm. Must be equal on both sides within ¼". If not correct, disconnect one stabilizer link. If this does not correct height differences, remove and check front springs (see spring data below), install special spacer washer #1310413 (⅛" thick) or replace springs.

Caster:—Machined surface provided on each end of steering knuckle bosses. Caster should be ¼° plus or minus ⅜° and equal within ¼° for both wheels (1937), **Negative** ⅞° (kingpin tilts forward at top) plus or minus ⅜° for 1938 models.

To Adjust (40, 60):—Jack up front wheels, loosen clamp bolt at upper end of knuckle support, remove lubricant fitting at forward end of top support pin bushing, insert Allen wrench No. J-720, turn support pin clockwise to increase, counter-clockwise to decrease caster, tighten clamp bolt, replace lubricant fitting, recheck caster. ¼ turn of wrench will change caster ¼°. If caster changed more than ¼°, check toe in.

1939 Adjusting Note. Adjusting socket (for Allen wrench) located at rear of control arm (left side), front of control arm (right side) under lubricant fitting (remove fitting for access).

Camber:—Can be checked by protractor held against machined edge of bearing hub with dust cap and hub cap removed. Camber should be negative ¼° to positive 1°.

NOTE—Camber can be checked by measuring distance from mark on center of tire tread on each wheel at top and bottom (see table below). No adjustment provided (see 40, 60 note).

Model	Camber	Top - Distance - Bottom
40	Neg. ¼°	58 37/64" — 58 13/16"
40	Pos. 1°	59 7/32" — 58 15/64"
60	Neg. ¼°	58 43/64" — 58 29/32"
60	Pos. 1°	59 5/16" — 58 5/16"

Model 40, 60. Standard upper control arm knuckle support pin can be replaced with special eccentric type (Group 6.178 Part No. 231760) to permit slight camber adjustments. Camber readings outside limits given above indicate bent parts which should be replaced.

Toe In:—Roll car ahead one revolution, then check by measuring to marks at center of tire tread at rear, roll car ½ wheel revolution, repeat measurement to same marks at front. Correct toe in determined by average camber (½ sum of camber for both wheels) and should be 3/32" (1° camber), 1/16" (¾-½° camber), 1/32" (¼° camber), 0" (0-Neg. ¼° camber).

To Adjust—Loosen clamp bolts at each end of each tie rod, turn rod tubes equally in direction of forward wheel rotation to increase, or opposite direction to decrease toe in. ½ turn of tubes changes toe in 5/16". Tie rods lengths must be equal and intermediate steering arm must be on center-line of car (equi-distant from rear lower control arm inner brackets) with wheels straight ahead. Correct by shortening one tie rod and lengthening other rod equal amount.

Model 40, 60 (1938-39). New type tie rods are used (no intermediate steering arm, short left hand tie rod ball seat located in longer right hand tie rod near pitman arm ball seat). Adjust by loosening clamp bolt at wheel end of each tie rod and turning threaded sleeve (between tie rod and ball seat stud) equally at each side. One half turn of each sleeve will change toe-in 5/32".

CONTROL ARM ASSEMBLY (40, 60):—Upper Knuckle Support. Consists of threaded bushing screwed in upper end of knuckle support and in bushings in forward and rear forks of upper control arm. To assemble, screw pin in knuckle support, hold support centered in upper control arm fork, install rear (threaded) bushing turning bushing in against arm. Then install front (plain) bushing being careful not to turn bushing in tight which will cause binding. Install clamp bolt on this bushing.

NOTE—Entire assembly (without spring) must move up and down freely without binding. Lower control arm shaft may be turned one full turn in either direction to correct binding but must not be turned more than this amount (caster adjustment insufficient for greater correction).

Lower Knuckle Support:—Consists of bolt threaded through lower control arm and bushing in lower end of knuckle support. To assemble, turn threaded bushing in lower end of knuckle support from rear until tight, position knuckle support in lower control arm fork, turn bolt in from front through forward arm, knuckle support bushing, rear arm, assemble washer and nut on rear end of bolt.

Lower Control Arm. Control arms threaded directly on ends of shaft bolted to cross-member. Must be installed separately with spring seat removed. Distance from center of bolt hole in shaft bracket to inner face of control arm at rear should be 1 7/32" (1937), 1⅜" (1938). On 1938 models, hardened bushings are installed in inner ends of control arms but will ordinarily not require removal.

BUICK TYPE CONT.

1939 Note. Lower control arms riveted to spring seat and rivets must be removed to dismantle arms for bushing renewal, etc. Use 1938 type control arm bolts to secure spring seat when reassembling.

SPRINGS:—Springs are paired and should have same free height. If not equal, install not more than two ⅛" thick service spring washers No. 1290142 on top coil of short spring. Spring number stamped on flat of first coil and marked with paint for identification as follows:

	(Spare at Rear)		(Fender Wells)	
Model	**Part No.**	**Color**	**Part No.**	**Color**
40 (all)	1297818	Yellow	1298801	White
60 (all)	1297819	Red	1298802	Brown

1938 Spring Specifications

	Spare at Rear		Fender Wells	
Model	**Color**	**Free Lgth.**	**Color**	**Free Lgth.**
40 (All)	Yellow	14⅛"	Red	14⅛"
60 (All)	Red	14¼"	Brown	14¼"

SPRINGS (1939):—Have special end coils. Must be installed as follows: **Upper End**—Coil pilots around cup attached to frame by shock absorber mounting bolt (cup will remain in place unless both spring and shock absorber removed) and has rubber insulator between frame and spring end. **Lower End**—End coil not ground flat and must be fitted in recess in spring seat.

1939 Spring Specifications

	(Spare at Rear)		(Fender Wells)	
Model	**Part No.**	**Color**	**Part No.**	**Color**
40 (all)	1310096	Yellow	1310360	Red
60 (all)	1310411	White	1310412	Brown

60 (all)....1310360 (Late cars with long frame).

NOTE—See Rear Suspension article for special springs to be installed with heavy duty rear springs

FRONT STABILIZER SHAFT (1939):—Disconnect links by removing nut on link bolt, take out frame bracket mounting bolts. To service frame bracket rubber bushings, break weld between bracket and backing plate, remove backing plate. If bushings being re-located (due to popping out of bracket caused by excessive soaping when installed), clean outside of bushings thoroughly with steam or gasoline. To install new bushings, cut old bushings off, apply weak solution of water and soap suds to shaft and new bushings, slide bushings on shaft (avoid excessive soaping, do not use strong soap or grease). Clamp assembly in vise and wire backing plate to bracket (not necessary to weld), remove wire after stabilizer installed on car.

Stabilizer Links—When installing links, make certain that retainer installed at ends of rubber grommets and spacer installed on bolt at center. Tighten bolt nut to limit of threads so that overall length of grommet assembly at each end of link (distance between outer faces of upper and lower grommet retainers) is exactly 1 11/16".

SHOCK ABSORBERS:—Delco Double acting type. Mounted on frame by four special heat treated bolts and positioned by reaming out two bolt holes to provide .002-.007" clearance. See separate article for complete data.

CADILLAC FIRST TYPE

Used on:

CADILLAC V8, MODEL 355-D (1934-35).
CADILLAC V12, MODEL 370-D (1934-35).
CADILLAC V16, MODEL 452-D (1934-35-36).
LA SALLE, MODEL 350 SERIES 50 (1934-35).

CHECKING & ADJUSTMENT:—Check these points first before checking or changing settings:

Tire Inflation—35 lbs. (Cadillac), 25 lbs. (La Salle—front), 30 lbs. (La Salle—rear).

Frame Height—Should be 3 13/16" (La Salle), 5 3/16" (Cadillac) measured between lower face of frame side rail and upper face of lower spring seat. Must be alike on both sides of car. Check spring length if car sags.

Wheel Runout—Must not exceed 3/32". Mark high spot on tire and turn wheel so that mark on top vertically (to check toe in), or at one side (to check caster and camber).

Toe In:—Should be 0-1/16" (all models). Adjust by changing length of both tie rods equally. Intermediate steering arm must be exactly at center with wheels straight ahead (correct by lengthening short rod and shortening long rod equal amounts).

Caster:—Should be 1½-2° (La Salle), 3° (Cadillac V8 Series 10, 20), 1° (Cadillac V8 Series 30, all V12, V16). Must be equal within ½° for both wheels.

Adjustment (La Salle)—Loosen upper and lower control arm yoke nuts, and clamp screw on upper end of knuckle support, remove lubrication fitting in front bushing of upper control arm yoke. Insert Allen wrench, turn threaded pin clockwise to increase caster, counter-clockwise to decrease caster.

Adjustment (Cadillac)—Loosen lower control arm yoke nut, and upper knuckle support lockscrew. Turn threaded pin in upper control arm yoke (head of pin to rear on right side, to front on left side) in following direction when facing head of pin: **Right Hand Pin**—Clockwise to increase, counter-clockwise to decrease caster; **Left Hand Pin**—Counter-clockwise to increase, or clockwise to decrease caster.

Camber:—Should be ¼-1° (La Salle), ¾-1½° (Cadillac). Must be equal within ½° for both wheels.

Adjustment—Camber corrected by adding shims between face of yoke and face of control arm. On Cadillac models shims may be added only at lower yoke to decrease camber, no adjustment to increase camber possible. On La Salle, shims should be installed on lower yoke to decrease camber, or on upper yoke to increase camber. Shims furnished 1/16" thick and change camber 1/3°.

CONTROL ARM ASSEMBLY:—Lower Control Arm—Mounted at inner end on threaded studs which are bolted individually to anchor plate. To install, screw threaded studs in control arm bosses so that bosses are centered in clearance pockets in anchor plate with mounting bolt holes in studs and anchor plate lined up.

Lower Knuckle Support (First Type on Cadillac Models):—To install first type yoke pins, turn threaded bushings in yoke ends against steering knuckle support, installing bushing with shoulder at rear and allowing ⅛" more clearance at this end. Outer ends of bushings should be flush with face of yoke. Install taper pin, assemble gasket and cover plate at each end, insert mounting screw and tighten nut just enough to prevent oil leakage.

Second Type—Install short bushing in front leg of lower control arm yoke, long bushing in rear, turn bushings in until flush with outer face of yoke, install small end of taper pin marked 'small end' from rear loosely, adjust bushing clearance between steering knuckle boss and inner face of yoke at front to 1/16", then press in taper pin until ends are flush with bushings (pin is press fit and should be installed on the bench).

Knuckle Support (LaSalle):—See Model 35-50 for installation of upper and lower yoke pins.

SPRINGS:—Springs should be replaced if sagged more than ¼".

Model	**Spring Diameter**	**Free Length**
Cadillac (all)	5½"	15⅛-15¾"
La Salle	5⅜"	14-14 5/16"

SHOCK ABSORBERS:—Shock absorbers used on Cadillac models fitted with ride control. Control linkage should be adjusted to eliminate all play so that each shock absorber lever is in fully closed position with ride control lever in 'firm' position or all the way up. Adjust linkage in following order: (1) Right front and right rear, (2) left rear, (3) left front, and check by operating lever several times between each setting.

CADILLAC LATER TYPE

Used on:

CADILLAC V8, ALL SERIES (1936-37-38-39)
CADILLAC V12, SERIES 80, 85 (1936-37)
CADILLAC V16, SERIES 90 (1937-38-39)
LA SALLE, SERIES 50 (1935-36-37-38-39)

NOTE:—First 36-60 Cadillac cars fitted with same type suspension as other Cadillac models. Later 36-60 and all 37-60, 38-60, 39-61 use same type as LaSalle 36-50 and later models. Changes in design have been made as follows:

Lower Control Arms on Models 38-50, 38-60:—Hardened bushings are threaded in inner ends of lower control arms and on frame bracket shaft (arms threaded directly on shaft on previous design). Synthetic rubber seals are installed between bracket shaft and inner ends of lower control arm and also at each side of knuckle support at outer end of lower control arm. Rubber rebound cushions for front end are softer to reduce rebound shock.

Lower Control Arm (La Salle & Cadillac 39-61 only)—New type straight arms with rubber bushings at inner end (on frame bracket shaft). Arms are riveted to spring seat and rivets must be removed to dismantle assembly (for bushing renewal, etc.). Use bolts and nuts to fasten spring seat on arms when reassembling. Arms and steering knuckle supports have been redesigned for greater strength.

Upper Control Arm (La Salle & Cadillac 39-61 only)—New type (shock absorbers unchanged from 1938). New springs and new rubber bumpers also used.

CHECKING AND ADJUSTMENT:—Check these points first:

Kingpin Inclination—4°51' (La Salle & Cadillac 60 '36-37), 5°44' (La Salle & Cadillac 60 '38), 5°38' (Cadillac 65, 70, 75, 80, 85 '36-37), 4°30' (90 '37), 5°1' (Cadillac 65, 75, 90, '38), 5°6' (LaSalle 39-50, Cadillac 39-61), 5°44' (Cadillac 39-60S), 5°1' (Cadillac 39-75, 90).

Tire Inflation—Minimum pressure 26 lbs. (50, 60), 28 lbs. (60S, 65, 70), 32 lbs. (75, 85, and 90 '38), 36 lbs. (90 '37), 24 lbs. (50, 61 '39), 28 lbs. (60S '39), 32 lbs. (75, 90 '39).

Frame Height—3 13/16" (35-50, 36-50, 36-60), 5 3/16" (36-70, 75, 80, 85) plus or minus ¼" measured between lower face of frame side rail and upper surface of lower spring seat. Must be same on both sides of car. Check spring length and suspension unit assembly if car sags.

CADILLAC TYPE CONT.

Wheel Runout—Must not exceed 3/32" with wheels in place on car. Mark high spot on tire and place wheel with mark at top vertically (to check toe in) or at one side (to check caster and camber).

Steering Geometry (Toe Out on Turns):—With outer wheel set at 20°, inner wheel should be 21¾-23¼° (La Salle 36-50, 37-50, Cadillac 36-60, 37-60), 22-23½° (Cadillac 65, 70, 75, 80, 85, 90 '36-37), 23½° (Cadillac 60, 75, 90; La Salle 50 '38), 23¾° (Cadillac 60S, 65 '38), 22¼-23¾° (50, 61 '39), 22¾-24¼° (60S, 75, 90 '39).

Front Wheel Stopscrew Adjustment (38-65, 75, 90):—With front wheels turned to straight ahead position, and steering gear roller on 'high point' of worm, mark steering wheel, then turn wheel exactly two full turns to the right, adjust right hand stopscrew so that it rests against stop. Adjust left hand stopscrew in same way with wheel turned two full turns to left.

NOTE—Stopscrews not installed on first 75 and 90 cars. May be installed by drilling .332" hole in web of steering knuckle support and tapping with ⅜-24 American thread tap.

Toe In:—Should be 0-1/16" (car in motion) or 1/32-3/32" (car at rest). Adjusted by changing length of both tie rods equally.

LaSalle 39-50, Cadillac 39-61 Note—The adjustment is new because of new type linkage (Cross type drag link connected between steering gear pitman arm and idler arm pivoted on right frame member with individual tie rods between drag link and each front wheel). To adjust, loosen two clamp bolts and turn adjusting sleeve at wheel end of each tie rod equally. Toe in should be 0-1/16" with car in motion, 1/32-3/32" with car at rest, (same as for 1938 models).

Caster (LaSalle 35-50, Cadillac including 36-60 first cars). Should be ¼-1° (La Salle 35-50, Cadillac 36-60 first cars), ¾-1¼° (36-75, 80, 85, 90), 0° plus or minus ¼° (65 '37-38, 70 '37, 75 '37-39, 85 '37, 90 '37-39). Must be equal within ¼° for both wheels.

To Adjust—Loosen nuts on knuckle support upper and lower yokes, loosen clamp screw in upper end of knuckle support, remove lubrication fitting from front bushing of knuckle support upper pivot pin, insert Allen wrench, turn wrench clockwise to increase or counter-clockwise to decrease caster, tighten clamp screw and yoke nuts.

Model 90. Remove locking bolts in outer end of upper suspension arm yoke, turn threaded pin with wrench to adjust caster (full turns only to permit locking bolts to enter when replaced).

Caster (LaSalle 36, 37, 38, 39-50; Cadillac 36-60 later cars; 37, 38, 39-60; 39-61):—Should be 1½-2° (1936), ¼-1° (1937), Neg. ¼ to Neg. 1¼° (1938), Neg. ¼ to Neg. 2¼° (50, 61 '39), Neg. ¼ to Neg. 1¼° (60S '39). Must be equal within ½° for both wheels. NOTE—Negative figures indicate Reverse Caster.

To Adjust—Loosen clamp bolt in upper end of knuckle support, take out lubrication fitting in front bushing, insert Allen wrench, turn wrench in complete revolutions only clockwise to increase or counter-clockwise to decrease caster, tighten clamp bolt. Camber will be affected unless wrench turned complete revolution. Check camber after making this adjustment.

Camber (LaSalle 35-50, Cadillac including 36-60 first cars). Should be ¼-1° (La Salle 35-50, Cadillac 36-60 first cars), 0-½° (all other Cadillacs). Must be equal within ¼° for both wheels.

To Adjust—Remove retaining nut and spacers from lower control arm yoke at knuckle support, pull out yoke and arrange spacers to secure correct camber (shift spacers to outer face of arm at yoke to decrease camber, or inner face of arm under nut to increase camber), re-install yoke and tighten nut.

Camber (LaSalle 36, 37, 38, 39-50; Cadillac 36-60 later cars; 37, 38, 39-60, 39-61):—Should be ¼-1° (1936-37), Neg. ¼ to Pos. ½° (50, 60 '38; 60S '39), Neg. ¼ to Pos. ¾° (50, 61 '39). Must be equal within ¼° for both wheels. If Camber not correct, check Kingpin Inclination.

To Adjust—Adjusted in same manner as Caster for these models except that wrench turned not more than ½ revolution. Knuckle support section of pivot pin eccentric and entire range of adjustment secured by ½ turn of wrench. Caster affected by camber adjustment but not outside limits if correctly set first.

CONTROL ARM ASSEMBLY:—La Salle 35-50, Cadillac including 36-60 first cars. On Model 90, a yoke is not used at outer end of upper control arm and knuckle support pin must be removed (as on 60 model below).

Lower Control Arm:—One piece type mounted on shaft on cross member by plain bushing threaded on shaft (front) and threaded bushing screwed on shaft and in control arm (rear). To assemble, place bracket shaft in position centered in control arm, thread rear bushing in arm and on shaft, turn in until tight with shoulder contacting arm, thread front bushing on shaft, turn up until tight, install clamp bolt in control arm. Arm should move freely on shaft without binding.

Knuckle Support Pivot Pins:—On these models, upper and lower control arm yoke nuts can be taken off, and knuckle support, pivot pins and yokes removed as an assembly. If disassembled further, mark position of pins and bushings, when reassembling turn pins and bushings in to same point to maintain front end alignment. Check caster and camber.

CONTROL ARM ASSEMBLY:—LaSalle 36, 37, 38, 39-50; Cadillac 36-60 later cars; 37, 38, 39-60, 39-61):—See Note below for 1939 lower control arm change.

Lower Control Arm:—Arms screwed on ends of mounting shaft directly (see note). Must be assembled separately with spring seat and jack pad removed. To assemble, screw arms on shaft equally until distance on shaft between inner faces of arm eyes is 11" (1936), 10 15/16" (1937). Assemble spring seat and jack pad, tightening nuts securely. Distance between inner faces of arms at outer end must be 2⅜". On 1938 models, make certain that rubber seals are in place on bracket shaft at inner face of lower control arm ends before screwing arms on shaft. NOTE—Hardened bushings used at inner ends of lower control arms on 1938 models only. **1939 LaSalle & Cadillac 39-61.** Lower control arms are riveted on spring seat and rivets must be removed to dismantle arms for bushing or bracket renewal. Use bolts and nuts to secure spring seat to control arms when reassembling.

Knuckle Support Lower Pivot Pin:—Note position of threaded bushing in lower end of knuckle support on threaded pin before disassembling so it can be assembled in same position. With knuckle support positioned in lower control arm, screw threaded pin in front through arm and knuckle support bushings until tight (locking washer gripped under head), assemble locking washer and nut on rear end.

NOTE—On 1938 models, make certain that rubber seals are in place between knuckle support and inner face of lower control arm outer ends when installing pivot pin.

Knuckle Support Upper Pivot Pin:—Note position of threaded pin in support before disassembling so that it can be reassembled in same position. With knuckle support positioned in upper control arm, screw threaded pin in from rear through support and in plain bushing in front upper control arm. Screw rear threaded bushing in on pin and in rear control arm. Insert clamp bolts in control arm and knuckle support. Entire assembly should move up and down freely without binding.

SPRINGS:—Part No. stamped on flat surface of end coil. Figure in table below following color indicates number of color markings. Replace springs if sagged more than ¼". See that insulator installed at top and bottom of each spring.

1936 Spring Specifications

Model	(Spare at Rear) Part No.	Length	(Fender wells) Part No.	Length

5W—Spare at rear. 6W—Fenderwells.
Com.—Commercial Chassis.

SHOCK ABSORBERS:—Shock absorber valve number stamped on outside cap.

CHEVROLET KNEE-ACTION TYPE

Used On:
CHEVROLET MODELS.
MASTER, DA (1934), EA (1935), FA (1936).
MASTER DELUXE MODEL GA (1937)
MASTER DELUXE MODEL HA (1938)

NOTE:—Kingpin and Floating Bushing (special oversize) data applies to Master Deluxe Models GA, HA (floating bushings standard equipment), and to Models DA, EA, FA (when original needle bearings replaced by bushings).

DESCRIPTION:—Same design as on Pontiac models (see Pontiac article for complete description and assembling directions for suspension unit).
1937. Kingpin design is new. Needle bearings have been discontinued and new type floating bushings are used (bushings free to turn within kingpin support).

CHECKING:—Manufacturer recommends that front wheels be removed and car supported on jacks or horses under front spindle at inner bearing cone to permit use of approved Chevrolet checking tools. Car weight must be on spindles when checks are made.

Suspension Unit Height:—Measure from bottom of kingpin support to bottom of brake flange plate. See table under Adjustment below for directions. If correct adjustment cannot be secured, remove adjusting plug, housing cover and spring, install knee-action spring checking tool, Part No. J-764, reassemble housing cover and adjusting plug, recheck height. If height is correct, spring is defective and should be replaced. If height is not correct, suspension unit is defective and should be replaced.

Kingpin Inclination:—7° (1934), 7¾° (all others) crosswise. May be corrected by bending outer end of cross-member (kingpin support) if approved Chevrolet service tools used.

Camber:—1° (1934), ¼° (all others). Incorrect camber (after kingpin inclination checked and corrected) indicates that spindle is bent (replace Knee-action unit), or that kingpin bearings are worn (replace bearings).

Caster:—Kingpin caster 0°. Wheel caster effect secured by trailing wheel behind kingpin center. May be corrected by bending outer end of cross-member (kingpin support).

Toe In:—1/16-3/32". Check with car weight on wheels and roll car ahead at least one revolution before checking. Measure to chalk marks in center of tire tread, hub high, at rear, roll car ahead one half revolution, measure to same marks at front. Correct by loosening tie rod clamp bolts and changing length of rod.

Steering Geometry (Toe-out on Turns):—With outer wheel turned exactly 20°, inner wheel should be turned exactly 23°. Correct by replacing steering arms (no adjustment provided).

SERVICING:—To Remove Suspension Unit. Jack up car remove front wheel, remove two bolts and locking plate at bottom of front spring housing (radius rod bracket), turn unit outward, lift off brake assembly (hold radius rod to prevent it falling on floor). Remove steering arm nut, drive out steering arm with brass drift, remove kingpin lock pin. Remove dust caps and locking rings from kingpin support yokes (at upper and lower ends). Drill ¼" hole in center of upper kingpin plug, insert punch through this hole, drive kingpin down until lower plug is driven out. Then use soft steel drift against lower end of kingpin, drive kingpin up to remove upper plug, remove kingpin (lower bushing is loose and will fall out). Remove suspension unit. Remove upper kingpin bushing.

Servicing:—Manufacturer recommends that no attempt be made to disassemble unit or make repairs other than replacement of springs, spring guide, adjusting plug, or housing cover (accessible after removing adjusting plug and cover at top of unit), or shock absorber units (bolted individually on front of housing).

To Install Suspension Unit:—Insert kingpin from below making certain that longest end from slot is up and that locking pin slot lines up with hole. Tap thrust bearing in place between upper support yoke and suspension unit knuckle with dust shield side up. Check clearance or endplay and install steel shim if greater than .006". Install kingpin bushings lining up oil grooves on outside with lubrication fittings on steering knuckles (upper bushing groove down, lower bushing groove up). Coat cork gasket with heavy oil or grease before installing on spindle, see that bearing spacer engages slot in spindle when assembling inner bearing cone. When installing radius rod, first screw bracket up tight on rod, then bring radius rod straight up without side motion, loosen bracket just enough to line it up with boss on front spring housing, place it in position on boss, install lock plate and two bracket bolts, tighten bolts securely. Check suspension unit height and adjust if required.

KINGPIN AND BUSHING SERVICING:—Replacement bushings are finished to size and no reaming required. Bushings should be free on kingpin and may be somewhat snug in support yoke. If new standard bushings are loose in support yokes, yokes should be reamed and special oversize replacement bushings (Part No. 603076) installed. Use special reamer KMO-108 to ream support yokes, install smaller pilot in lower yoke, insert reamer through top yoke and pilot, ream top yoke, then install larger pilot in top yoke, reverse reamer and ream lower yoke. Reamer will finish yoke to correct size for oversize bushings.

ADJUSTMENT:—Suspension Unit Height. Remove adjusting plug lockscrew and lock, remove plug, clean out the groove and fill with Permatex (this should be done whenever plug is disturbed), install adjusting plug and turn plug in until suspension unit height is correct (see table below). Adjusting plug must not be more than ⅛" above or below top edge of housing cover (if outside these limits, check spring and replace either spring or unit).

Suspension Unit Height

Chevrolet '34 (Spare at rear)	5½"
Chevrolet '34 (Fender wells)	4½"
Chevrolet '35-36 (Spare at rear)	5⅜"
Chevrolet '35-36 (Fender wells)	4⅜"
Chevrolet 1937-38 Models	4⅞"

LUBRICATION:—Check level of lubricant in housing at 1000 mile intervals and keep housing full to lower edge of filler plug hole. Use only G.M. Shock Insulation Fluid.

CHEVROLET 1939 TYPE

Used On:
MASTER DELUXE, MODEL JA (1939)

NOTE:—Entire suspension unit assembly (Frame cross member and both control arm assemblies) may be removed from car as a unit for overhaul or replacement if desired. See Servicing data below for removal instructions.

TYPE:—New design 'S.L.A.' (short & long arm) or parallelogram type similar to design used on other car models. Shock absorbers are new 'parallel cylinder' type and are assembled as unit with upper control arms (arms permanently assembled on shaft and welded together). Neoprene seals are used at inner and outer ends of lower control arm and outer end of upper arm.

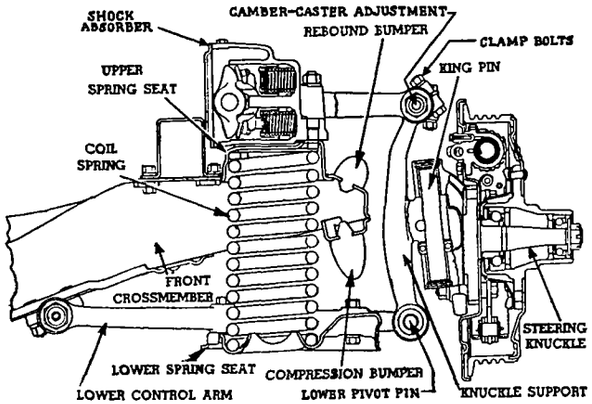
CHECKING & ADJUSTMENT:—Check the following points first before checking or adjusting front suspension unit.
Tire Inflation—26 lbs. (front), 28 lbs. (rear).
Wheel Runout—Check and adjust front wheel bearings. Check wheel for tire and rim runout and eccentricity. Mark tire midway between high and low spots (mean point) and place this mark at top (vertically) when checking Camber, at side (horizontally) when checking Toe In.
Steering Gear & Connections—Check mounting bolts and tighten if necessary. Check tie rod ball and socket joints for excessive looseness.
Frame Height—Install special gauges at front and rear ends of car to level frame when checking. Front gauge has holes to engage lower control arm shaft (inner end) and pivot pin (outer end) to hold control arms rigid in correct position. Rear gauge clamps axle housing and frame so that clearance between top of axle housing and lower face of frame side rail is 7 7/32".
NOTE—Make all checks with car weight on wheels (curb weight—car ready for road but no load).

Kingpin Inclination:—4¾° plus or minus ½°.

Caster:—0° plus or minus ½°. Adjusted by turning knuckle support eccentric upper pivot pin (same adjustment as for camber—See Camber Adjustment).

Camber:—Neg. ¼° (Wheel tilts in at top) plus or minus ½°.
Adjustment—Remove lubricant fitting on knuckle support upper pivot pin front bushing, loosen clamp bolt in upper end of knuckle support which clamps pivot pin. Insert ¼" Allen wrench through lubricant fitting hole in bushing to engage pivot pin, turn pivot pin clockwise to increase caster, counter-clockwise to decrease caster (pin is eccentric and this same movement will change Camber from minimum to maximum every half turn of the pin) until both caster and camber are correct within limits given above, tighten clamp bolt and replace lubricant fitting. One half-turn of pivot pin will change caster angle 39' and change camber angle from 0° to 1°2' (depending on initial position of pin).

Toe In:—0" to 1/16". **Adjustment**—Loosen clamp bolts and turn left hand (short) tie rod. When tightening clamp bolts, make certain that both tie rod ends are in alignment with the ball studs.
NOTE—Right hand (long) tie rod is not adjustable.



Steering Geometry (Toe out on Turns)—Outer wheel turned in 20°, Inner wheel turned 24° plus or minus 2°. Not adjustable (replace steering arm).

CHEVROLET TYPE CONT.

SERVICING:—Suspension Unit Assembly Removal—Remove front fender and radiator grille assembly as a unit (see Chevrolet Shop Notes for instructions). Remove front bumper, disconnect stabilizer from frame horns, remove pitman arm from steering gear, take out bolts holding front cross-member to frame side rails, slide suspension unit assembly off over frame side rails at forward end. Install in same manner.

Upper Control Arm Pivot Pin:—To remove pin, raise car with chain hoist, place jack under spring seat so that it takes weight of car, remove wheel and tire assembly. Unscrew rear (threaded) bushing, remove front bushing clamp bolt, remove bushing. Loosen clamp bolt in upper end of knuckle support, unscrew pivot pin (use Allen wrench).

Assembly—Place Neoprene seal over end of each upper control arm (so seals will be out of the way while installing pivot pin). With knuckle in upper arm yoke, enter pivot pin through eye in control arm and screw pin in knuckle support (with Allen wrench socket hole in pin toward front of car) until larger diameter center section is centered in

knuckle support. Hold knuckle support centered in control arm, thread rear bushing in control arm eye and on pivot pin, tighten bushing securely and make certain that support still centered in control arm yoke. Screw front bushing in on pivot pin until clearance between head of bushing and face of control arm is .020-.040". Use a wire hook to pull Neoprene bushings down over the ends of control arm so that they seat on pivot pin. Install front bushing clamp bolt. Adjust Caster and Camber (see instructions above).

Lower Control Arm Pivot Pin:—To remove, raise car install jack stand under inner side of lower spring seat, remove wheel and tire assembly, unscrew pivot pin (use socket wrench, remove pin through front arm), turn wheel to extreme outward position (will prevent knuckle support moving out at bottom), install block between upper control arm and cross-member to raise lower end of knuckle support clear of control arm yoke, unscrew bushing from support.

Assembly—Screw bushing securely in knuckle support from front end. Place new Neoprene seal on end of front lower control arm (so that it will be out of the way while installing pivot pin), place second seal on exposed end of bushing at rear of knuckle support. Thread pivot pin through front control arm, knuckle support bushing, and rear control arm while holding knuckle support centered in control arm yoke (if threads on pin and control arms do not index correctly, use 'C' clamp to compress arms slightly until pin enters rear control arm). Tighten pin securely. Use wire hook to pull Neoprene seal down over end of control arm so that it is seated on pivot pin between control arm and ahead of bushing, slip second seal off bushing so that it is seated on pivot pin.

Lower Control Arm Shaft (Frame Support):—To remove, disconnect stabilizer link at lower spring seat, remove front spring (see Spring Removal below), remove lower control arm pivot pin (see directions above), remove lower control arm assembly. Place assembly in vise, remove front and rear control arm shaft bushings. Take out two bolts mounting front control arm on spring seat, remove arm and shaft.

Assembly—Install steel retainer cup on each end of shaft with cupped shaped ends out, install new Neoprene seal on shaft next to each retainer, install shaft in control arm assembly with letter 'F' (forged on one bracket) toward front of car, bolt front control arm securely to spring seat (screw pivot pin through both control arm eyes first to maintain alignment while spring seat bolts are being tightened). Hold shaft centered between control arms, screw front and rear bushings on shaft and in control arms, tighten bushings securely, install assembly on car.

Front Stabilizer Shaft:—To remove, disconnect links by removing nut on upper end of link bolts and withdrawing bolts, then remove bolts from frame mounting brackets. To install stabilizer, make certain that steel spacer installed between frame and bracket, bolt bracket loosely to frame, install links, tighten bracket bolts only with links connected and car weight on wheels.

Stabilizer Links—Spacer must be installed on center of link bolt and steel retainer at outer end of bushings. Tighten link bolt nut to limit of threads.

SPRINGS:—Removal—Disconnect stabilizer link from lower spring seat, support weight of car on stand jack at inner side of lower spring seat, remove cotter pins and nuts from lower control arm shaft bracket bolts, drive out bolts and install long drift punch through bolt hole in bracket and cross-member to maintain alignment, raise care with chain hoist to remove spring pressure. Remove jack from beneath lower control arm allowing control arm and spring seat to drop down to free spring.

Assembly—Make certain that spring installed with ground end (flat surface) up and that lower end coil of spring fits in recess in spring seat. Reverse removal directions given above.

CHRYSLER 1934-35 TYPE

Used on:

CHRYSLER AIRSTRM. SIX, CA, CB ('34), C6 ('35).
CHRYSLER AIRSTRM. EIGHT, MODEL CZ (1935).
DE SOTO AIRSTRM. MODEL SF (1935).
DODGE SIX, MODELS DR, DS ('34).
PLYMOUTH DELUXE MODEL PE (1934).

CHECKING & ADJUSTMENT:—Check following points first before changing settings:

Tire Inflation—22 lbs. (front '34), 26 lbs. (rear '34 Coupes), 28 lbs, (rear '34 Sedans, all 1935).

Frame Height—Must be equal within ⅛" on both sides of car. Distance from top of lower control arm to underside of frame siderail should be 3½" (1934), distance from center line of lower control arm yoke pin to top of frame cross member should be 7¼-7⅜" without load (1935). See Springs below.

Toe In:—Measure to marks on center of tire tread. hub high, at rear, roll car ahead ½ revolution, repeat measurement at front. Should be 1/16-⅛".

To Adjust—Change length of each tie rod equally. Intermediate steering arm must coincide with center line of car with wheels straight ahead and tie rod lengths must be equal.

Caster:—Should be 1½° and must be within ½-2½° with car weight on wheels.

To Adjust—Loosen upper and lower control arm yoke nuts, remove lubrication fitting at front end of upper control yoke pin, loosen clamp bolts in upper end of knuckle support and yoke, insert special caster adjusting wrench through lubricant fitting hole, turn upper yoke pin so as to move upper end of support to rear to increase, or toward front to decrease caster.

Camber:—Should be ½° and must be within ¼-1°. with car weight on wheels. Camber affected by caster adjustment. Check when caster changed.

To Adjust—Jack up car with jack placed under lower control arm. Disconnect tie rod at wheel end. Remove upper control arm yoke nut, pull yoke out of upper control arm, remove spacer washer on yoke bolt to decrease camber, or transfer spacer from under nut to yoke bolt to increase camber. Extra spacers must be placed under nut on inner end of yoke bolt and must not be discarded.

CONTROL ARM ASSEMBLY:—Upper Control Arm Yoke Pin—Place yoke in position on upper end of knuckle support, screw threaded pin in support from front end (wrench recess toward front) until it is centered in support. Screw plain bushing in front end of yoke until clearance between bushing shoulder and front face of yoke is .040". Screw threaded bushing in rear end of yoke and tighten with 100 lb. force on 24" wrench. Tighten clamp bolt in yoke at front bushing. Set caster and then tighten clamp bolt in knuckle support.

Lower Control Arm Yoke Pin:—Center lower yoke on lower end of knuckle support, assemble plain bushing in rear end of yoke so that clearance between shoulder on bushing and face of yoke is .040". (inner end of bushing should be flush with inner face of yoke). Screw threaded pin in through knuckle support and into bushing keeping yoke centered. Install tapered locking pin in support and peen head. Screw threaded bushing into place in yoke and on pin and tighten with 100 lb. force on 24" wrench. Tighten clamp bolt in yoke holding plain bushing.

Lower Control Arms (1934 Models):—Mounted at inner end of individual threaded studs screwed in bushings in arms and bolted to anchor plate. Screw studs in or out of bushings until control arm bosses are centered in clearance pockets in anchor plate with bolt holes in stud and anchor plate lined up.

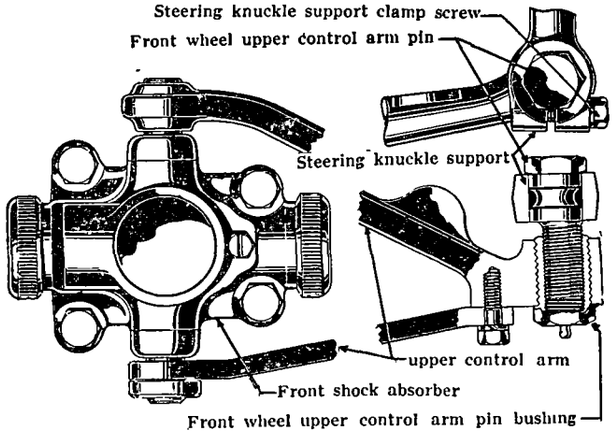
Lower Control Arms (1935 Models):—Mounted at inner end on shaft bolted to anchor plate by bracket at each end. To install, position control arm on bracket shaft so that clearance between inner face of arm and bracket equal at each end. Screw plain bushing in rear arm until clearance between head and face of control arm is .040". Screw threaded bushing in front arm and tighten securely with 100 lb. force on 24" wrench. Tighten clamp bolt on rear plain bushing.

SPRINGS:—Spacers installed in spring cup on lower control arm under metal bumper to level frame. On 1934 cars, one extra spacer installed on drivers side. If frame height not equal, install spacer #623114 (1934 models), #633295 (1935 models) on low side.

CHRYSLER 1936 TYPE

Used on:

CHRYSLER AIRSTREAM SIX, MODEL C7 (1936).
CHRYSLER AIRSTREAM EIGHT, MODEL C8 ('36).
DE SOTO AIRSTREAM SIX, MODEL S1 (1936).



CHECKING AND ADJUSTMENT:—Check these points first:

Tire Inflation—28 lbs. (all models).

Frame Height—Should be 7¼-7⅜" measured from center of lower control arm yoke pin (knuckle support lower pivot pin) to top of frame cross-member. Allowable variation ⅛" plus or minus but both sides of car must be equal within ⅛". Adjusted by inserting spacer washer Part No. 657770 under spring on driver's side.

Toe In:—Measure to marks on center of tire tread hub high, at rear, roll car ahead ½ revolution, repeat measurement. Toe in should be 0-⅛".

To Adjust—Loosen tie rod end clamp bolts, set long tie rod at exactly 31 7/32", adjust length of shorter tie rod for toe in. Ball studs must be centered in tie rod slots when tightening clamp bolts to assure sufficient angular rotation of tie rod for extreme turns.

Caster:—Should be 1½°. Controlled by distance upper pivot pin screwed in bushing in upper (shock absorber) arm.

To Adjust—Loosen clamp bolt in knuckle support upper end, turn eccentric pin (hexagonal head at rear) in or out of bushing until clearance is exactly ⅜", tighten clamp bolt, check caster. This adjustment affects camber and should be made first.

Camber:—Should be +¼° and within limits of —¼° to +½°. Controlled by position of eccentric shoulder of upper pivot pin in knuckle support.

To Adjust—Loosen clamp bolt at upper end of knuckle support, and with correct Caster (⅜" clearance—see above), turn eccentric pin less than ½ revolution in either direction, recheck camber. Total adjustment obtained by ½ revolution of pin. Caster affected only slightly by this adjustment. Toe in is changed and must be checked after Camber adjustment made.

CONTROL ARM ASSEMBLY:—First screw knuckle support lower pin in support centrally (equal projection at each end), drive in taper lock pin and peen in place in support. Center support in lower control arms, screw threaded bushings on pivot pin and in control arm eyes loosely until shoulders contact outer faces of control arm. Center frame bracket shaft or bar in eyes on inner end of control arm. Screw threaded bushings on bar and in control arm eyes loosely until shoulders contact outer faces of control arm. Tighten all bushings with approximately 100 lbs. force on 24" lever. Tighten spring seat bolts securely, striking bolt heads with 2 lb. hammer to seat serrated washers. Check assembly to see that it moves up and down freely without binding.

SPRINGS:—See table below for type used on each car. If frame height not correct, or dimensions on right and left sides of car vary by more than ⅛", replace springs or install spacer between lower end of spring and silencer on low side.

Car Model	Spring Part Number Std.	With Fenderwells
Chrysler C7 ('36)	658462	658464
Chrysler C8 ('36) .	660722①	660724②
7 Pass. Cars	660724	660726
DeSoto S1 ('36)	658464	

①—Replaced by 658464 (Serial No. 6714558 Up).
②—Replaced by 663466 (Serial No. 6714360 Up).

CHRYSLER 1937-38 TYPE

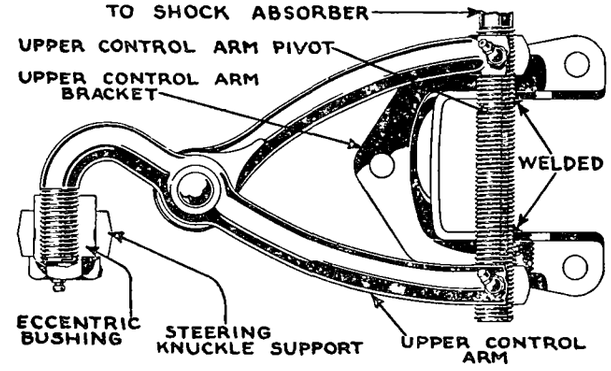
Used On:

CHRYSLER ROYAL, MODEL C16 (1937)
CHRYSLER IMPERIAL, MODEL C14 (1937)
CHRYSLER CUSTOM IMPERIAL, MODEL C15 ('37)
CHRYSLER ROYAL, MODEL C18 (1938)
CHRYSLER IMPERIAL, MODEL C19 (1938)
CHRYSLER CUST. IMP., MODEL C20 (1938)
DE SOTO, MODEL S3 (1937)
DE SOTO, MODEL S5 (1938)

1937 TYPE:—Design changed so that Shock Absorber is not incorporated in upper control arm (Direct Acting type used). Threaded bushing at outer end of upper control arm has been discontinued and eccentric bushing is threaded on upper control arm outer end and seated in upper end of knuckle support (locked by clamp bolt).

1938 TYPE:—Design same as type used in 1937 except for the following points:

Control Arm Seals:—Rubber seals now used at all moving points on upper and lower control arms (see Control Arm Assembly below).



Shock Absorber Mounting:—Linked to bolt at midpoint of upper control arm at top, outer end of lower control arm at bottom, this mounting results in reduced shock absorber piston movement.

Upper Control Arm Mounting:—Pivot bar at inner end of upper control arm bolted directly to frame bracket (take out pivot bar bolts to remove control arm). Control arm mounted on bar by threaded bushing at rear, plain bushing (locked by clamp bolt in control arm) at front. Both bushings threaded on pivot bar and provided with lubricant fittings.

CHECKING & ADJUSTMENT:—Car weight must be on wheels. Adjust front bearings and check these points first:

Tire Inflation—Inflate evenly to correct pressure.
King Pin Inclination—4¾-6° crosswise (all mod'ls).
Frame Height—Measure from underside of lower spring seat to top surface of frame cross-member on center line of spring. Should be 9¾-9⅞" (S5, C14, C18), 9½-9⅝" (C19), 10¼-10⅜" (C20), 10½-10⅝" (C15), 9⅞-10" (C16, S3 except 7 Pass.), 10 1/16-10 3/16" (C16, S3, 7 Pass.) plus or minus ⅛" but must be equal within ⅛" on both sides. Correct by installing special spacer washer between spring and silencer in lower spring seat.

Toe In:—Measure to marks at center of tire tread at rear of wheel and hub high, roll car ahead ½ wheel revolution, repeat measurement to same marks at front. Toe in should be 1/16" and must be within limits of 0-⅛".

To Adjust (Except C15, C20). Loosen clamp bolts and first set longer tie rod so that length between ball end centers is exactly 30 15/16" (C14), 31 7/32" (C16, S3), 31⅝" (C18, S5), 30 25/32" (C19). Then adjust toe in by changing length of shorter tie rod in same manner.

To Adjust (C15, C20). Loosen tie rod bolts and turn both tie rods equally. Tie rod lengths must be equal after toe in adjustment completed. Correct by lengthening short rod and shortening long rod equal amounts.
NOTE—When tightening tie rod clamp bolts see that both ball studs centered in rod end slots to allow necessary angular rotation of the tie rod in operation. With wheels straight ahead, steering gear pitman arm must be approximately parallel to center-line of car and steering wheel center spoke must point straight down. Correct by removing steering wheel and engaging it on shaft in proper position.

Caster:—Should be 1½°. Controlled by distance knuckle support upper eccentric pin screwed on threaded end of upper control arm. Caster limits are ½-2½° (except C15, C20), 1-3° (C15, C20) and caster should not require adjustment unless control arm assembly has been dismantled.

To Adjust—Loosen clamp bolt in upper end of knuckle support, turn eccentric bushing (hexagonal head at rear) in or out. Bushing must not be turned in until it binds on control arm (at least one thread must be exposed) and caster must be set exactly with no variation. Tighten clamp bolt, check Camber.

CHRYSLER 1937-38 TYPE CONT.

Camber:—Should be +¼° and within limits of —¼° to +½°.

To Adjust—Adjusted in same manner as caster except that eccentric bushing must not be turned more than ½ revolution from point where correct caster setting secured (½ revolution provides entire range of adjustment) and greater movement will disturb caster setting. Recheck toe in.

Steering Geometry:—With outer wheel turned exactly 20°, inner wheel should be turned exactly 22°40′ (C18, S5 except 7 Pass.) 22°50′ (C18, S5 7 Pass. models), 22°0′ (C19), 22°15′ (C20). No adjustment provided. If not correct check for bent steering arms.

CONTROL ARM ASSEMBLY:—Lower Control Arm. Center lower control arm pin in lower end of knuckle support, drive in tapered locking pin, peen in place. Assemble complete lower assembly (knuckle support, control arms, spring seat, inner shaft) loosely. Hold knuckle support centered in control arms, turn bushings at front and rear in loosely, hold inner support shaft centered in control arm, turn bushing at each end in loosely, tighten all bushings with 100 lb. force on 24″ bar. Tighten spring seat bolts and seat serrated washers by srikking bolt heads with 2 lb. hammer. Check assembly to see that it moves freely without binding.

Upper Control Arm—Mounted at inner end on threaded pin which is spot welded in bracket. Should be removed by taking out bracket bolts. To assemble knuckle support on control arm, insert threaded outer end of control arm in knuckle support hole, turning bushing in on control arm end from rear, install clamp bolt in support.

CONTROL ARM ASSEMBLY (1938):—Serviced in same manner as above (except upper control arm frame mounting—see description above). See that seal is in place on outer end of upper control arm before installing eccentric bushing (seal fits over end of bushing), on knuckle support lower pin (at each side of support), and on each end of frame bracket shaft at inner ends of lower control arms before assembling the lower arms and spring seat.

SPRINGS:—See table below for type used on each car. If frame height not correct, or dimensions on right and left sides of car vary by more than ⅛″, replace springs or install spacer between lower end of spring and silencer on low side.

Car Model	Spring Part Number Std.	With Fenderwells
Chrysler C16 ('37)	670002	670004
7 Pass. Cars	660723	660725
Chrysler C14 ('37)	658465	660724
Chrysler C15 ('37)	674532	674534
Chrysler C18 ('38)	670002	.....
7 Pass. Cars	670004	.....
Chrysler C19 ('38)	670004	663466
Chrysler C20 ('38)	685553	674534
Extreme Duty	688753	688755
DeSoto S3 ('37)	670002	.....
7 Pass. & Limo.	660723①	.....
DeSoto S5 ('38)	670001	.....
7 Pass. & Limo.	670004	.....

①—Replaced by No. 660722.

SHOCK ABSORBERS:—Monroe Direct Acting type (not part of front suspension). See separate article for complete data.

CHRYSLER 1939 TYPE

Used On:

CHRYSLER ROYAL, MODEL C22 (1939)
CHRYSLER IMPERIAL, MODEL C23 (1939)
CHRYSLER CUSTOM IMPERIAL, C-24 (1939)
DE SOTO, MODEL S6 (1939)
DODGE LUXURY LINER, MODEL D11 (1939)
PLYMOUTH, STD. & DELUXE P7, P8 (1939)

TYPE:—Design used on Chrysler and DeSoto models is same as on corresponding 1938 cars (see preceding article). This design modified for Dodge and Plymouth models as follows:

Dodge, Plymouth Models (except 7 Pass.)—Lower coil of spring not ground flat and spring seat on lower control arm provided with recess to engage spring end (silencer formed to fit spring seat). Spacers cannot be installed to correct frame height on these models and springs must be replaced. Rubber bumpers mounted on control arms (upper bumper at shock absorber mounting stud, lower bumper on spring seat adjacent to spring.

Dodge, Plymouth (7 Pass.)—Design same as for other Chrysler models (spring lower coil ground and spacers may be installed).

CHECKING & ADJUSTMENT:—Car weight must be on wheels. Adjust front wheel bearings, inflate all tires evenly to correct pressure and check following points first:

Frame Height (Chrysler, De Soto, Dodge & Plymouth 7 Pass.):—Measure from underside of spring seat on lower control arm to top of frame cross-member on center-line of spring. Should be 9¾″ (Chrysler C22, C23, De Soto), 10¾″ (Chrysler C24), 9⅝-9⅞″ (Dodge 7 Pass.), 9⅝-9¾″ (Plymouth 7 Pass.). Allowable variation between right and left side of car is ⅛″. Adjust by installing spacers between lower end of spring and silencer.

Dodge, Plymouth (except 7 Pass.)—Frame height measurement not made in same manner as on other models. Measure from top of spring seat on lower control arm (near spring seat inner bolt) to lower plate of front cross-member at frame side rail. Should be 6-6¼″ (Dodge), 6-6⅛″ (Plymouth). Allowable variation between right and left sides of car is ⅛″. Adjust by replacing springs (not possible to install spacers).

Kingpin Inclination:—4¾-6° (Chrysler C22, C24, De Soto—Same as 1938), 5¾-7° (Chrysler C23), 5¼-6½° (Dodge, Plymouth except 7 Pass.), 4¾-6° (Dodge, Plymouth 7 Pass.).

Toe In:—1/16″ (0-⅛″) for all models—same as 1938. When checking toe in, measure to marks on center of tread at rear of wheel and hub high, roll car ahead ½ wheel revolution and repeat measurement to same marks at front.

Adjustment (except C24)—Set long tie rod first so that length between ball centers is 31⅝″ (Chrysler C22, De Soto S6), 30 25/32″ (Chrysler C23), 31 11/16″ (Dodge, Plymouth), then adjust short (left hand) tie rod for correct toe in.

Adjustment (Chrysler C24)—Center steering. Adjust both tie rods equally for toe in. See that tie rod lengths equal after adjusting. Correct by lengthening short rod and shortening long rod equal amounts.

NOTE—When tightening tie rod clamp bolts, see that both ball studs centered in rod end slots to allow for angular rotation of tie rod in operation.

Caster:—Limits are ½-2½° (Chrysler C22, De Soto S6), 1-3° (Chrysler C24), Neg. ½°-Pos. 1½° (Chrysler C23, Dodge & Plymouth except 7 Pass.), Pos. ½° —Pos. 2½° (Dodge & Plymouth 7 Pass.). Controlled by amount which knuckle support upper pivot bushing (eccentric camber adjustment) turned in on upper control arm. Not adjustable and should not require attention unless disassembled. See Camber Adjustment.

Camber:—Should be Pos. ¼° (Limits Neg. ¼° to Pos. ¾°) for Chrysler C22, C24, De Soto S6), 0° (Limits Neg. ¼° to Pos. ½°) for Chrysler C23, Dodge & Plymouth except 7 Pass. Plus ¼° (Limits Neg. ¼° to Pos. ¾°) for Dodge & Plymouth 7 Pass.

Adjustment—Same as for 1938 models. Turn eccentric bushing on knuckle support upper pivot pin not more than ½ revolution in either direction from point where correct caster secured (complete range of adjustment secured in ½ revolution).

NOTE—Eccentric bushing must not be turned up so that it binds on upper control arm (at least one or two threads on arm must be exposed beyond end of bushing).

CONTROL ARM ASSEMBLY:—Upper and lower control arms serviced in same manner as on 1938 car models (see preceding article) except as follows:

Dodge & Plymouth Models—When the upper and lower control arms are being assembled, check the distance from the front face of front lower control arm to center line of mounting holes in shaft bracket—should be 2 5/32″ (except 7 Pass.), 2¼″ (7 Pass.). Also check distance from rear face of rear upper control arm to center line of shaft mounting hole—should be 1 3/16″ (except 7 Pass.), 1 9/16″ (7 Pass.).

SPRINGS:—If frame height not correct and equal for both sides of car within ⅛″ (see above), install spacer between spring and silencer at lower end (types with lower coil ground flat only) or replace spring. Spacer #657770 installed at lower end of spring on drivers side of car (top of spring on types with lower coil not ground flat).

Car Model	Spring Number
Chrysler C22	670003
De Soto S6	670002
De Soto Taxicab	660722
Chrysler, De Soto 7 Pass	670004
Chrysler, De Soto 18″ Wheels	661381
Chrysler, De Soto 7 Pass. & 18″ W	661383
Chrysler C23	663466
Chrysler C23—Fender wells	660724
Chrysler C24	685553
Chrysler C24 Fender Wells (First)	674534
Chrysler C24 Fender Wells (Later)	852873
Dodge Spec. D11	695233
Dodge De Luxe D11	695234

Plymouth 7 Pass	670003
Plymouth 18″ or 20″ Wheels	695692

OLDSMOBILE 1934-35 TYPE

Used on:

SIX, MODELS F-34 (1934), F-35 (1935).

EIGHT, MODELS L-34 (1934), L-35 (1935).

CHECKING & ADJUSTMENT:—Check the following points first before changing Front Suspension settings:

Tire Inflation—35 lbs. (F-34), 30 lbs. rear, 25 lbs. front (F-35), 25 lbs. (L-34, 35).

Frame Height—Bounce car up and down several times to allow frame to assume normal position (height should be equal on both sides of car).

Toe In:—Roll car ahead one revolution. Check between tires 10" up from floor. Should be 1/8-3/16". Adjust by changing length of each tie rod equally. Wheel distance from center gauge plate should be 26¼" (Six), 25¾" (Eight) right and left with wheels straight ahead. Correct by lengthening one tie rod and shortening second rod equal amounts.

Caster:—Machined bosses provided on front of knuckle support for protractor mounting. Caster should be 3° (F-34), 2° (L-34), 1½-2¼° (F-35, L-35). If measured from vertical line top boss should be 3/16-9/32" behind lower boss (1935 models).

To Adjust—Loosen yoke nuts in upper and lower control arms, loosen clamp bolt in upper end of knuckle support, remove lubrication fitting in front bushing of upper support arm yoke, insert Allen wrench, turn threaded pin clockwise to increase, or counter-clockwise to decrease caster.

Camber:—Should be 1/8-1°. If measured from vertical line, wheel felloe at top should be 3/16-9/32" outside felloe at bottom.

To Adjust—Jack up car so that weight is off wheel. Disconnect tie rod at wheel end. Remove nut on upper control arm yoke (if camber to be increased) or lower control arm yoke (if camber to be decreased), pull yoke out of arm, install special washer on yoke bolt between yoke and arm, reinstall yoke and tighten nut. Washers furnished 1/16" thick and change camber 1/3° or 3/32".

CONTROL ARM ASSEMBLY:—Knuckle Support Upper Pivot Pin—Hold control arm yoke in position on upper end of knuckle support, screw threaded pin into control arm until end of pin is flush with front face of yoke with 5/16" clearance between front face of support and inner face of yoke, tighten clamp screw. Screw in front bushing until clearance between yoke and support arm decreased to ¼", screw rear bushing on pin and in yoke until it is tight. Clearance between hexagonal portion of front bushing and front face of yoke should be 1/32" with rear bushing tight Tighten clamp bolt holding front bushing.

Knuckle Support Lower Pivot Pin:—To assemble, place yoke in position on knuckle support, screw threaded pin in support until centered, drive locking pin into place in support. Screw plain bushing on pin in clamp bolt side of yoke until clearance between hexagonal head of bushing and face of yoke is 1/32" with yoke centered on support. Screw threaded bushing in opposite end of yoke until tight, tighten clamp bolt in plain bushing.

Lower Control Arm:—To install, position control arm on bracket shaft so that distance from shaft bracket to inner face of arm boss is equal at each end. Screw threaded bushing in arm at front end (start threads in arm first), tighten securely. Screw plain bushing into arm at rear until clearance between head and face of arm bushing is 1/64", tighten clamp bolt.

SPRINGS:—Not interchangeable between models. The springs on 1935 models may be identified by length and color (2 daubs of paint on each spring) as follows:

Model	Free Length	Color
F-35 (Spare at rear)	14⅛"	Blue
F-35 (Fender Wells)	14⅜"	Green
L-35 (Spare at rear)	13 15/16"	Red
L-35 (Fender Wells)	14¼"	Yellow

SHOCK ABSORBERS:—Front shocks located on frame by close fitting bolts. Shims used between shock absorber and frame must be replaced when reinstalling units.

OLDSMOBILE-PONTIAC 1936-38 TYPE

Used On:

OLDSMOBILE SIX, MODEL F-36 (1936)
OLDSMOBILE EIGHT, MODEL L-36 (1936)
OLDSMOBILE SIX, MODEL F-37 (1937)
OLDSMOBILE EIGHT, MODEL L-37 (1937)
OLDSMOBILE SIX, MODEL F-38 (1938)
OLDSMOBILE EIGHT, MODEL L-38 (1938)
PONTIAC SIX, MODEL 37-26CA (1937)
PONTIAC EIGHT, MODEL 37-28CA (1937)
PONTIAC SIX, MODEL 38-26DA (1938)
PONTIAC EIGHT, MODEL 38-28DA (1938)

1938 TYPE:—Design changed from that used in 1937 as follows:

Control Arm Seals—Rubber seals installed at inner and outer ends of lower control arms.

Lower Control Arm Bushings—Hardened threaded bushings installed in inner ends of lower control arm on pivot shaft (arm formerly screwed directly on shaft).

CHECKING & ADJUSTMENT:—Car weight must be on wheels. Adjust front wheel bearings and check following points first:

Tire Inflation—Oldsmobile 24 lbs. (except rear tires on Six—28 lbs.). Pontiac 25 lbs. minimum (front), 30 lbs. minimum (rear).

Wheel Runout—Must not exceed 1/8". Mark high spot on tire and place wheel with mark at top vertically (to check toe in) or at side (to check caster and camber).

Kingpin Inclination—5°51' (Oldsmobile '36), 4°51' 10" (Oldsmobile '37-38), 4½-5° (Pontiac '37-38).

Frame Height—Car must be level crosswise of frame. Check by measuring distance from lower surface of frame siderail to top surface of lower spring seat on each side. Distances must be equal (replace spring if frame uneven due to spring sag). On Oldsmobile models, level frame while checking front end by inserting 2" wood blocks, Tool No. J-886 between upper control arm and frame flange.

Toe In:—Roll car forward one revolution with wheels straight ahead before checking (on Oldsmobile, use Centering gauge No. J-1023 to determine wheel position, distance to brake backing plate on each side should be 26¼" (F-36), 25¾" (L-36), 26 11/16" (all 1937-38 models). Measure toe in between tires 10" up from floor at front and rear (runout mark must be at top and wheel should not be disturbed while taking measurements). Toe in should be 1/8-3/16" (Oldsmobile), 0-1/16" (Pontiac).

To Adjust—Loosen clamp screws at each end of each tie rod, turn tie rods equally in direction of forward wheel revolution to decrease toe in, or opposite direction to increase toe in.

Caster:—Machined bosses provided on steering knuckle support front face for protractor mounting. Caster should be 1½-2¼° (Oldsmobile 1936), ¼-1° (Oldsmobile 1937), 0 to Neg. ¾° (Oldsmobile 1938), Neg. ¾ to Neg. 1¼° (Pontiac 1937-38). These negative figures are Reverse Caster (kingpin tilted forward at top). Caster must be equal for both wheels within ½°.

To Adjust—Loosen steering knuckle support clamp bolt, remove lubrication fitting in upper pivot pin front bushing, insert Allen wrench (J-720), turn pivot pin to thread support forward or backward on pin. Camber affected by this adjustment unless pin turned in complete revolutions only (start and stop at same point). Check camber.

Camber:—Should be 1/8 to 1° (Oldsmobile 1937-38), 3/8-¾° preferred (Service limits Neg. ½° to Pos. 1°) for Pontiac 1937-38 models. Must be equal for both wheels within ½°.

To Adjust—Same as Caster Adjustment (above) except that pin should be turned less than 180°. Pin is eccentric and maximum adjustment secured with one half turn. This adjustment changes Caster but not outside limits as given above if Caster set first at correct figure (see Caster adjustment above).

Steering Geometry (Toe out on Turns):—With outer wheel turned exactly 20°, inner wheel should be turned 22½-23½°. Replace steering arms to correct (no adjustment provided).

CONTROL ARM ASSEMBLY:—Lower Control Arm—Control arms threaded on ends of shaft bolted to cross-member. Spring seat and jack pad must be removed and arms turned on shaft separately until distance from inner face to center line of shaft bracket bolt holes is 1 23/32" (front arm—1936), 1 7/32" (rear arm—1936), 1 7/32" (both arms—Oldsmobile 1937-38, Pontiac 1937), 1⅜" (both arms—Pontiac 1938). With spring seat and jack pad in place, distance between eyes at outer end of control arm should be 2⅜" (all models).

1938 Service Note:—When installing new bushings in lower control arm (or tightening old bushings before assembling arms), tighten bushings with 150 lb. force on 16" wrench. With bushing tight there should be no clearance between bushing flange and arm. See that rubber seals are in place on pivot shaft and on knuckle support lower pivot pin (at each side of knuckle) before installing control arms.

New Spring Seats—Two holes must be drilled in seat after one arm is assembled. Bolt spring seat and bumper pad in place with two bolts, use bolt holes in control arms as pilot and drill two holes with 7/16" drill.

Knuckle Support Lower Pivot Pin:—Knuckle support threaded on bushing which is threaded on pivot pin. Pin threaded through control arm eyes and held by nut on rear end. To assemble, screw bushing in support lower end from rear until tight, hold support midway between lower control arms, thread pivot pin in from front through bushing and rear arm. Clearance in arms at either end of bushing must be 1/8" and exactly equal within 1 thread. Install lock washer and nut on pin.

1937 Knuckle Support Upper Pivot Pin—Eccentric upper pivot pin is threaded in support, in plain bushing in front shock absorber arm, and in threaded bushing in rear arm. Held by clamp bolt

OLDSMOBILE-PONTIAC 1936-38 TYPE CONT.

in knuckle support. To install, hold knuckle support in place in upper control arm, screw pivot pin in place in support (adjusting wrench hole end toward front) so that larger center section is centered in support, tighten clamp bolt. Start front bushing on pin until it engages front arm, center support in control arm yoke, thread rear bushing in on pin and in control arm, tighten securely. Turn front bushing in until clearance between head of bushing and front face of arm is 1/32", tighten clamp bolt.

NOTE—Clearance between threaded pins and bushings of front suspension should be .014-.018". Threaded construction requires this clearance for best performance and clearance must not be reduced.

SPRINGS:—Not interchangeable between models. If car is not level, check over-all length of springs and replace if sagged. When installing spring see that spring is centralized by four lugs in cross-member at top and spring seat at bottom.

Oldsmobile Spring Specifications

May be identified by 2 daubs of paint as indicated.

Model	Inside Diam.	Color Tracer
F-37(all)	4 3/64"	Blue
L-37 (Spare at rear)	4 3/64"	Red
L-37 (Fender wells)	4 3/64"	Yellow

1938 Oldsmobile Springs

Model	(Spare at Rear)	(Fender Wells)
F-38	Brown	
L-38	Orange	Green

Pontiac Spring Specifications

Model	Outside Diam.	Free Length
Six 1937-38	5 3/16"	14"
Eight 1937-38	5 3/16"	14⅜"

SHOCK ABSORBERS:—Delco, double acting type. Positioned on frame by close-fitting bolts. See separate article for complete data and valve calibration.

OLDSMOBILE-PONTIAC 1939 TYPE

Used On:

OLDSMOBILE MODELS
SERIES 60 SIX, MODEL F-39 (1939)
SERIES 70 SIX, MODEL G-39 (1939)
SERIES 80 EIGHT, MODEL L-39 (1939)

PONTIAC MODELS
QUALITY SIX, MODEL 39-25 (1939)
DELUXE SIX, MODEL 39-26 (1939)
DELUXE EIGHT, MODEL 39-28 (1939)

TYPE:—Design same as for 1938 except as follows: **Lower Control Arm Assembly**—New type channel-section type arms which are riveted to spring seat (assembly cannot be dismantled). Seals are used on control arm shaft at control arm bushings (inner end) and on pivot pin at arm (outer end). **Spring**—New type with top end only ground flat. Springs must be installed with this flat end up and end of lower coil fitted in recess in lower spring seat (coil end must register with hole in spring seat). **Steering Linkage**—New type linkage with center (non-adjustable) tie rod linked between steering gear pitman arm and idler arm mounted on right hand frame side rail with individual adjustable tie rods linked between the center tie rod and each wheel.

CHECKING & ADJUSTMENT:—Car weight must be on wheels. Adjust front wheel bearings and check following points first:

Tire Inflation—Inflate tires evenly as follows: Oldsmobile—24 lbs. (front), 26 lbs. (rear). Pontiac —27 lbs. (Quality Six 6.00x16), 30 lbs. (Others 6.00x 16), 25 lbs. (Others 6.50x16).

Wheel Runout—Check wheel and tire eccentricity or runout. Correct if in excess of ⅛". Mark high point on tire and turn tire so that mark at top (vertically) when checking toe in and toe out, or at side (midway between top and bottom) when checking Caster, Camber, and Kingpin Inclination.

Kingpin Inclination—4°51'10" (Oldsmobile), 4½-5° (Pontiac) crosswise.

Toe In Adjustment:—To adjust, loosen clamp bolts on adjuster near wheel end of each side tie rod, turn adjuster on each tie rod equally. Toe in should be ⅛-3/16" for Oldsmobile models, 0-⅛" for Pontiac models (same as for 1938).

NOTE—Make certain that tie rod end ball stud is properly aligned in seat before tightening clamp bolts.

Caster:—Should be 0° to Negative ¾° (all Oldsmobile and Pontiac models) and equal for both wheels within ½°. Adjusted in same manner as in 1938 (loosen clamp bolt at upper end of steering knuckle support, remove lubricant fitting on upper pivot pin front bushing, insert Allen wrench through lubricant fitting hole, turn eccentric pivot pin clockwise to increase caster, counter-clockwise to decrease caster, in complete turns only—camber adjustment will be disturbed if pin rotated in partial turns only).

Camber:—Should be ⅛-1° and equal within ½° for both sides of car. Pontiac preferred camber is ⅜-¾° with service limits of Neg ½° to Pos. 1°. Camber can also be checked by measuring distance from square placed on level floor to wheel felloe at top and bottom. Distance at top should be 1/32-9/32" less than at bottom (wheel should lean out at top) and both sides of car must be equal within 9/64". Adjust in same manner as for 1938 cars (turn upper pivot pin with Allen wrench in same manner as for Caster adjustment, do not turn pin more than 180° which provides entire range of adjustment—turning pivot pin more than this amount will change caster setting excessively).

Steering Geometry (toe out on turns):—With outer wheel turned exactly 20°, inner wheel should be turned 23° plus or minus ½° (all models). Correct by replacing steering arms (no adjustment).

CONTROL ARM ASSEMBLY:—Lower Control Arm—Serviced as an assembly and not interchangeable on right and left sides of car. Pivot shaft at inner ends of control arms can be removed by taking out bushing in each arm. To install shaft, install tool J-1052 or block between arms adjacent to shaft eyes so that distance between inner faces of arms at shaft eyes is exactly 11½" (necessary to prevent distortion of arms when bushings installed). Install shaft with seal on each end adjacent to mounting bracket, thread bushing in on shaft and in arm simultaneously (new bushings not threaded on outside and cut their own thread as they are turned in), tighten bushings with 150 lb. pull on 16" wrench (200 lbs. on 12" wrench) so that there is no clearance between bushing flange and control arm. See that distance between shaft bracket mounting holes and inner face of control arm is exactly 1½" at each end (turn shaft to centralize), and that seal ends lap over bushings.

Front Stabilizer Bar:—To remove, remove nut on upper end of link bolts, pull bolts out from below. Remove bracket bolts at stabilizer frame mounting, remove stabilizer bar. NOTE—On Oldsmobile L-39 Eight, radiator lower support (removable cross-member) must be removed with stabilizer (radiator need not be removed but must be supported while cross-member is out of car). Stabilizer bar rubber bearings (frame mounting) are serviced separately. When installing stabilizer links, make certain that spacer installed on bolt between arm and control arm mountings, place one rubber block and one steel retainer on both top and bottom of stabilizer arm and control arm bracket, tighten bolt nut to limit of threads and install locknut.

SPRINGS:—Removal & Installation—To remove springs, disconnect stabilizer link and tie rod, support car with chain hoist, install jack under spring seat on lower control arm, remove knuckle support lower pivot pin, raise car or lower jack under lower control arm to relieve tension on spring, remove spring. Install in same manner.

NOTE—Install spring with ground (flat) end up and centered on lugs on frame cross-member. Spring lower end (not ground flat) must be fitted in recess in spring seat on lower control arm.

Spring Identification—Oldsmobile springs have part number stamped on outside of one end coil and paint mark as follows:

Oldsmobile Springs

Model	Diameter of Wire	Color Mark
F-39 '60'	.594"	Red
G-39 '70'	.608"	Yellow
L-39 '80'	.635"	Brown

Pontiac Springs

Model	Diameter of Wire	Free Length
39-25 Qual. 6	.630"	13 31/32"
39-26 Deluxe 6	.630"	14 3/16"
39-28 Deluxe 8	.635"	14 7/16"

PONTIAC KNEE-ACTION

Used On:

DE LUXE SIX, 701-A (1935), 36-26A (1936).
EIGHT, 603 (1934), 605 (1935), 36-28 (1936).

DESCRIPTION:—Entire suspension unit (wheel support arm, coil springs, shock absorber) pivoted on kingpin at outer end of frame cross-member and turns with wheel. Wheel support arm mounted on support arm shaft carried on needle bearings in housing. Crank in inner end of shaft has a needle bearing mounted roller pin on end which engages spring guide. Two coil springs (outer main spring, inner control spring) mounted between guide and upper spring seat which is positioned in housing by adjusting plug at upper end. Shock absorber units (independent compression and rebound units) mounted in front of case act directly on support arm lever. Entire unit filled with oil. An additional radius rod linked to wheel and support housing used to guide wheel.

CHECKING:—Place car on level, with weight on wheels (roll ahead several revolutions if front wheels previously jacked up. Check following points first. **Tire Inflation**—Front wheels not less than 25 lbs. Rear wheels not less than 30 lbs.

Front Wheel Bearings—Adjust bearings, check king pins and tie rod ball ends for looseness.

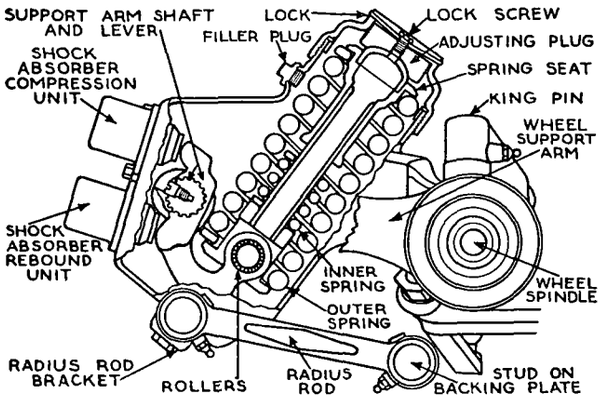
Frame Leveling—Frame must be level from front to rear. On Pontiac, check height of front tubular cross-member lower face at center (15 11/16") and lower face of rear frame horns (19") level with jacks. If frame not level crosswise, see Suspension Unit Height Adjustment below.

Kingpin Inclination:—7° (1934-35), 8¾° (1936). No adjustment provided other than bending cross-member.

Camber:—1-2° (1934-35), —¼ to +¼° (1936). with car weight on wheels or wheel spindles. No adjustment provided other than bending cross-member.

Caster:—King-pin caster 0° with frame level. Caster effect obtained by trailing wheel behind center line of king-pin. No adjustment provided other than bending cross-member.

Toe In:—1/32-⅛" (1934), 0-1/16" (1935-36). Adjusted by changing length of tie rod in usual manner.



SERVICING:—To Remove Suspension Unit—Jack up car, remove wheel, disconnect brake hose at frame (wheel brake must be 'bled' when replaced), remove hub and brake assembly, disconnect radius rod bracket at lower end of suspension unit, turn suspension unit outward, lift off brake assembly supporting radius rod, remove steering arm nut, drive steering arm out using special brass drift, remove king-pin lockpin and plug lockrings, blow out upper plug using special plug remover J-746, drive king-pin and lower plug out through bottom using brass drift. Loose needle bearings will fall out at this point. On Pontiac 1936 models, needle bearings not used and conventional bronze bushings are installed at upper and lower ends.

Disassembly:—Clean outside of unit thoroughly and clamp in vise at radius rod bracket boss. Remove capscrew from adjusting plug, lift out plug lock, install special K-477 adjusting nut wrench in plug slot securing wrench with capscrew, remove adjusting plug (this relieves tension on outer spring), remove housing cover, lift spring upper seat assembly out, remove outer spring (if spacer forward under spring this must be reinstalled if old spring used again—spacer for new spring furnished attached to spring), lift out inner spring, drain fluid from case, back off shock absorber capscrews slowly and evenly and remove shock absorber units (shock absorber units matched pairs and must be reinstalled in same position in same unit). Remove lockscrew from support arm shaft cover, loosen hexagonal nut, pull shaft out of spring seat and shaft lever assembly catching loose needle bearings which will drop out at this point. Insert brass drift through housing, drive off shaft end packing cover, lift lower spring seat and shaft assembly out.

Servicing:—Clean all parts with gasoline, replace any worn parts.

Assembly:—Reverse disassembly directions above and note special points as follows: To assemble support arm shaft lever pin, place one spacer on pin, apply light film of grease, insert pin in lever, insert 32 loose rollers or needle bearings, place second spacer on pin. To assemble support arm shaft, place bearing spacer on shaft level side out, insert rubber packing in packing cover, then cork packing, use special support shaft seal and packing inserter to install this assembly on support arm shaft, apply light film of grease on shaft, assemble 49 rollers or needle bearings on shaft holding them in place with rubber band which can be removed after shaft started in housing, see that lockscrew hole in shaft lines up with hole in lever, tighten lockscrew securely and peen metal around screw hole to prevent screw working loose. When installing end cover (after 42 needle bearings and bearing retainer inserted at small end of shaft), use new cork packing, coat with Formagasket #1 (not Shellac), drive into place. To install shock absorber units, line up holes in piston and cylinder by compressing spring, insert cotter pin loosely, install capscrews loosely using new lead washers under screw head, raise support arm to relieve spring tension, pull out cotter pin, tighten capscrews evenly and securely. Coat housing cover gasket, adjusting plug threads and locking plate capscrew with gasket cement, coat threads in housing with white lead, coat bottom of adjusting plug with grease before installing these parts. Fill unit with shock absorber oil, turn adjusting plug down flush with top of housing (adjust after installation in car).

Installing:—King-pin ball thrust washer installed at top of support. If endplay more than .006" insert steel shim above bearing. See Adjustment for Radius Rod Bracket Installation.

ADJUSTMENT:—Radius Rod—Screw radius rod up tight against brake backing plate, then back off not more than ½-1 turn so that wheel moves freely. Screw radius rod bracket on rod until tight, then back off not more than ½-1 turn until free, mount bracket in suspension unit, turning screws in loosely, roll car ahead several revolutions and bounce frame up and down, tighten screws securely, note wheel action. If wheel action stiff, file bracket boss slightly so that bracket can be placed in position by hand, install shim #496974—.010", #496910—.025" under screws. Wheel action must be free throughout range with bracket screws tight. Lock screws by turning up edge of lockplate under screwhead.

Frame Leveling:—Turn adjusting plug in housing cover not more than 2 turns in or 5 turns out from flush position so that distance from bottom of cross-tube to bottom of brake drum is correct as shown in table below and equal on both sides of the car. Install lock and lock capscrew after adjustment completed.

Car Model.	Suspension Height
Pontiac '34-35	5⅛"
Pontiac '36	5⅜"

SHOCK ABSORBERS:—See separate article on "Special Knee-action Type" for complete data.

PACKARD SAFE-T-FLEX TYPE

USED ON MODEL 120 (1935), 120B (1936).

DESCRIPTION:—Consists of vertical wheel support arm pivoted at upper end on outer end of double shock absorber arm (shock absorber mounted on frame siderail at wheel), and at lower end on outer end of triangular arm mounted on frame cross member near center line of car (forward arm) and on frame side rail in front of cowl (rear or torque arm). Coil spring located between spring seat on lower control arm and upper seat on cross member. All control arm pivot points on frame are rubber bushed.

CHECKING AND ADJUSTMENT:—Check these points first:

Tire Inflation—22 lbs. (Conv.Coupe) 24 lbs. (others).

Frame Height—Load car so that top of frame side rail is 18" above floor and parallel to it.

Front Wheels—Check for runout, adjust bearings, turn wheels to straight ahead position.

Caster:—Should be 2° plus or minus ½°. Must be equal for both front wheels within ½°. Machined bosses provided on vertical wheel support for checking.

To Adjust—Jack up front end, take out 3 screws in torque arm rear socket, take off 2 nuts at forward end of torque arm freeing arm from forward or load carrying arm. Pull torque arm to rear until free, install wedge shim on torque arm studs, reinstall. Shims provided in two sizes; Part No. 0304699—½° taper, 0304698—1° taper. Install shims with thick end up to decrease, or down to increase caster. See that entire suspension unit moves up and down freely without binding after shims installed.

Camber:—Should be 1° plus or minus ¼°.

To Adjust—Jack up front end, support wheel, remove shock absorber link bushing bolt and pilot. Replace pilot with service pilot which throws top of wheel farther out to increase, or farther in to decrease, camber. Pilots furnished in four types with increasing offset as follows: Part No. 303075—0 offset, 303076—1/16 offset, 303077—⅛ offset, 303078—3/16 offset.

Toe In:—Should be 1/16-⅛". Check by measuring to center of tire tread at front and rear of wheels (spin wheel and chalk mark center of tread).

To Adjust—Loosen tie rod clamps, turn each tie rod equal amount. Check lengths after adjusting. If not equal, correct by shortening long rod and lengthening short rod to secure equal lengths with correct toe in. Clamp bolts should be vertical and at rear of tie rods.

SPRINGS:—Coiled helical type. All springs 5¼" diameter. Spring Rates as follows:

Model	Spring Rate (lbs. per in.)
120	90 lbs.
120-B Std.	75 lbs.
120-B Export	110 lbs.
120-BA (Comm.)	130 lbs.

PACKARD SAFE-T-FLEX TYPE

Used On:

SIX, ALL MODELS (1937-38-39)
'120' EIGHT, ALL MODELS (1937-38-39)
SUPER EIGHT, ALL MODELS (1937-38-39)
TWELVE, ALL MODELS (1937-38-39)

NOTE:—This design similar to type used on previous '120' models.

CHECKING & ADJUSTMENT:—Car weight must be on wheels. Adjust front wheel bearings and check following points first:

Tire Inflation—Inflate all tires evenly to correct pressure.

Frame Height—Load car as indicated in table below and check height (front and rear). If heights not correct (within limits of plus or minus ¼"), replace or shim front springs (see spring data below), replace rear springs.

Front Height—Measure from floor to top of frame side rail at center-line of front spring.

Rear Height—Measure from under side of frame side rail to top of axle housing at rear of car.

IMPORTANT NOTE—Frame Heights must be correct as shown in table below when checking Caster and Camber.

Car Loads (for Frame Height Check)

Body Type	Front Seat	Rear
Coupes	300 lbs.	225 lbs.
5 Pass. Sedans	300 lbs.	375 lbs.
7 Pass. Sedans	300 lbs.	675 lbs.
Comm'l Chassis	300 lbs.	500 lbs.

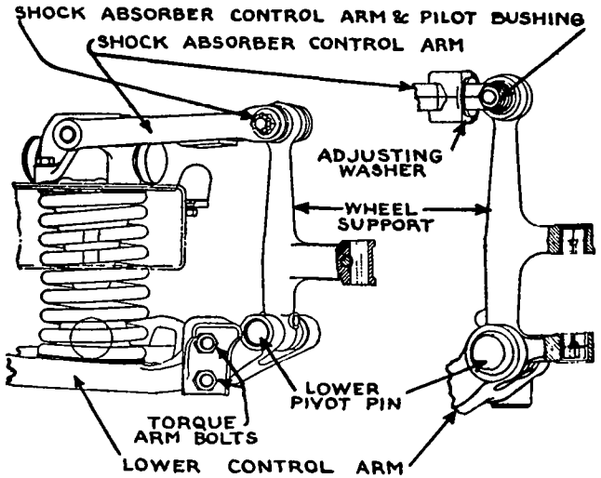
Frame Heights

Model	Front Height	Rear Height
Six '37	17⅝"	4⅞"
Six '38-39	18¾"	6¼"
Eight '37	18"	4⅞"
Eight 7 Pass. '37	18⅛"	4⅞"
Eight '38-39	19¼"	6¼"
Super 8 '37-38	20⅛"	4¾"
Super 8 '39	19¼"	6¼"
Twelve '37	20 7/16"	4¼"
Twelve '38-39	20½"	4¼"

Kingpin Inclination—1° 30' (Six & Eight '37, Super Eight '37-38, Twelve '37-38-39), 1° 54' (Six & Eight '38-39, Super Eight '39).

Front Wheels—Set in straight ahead position. Check by measuring from backing plate on each wheel to frame siderail at first rivet behind bumper (must be equal within ⅛" with intermediate steering arm on center line of car). Correct by equalizing tie rod lengths.

Toe In:—Should be 1/32"-1/16" (Six '37-38-39, 120 Eight '37-38), 0-1/16" (120 Eight '39), 1/32-⅛" (Super Eight '37-38-39, Twelve '37-38), 0-⅛" (Twelve '39).



To Adjust—Loosen tie rod clamps and turn each tie rod equally. If tie rod lengths not equal within ⅛" with correct toe in, wheels straight ahead, and intermediate steering arm on center line of car (see wheel section above), check for bent steering arm.

Caster:—Should be 2½° (Six & Eight '37, Super Eight '37-38 and Comm'l. 1703A '39), 1½° (Six '38-39, Eight 1601 '38 and 1701 '39), 0° (Eight 1602 '38 and 1702 '39), ½° (Super Eight '39), 0° (Twelve '37-38-39). All specifications plus or minus ½° except Twelve which has allowable variation of Minus ½° only (Neg. ½° caster).

To Adjust—Jack up front end, take out three screws in torque arm rear socket, take off two nuts at forward end of torque arm on front face of lower control arm, pull torque arm to rear until free. Install wedge shim furnished in ½° and 1° taper on torque arm with thick end up to decrease or down to increase caster, re-install torque arm. Check upper control arm pivot pin for alignment (if necessary, elongate shock absorber mounting bolt holes to line up pin).

Camber:—1° plus or minus ¼° (Six & Eight '37, Super Eight '37-38, Twelve '37-38-39), ½° plus or minus ½° (Six & Eight '38), ½° plus ¾° or minus 0° (Six, Eight, Super Eight '39).

To Adjust (Six, Eight, Super 8)—Jack up front end, support wheel, remove shock absorber link bushing bolt and pilot bushing. Install proper offset pilot (furnished in four sizes—0, 1/16", ⅛", 3/16" offset to throw top of wheel out (increase camber), or in (decrease camber). Pilots may be installed with offset in either direction. 1/16" offset at pilot will change camber 1/3°.

To Adjust (Twelve)—Jack up front end, loosen shock absorber control arm yoke nut, install split washer between yoke and end of arm. Washers furnished ⅛", 3/16", ¼", 5/16" thick. 1/16" washer thickness will change camber 1/3°.

SERVICING:—**1939 Control Arm Damper**—To check, remove knuckle support upper pivot bolt at outer end of shock absorber arms and damper bolt at center of arms. Clearance between arms at damper friction disk should be .125-.135". If clearance not correct arms should be straightened or replaced. Damper tension spring pressure should be 105-115 lbs. compressed to 13/16". To assemble damper, install spring on bolt, insert bolt through arm which has larger hole, tighten nut securely so that opposite arm seated against shoulder on bolt. NOTE—This damper not used on Twelve.

Lower Control Arm Pivot Pin (Except Twelve)—Pivot pin is clamped in knuckle support and is mounted on special roller bearings in control arm ends with ball thrust bearing between knuckle support and rear arm. Bearing should be pre-loaded by installing thrust bearing shims (furnished in .001" thickness steps) between arm and support so that pull of 3-8 lbs. (1937), 1-6 lbs. ('38-39) required to move upper end of knuckle support with upper pivot bolt removed (use spring scale hooked to upper end of support to check this pre-load).

Lower Control Arm Pivot Pin (Twelve)—Pivot pin mounted on special roller bearing (rear end), adjustable tapered roller bearing (front end) with ball thrust bearing between knuckle support and front control arm. Front roller bearing should be adjusted by removing bearing cap and tightening bearing nut so that 5-6 lb. pull required to move upper end of support (upper pivot bolt removed). Make certain that bearing adjusting nut locknut securely tightened and lockplate ears turned up against nuts after making adjustments. Always use new bearing cap and install with special driver to seat cap in control arm.

Kingpin Bushings—Two types used, oil-impregnated bronze or split type steel-backed bronze bushings (later type superseding the solid bronze type). When installing new bushings, finish each type as directed below.

Oil-impregnated Bronze Bushings—Cannot be reamed and must be finished by burnishing to size with a burnishing bar (see table below). Use soap water to lubricate burnisher and install a long bolt between knuckle support yoke ends to prevent buckling while burnishing bar is being used.

Model	Burnishing Bar	Finished Diameter
Six & Eight '37-38-39	ST-5046	.866"
Super 8 '37 & '39	ST-5046	.866"
Super 8 '38	ST-2006	1.063"
Twelve '37-38-39	ST-990	1.054"

Steel-backed, Bronze Bushings—May be finished by reaming or burnishing. See table above for burnishing bar type and finished diameter of bushing for each model.

Lower Control Arm Inner Bushings—Lower arms mounted on rubber bushings at inner end. To renew bushings, press new bushings in place in an arbor press using special bushing drift ST-5021 (Six, Eight, Super Eight), ST-989 (Twelve). Protect bushing with special sleeve ST-5099 (Six, Eight, Super Eight), ST-2003 (Twelve) to prevent bushing collapse while it is being pressed into place. **Important**—Check bushing alignment.

Bushing Alignment—Bushing must be started in hole in control arm so that flatted end of bushing pin is in correct position to prevent binding or excessive distortion of bushing when control arm installed on car. To check bushing alignment, install special dummy bolt with flatted end ST-5030 (Six & Eight '37, Super Eight '37-38), ST-5102 (Six & Eight '38-39, Super Eight '39), ST-987 (Twelve '37-38-39) in bolt hole at outer end of control arm, use straightedge installed on top of flatted end of bushing pin at inner end of arm and check clearence between straight edge and flatted portion of dummy bolt at outer end of arm (dummy bolt flat will indicate center line of bolt hole). Clearance should be ⅛" (Six, Eight, Super Eight '37-38), Flush or no clearance (Six, Eight, Super Eight '39), 9/32" (Twelve '37-38-39).

Wheel Support Upper Bushing—Rubber bushing type. Bushing may be renewed without removing wheel support from car by using special puller and pusher ST-5049.

Torque Arm—Dip torque arm rubber end bushings in soap water before assembling.

PACKARD SAFE-T-FLEX CONT.

SPRINGS:—If frame height not correct (see above), install not more than two spacers #326836 (except Twelve), 341052 (Twelve) between upper spring cup and insulator on top of spring (if two spacers used, install insulator between spacers). Spacers are ¼" thick. If height cannot be corrected by this means, replace spring. Springs marked by 1, 2, or 3 color marks on center coils as follows:

1937 Spring Specifications

Model	Part No.	Free Lngth	Color
120C	304408	14.63"	Gray

1708 FW	240293	Green & White

NOTE—This spring Orange, Red and Silver.

SHOCK ABSORBERS:—Delco, Double Acting type. See separate article for complete data and valve calibrati n.

STUDEBAKER PLANAR TYPE

Used On:

CHAMPION, MODEL G (1939)

DICTATOR MODEL 2-A (1935), 4-A (1936).

DICTATOR MODEL 6A (1937)

COMMANDER MODEL 1-B (1935).

COMMANDER MODEL 7A (1938)

STATE COMMANDER MODEL 8A (1938)

COMMANDER, MODEL 9A (1939)

PRESIDENT MODEL 1-C (1935), 2-C (1936).

PRESIDENT MODEL 3C (1937)

PRESIDENT MODEL 4C (1938)

PRESIDENT, MODEL 5C (1939)

NOTE—Model 7A called 'Six', Model 8A 'Commander' in early 1938.

DESCRIPTION:—Consists of vertical steering knuckle support pivoted at lower end on outer end of transverse cantilever spring and at upper end on tubular support arm which is pivoted on frame siderail. An additional spring control link is linked to the support and the frame cross member directly below the spring to insure control and act as a jack pad in raising the car. Control link is rubber bushed at both ends and upper support arm is rubber bushed at frame end.

1938 Models:—Design changed as follows:

Shock Absorbers:—Houdaille double-acting type mounted on bracket on frame side rail and linked to lower control link at outer end.

Spring Mounting:—Spring bolted to lower spring plate by two 'U' bolts. Spring plate bolted on lower face of spring housing or cross-member.

1939 Models:—Design changed from that used in 1938 and special features used on new Champion model as follows:

Support Arms (Champion)—Upper support arm is wishbone type with arms widely separated and attached to frame by individual brackets at inner end, yoked to knuckle pin (kingpin) pivot pin at outer end. Shock absorber mounted on rear face of forward arm and pivots with arm (lever stationary). Knuckle pin has yoke at lower end for spring (lower support) pivot pin so that no separate knuckle support used. Lower control link not required (spring has two outer leaves wrapped around knuckle pin pivot pin).

Upper Support Arm & Knuckle Pin (President)—Support arm is tubular type (as on previous models) with new type frame brackets and camber adjusting shims between brackets and frame. Shock absorber mounted on front face of arm and pivots with arm (lever stationary). Knuckle pin (kingpin) has eye at upper end which is linked directly to support arm by pivot pin (no separate knuckle support) and yoke on lower end for spring eye bolt (lower support pivot pin).

Shock Absorbers (Champion & President)—Reversed type mounting with shock absorber body pivoting with upper support arm and shock absorber lever held stationary (bolted to top of frame side rail).

Steering Linkage (all models)—New type with adjustable tie rod connected between steering gear pitman arm and idler arm mounted on right hand frame side rail. Pitman arm connected to left wheel, and idler arm connected to right wheel by non-adjustable reach rods.

CHECKING & ADJUSTMENT:—Car weight must be on wheels. Adjust front wheel bearings and check following points first:

Tire Inflation—30 lbs. (1935), 33 lbs. (1936-38), 30 lbs. (Comm., Pres. '39), 26 lbs. (Champion '39).

Frame Height—Bounce car up and down several times to insure frame assuming normal position.

Kingpin Inclination—9½° all models before Serial Nos. 5,258,246 (Dict. South Bend), 5,803,288 (Dict. Pacific Coast), 7,111,836 (Pres.). 5½° all models after these numbers.

Caster:—Should be Neg. ¼° to Pos. ¾° (all models except Champion '39), 5½-6½° (Champion '39). Caster angle controlled by front spring and is not adjustable.

Camber:—Should be 1-1½° (all models 1935-36-37), ¼-¾° (all models 1938-39). Controlled by shims between upper support arm and knuckle support pin yoke at outer end of arm (1935), eccentric upper support pin (1936-38 & Comm. 1939), shims between upper support arm mounting brackets and frame (Champion & President 1939).

To Adjust (1935)—Take out bolts mounting upper support arm yoke on outer end of arm, add or remove shims. Shims are 1/32" thick and change camber ¼°. Shims installed must not exceed six.

To Adjust (1936-38)—Loosen clamp bolts in knuckle support upper end. Install wrench on hexagonal head of support pin, move wrench toward car frame to increase, or toward wheel to decrease camber. Tighten clamp bolts. Neutral position of pin is with wrench flats vertical.

To Adjust (Commander '39)—Same as 1938 (above).

To Adjust (Champion & President '39)—Remove shims from between both upper support arm mounting brackets and frame (to decrease camber), add shims (to increase camber). One thin shim will change camber ¼°, thick shims are equal to four thin shims. Shims are slotted and may be removed or installed by loosening bracket mounting bolts (bolts need not be removed). Use extreme care to keep shim thickness equal for both brackets (add or remove shims equally at both points). Tighten bracket bolts securely after making adjustment.

Toe In:—3/16" (⅛-7/32") for 1935-36-37 models, 1/16-⅛" for 1938-39 models.

To Adjust (1935-38 Models)—Loosen clamp bolts and turn longer (right hand) tie rod or reach rod. The shorter left hand tie rod is not adjustable.

NOTE—Non-adjustable reach rod (tie rod) fitted with non-adjustable spring loaded end which absorbs road shocks. Outer bearing (ball end) must be screwed in tight and clamp bolt kept tight at all times.

To Adjust (1939 Models)—Loosen clamp bolts on center tie rod (between steering gear pitman arm and idler arm on frame), turn rod. The two end tie rods (connected to wheels) are not adjustable.

CONTROL ARM ASSEMBLY:—Upper Support Arm Inner Bushing—Support arm should be centered in frame brackets, straight rubber bushings pushed in from each end until they contact shoulder on arm, washer installed on outer end of bushing, and retainer screw turned up until it is tight (washer against shoulder on shaft). This will squeeze rubber out at each end forming flange at bracket. Bushings should not turn, all pivoting action being through elasticity of bushings.

Upper Support Outer Pivot Pin:—Eccentric pin clamped in upper end of knuckle support by two clamp bolts. Assembled by placing knuckle support in position in upper support arm, installing eccentric pin in support, threading support pin bushings in on pin through support arm yoke from front and rear and tightening all clamp bolts.

Lower Control Link:—Mounted on spring plate at inner end and lower end of knuckle support at outer end in rubber bushings. Coat bushings with soft soap when installing control link bolts. Draw bolt nuts down tight. Do not put grease or oil on rubber bushings.

FRONT SPRING:—To remove—Jack up front end with jacks placed under each frame side rail at rear of front wheels. Raise car approximately 3". Remove cotters, nuts and washers on outer ends of spring control link, drive bolts out (use brass drift). Remove threaded spring bolts at each end of spring. Take out 10 bolts attaching spring plate to spring retaining channel, remove plate and control link assembly. Spring may then be taken out.

To Install—See that grease retainers at each end of spring channel are in place, coat spring channel and fill spring plate with fibrous grease before installing spring. Center spring eyes in spring support of knuckle support when installing spring bolts (⅛" minimum clearance between face of spring and inner face of support when entering bolt in threaded spring bushing). See that lock is in place under spring bolt head.

1938-39 Type—Spring is bolted to lower spring plate and can be removed with the plate after the spring plate bolts have been taken out.

Front Spring (Champion)—Spring bolted to lower face of frame cross-member by two 'U' bolts. May be removed by taking off nuts on bolts.

SERVICING:—Steering Knuckle & Kingpin (Champion & President)—Pivot pin yoke at lower end of knuckle pin (kingpin) is keyed to knuckle pin and is a press fit. It must be removed in an arbor press after assembly removed from car. To remove knuckle pin assembly, jack up wheel with jack under spring eye, remove wheel and brake backing plate, disconnect tie rod at steering arm. Remove nut and unscrew knuckle pin lower pivot pin from spring eye. Drive out taper locking pin holding knuckle pin upper pivot pin, remove pivot pin to free knuckle pin from upper support arm. Remove knuckle pin, knuckle, and yoke as an assembly. Take off nut on lower end of knuckle pin, use arbor press to press yoke off lower end of pin. Knuckle is mounted on pin by bronze bushing at lower end, roller bearing at upper end, with ball thrust bearing between upper end and head of knuckle pin. When assembling, install shims (available in various thicknesses) between knuckle and thrust bearing so that endplay is .003-.006" (measured by feeler gauge below lower face of knuckle). Make certain that cork seal installed in groove in top face of lower yoke below knuckle.

Steering Knuckle Removal (Commander)—Jack up car with jack under front spring plate, remove front wheel and backing plate, disconnect tie rod at steering arm. Drive out taper lockpin holding kingpin in knuckle, remove upper Welch plug and felt from knuckle support, use brass drift to drive kingpin down and out.

BUICK 40, 50, 60, 70 TYPE

Used On:

BUICK, SERIES 40-40, 50, 60, 70 (1940)

Suspension design same as used on 1939 Buick 40, 60 except for construction detail and specification changes as given below.

TYPE:—Design same as for 1939 except as follows:

Lower Control Arms—Fabric bushings used at inner ends of lower control arms (frame connection). These bushings swaged on grooved shaft and lower control arms pressed on bushing and shaft assembly with .002-.007" press fit. Control arm, bracket shaft, and spring seat cannot be dismantled and serviced as an assembly only. Rubber seals are used on knuckle support bolt at outer end of control arm.

Upper Control Arm (Shock Absorber Assembly)—Interchangeable on right and left side of car (same as 1939). Caster adjustment located at rear of control arm (left side of car), front of arm (right side). Seals are not used on knuckle support eccentric pin at outer end of upper control arm.

CHECKING & ADJUSTMENT:—Before making adjustments, place front wheels in straight ahead position (measurement from center of tire tread to lower arm frame bracket shaft should be same on each side of car), and check following points:

Frame Height—Distance from lower face of frame cross-member to upper face of lower control arm should be 4". If height not correct or unequal, install shim on outer spring on lower side of car or replace springs (see Spring data below).

Tire Inflation—Check tires and inflate to 25 lbs. (front), 30 lbs. (rear).

King Pin Inclination—3½-4½° crosswise (all cars).

NOTE—Car weight must be on wheels when checking adjustments.

Caster:—Should be ⅜° ± ⅜° Positive (all cars). Machined bosses provided on ends of knuckle support for protractor mounting.

To Adjust—Jack up front wheels, loosen clamp bolt in upper end of knuckle support, remove lubrication fitting in end of upper support bushing (at front on right side of car, at rear on left side of car), insert Allen wrench through hole in bushing and turn upper support pin so as to move upper end of knuckle support to rear (to increase caster) to front (to decrease caster). One quarter turn of pin will change caster ¼°. Use care not to turn support pin beyond end of threads or bind knuckle support on upper control arm. Tighten clamp bolt and recheck with car weight on wheels.

Camber:—Should be Negative ¼° to Positive 1° (all cars). Can be checked by placing protractor on machined end of bearing hub (with hub cap and dust cap removed) or by measuring distance between center of tire treads at top and bottom of wheel. Top distance should be from 58 19/32" to 59 15/64" (40, 50), 59 3/32" to 59 29/32" (60, 70). Bottom distance should be from 58 53/64" to 58¼" (40, 50) , 59 21/64" to 58¾" (60, 70). First figure being for Neg. ¼° Camber, second figure for Pos. 1° Camber in each case.

To Adjust—No adjustment provided. Special eccentric upper support pin, Group 6.178, Part No. 231760, may be installed and will permit slight camber corrections (turning eccentric pin will increase or decrease camber).

Toe-In:—Should be 0-1/16" depending on average camber (half sum of camber for each wheel). To check toe-in, measure between outside of tire treads at rear, roll car ahead ½ revolution and measure between same points on tires at front.

To Adjust—Loosen clamp bolts and turn adjusting sleeve at outer end of each tie rod equally (turn wrench toward rear to lengthen rods to increase toe-in). Three-eighths turn of adjusting sleeve on each side of car will change toe-in ⅛".

Steering Geometry (Toe-out on Turns):—With outer wheel turned exactly 20°, inner wheel should be turned 22° ± ¾°. No adjustment provided.

SERVICING:—Lower Control Arm & Support Pin—Lower control arm cannot be dismantled and is serviced as an assembly. When assembling control arm on knuckle support, first place rubber seal over end of each arm, make certain that bushing tight in lower end of knuckle support with head toward rear, center knuckle support between control arms and thread lower support bolt through arms and bushing from front, install nut on rear end. Then pull rubber seals down over ends of arms and see that they seat on bolt between arm and end of knuckle support bushing.

Upper Control Arm—Both bushings threaded on upper support pin (rear bushing also threaded in control arm, front bushing plain type and locked by clamp bolt in control arm. Seals not used.

SPRINGS:—On 40, 60 models, upper end of front spring has smaller end coil which pilots on cup attached to frame by shock absorber mounting bolts and end coil at lower end is not ground flat (must be fitted in recess in lower spring seat). All springs marked with part number on coil near end and are paint marked for identification. If spring length incorrect by more than ¼", install special spacer shim, No. 1310413 (⅛" thick), on top coil of spring (if spring too short), replace spring (if too long).

BUICK 80, 90 TYPE

Used On:

BUICK, SERIES 40-80, 90 (1940)

Suspension design same as used on 1939 Buick 80, 90 models except for construction detail and specification changes as given below.

TYPE:—Design same as for 1939 except as follows:

Lower Control Arms—Welded construction and furnished only as an assembly with frame bracket shaft and lower knuckle support pin and bushings (pins and bushings serviced separately).

Knuckle Support Upper & Lower Support Pins—Pins are threaded in knuckle support ends (lower pin locked by taper lock pin, upper pin locked by taper lock bolt) and are threaded in threaded bushings in both upper and lower control arms (bushings are threaded in control arms and no locking bolts used—bronze bushings used on previous models have been discontinued).

CHECKING & ADJUSTMENT:—Before making adjustments, place front wheels in straight ahead position (measurement from center of tire tread to lower control arm frame bracket shaft should be same on each side of car), and check following points:

Frame Height—Distance from lower face of frame cross-member to upper face of lower control arm should be 4 27/32". If height not correct or unequal, install shim on spring on lower side of car or replace springs (see Springs below).

Tire Inflation—Check tires and inflate to 25 lbs. (front), 30 lbs. (rear).

Kingpin Inclination—4-5° crosswise.

NOTE—Car weight must be on wheels when checking adjustments.

Caster:—Should be 0° ± ⅜°. Machined bosses provided on ends of caster adjuster for protractor mounting.

To Adjust—Jack up front wheels, loosen nuts on caster adjusting bolt and pivot bolt (on inner face of knuckle support) one turn, loosen locknuts on adjusting screws which locate caster adjuster bolt in slotted hole in knuckle support. Back off one adjusting screw, tighten opposite screw equal amount so that caster adjuster is clamped tightly between them (turn front screw in to increase caster, rear screw in to decrease). One-fourth turn of screw changes caster ¼° (check toe in if caster changed greater amount). Tighten adjusting screw locknuts, caster adjuster bolt nut, pivot bolt nut. Recheck caster with car weight on wheels.

Camber:—Should be Negative ¼° to Positive 1°. Can be checked by placing protractor on machined end of bearing hub (with hub cap and dust cap removed) or by measuring distance between center of tire treads at top and bottom of wheel. Top distance should be 59 59/64", bottom 60 11/64" (Neg. ¼° camber); top distance 60 13/32", bottom 59 35/64" (Pos. 1° camber). No adjustment is provided.

Toe-In:—Should be 0-1/16" (depending on average camber (half sum of camber for each wheel). To check toe-in, measure between outside of tire treads at rear, roll car ahead ½ revolution, measure between same points on tires at front.

To Adjust—Loosen clamp bolts on each end and turn each tie rod equal amount (important to maintain correct position of intermediate steering arm). One-quarter turn of each tie rod will change toe-in 5/32".

Steering Geometry (Toe-out on turns):—With outer wheel turned exactly 20°, inner wheel should be turned 24° ± ¾°. No adjustment provided.

SERVICING:—Lower Control Arm & Support Pin—Arms are pivoted on frame bracket shaft at inner ends on bushings which are threaded on shaft and are sealed by rubber seals on shaft which fit over inner ends of bushings. When installing shaft, center shaft in control arms so that distance from mounting bracket bolt hole center line to outer face of control arm is 2 15/16", thread bushings through control arm on shaft and tighten bushings securely making certain that seals fit over ends of bushings. Support pin at outer end of control arms is locked in knuckle support by taper pin. Pin bushings in each control arm are threaded type and are designed to cut their own threads in control arm as they are threaded on support pin. NOTE—Lower support pin bushings have 1¼" hexagonal head, upper support pin bushings are 1⅛" (may be identified in this manner).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Upper Control Arm Knuckle Support Pin—These bushings threaded type and installed in same manner as lower support pin bushings (see paragraph above).

SPRINGS:—All springs marked with part number on coil near end and are paint marked for identification. If spring length incorrect by more than ¼", install special spacer shim, Part No. 1290142 (⅛" thick), on top coil of spring (if spring too short), replace spring (if too long).

Spring Specifications

Car Model	(Spare at Rear) Part No.	Color	(Fender Wells) Part No.	Color
80 (all)	1309916	Orange	1309917	Blue
90 (all)	1309917	Blue	1309918	Green

CADILLAC TYPE

Used On:

CADILLAC V8, SERIES 40-60S, 62, 72, 75 (1940)

CADILLAC V16, SERIES 40-90 (1940)

LA SALLE V8, SERIES 40-50, 52 (1940)

Suspension design same as used on 1939 models except as noted below.

NOTE:—Two types of suspension design used on these models as follows: (1) Cadillac 60S, 62, 72 & La Salle 50, 52; (2) Cadillac 75, 90. Adjustments are not made in same manner on both types (see instructions below).

ADJUSTMENT:—Before making adjustments check wheels for balance, run-out, and tracking; check front wheel bearing adjustment, see that shock absorbers filled with fluid and operating properly, check steering gear adjustment, see that control arms operate freely and that control arm and knuckle support bushings are correctly installed. Place front wheels in straight ahead position and check following points first:

Tire Inflation—Check tires and inflate to 24 lbs. (50, 52), 26 lbs. (62), 28 lbs. (60S, 72), 32 lbs. (75, 90).

Wheel & Tire Run-Out—Check wheels for run-out and mark high point on tire. Place this mark vertically (at top of wheel) when checking Toe-in and Toe-out, horizontally (at one side of wheel) when checking Caster, Camber and Kingpin Inclination.

Kingpin Inclination—5°6′ (50, 52, 60S, 62), 5°1′ (72, 75, 90) crosswise.

NOTE—Car weight must be on wheels when checking adjustments.

Caster:—Should be Negative 1¾-2¼° (50, 52, 60S, 62, 72), Negative ½-1° (75, 90). Must be equal within ½° on both sides of car.

To Adjust (50, 52, 60S, 62, 72)—Loosen clampscrew in upper end of knuckle support, remove lubrication fitting in front bushing of upper control arm, insert Allen wrench, Tool J-720, through lubricant fitting hole, turn eccentric upper support pin in **complete turns only**, clockwise to increase caster, counter-clockwise to decrease caster. IMPORTANT—Camber will be disturbed unless pin turned in complete turns only.

To Adjust (75, 90)—Loosen retaining nuts fastening upper and lower knuckle support yokes to control arms, loosen clampscrew in upper end of steering knuckle support, remove lubricant fitting from front bushing of upper control arm. Insert wrench J-720 through lubricant fitting hole in bushing, turn threaded support pin clockwise to increase caster, counter-clockwise to decrease caster. After making adjustment, make certain that knuckle support yoke retaining nuts are securely tightened.

Camber:—Should be 0-¾° (50, 52, 60S, 62, 72), 0-½° (75, 90). Must be equal within ½° on both sides of car.

To Adjust (50, 52, 60S, 62, 72)—Same as Caster Adjustment on these same cars (see Caster Adjustment above) except that entire range of adjustment secured in ½ turn of eccentric pin. Pin must not be turned more than ½ turn from point where correct caster secured or caster will be upset when this camber adjustment made.

To Adjust (75, 90)—Take off retaining nut on knuckle support yoke in lower control arm, pull yoke out of arm, rearrange spacers on yoke stud (cars normally set up with one spacer between yoke and control arm, one spacer between control arm and retaining nut). Place both spacers between control arm and retaining nut to increase camber, both spacers between yoke and control arm to decrease camber. Tighten retaining nut securely and lock in place after making adjustment.

Toe-In:—Should be 1/32-3/32" with car at rest. If tested with car in motion, toe-in should be 0-1/16" or 2-6′ sideslip per mile. Camber should be ½° Pos.

To Adjust (50, 52, 60S, 62, 72)—Loosen clamp bolts and turn tie rod adjuster (at wheel end of each tie rod) equally on both sides of car (to maintain correct position of steering gear).

To Adjust (75, 90)—Loosen clamp bolts and turn each tie rod equally (to maintain correct position of intermediate steering arm).

Steering Geometry (Toe-out on turns):—With outer wheel turned exactly 20°, inner wheel should be turned 22¼-23¾° (50, 52, 60S, 62, 72), 22¾-24¼° (75, 90). No adjustment is provided.

SERVICING (50, 52, 60S, 62, 72):—Lower Control Arm & Knuckle Support Pin—Control arm mounted on inner frame bracket shaft by threaded bushings (bushings threaded on shaft and in control arms) with rubber seals on shaft. Shaft can be removed from control arms after bushings have been removed. Support pin at outer end of control arm is threaded through both control arms and bushing in lower end of knuckle support and has nut on rear end. Rubber seal is installed on support pin at front end of bushing (between knuckle support and front control arm).

Upper Control Arm Support Pin—This eccentric pin is threaded in bushings in each upper control arm and in upper end of knuckle support (rear bushing is threaded type and is screwed in control arm, front bushing is plain type and is locked in control arm by clamp bolt). A clampscrew in the upper end of the knuckle support locks the pin in the support to maintain caster and camber setting.

SERVICING (75, 90):—Lower Control Arm & Knuckle Support Pin—Lower control arm mounting on inner frame bracket shaft similar to other models (above) except that front bushing is plain type (threaded on shaft only) and locked by clampscrew in end of control arm. Rubber seals are used. Support pin at outer end of control arm is threaded through bushings in both arms of yoke and is locked in lower end of knuckle support by lockpin. Rear bushing is threaded in yoke arm, front bushing is plain type (threaded on pin only) and is locked by clampscrew in yoke arm. Seals are installed on pin at inner end of each bushing (between bushings and knuckle support).

Upper Control Arm Support Pin—Pin is threaded in upper end of knuckle support and in bushing in each arm of yoke and is locked in knuckle support by clampscrew. Rear bushing is threaded in yoke arm, front bushing is plain type (threaded on pin only) and locked in yoke arm by clampscrew. Seals are installed at inner end of bushings (between bushings and knuckle support).

SPRINGS:—Part number is stamped on end coil of each spring. When installing springs see that insulator at top and bottom of each spring.

Spring Specifications

Car Model	Spare at Rear Part No.	Fender Wells Part No.	Spring Normal Hgt
50, 52	1428430	1428432	9 13/16"
50 Comm'l.	1428429		9 13/16"

90	1413790	1413791	9 13/16"

CHEVROLET TYPE

Used On:

SPECIAL DELUXE KA, MASTER DELUXE KH ('40)

Independent Suspension is same design as used on 1939 Master Deluxe Model.

CHECKING & ADJUSTMENT:—Check the following points first before checking or adjusting front suspension unit.

Tire Inflation—26 lbs. (front), 28 lbs. (rear).

Wheel Runout—Check and adjust front wheel bearings. Check wheel for tire and rim runout and eccentricity. Mark tire midway between high and low spots (mean point) and place this mark at top (vertically) when checking Camber, at side (horizontally) when checking Toe In.

Steering Gear & Connections—Check mounting bolts and tighten if necessary. Check tie rod ball and socket joints for excessive looseness.

Frame Height—Install special gauges at front and rear ends of car to level frame when checking. Front gauge has holes to engage lower control arm shaft (inner end) and pivot pin (outer end) to hold control arms rigid in correct position. Rear gauge clamps axle housing and frame so that clearance between top of axle housing and lower face of frame side rail is 7 7/32".

NOTE—Make all checks with car weight on wheels (curb weight—car ready for road but no load).

Kingpin Inclination:—4¾° plus or minus ½°.

Caster:—0° plus or minus ½°. Adjusted by turning knuckle support eccentric upper pivot pin (same adjustment as for camber—See Camber Adjustment).

Camber:—Neg. ¼° (Wheel tilts in at top) plus or minus ½°.

Adjustment—Remove lubricant fitting on knuckle support upper pivot pin front bushing, loosen clamp bolt in upper end of knuckle support which clamps pivot pin. Insert ¼" Allen wrench through lubricant fitting hole in bushing to engage pivot pin, turn pivot pin clockwise to increase caster, counter-clockwise to decrease caster (pin is eccentric and this same movement will change Camber from minimum to maximum every half turn of the pin) until both caster and camber are correct within limits given above, tighten clamp bolt and replace lubricant fitting. One half-turn of pivot pin will change caster angle 39′ and change camber angle from 0° to 1°2′ (depending on initial position of pin).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Toe In:—0" to 1/16". **Adjustment**—Loosen clamp bolts and turn left hand (short) tie rod. When tightening clamp bolts, make certain that both tie rod ends are in alignment with the ball studs.

NOTE—Right hand (long) tie rod is not adjustable.

Steering Geometry (Toe out on Turns)—Outer wheel turned in 20°, Inner wheel turned 24° plus or minus 2°. Not adjustable (replace steering arm).

SERVICING:—All servicing operations same as for 1939. ***See 'Chevrolet Type' Independent Suspension article in Mechanical Equipment Section of manual (or 1939 Supplement) for complete instructions.***

SPRINGS:—Springs have end coil at upper end only ground flat. When installing springs, make certain that this flat end placed up and that end coil at lower end of spring is fitted in recess in lower spring seat.

Spring Specifications

KA, KH	No. 3653059

CHRYSLER TYPE

Used On:

CHRYSLER, SIX C25, EIGHT C26, C27 (1940)
DE SOTO, S7 CUSTOM & DELUXE (1940)
DODGE, D14 DELUXE, D17 SPECIAL (1940)
PLYMOUTH, P9 ROADKING, P10 DELUXE (1940)

Suspension design same as used on Corresponding 1939 models except as note below.

TYPE:—Design same as for 1939 except as follows: **Springs**—On Chrysler C25, DeSoto, Dodge, Plymouth (except 7 Pass. cars), lower end of front spring is not ground flat and must be installed in recess formed in lower spring seat. On Chrysler C26, C27 and Chrysler C25, DeSoto, Dodge, Plymouth 7 Pass. cars, both ends of spring are ground flat and lower spring seat is likewise flat. Springs must not be interchanged for this reason.

CHECKING & ADJUSTMENT:—Before making adjustments, check wheel and tire balance and run-out, front wheel bearing adjustment and king pin bushing clearance, steering gear adjustment, and shock absorbers. See that springs and shock absorbers in normal position (grasp bumper and work front end of car up and down several times). Then check following points first:

Frame Height—Use tool C-592 to measure distance from lower face of frame front cross-member lower plate (measure through hole in lower flange of frame side rail) to dimple on lower spring seat directly below this point. Distance should be 3½" (all models) and must be equal within ⅛" on both sides of car. If height not correct, install spacer on spring on low side (see Spring data below).

Tire Inflation—Check tires and inflate to 28 lbs. front and rear (except Chrysler C25, DeSoto, Dodge, Plymouth P10 7 Pass. cars and Chrysler C26 Traveler—30 lbs., Plymouth P9 Roadking—32 lbs.).

Kingpin Inclination—4¾-6° crosswise (all models). NOTE—Car weight must be on wheels when checking adjustments.

Caster:—Negative 1° to Positive 1° (all models). Not adjustable. Controlled by distance knuckle support upper pivot pin bushing (eccentric camber adjustment) turned in on upper control arm. See Camber adjustment following.

Camber:—Positive ¼° preferred (0° to ¾° permissible) for all models. Correct kingpin inclination before adjusting camber.

To Adjust—Loosen clampscrew in upper end of knuckle support, turn eccentric bushing in upper end of knuckle support not more than ½ revolution from place where correct caster is secured (bushing eccentric and entire range of adjustment secured in ½ turn). Bushing must not be turned so as to bind on upper control arm and distance from shoulder on arm to rear of knuckle support should be ⅝" (9/16-¾" permissible).

Toe-In:—1/16" preferred (0-⅛" permissible). To check toe-in, set wheels straight ahead, move car forward one full revolution of wheels. Measure between center of tire treads, hub high, at rear, then roll car forward ½ revolution and measure to same points on tires at front.

To Adjust—Loosen clamp bolts on each tie rod (long rod right side, short rod left side), turn tie rods equally. CAUTION—Make certain that steering gear turned so that roller on 'high' point of worm with wheels in straight ahead position after toe-in adjustment completed. Steering gear position can be corrected by shortening one tie rod and lengthening opposite rod equally.

Steering Geometry (toe-out on turns):—With outer wheel turned exactly 20°, inner wheel should be turned 22° (except Chrysler C26, C27), 21°30′ (Chrysler C26, C27). No adjustment provided. Check for bent steering arm if incorrect.

SERVICING:—Steering Knuckle & Kingpin Bushings—To remove, remove wheel and hub, block brake pedal, remove nuts fastening brake support to steering knuckle, remove steering arm from knuckle, lift complete backing plate & brake shoe assembly off and hang up on frame (Caution—assembly must not be allowed to hang on flexible brake tube, on Models C26, C27 brake tube must be disconnected before assembly can be removed and lines must be bled when reconnected). Drive out kingpin taper lockpin. Drive punch into kingpin upper oil seal disc and pry disc out. Use soft brass drift to drive kingpin down which will force out lower oil seal disc, remove knuckle. Pull upper bearing out toward bottom (use puller C-328—bushings used at this point on Dodge & Plymouth only), pull lower bushing with same tool. Install new lower bushing and line-ream with special tool using pilot in place of upper bearing (on Dodge & Plymouth install upper bushing from top and line up oil hole in bushing and knuckle), install roller bearing from top (trade mark up) and line up oil hole in bearing with hole in knuckle.

Upper Control Arm & Bushings—Control arm mounted on frame bracket shaft by threaded bushings (rear bushing threaded on shaft and in arm, front bushing threaded on shaft and locked in arm by clampscrew) with rubber seal on shaft at inner end of each bushing. Rubber seal also used on outer end of control arm at end of eccentric knuckle support bushing. When assembling control arm, centerline of rear mounting bolt holes in shaft should be 1" (Chrysler C25, DeSoto, Dodge, Plymouth except 7 Pass. Sedans), 1 5/32" (Chrysler C26, C27 and all 7 Pass. Sedans) to rear of front face of outer end of control arm. Eccentric knuckle support bushing should be turned in on arm until distance from rear face of knuckle support to shoulder on control arm is ⅝" (9/16-¾").

Lower Control Arm & Bushings:—Control arms and spring seat are riveted assembly. Bushings at inner end (frame connection) are self-threading type and new bushings should be used when a new control arm assembly is installed as follows:

Control Arm Shaft Bushings—Special tool C-594 must be used to maintain control arm alignment when bushings installed. Insert bracket shaft in control arm, install special tool so that it engages legs of control arm and studs on tool enter shaft mounting bolt holes, install nuts on studs and tighten securely. Tool will position arm correctly so that rear face of arm is 2 5/32" (Chrysler C25, DeSoto, Dodge, Plymouth except 7 Pass. Sedans), 2 7/32" (Chrysler C26, C27 and all 7 Pass. Sedans) in back of rear shaft mounting bolt hole center-line. Start both bushings on shaft, use lubricant such as tapping compound and turn bushings in until bushing shoulders contact faces of control arms (bushings will cut own thread in control arm bosses), tighten bushings with 180 ft. lb. force. Remove tool and make certain that shaft pivots freely in control arms. CAUTION—Do not rotate shaft which would change rear arm dimension as given above.

Knuckle Support Lower Pivot Pin & Bushings—Pin should be inserted through rear arm and is locked by nut and cotter pin on forward arm. To assemble control arm and knuckle support, see that bushing installed in knuckle support with head toward rear, position knuckle support between control arms so that distance from rear face of support to rear face of support pin boss on rear arm is exactly 15/16" (Chrysler C25, DeSoto, Dodge, Plymouth except 7 Pass. Sedans), 1 1/32" (Chrysler C26, C27 and all 7 Pass. Sedans). Thread support pin through rear arm, rubber seal, knuckle support bushing, front rubber seal, and front arm. Install nut on forward end of pin and lock with cotter pin. If correctly assembled, rear face of knuckle support will be 7/16" in front of center-line drawn through frame bracket shaft rear mounting bolt holes.

SPRINGS:—Springs used on Chrysler C25, DeSoto, Dodge, Plymouth (except 7 Pass. Sedans) do not have lower end coil ground flat and must be installed with spring end fitted into recess formed in lower spring seat (frame height will be incorrect if spring not properly installed). On Chrysler C26, C27 and on all 7 Pass. Sedans, both ends of springs are ground flat and lower spring seat is also flat. When installing springs on all cars, see that silencer installed on lower end of all springs (in spring seat), and on upper end of spring (in seat in cross-member). If spacers used, these should be installed between upper end of spring and upper silencer.

Frame Height Correction—If frame height not correct spacer may be installed on top of spring on low side of car (between spring and upper silencer).

Spring Specifications

Car Model	Spring Part No.

NOTE—Part No. 657770 spacer used on driver's side of car when Commercial (Comm'l.) or Extreme (Ext.) Duty springs installed.

HUDSON TYPE

Used On:
SIX, MODELS 40T, 40P, 41, 43, 48 (1940)
EIGHT, MODELS 44, 45, 47 (1940)

DESCRIPTION:—Conventional design with knuckle support pivoted on outer ends of upper and lower support arms. Knuckle support upper pivot is an eccentric bushing (for Camber and Caster adjustment), lower support is a bushing and bolt assembly. Control arms are pivoted at inner ends on bracket shafts bolted to the frame with threaded type bushings and rubber seals at pivot points. Shock absorber is mounted in center of the coil spring with mounting studs passing through holes in upper and lower control arm brackets.

CHECKING & ADJUSTMENT:—Before checking specifications and making adjustments, always perform the following operations first:

Wheels & Tires—Check wheels and tires for balance and runout, correct if required. Inflate all tires to correct pressure. Check front wheel bearings and adjust if loose. Runout must not exceed 1/16-3/32". mark 'high' point on tire and place this mark at top of tire (vertical) when checking toe-in, at front of tire (horizontal) when checking Camber and Caster.

Steering Linkage & Kingpin Looseness—Check kingpin bushings, drag link and connecting rod ends, and steering gear for looseness. Adjust steering gear and replace worn bushings and end joints.

Shock Absorbers—Check shock absorber action.

Frame Level and Spring Height—Level car by rocking car sideways (not endwise) several times and allowing it to come to rest. Check spring height at each side of car. If heights not equal within ½", replace or shim low spring (see Springs below).

NOTE—Car weight must be on wheels when checking following specifications

Kingpin Inclination:—4°36' crosswise. NOTE—Kingpin inclination affected by Camber adjustment (decreases as Camber is increased).

Camber:—Should be Pos. ¼° to Pos. ¾° and equal within ½° on both sides of car. NOTE—Toe-in setting depends on Camber and should be checked when Camber adjusted.

To Adjust—Adjusted by turning knuckle support upper eccentric pivot pin (Same as Caster Adjustment). See Caster Adjustment below and turn eccentric bushing not more than ½ turn from point where correct caster is secured.

Caster:—Should be 0° (plus or minus ¼°) and equal within ½° on both sides of car.

To Adjust—Loosen clamp bolt in upper end of knuckle support, turn eccentric bushing into support to increase caster, out of support to decrease caster. One complete turn of bushing will change caster ½°. Correct caster of 0° should be secured with center of knuckle support (clamp bolt center) exactly 1 11/32" ahead of face of upper support arm. After correct caster secured, turn bushing not more than ½ turn in either direction to adjust Camber (½ turn will give maximum camber adjustment of plus or minus ½°). Tighten clamp bolt.

Toe-In:—Should be 0-1/16" measured at wheel rim with wheels set straight ahead and intermediate steering arm centered by means of centering tool J-1442

To Adjust—Loosen clamp bolts and turn both tie rods equally. NOTE—Tie rod lengths must be equal.

Steering Geometry:—With inner wheel turned 24°, outer wheel should be turned 20°50' (or Inner 30°, outer 25°). Allowable variation plus or minus ½°. No adjustment provided (if incorrect, check for bent steering arms).

SERVICING:—Spring Removal & Installation—To remove spring, support front of car on jack stand under inner side of lower support arm on side from which spring to be removed, remove shock absorber (see below), remove bolts from lower support arm inner pivot shaft bracket, raise car slowly and carefully until spring fully expanded. Install spring in same manner. Make certain that spring installed with flat end up and rubber-and-fibre silencer on upper end of spring, and see that lower end of spring properly seated in spring seat on lower support arm. Check spring height (see Springs below).

Shock Absorber Removal & Installation:—Remove retainer nut on upper mounting stud (on upper support arm frame bracket), remove washer and rubber bushing. Remove two screws holding shock absorber lower anchor plate on underside of spring seat on lower support arm, turn shock absorber ¼ turn, and lower through hole in spring seat, remove from below. Replace shock absorber in same manner.

Lower Support Arm:—When installing inner pivot shaft, use tool J-1052 to maintain exact distance of 11½" between inner faces of lower support arms while bushings are being installed. Distance from inner face of support arm to center-line of frame mounting bolt holes must be exactly 1½" for correct alignment. Make certain that seals installed on shaft so that end of seals extends over inner ends of bushings.

Upper Support Arm:—When installing frame mounting shaft bushings, use tool J-1360 installed on center stud of pivot shaft mounting, center arm in tool when bushing installed. See that seals installed on pivot shaft so that ends extend over ends of bushings. When installing knuckle support eccentric bushing, hold support 9/32" from shoulder on arm, screw into support and on arm until support is ⅞" from shoulder on arm. Check Caster & Camber

SPRINGS:—Install springs with flat end up and silencer on upper end of spring. If spring height (measured from upper face of lower support arm to lower edge of upper rubber bumper support bracket) is not equal within ½" on each side of car, spring should be replaced (rock car sideways and allow it to come to rest naturally before checking heights) A maximum of 2 shims .120" thick may be installed on top of low spring to correct minor height differences (replace springs if more than 2 shims required).

Spring Specifications

Car Model	Part No.	Color
40, 41, 48	160510	Light Blue
43	160511	Yellow
44 45	160512	White
47 Right Side	160512	White
47 Left Side	160513	Green

Identification Note—Part No. marked on flat end of spring with Brinell mark, and Limit Mark as follows: 1 Grind Mark—Low Limit, 2 Grind Marks—High Limit.

NASH TYPE

Used On:
NASH, SIX MODEL 4020, EIGHT 4080 (1940)
NASH-LAFAYETTE, MODEL 4010 (1940)

DESCRIPTION:—Linked parallelogram type with vertical knuckle support linked to short upper control arms (shock absorber arms) and longer lower control arms pivoted at inner ends to bracket bolted on frame front cross member. Coil spring is seated at upper end in spring seat formed in cross member and at lower end in spring seat riveted to lower control arms. Adjustments provided for Caster, Camber, and Toe-in.

CHECKING & ADJUSTMENT:—Always check following points first before making any adjustments:

CAUTION—Always place 2" blocks, Tool J-886, between frame top flange and front suspension upper control arms before jacking up car so as to remove weight from front wheels. Wheels must not be allowed to hang on control arms without these blocks being installed first.

Tire Inflation—Check tires and inflate to recommended pressure of 28 lbs. (4010), 27 lbs. (4020), 26 lbs. (4080).

Front Wheel Bearings—Check for looseness and adjust front bearings if required.

Wheel & Tire Balance & Runout—Check wheel and tire assemblies for balance. Check front wheels for runout which must not exceed ⅛". Mark high point (point of greatest runout) on tire and place this mark on top (vertical) when checking toe-in and toe-out (steering geometry), place mark on side (horizontal) when checking Camber, Caster, and Kingpin inclination.

Wheel Straight-ahead Position—Wheels must be set in straight-ahead position when checking toe-in. Use centering gauge, Tool J-1383.

Kingpin Inclination:—Should be 4½° crosswise for all models. No adjustment.

Caster:—Should be 0° to Neg. ½° for all models with car weight on wheels.

Adjustment—Loosen clamp bolt in upper end of steering knuckle support, remove lubrication fitting in front bushing of outer end of upper control arm, insert special wrench, Tool J-720, in lubrication fitting hole and turn eccentric upper support pin clockwise to increase caster, counter-clockwise to decrease caster. Tighten knuckle support clamp bolt and replace lubrication fitting.

Camber:—Should be Pos. ¼° to Pos. ¾° for all models with car weight on wheels and frame leveled by 2" blocks (see Caution Note above).

Adjustment—Adjust in same manner as for Caster above (wrench inserted through lubrication fitting hole in upper control arm front bushing) except that entire range of adjustment secured in ½ turn of eccentric pin. This adjustment changes caster but caster will be within limits given above providing that it has been correctly set first and pin is not turned more than ½ turn maximum

Toe-in:—Should be 1/32-3/32" measured 10" from floor with wheels in straight-ahead position.

Adjustment—Loosen clamp bolts and turn each outer tie rod equally toward front of car to decrease toe-in, toward rear to increase toe-in. Center connecting rod is not adjustable.

CAUTION—See that center connecting rod ball stud is not raised from its normal position while making toe-in adjustment and that outer tie rod ends are horizontal with ball studs fitting squarely in seats before tightening clamp bolts.

Toe-out (Steering Geometry):—With outer wheel turned 20°, inner wheel should turn 21½°. No adjustment. If toe-out incorrect, check for bent steering arms, recheck Caster, Camber, and Toe-in.

SERVICING:—Upper Control Arm Pivot Pin. Eccentric pivot pin is threaded in upper end of knuckle support and in bushings in front and rear upper control arms Rear bushing is threaded in control arm.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Front bushing is plain type and is locked in control arm by clamp bolt. Clearance between front face of control arm and head on bushing must be 1/32".

Lower Control Arm Outer Pivot Pin. Pivot bolt is threaded in knuckle support bushing and in front and rear lower arms. Bushing is threaded on bolt and in lower end of knuckle support with rubber seal on bolt between each end of bushing and control arm. When assembling, bushing should be centered in control arm with equal clearance of 3/16" between each end of bushing and control arms.

Lower Control Arm Frame Bracket. Lower control arm inner ends are bushed on frame bracket shaft with washer and nut on shaft ends. Shaft is bolted directly to frame cross member.

SPRINGS:—Coil springs are same on all body styles and are interchangeable on 4010 and 4020. 4080 springs are paint marked for identification. Check spring heights on car with special height gauge, Tool J-709, which should fit between spring seat on lower control arm and lower face of front frame cross member. If spring height not correct, replace spring or install special ¼" spacer under spring.

Spring Specifications

Model	Free Length	Loaded Height	Color Mark
4010, 20	13⅛"	9"	
4080	13⅞"	9"	Yellow

PACKARD SAFE-T-FLEX TYPE

Used On:

'110' SIX, MODEL 1800 (1940)
'120' EIGHT, MODELS 1801, 1A (1940)
'160' SUPER 8, MODELS 1803, 4, 5 (1940)
'180' CUSTOM SUPER 8, 1806, 7, 8 (1940)

Suspension design same as used on 1939 models except for construction details and specifications given below.

CHECKING & ADJUSTMENT:—Check front wheel bearings and set wheels in straight ahead position, check following points first:

Tire Inflation—Check tires and inflate to correct pressure for each model.

Frame Height—Must be correct when checking caster and camber. To check, load car with 300 lbs. (front—all models), 225 lbs. (rear—Coupe), 375 lbs. (rear—5 Pass. Sedan), 675 lbs. (rear—7 Pass. Sedan), 500 lbs. (rear—1801A Hearse), 800 lbs. (rear—1803A Hearse). Measure from floor to top of frame side rail at front spring center-line (front) from underside of frame to top of axle housing (rear). If height not correct, install spacer or replace spring (see Springs below).

Car Model	Front — Frame Height — Rear
1800 Six	18⅝" — 6⅜"
1801 Eight	18¾" — 6¼"
1801A Comm'l.	19¼" — 6¼"
1803, 4, 5, 6, 7, 8	19¼" — 6¼"

Kingpin Inclination—1°54' crosswise (all models). NOTE—Car weight must be on wheels when checking following adjustments.

Toe-in:—1/32-1/16" at hub height (all models).

To Adjust—Loosen clamp bolts and turn both tie rods equally. Tie rod lengths must be equal within ⅛" after adjusting with intermediate steering arm centered and steering wheel roller on 'high' point of worm (adjust by shortening one rod, lengthening opposite rod equally).

Caster:—Positive 1½° ± ½° (Six & Eight), Negative 1° ± ½° (Super 8 except 1803A), Positive 2½° ± ½° (1803A).

To Adjust—Install wedge shims (furnished in ½° and 1° taper) between front face of lower torque arm and lower control arm. Install shims with thick end up to decrease caster, thick end down to increase caster. If 1° shim does not correct caster, check for bent parts. Check torque arm alignment (end of arm must be square with face of lower control arm).

Camber:—½° (limits ½° to 1¼°) for all models.

To Adjust—Remove support pin linking upper control arm and knuckle support, change pilot thimbles in outer end of each upper control arm. Thimbles furnished with offset of 0", 1/16", ⅛", 3/16", and change of 1/16" in offset will change camber ⅓°. CAUTION—Make certain that thimbles installed in both arms with offset in same direction (reversing offset will change camber).

Steering Geometry (toe-out on turns):—With outer wheel turned exactly 20°, inner wheel should be turned 23° (Six), 22°50' (Eight and Super 8 1803, 6), 22°30' (Super 8 1804, 7), 22°20' (Super 8 1805, 8). No adjustment provided (check for bent steering arms if not correct).

SERVICING:—Upper Control Arm Damper—To check, remove knuckle support upper pivot bolt at outer end of shock absorber arms and damper bolt at center of arms. Clearance between arms at damper friction disk should be .125-.135". If clearance not correct arms should be straightened or replaced. Damper tension spring pressure should be 105-115 lbs. compressed to 13/16". To assemble damper, install spring on bolt, insert bolt through arm which has larger hole, tighten nut securely so that opposite arm seated against shoulder on bolt.

Lower Control Arm Pivot Pin—Pivot pin is clamped in knuckle support and is mounted on special roller bearings in control arm ends with ball thrust bearing between knuckle support and rear arm. Bearing should be pre-loaded by installing thrust bearing shims (furnished in .001" thickness steps) between arm and support so that pull of 1-6 lbs, required to move upper end of knuckle support with upper pivot bolt removed. CAUTION—Roller bearings are caged type and one of the two bearings must be renewed whenever pivot pin or either bearing is removed.

Lower Control Arm Frame Mounting—Arm is rubber bushed on frame bracket pin (two Harris type bushings used, bushings held by locking ring on pin at one end-washer). Bushings can be installed without using arbor press but must be aligned in neutral position (flat on pin must be in line with flat on special gauge bolt installed in hole in outer end of arm—new type gauge required, 1939 type cannot be used).

Torque Arm Frame Mounting (Six, Eight, Super 8 1803, 6 Only)—New type mounting consisting of two Harris type rubber bushings in end of arm. When installing torque arm, tighten mounting bolt until frame mounting bracket bottoms on bolt shoulder. NOTE—Frame mounting on other models same as 1939.

Kingpin Bushings—Steel-backed bronze split bushings (same as 1939). Bushings should be finished by burnishing with Packard Burnishing Broach ST-5046 or by reaming to inside diameter of .866". NOTE—Kingpins also furnished .005" oversize to compensate for worn spindle bushing holes. When installing kingpin, pre-load thrust bearing by installing shims (furnished in thickness steps of .001") so that force of 3½-5 lbs. applied at end of spindle required to turn spindle on kingpin.

SPRINGS:—Springs paint-marked for identification as shown in table below. If frame height not correct, install not more than two spacers #326836 (¼" thick) between upper spring cup and insulator on top of spring (if two spacers used, install Insulator #326706 between spacers). If height cannot be corrected by this means, replace springs.

Spring Specifications

Model	Part No.	Color Marks
1800 Std.	348127	Yellow & Red
1801 Std.	348377	Yellow & Blue

Std.—Spare at Rear. **FW.**—Fender Well cars.

OLDSMOBILE-PONTIAC TYPE

Used On:

OLDSMOBILE SIX, '60' F-40, '70' G-40 (1940)
OLDSMOBILE EIGHT, '90' MODEL L-40 (1940)
PONTIAC SIX, 40-25 SPECIAL, 40-26 DELUXE ('40)
PONTIAC EIGHT, 40-28 & 40-29 TORPEDO (1940)

Suspension design same as used on 1939 models.

CHECKING & ADJUSTMENT:—Check and adjust front wheel bearings, check kingpins for looseness, check shock absorbers and following points:

Tire Inflation—Check tires and inflate to 27 lbs. min. (Oldsmobile 60 & 90), 25 lbs. min. (Oldsmobile 70) 26 lbs. front, 28 lbs. rear (Pontiac 40-25 & 40-26 with 6.00x16 Tires); 23 lbs. front, 25 lbs. rear (Pontiac 40-26 & 40-28 with 6.50x16 Tires), 28 lbs. front and rear (Pontiac 40-29 Torpedo).

Wheel Runout—Check wheels and tires for run-out. Must not exceed ⅛". Mark 'high' point on tire and place this mark at top (vertically) when checking Toe-in and Toe-out, at one side (horizontally) when checking Caster, Camber & Kingpin Inclination.

Frame Height—Raise and lower front end of car several times by grasping front bumper to allow frame to come to normal level.

Kingpin Inclination—4°51'10" (Oldsmobile), 4⅝-5¼° (Pontiac) crosswise.

NOTE—Car weight must be on wheels and wheels should be set in straight ahead position when checking adjustment.

Caster:—0° to Negative ¾° (Oldsmobile), Negative ¾° (limits Neg. ½° to Neg. 1°) on Pontiac models. Must be equal within ½° on both sides of car. Machined bosses provided on front side of knuckle support for protractor mounting.

To Adjust—Loosen clamp bolt in upper end of knuckle support, remove lubricant fitting on front bushing of upper support pivot pin, insert Allen wrench J-720 through lubricant fitting hole and turn upper pivot pin clockwise to increase caster, counter-clockwise to decrease caster. CAUTION—Pin must always be turned in complete turns only to avoid disturbing camber adjustment (below).

Camber:—Negative ¼° to Positive ¾° (Oldsmobile), Positive ⅜° (limits 0° to Pos. ⅝°) for Pontiac.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

To Adjust—Same as for Caster (above) except that entire range of adjustment secured in ½ turn of eccentric pivot pin. CAUTION—Do not turn pin more than ½ turn when adjusting camber to avoid disturbing caster adjustment.

Toe-In:—1/16-⅛" (Oldsmobile), 0-1/16" (Pontiac) measured 9-10" above floor with wheels straight ahead.

To Adjust—Loosen clamp bolts at wheel end of each tie rod, turn tie rod adjuster on each rod equally. On Oldsmobile, turn both adjusters in direction opposite to that in which wheel revolves to increase toe-in. On Pontiac, turn right hand adjuster in same direction wheel revolves, and left hand adjuster in opposite direction to increase toe-in.

Steering Geometry (toe-out on turns):—With outer wheel turned exactly 20°, inner wheel should be turned 23° ± ½°. No adjustment provided (check for bent steering arms if incorrect).

SERVICING:—Lower Control Arm & Pivot Shaft—Serviced as an assembly and not interchangeable on right and left sides of car. Pivot shaft at inner ends of control arms can be removed by taking out bushing in each arm. To install shaft, install tool J-1052 or block between arms adjacent to shaft eyes so that distance between inner faces of arms at shaft eyes is exactly 11½" (necessary to prevent distortion of arms when bushings installed). Install shaft with seal on each end adjacent to mounting bracket, thread bushing in on shaft and in arm simultaneously (new bushings cut their own thread in arm as they are turned in), tighten bushings with 150 lb. pull on 16" wrench (200 lbs. on 12" wrench) so that there is no clearance between bushing flange and control arm. See that distance between shaft bracket mounting holes and inner face of control arm is exactly 1½" at each end (turn shaft to centralize), and that seal ends lap over bushings.

Knuckle Support Lower Pivot Pin—To install pin, slip rubber seal over outer end of each lower control arm, center knuckle support between lower control arms (approximately ⅛" between end of bushing and front arm, same distance between head of bushing and rear arm). Screw pivot pin through front arm, knuckle support bushing, rear arm, install nut on rear end of pin. Pull seals down over end of arms so that they seat on pin between arm and bushing at each side.

Knuckle Support Upper Pivot Pin—To install, center knuckle support in upper control arm yoke, screw pivot pin in until larger center section is centered in knuckle support, tighten clamp bolt. Install seal on pin at each side, start front bushing in on pin, then screw rear bushing in control arm and on pin and tighten securely. Turn front bushing in until clearance between front face or arm and head on bushing is 1/32" and tighten clamp bolt.

Kingpin Installation (Oldsmobile)—Bushings should be installed with oil hole lined up with oil hole in knuckle support and short groove on inner surface leading from oil hole to outer end of bushing (up on top bushing, down on lower bushing). Bushings should be burnished with J-722-1 burnishing tool and line-reamed to size with tool HM-592.

Kingpin Installation (Pontiac)—Bushings are floating type and should be installed with lubrication groove on inner face leading toward outer end of bushing (up on top bushing, down on lower bushing).

SPRINGS:—Lower end of spring not ground flat and must be installed with end coil fitted into recess in lower spring seat. Upper end of spring is ground flat. CAUTION—Spring must be installed with flat (ground) end up and lower end fitted in spring seat. Oldsmobile springs are paint marked on end coil for identification.

Oldsmobile Springs

Car Model	Wire Diameter	Color Mark
60, 70	.608"	Yellow
90	.635"	Brown

Pontiac Springs

Car Model	Wire Diameter	Free Length
40-25	.594"	14⅞"
40-26	.608"	14 27/32"
40-28	.635"	14 7/16"
40-29	.635"	14 27/32"

STUDEBAKER PLANAR TYPE

Used On:

CHAMPION, MODEL 2G (1940)

COMMANDER, MODEL 10A (1940)

PRESIDENT, MODEL 6C (1940)

Suspension design same as used on corresponding 1939 car models except as noted below.

1939 PRODUCTION CHANGE NOTE:—Commander Model 9A—Beginning with Serial No. 4112701, upper support arm changed to same type used on 1939 President Model (new type upper support arm frame bracket with shims for Camber adjustment located between bracket and frame). At the same time, the knuckle pin design and Shock Absorber mounting was likewise changed to the same type used on the President Model.

Camber Adjustment Note—All Commander Cars after Serial No. 4112701 in 1939, and 1940 cars, are adjusted by adding or removing shims from between both upper support arm frame brackets equally. See Camber adjustment directions below.

TYPE:—Design changed from 1939 type as follows:

Steering Knuckle Supports—Knuckle pin (kingpin) has eye at upper end for connection to upper support arm and has bracket bolted on lower end for transverse spring connection. Spring has second main leaf which is wrapped around spring eye in main leaf so that no additional lower link or support arm is required (this construction same as used on 1939 Champion model).

Steering Gear Linkage—Steering Gear has insulated steering arm (bolted to adapter arm on steering gear shaft through rubber bushings) and non-adjustable link between steering arm and idler lever on bracket on right frame side rail. Each wheel linked individually to steering arm (left wheel) or idler lever (right wheel) by adjustable reach rod. See Toe-in adjustment for special reach rod adjusting instructions.

CHECKING & ADJUSTMENT:—Adjust front wheel bearings, check shock absorbers, steering gear adjustment, steering arm and tie rods for looseness. Check following points first:

Frame Height—Raise and lower front end several times by grasping bumper so that frame will assume normal position.

Tire Inflation—Check tires and inflate to 26-28 lbs. (Champion & Comm.—front), 30-32 lbs. (Champion—rear), 28-32 lbs. (Comm.—rear), 30 lbs. (Pres. —front and rear).

Kingpin Inclination—5½° crosswise (all models).

Caster:—1-2° (Champion), Negative ¼° to Positive ½° (Comm. & Pres.). Caster angle determined by front spring and is not adjustable.

Camber:—½° (¼-¾°) for all models—same as 1939.

To Adjust—Loosen upper support arm frame mounting bracket bolts, remove shims from between mounting bracket and frame to decrease camber, add shims to increase camber (shims slotted). One thin shim will change camber ¼°, thick shims are equal to four thin shims. Tighten bracket bolts securely after adjusting. CAUTION—Make certain that shim thickness equal on both mounting brackets (add or remove shims equally at each bracket when making adjustments).

Toe-In:—⅛-7/32" (Champion), 1/16-⅛" (Comm. & President).

To Adjust—Set steering gear in straight ahead position (center of travel with lever lugs on 'high' points of cam), loosen clamp bolts and turn **l ft hand** reach rod until left hand wheel is in straight ahead position (parallel to rear wheel). Then loosen clamp bolts and turn **right hand** reach rod (between steering idler arm and right hand wheel) to adjust toe-in. CAUTION—Toe-in adjustment must be made exactly as detailed above to insure correct steering gear position.

Steering Geometry (toe-out on turns):—With outer wheel turned exactly 20°, inner wheel should be turned 22½° (Champion), 22° (Comm. & Pres.). No adjustment provided (check for bent steering arms if incorrect).

SERVICING:—Steering Knuckle Pin (All Models)—Pivot pin yoke at lower end of knuckle pin (kingpin) is keyed to knuckle pin and is a press fit. It must be removed in an arbor press after asembly removed from car. To remove knuckle pin assembly, jack up wheel with jack under spring eye, remove wheel and brake backing plate, disconnect tie rod at steering arm. Remove nut and unscrew knuckle pin lower pivot pin from spring eye. Drive out taper locking pin holding knuckle pin upper pivot pin, remove pivot pin to free knuckle pin from upper support arm. Remove knuckle pin, knuckle, and yoke as an assembly. Take off nut on lower end of knuckle pin, use arbor press to press yoke off lower end of pin. Knuckle is mounted on pin by bronze bushing at lower end, roller bearing at upper end, with ball thrust bearing between upper end and head of knuckle pin. When assembling, install shims (available in various thicknesses) between knuckle and thrust bearing so that endplay is .003-.006" (measured by feeler gauge below lower face of knuckle). Make certain that cork seal installed in groove in top face of lower yoke below knuckle.

Insulated Steering Arm—To remove assembly from steering gear shaft, remove cotter pin, nut, and washer from steering gear lever shaft, use puller J-871 to remove assembly from shaft (On Champion, nuts on steering arm bushing studs can be removed and arm pulled off without disturbing adapter arm on steering gear lever shaft). Adapter shaft and steering gear shaft are marked and marks should be lined up when assembly re-installed.

SPRINGS:—Front spring is transverse leaf type. Spring eye is formed in main leaf and second leaf is wrapped around eye for additional strength.

SPIRAL BEVEL & HYPOID GEAR ADJUSTMENT (ALL MAKES)

NOTE ON PINION SETTING GAUGES:—These gauges are designed to locate the pinion gear (with respect to ring gear center line) so as to duplicate the factory set up when the gears were burnished or run in. Mated gears of this type will run quieter and give more satisfactory service in this position and other settings should not be used. See separate articles for each type axle and complete instructions and specifications for use of these gauges.

RING AND PINION GEAR MESH:—To check gears, paint a number of ring gear teeth with some suitable indicator such as Prussian Blue or red lead mixed with oil. Rotate ring gear by hand applying tension on pinion shaft flange with a block of wood to simulate load. Indicator will be wiped off on teeth in area of tooth contact so that mesh can be judged. See illustration (No. 1) for desired tooth contact and possible variations which should be corrected as directed below. If desired, gears can be turned over a few times by the engine with the rear wheels jacked up and brakes applied for load (preliminary inspection of mesh should be made by turning gears by hand to avoid damage caused by running gears under load when badly meshed).

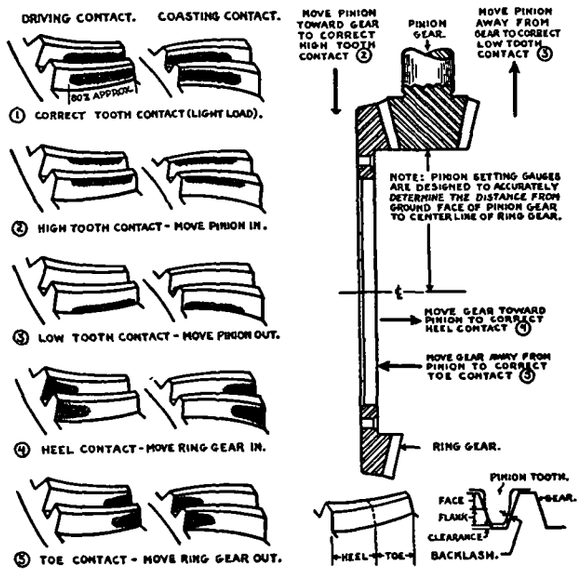
High Tooth Contact (Illustration No. 2):—Will be noisy and cause gear teeth to roll over at top if run for any length of time. To correct, move pinion in toward ring gear. If backlash is then insufficient, move ring gear away from pinion.

Low Tooth Contact (Illustration No. 3):—Will be noisy and gear teeth will groove or score if run with this setting. To correct, move pinion out or away from ring gear. If backlash is then excessive, move ring gear in toward pinion to decrease backlash.

Heel Contact (Illustration No. 4):—Will be noisy and cause excessive wear, chipping, and tooth breakage. To correct, move ring gear in toward pinion. If backlash is then insufficient, move pinion out or away from ring gear to increase backlash.

Toe Contact (Illustration No. 5):—Will be noisy and cause excessive wear due to small contact area, chipping, and tooth breakage. To correct, move ring gear away from pinion. If backlash then excessive, move pinion in toward ring gear.

Backlash Specifications:—See individual Rear Axle articles for recommended backlash for each axle type and complete directions on moving pinion and ring gears to secure above adjustments.



TROUBLE SHOOTING:—Before attempting to classify rear axle trouble from noise (hum or growl), eliminate other sources such as tires, engine, transmission as follows:

Tire Noise. Will change on different road surfaces and continue as speed decreases, will be more noticeable with low pressures. To check, coast car with gears in neutral from speed of 30 M.P.H. down. Rear axle noise will ordinarily disappear, tire noise will continue with lower tone as speed decreases.

Engine & Transmission. With car stationary, hold clutch disengaged, operate engine and vary speed through range in which noise previously noticed, check for similar sound. Then repeat test, engaging clutch to note transmission idling noises (gears in neutral). This will also check for muffler and exhaust noise.

REAR AXLE TROUBLE SHOOTING TABLE

1. **Drive Noise.** Most pronounced when car accelerated at constant rate from 15 to 45 M.P.H. Pinion should be moved in toward ring gear slightly.
2. **Coasting Noise.** Most evident when car allowed to coast from 45 M.P.H. down to 15 M.P.H. with throttle closed and clutch engaged. Pinion should be moved out or away from ring gear slightly.
3. **Float Noise.** Most evident when speed held constant at close intervals between 15 and 45 M.P.H. Correct by same adjustment as for coasting noise above, or by changing backlash slightly.
4. **Continuous Noise.** Check axle shaft bearing, differential bearing, pinion bearing adjustment. Check ring and pinion gear for incorrect adjustment, not matched or defective, gear teeth badly worn, scuffed or chipped. Backlash may be excessive or insufficient.

5. **Noisy on Turns.** Check for tight, binding, chipped, scuffed differential pinion gears or side gears, worn or rough thrust washers, excessive differential gear backlash, excessive axle shaft endplay.
6. **Intermittent Noise.** Check for sprung or warped differential case, excessive ring gear runout, loose or broken differential bearings.

WORM DRIVE AXLES

Used On:

CHRYSLER CUST. IMP., CW (1934), CW* (1935)
NASH ADVANCED 8, MODEL 1180 (1933)
NASH AMBASSADOR 8, 1190 (1933), 1290 (1934)
PIERCE ARROW 8, MODEL 836, 839 (1933)
PIERCE ARROW 12, MODEL 1236 (1933)

TYPE:—Worm gear type with underslung worm. Worm mounted on taper roller bearings with shim adjustment at rear bearing cap. Worm wheel and differential assembly mounted on taper roller bearings with adjusting nut under bearing cap at each side (worm wheel seated in groove in outer rim of differential case formed by riveting together of the case halves, rivets must be cut and worm wheel disturbed to get at differential pinions and side gears).

Chrysler—Worm and worm wheel mounted in carrier bolted to lower face of axle housing. Inspection plate bolted on top face of housing can be removed without disturbing gears or axle shafts.

Nash 1180, 1290—Design same as Chrysler (carrier bolted to lower face of housing) except that top cover cannot be removed.

Nash 1190—Separate carrier not used (worm and worm wheel mounted in center section of axle housing) with inspection cover at top. Axle housing halves are bolted at each side of the worm housing.

Pierce Arrow—Design same as on Nash 1190 except that no inspection plate provided.

SERVICING:—Gear Adjustment. Correct backlash for gears stamped on worm wheel with prefix 'B.L.' Adjusted by backing off one differential bearing adjusting nut and tightening opposite nut equally (see Differential Bearing Adjustment below). Set gear for maximum backlash (secured when worm wheel centered over worm), paint gears and adjust for correct mesh. Tooth contact should be approximately 80% of entire tooth area starting at the 'leaving' side (where tooth is almost vertical) and extending toward the 'entering' side (where tooth has flattest angle).

Axle Shaft Removal:—Remove wheel and brake backing plate at wheel end. Wheel bearings adjusted as follows:

Chrysler—Shims located behind inner bearing cup at outer end of axle housing. Shaft endplay .0025-.005".

Nash—Shims located between axle housing and brake support plate. Endplay .003-.006" (1180, 1290), .002-.006" (1190).

OVERHAUL:—Worm Bearing Adjustment:—Tighten rear universal joint flange nut securely. Set up dial indicator and check worm shaft endplay (if no endplay noticed, install shims under rear bearing cap until positive endplay reading secured, rotate shaft slightly while moving back and forth to seat bearings. Adjust as follows:

Chrysler—Remove shims from under rear bearing cap flange equal to amount of endplay plus .001-.002" shim thickness to secure bearing 'draw' or tension of .001-.002" on bearings.

Nash—Remove shims from under front cover plate (1180, 1190), rear cover plate (1290) exactly equal to endplay. Endplay should be zero.

Pierce Arrow—Remove shims from under front cover plate. Worm shaft endplay should be .002-.004". NOTE—With correct adjustment worm shaft should rotate freely but should not spin.

Differential Bearing Adjustment:—Make all bearing adjustments at left hand differential bearing nut without disturbing right hand nut (will not disturb worm and wheel mesh). Remove lock, turn adjusting nut in until tight, then back off one notch (Chrysler, Timken-Pierce Arrow), tighten bearing cap bolts securely, replace lock.

Backlash Adjustment:—When installing differential assembly, turn both adjusting nuts up equally so that worm wheel is centered on worm (maximum backlash in this position), then adjust for mesh by backing off one nut and tightening opposite nut (see Gear Adjustment above). Check differential bearing adjustment.

Differential Gear Assembly:—To remove gears it is necessary to cut rivets mounting worm wheel on differential case halves. Select thrust washers behind side gears (furnished in 3 thicknesses) so that clearance between gears and thrust washers is .007-.015" on each side. Install washers with indentations toward gears.

COLUMBIA TYPE

Used On:

AUBURN SIX, 652X, Y ('34); 653 ('35); 654 ('36-37)

AUBURN EIGHT, 8-100, A ('32); 8-101, 5 ('33), 850X, Y ('34), 851 ('35), 852 ('36-37)

AUBURN SCHGD. EIGHT, 851 (1935), 852 (1936-37)

PIERCE ARROW EIGHT, 836A, 840A ('34), 845 ('35)

PIERCE ARROW TWELVE, 1242, 1247 (1933); 1240A, 1248A (1934), 1245, 1255 (1935)

NOTE:—Auburn Models. Dual-Ratio standard on Models 652Y, 8-100A, 8-105, 850Y (Custom Models) and optional on other models. Dual Ratio axle serviced in same manner as other axles except for Dual-Ratio feature. See special Dual Ratio data below.

Pierce Arrow Models. Gears are Hypoid type. Serviced in same manner as other Columbia axles.

TYPE:—Spiral bevel or hypoid gear, semi-floating type with Hotchkiss drive. Pinion integral with shaft and mounted on taper roller bearings seated directly in housing (bearings positioned by shoulders in housing or by pinion adjusting sleeve which is threaded in housing). Differential assembly mounted on taper roller bearings with adjusting nut at each side.

SERVICING:—Gear Adjustment. Paint gears to check mesh. Backlash should be .003-.005" (Auburn), .002-.003" (Pierce Arrow). See Pinion setting and Backlash adjustment under Differential Bearing Adjustment below.

Axle Replacement. Wheels mounted on single taper roller bearing (designed to take thrust in one direction, thrust in other direction transmitted to other bearing by thrust spacer in differential assembly). To remove axles, remove wheel, take off backing plate which retains wheel bearing, pull shaft and bearing out. Bearings adjusted by adding or removing shims between backing plate and flange on axle housing.

NOTE—On models with Dual-Ratio, speedometer driven by gear on axle shaft near wheel. Remove speedometer pinion assembly before pulling axle shaft. When reassembling speedometer pinion, see that endplay is .010".

OVERHAUL (SLEEVE ADJUSTMENT TYPE):—Pinion Bearing Adjustment. Bearings adjusted by nut on end of pinion shaft (rear universal flange retaining nut). To adjust bearings, back off locknut until lockwasher dowel pin can be freed from pinion nut, turn up nut until all endplay in pinion shaft has just been removed, replace locking washer and tighten locknut securely.

Pinion Setting:—Pinion located by adjusting sleeve in housing which contacts both bearings cups. To adjust pinion, take out two capscrews and remove pinion lock plate on side of housing, loosen housing clamp bolts, turn sleeve (threaded in housing) to move pinion forward or backward in relation to ring gear, tighten clamp bolts securely and replace lock plate.

Differential Bearing Adjustment:—Turn up adjusting nut at outside of each differential roller bearing. See that locks are in place and bearing caps securely tightened after making adjustment.

Ring Gear Backlash Adjustment. When adjusting backlash, back off one differential bearing adjusting nut and tighten opposite nut exactly equal amount so as not to disturb differential bearing adjustment.

OVERHAUL (SHIM ADJUSTMENT TYPE):—Pinion Bearing Adjustment. Controlled by shims between front bearing cone and shoulder on pinion shaft. Shims furnished .100", .003, .005", .010" thick. See that pinion nut at rear universal joint flange is tight when checking bearing adjustment.

Pinion Setting:—Controlled by shims on pinion shaft between pinion and rear bearing cone. Shims furnished from .115" to .135" thick in .002" steps. Increase shim thickness to move pinion in toward ring gear, decrease shim thickness to move pinion out or away from ring gear.

Differential Bearing & Ring Gear Backlash Adjustment:—Same as for Sleeve adjustment type. See instructions above.

AUBURN DUAL-RATIO

TYPE:—Consists of a planetary reduction gear built in a housing around the differential assembly (ring gear mounted on this housing so that it transmits drive from engine to planetary pinions which are likewise mounted on it. Internal gear is integral with differential housing and sun gear is mounted on a sleeve which is free to revolve on the axle shaft within the dual-ratio housing. The control mechanism consists of a sliding clutch sleeve splined on the sun gear sleeve which is shifted by a vacuum cylinder so as to engage clutch teeth on a stationary gear bolted to the left hand differential bearing pedestal (high or dual-ratio drive through planetary gears), or similar clutch teeth on an extension of the dual-ratio housing (low or direct drive with planetary gears locked so that the entire mechanism revolves as a unit).

OPERATION:—Direct Drive. When the vacuum line from the intake manifold is connected to the rear end of the operating cylinder, the piston moves toward the axle, rotating the yoke and shifting the clutch sleeve in so that the dual-ratio housing (planetary pinion drive plate) and the sun gear are locked together and rotate as a unit. The pinions are thus prevented from rotating on their shafts and act merely as clutch teeth to revolve the large internal gear at the same rate as the housing (ring gear speed), affording a direct drive.

Dual-Ratio Drive. When vacuum is connected to the forward end of the cylinder, the clutch sleeve is shifted out so as to engage the stationary gear bolted to the axle housing (differential bearing pedestal) so that the sun gear is held stationary. The rotation of the dual-ratio housing causes the planetary pinions to revolve as they are carried around the sun gear causing the internal gear on the differential housing to revolve at a different rate, affording a high axle ratio.

SERVICING:—Serviced in same manner as other axle types (see preceding article on Columbia Axles) except for Dual-ratio disassembly and Differential Bearing adjustment as follows:

Dual-ratio Assembly:—Dual-ratio housing halves are bolted together by ring gear mounting capscrews. Taking out these screws will allow dual-ratio housing to be split, exposing all gears.

Differential Bearing Assembly. Clutch gear for dual-ratio drive bolted to left hand differential bearing pedestal with shoulder extending into pedestal to act as retainer for bearing cup (no adjusting nut used). Shims under the clutch gear flange are used for ring gear backlash adjustment.

Ring Gear Backlash Adjustment. Controlled by shims between stationary clutch gear flange and left hand differential bearing pedestal. Shims furnished .003", .010", .030" thick. Increase shim thickness to increase backlash, decrease shim thickness to move ring gear in and decrease backlash.

Differential Bearing Adjustment. After Ring Gear backlash correctly adjusted (above), adjust differential bearings by turning right hand differential bearing nut in to take up bearing endplay or looseness. See that lock plate installed and bearing cap securely tightened after completing adjustment.

COLUMBIA TWO-SPEED TYPE

Optional Equipment On::

FORD '85' MODELS (1938-39)

LINCOLN-ZEPHYR, MODELS HB (1937), 86H (1938), 96H (1939)

MERCURY, MODEL 99A (1939)

NOTE:—This axle provides low axle ratio for power and acceleration (with planetary gears locked out) and a higher ratio to reduce engine R.P.M. at high speeds (with planetary gears operating). Do not confuse this type with the Ford Two-Speed Truck Axle which operates differently.

TYPE:—Consists of a planetary gear reduction unit built in a special differential assembly case which is installed in place of the regular Ford or Lincoln-Zephyr differential (furnished with new right hand axle housing which replaces original housing). A vacuum cylinder mounted on the axle housing operates the planetary gear clutch and is controlled by a valve assembly linked to the clutch pedal and to a control button on the instrument board. An adapter (two-speed gear box) is provided for connection in the speedometer drive cable and is linked to the control button so that the speedometer drive ratio is changed for overdrive operation to insure speedometer reading accurately at all times. NOTE—Some 1939 cars have a speedometer drive gear on the right hand axle shaft and a driven gear assembly mounted on the axle housing. These cars do not require a separate adapter.

OPERATION:—With the dash control button pushed in (for direct drive), the sliding clutch in the rear axle locks the sun gear and the differential case (in which planetary pinions are mounted) so that the entire planetary gear system (sun gear, pinions, and outer internal gear) rotate as a unit and the

COLUMBIA TWO-SPEED TYPE CONT.

ring gear drives the rear wheels directly. When the clutch is released and the control pulled out to the overdrive position, the vacuum cylinder pulls the sliding clutch out so that the differential case is free and engages the stationary clutch plate so that the sun gear is prevented from rotating. The ring gear then drives the differential case and pinions, and the rotation of the pinions (on the stationary sun gear) causes the internal gear and the axle shafts to revolve at a faster 'overdrive' speed.

INSTALLATION:—When Overdrive axle is installed, the regular Ford or Lincoln-Zephyr axle should be dismantled (center pinion mounting housing need not be removed but torque tube should be blocked up so that it does not hang on the universal joint ball housing). Right hand axle housing, differential case (right and left halves and bearing on right half), differential pinion spider, and ring gear bolts and nuts should be discarded (replaced by overdrive axle parts). Overdrive axle assembly should be assembled on pinion housing using original capscrews except for top front hole (special long capscrew and copper washer furnished wired to hole in which it should be installed). Original right hand axle shaft should be filed smooth for distance 8" back from side gear to remove all scale and high spots, thoroughly cleaned, and dipped in regular axle lubricant (5" at side gear end), then insert shaft through overdrive unit (these instructions for shafts without speedometer drive gear only). Original differential pinions should be assembled on new spider, bronze thrust washer installed on spider in back of each pinion (lubricate washers with axle lubricant before installing), and inserted in overdrive differential case so that spider engaged in slots in internal gear case and pinions properly meshed with side gear. Original left hand axle shaft should be threaded through new yellow bronze side gear thrust washer and original ring gear, washer tongues entered in slots in differential case through which differential spider was assembled, and ring gear bolted to face of differential case with new capscrews. Left hand axle housing can then be assembled. **Important**—See that ring gear and differential clean and free from all nicks to insure gear running true, tighten mounting screws evenly and securely and lock screws with lockwire. Make certain that side gear thrust washer tongues do not slip out of slots in case while gear is being installed.

Control & Speedometer Adapter (Ford):—Control valve is mounted on bracket bolted to top of left hand frame side rail ahead of steering gear (bracket center hole engages rivet head, other holes must be drilled for bolts). Special clip should be bolted to lower end of clutch pedal and connected to bellcrank on control valve by rod (see adjustment below). Forward vacuum tube connection on valve should be connected to manifold spacer installed between carburetor and manifold (manifold studs must be replaced with new longer studs when spacer installed). Vacuum connections at rear of valve should be connected to vacuum cylinder by rubber tubing and copper tubing running along left hand frame side rail (connect 'low' top connection on valve to right hand end of cylinder, 'high' bottom connection to left hand end of cylinder). Control button is installed in drilled hole in instrument panel (2½" up from starter button, 1⅝" to left of instrument cluster), and control cable taken through drilled hole in dash (3½" in from left edge). Connect cable wire to lever on top of valve, see that lever is in forward detent position and that control button in forward position against instrument panel, then tighten cable clamp on valve.

Speedometer Adapter—Adapter screws directly on speedometer head (install square key furnished for connection between adapter and speedometer bfore mounting) with regular speedometer cable connected to adapter and short control cable (from control button connected to adapter lever.

CAUTION—Control cables, speedometer cables and vacuum tubes must not be kinked or bent in short radius which will interfere with correct operation.

Control Button & Valve Assembly (Lincoln-Zephyr):—Control valve mounted on steering gear housing cover plate. Connected in same manner as Ford except as follows: Clutch pedal rod clip clamped to shaft at clutch pedal end and inside edge of engine mud pan notched to provide clearance for rod, control valve vacuum line connected to windshield wiper connection on manifold with special adapter, control valve mounted on lower edge of instrument panel 2½" to right of starter button.

Speedometer Adapter—Adapter should be mounted on left front side of dash and connected to speedometer by special short length of cable taken through 15/16" hole drilled in center of dash. Regular speedometer cable should be looped up on left side of engine compartment and connected to adapter.

ADJUSTMENT:—Control Valve Clutch Connection—Adjust clevis on valve operating rod at control valve end so that valve plunger is depressed ⅛" minimum, ¼" maximum with clutch pedal depressed to floor. Valve travel must not exceed ¼".

Control Button—Cable conduit should be positioned in clamp on valve body so that valve lever is in forward position (stopped by detent) with control button pushed in toward dash and fastened in this position by tightening clampscrew.

SERVICING:—Axle Lubrication—When first installed, axle should be filled with 4½ pints (Ford), 6 pints (Lincoln-Zephyr) recommended axle lubricant and car should be run with rear wheels jacked up (transmission in high, overdrive in low) for 5 minutes to circulate oil through overdrive unit. Axle should then be refilled to level of filler plug in overdrive case. **Always fill to level of overdrive filler plug, do not use regular axle filler plug for this purpose.**

Vacuum Cylinder Lubrication—At 10000 mile intervals, remove vacuum cylinder, lubricate leather piston cups thoroughly with Houghtons Cosmolubric #1000 hydraulic oil or equivalent.

Speedometer Adapter Lubrication—At 10000 miles, or sooner if noise develops, remove adapter, take out small plug on side and repack case with Alemite lubricant by hand—**do not use pressure.**

TROUBLE SHOOTING:—If overdrive axle does not shift properly, check all vacuum lines and connections for leaks, check tubes for kinks, sharp bends, or flattened spots, make certain that rubber tubing not cut or torn so as to obstruct opening at valve and copper tubing connections. Check valve settings (see adjustment section above).

OVERHAUL:—See Ford and Lincoln-Zephyr Rear Axle articles for axle servicing data.

STUDEBAKER PRESIDENT, 5C (1939)
Model 50-2
HUPMOBILE 8, 825-H ('38), 925-H ('39)

TYPE:—Hypoid gear, semi-floating type with Hotchkiss drive. The hypoid gear pinion is integral with the pinion shaft and is mounted on taper roller bearings which seat directly against shoulders in housing. Bearing adjustment controlled by shims located between front bearing cone and spacer on pinion shaft (on models where no spacer used, shims are located between bearing cone and shoulder on pinion shaft). Pinion position controlled by shims installed between rear bearing cup and shoulder in housing (all models). Differential assembly mounted on taper roller bearings with adjusting shims on differential case hub at inner end of each bearing.

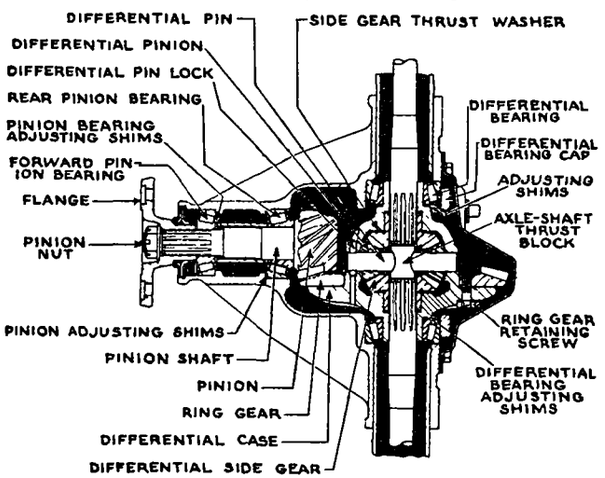
SERVICING:—Gear Adjustment. Paint gears to check mesh, or check pinion setting (see directions below). Backlash should be .004-.008" (except Hupmobile '34-37—.004-.007", Hupmobile '38-39—.003-.006", Studebaker—.005-.007"). Adjusted by shifting differential bearing adjusting shims from one side to the other. See differential bearing adjustment.

Axle Shaft Removal. Remove wheel, take off axle shaft nut and washer, use puller to remove hub and brake drum assembly. Disconnect brake line and cables, take out bolts mounting oil seal assembly and backing plate on axle housing flange and remove backing plate (do not lose wheel bearing shims), pull axle shaft and bearing assembly out. Use bearing puller and remove bearing from shaft.

OVERHAUL:—Disassembly. To remove differential assembly (with axle shafts out), take out bearing cap screws, remove bearing caps, pull differential assembly out. Remove nut on end of pinion shaft, take off rear universal joint flange, press pinion out of housing toward rear to avoid damage to oil seal and bearing. Pry oil seal out toward front. Use new oil seal when reassembled if old seal worn or damaged.

Pinion Bearing Assembly:—Make certain that pinion setting shims installed in housing ahead of rear bearing cup, insert pinion and rear bearing cone in housing from rear, install spacer and pinion bearing adjusting shims on pinion shaft, tap front bearing cone in place, assembly universal joint flange, tighten nut securely (if bearing adjustment to be checked, oil seal assembly may be left out until adjustment completed).

Pinion Bearing Adjustment. With pinion shaft nut tight, pinion should rotate with slight drag (no endplay). Adjust by removing front bearing cone and adding or removing shims between cone and spacer or shoulder on shaft. Shims furnished .003," .005", .010", .030" thick.



Pinion Setting:—Use special Pinion Setting Gauge, Salisbury No. J-772 or Studebaker No. HMJ-589 (see note below for Hypoid Gear Fittings). Set microme-

SPICER HYPOID TYPE CONT.

ter on gauge to correct figure for each axle model (see table below—this figure correct for standard pinions marked '0' on end) and correct micrometer for each pinion as follows: Figure etched on pinion indicates amount (in thousandths) that pinion should be set in toward ring gear (— figures) or out away from ring gear (+ figures). Install gauge in axle housing in place of differential assembly with side discs seated in differential bearing bores, add or remove shims located between rear bearing cup and shoulder in housing until micrometer pointer just contacts ground face of pinion gear (or adapter on hypoid gears—see note below).

Axle Type	Pinion Zero Setting
23, 41-2	.719"
50-2	.500"
Studebaker Models	
Dict. '37, All Models '38-39	.719"
President '37	.500"

Hypoid Gear Pinion Setting. Pinions are offset and micrometer gauge pointer will not contact ground face of pinion. Use special adapter on face of pinion and adjust so that micrometer pointer contacts face of offset plate on adapter. Special

clamp can be bolted on face of axle housing which has setscrew to hold adapter on pinion.

Differential Bearing Adjustment:—Shims installed on differential case hub at inner end of each bearing cone. To adjust differential bearings (with axle dismantled), remove bearing cones, add or remove shims until differential assembly will just slide into housing (no endplay when installed), then add additional .003-.006" (Studebaker .008-.010") shim thickness to secure correct bearing pre-load. Shims furnished .003", .005", .010", .030" thick. With correct adjustment, fairly heavy drag should be felt when ring gear revolved by hand (test preferably with pinion out to avoid added drag of pinion bearings and oil seal). When installing differential assembly, tighten bearing cap screws securely.

Ring Gear Backlash Adjustment. Adjust by transfering differential bearing adjusting shims from one side to the other (from left hand bearing to right hand bearing to increase backlash, from right to left to decrease backlash). Total shim thickness must not be changed. Shifting ring gear .005" will change backlash .0035".

Model 21-1.

WILLYS TRUCKS, ALL MODELS ('38-39)

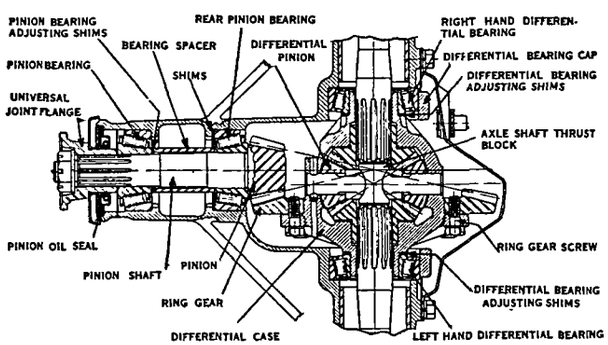
Model 42.

HUPMOBILE 6, 822-E ('38), 922-E ('39)

TYPE:—Spiral bevel, semi-floating type with Hotchkiss drive. Pinion is integral with pinion shaft and mounted on taper roller bearings which seat directly in carrier housing (rear bearing positioned by shoulder in housing, front bearing by spacer on shaft on Axle Models 20, 30, 30-1 or by second shoulder in housing for Axle Models 40, 40-1, 51 (no spacer used). Differential carrier mounted on roller bearings in housing.

SERVICING:—Gear Adjustment. Paint gears to check mesh or check pinion setting (see directions below). Backlash should be .004-.008" (Bantam .008", Hupmobile .004-.007", Studebaker .006-.008" '34, .002-.004" '35-36, .005-.007" '37-39). Adjust by shifting differential bearing adjusting shims from one side to the other (total shim thickness must not be changed to avoid disturbing differential bearing adjustment). See Pinion Setting and Differential Bearing Adjustment below.

Axle Replacement. When replacing axle shafts, check endplay. Total endplay between shafts and spacer in differential which transmits thrust from one shaft to the other should be .002-.007" (Bantam .005", Studebaker .001-.005"). Adjust by removing shims between backing plate and axle housing flange (at one wheel if clearance less than maximum, both wheels if greater). Shims furnished .003", .005", .010", .030" thick.



OVERHAUL:—Pinion Bearing Adjustment. When dismantling pinion assembly, pinion should be pressed out (to avoid damaging forward bearing) and oil seal should be pried out. Use new oil seal when reassembling if old seal damaged by removal. To adjust bearings, add or remove shims between forward bearing cone and spacer (or shoulder on pinion shaft on types where no spacer used), install universal joint flange and tighten nut securely. Pinion should rotate with slight drag (approximately .002" tight). Shims furnished .003", .005", .010", .030" thick.

Pinion Setting:—Use special pinion setting gauge, Salisbury No. J-772 or Studebaker No. HMJ-589 (see special instructions below for Reo gauge No. T-547), set gauge for correct zero position for each axle type or car model as shown in table below (correct for pinions marked 'O'). Figure etched on end of each pinion indicates amount in thousandths which pinion should be set ahead (plus figures) or in back (minus figures) of this zero position. Install gauge in axle housing in place of differential assembly, adjust pinion position by adding or removing shims between rear pinion bearing cup and shoulder in housing until correct gauge reading is secured (see note below for hypoid axles). Recheck pinion bearing adjustment (disturbed by pinion setting adjustment). Shims furnished .003", .005", .010" thick.

Axle Type.	Pinion Zero Setting.
10 (See Note)	.218"
20, 21-1, 30, 30-1	.407"
40, 40-1, 42	.126"
50	.000"
Studebaker Models.	
Dict. A ('34), 1A, 2A ('35), Rockne 65, 10	.407"
Comm. B ('34), Dict. 3A, 4A ('36)	.126"
Pres. C ('34), 2C ('36)	.000"

Model 10 Note—A special smaller pinion gauge must be used for this model. This gauge has an endplate diameter of 2.714-2.716" (to engage differential bearing bore) and the end of the micrometer pointer extends 2.000" beyond the differential bearing bore center-line with the micrometer set at zero.

Reo Models. Special Reo gauge (T-546) is fixed type without micrometer. Used by measuring clearance between pin and ground face of pinion, or between gauge cross-bar and front face of differential bearing bore in housing with feeler gauge. Standard setting (for pinion marked 'O') is 1.487" (gauge length).

Differential Bearing Adjustment:—Shims installed between bearing cones and differential case on each side. To adjust bearings, take out axle shafts, take off rear cover, remove capscrews and lift off differential bearing caps, then pull out differential assembly. Remove bearing cones, add or remove shims installed between bearing cone and case on each side until assembly will just slide into place in axle housing, then add additional shim thickness of .003-.006" (.008-.010" on Studebaker models), install assembly, tighten bearing caps. Ring gear should have fairly heavy drag when revolved by hand. Shims furnished .003", .005", .010", .030" thick.

NOTE—Early models fitted with adjusting nut at each bearing. These types adjusted by removing locks, loosening bearing caps, and turning up adjusting nuts to secure desired bearing adjustment.

Ring Gear Backlash:—Adjusted by transfering shims from behind left hand bearing to right hand bearing (to increase backlash), or from right to left (to decrease backlash). Total shim thickness must not be changed to avoid disturbing bearing adjustment. Shifting ring gear .005" will change backlash .0035".

BUICK (FIRST TYPE)

Used On:

MODEL 50, 60 (1932-33-34-35)

MODEL 80 (1932-33)

MODEL 90 (1932-33-34-35-36)

TYPE:—Spiral bevel gear, semi-floating (50), ¾ floating (60, 80, 90). Pinion shaft integral with propeller shaft and carried on double row ball bearing (front), single row ball bearing (rear) with spacer between bearings. Front bearing mounted in adjusting sleeve. Oil seal located in forward end of sleeve. Differential assembly carried on ball bearings with adjusting nuts under bearing caps on carrier.

SERVICING:—Gear Adjustment. Check pinion setting (see instructions below) or paint gears to check mesh. Backlash should be .006-.010" (recommended figure stamped on each pinion with prefix 'L'). To adjust, back off one differential bearing adjusting nut, tighten opposite nut equal amount (see differential bearing adjustment below).

Axle Replacement. On 60, 80, 90 with ¾ floating axle, cotter pin and nut at inner end of axle shaft (in differential case) must be removed before shaft can be pulled out.

OVERHAUL:—Pinion Bearing Assembly. Bearing inner races should be press fit on shaft or pinion shoulder. See that pinion key engages bearing spacer to prevent spacer turning. Front double row ball bearing should have no side play (outer race movement), rear single row bearing sideplay .010" max. Bearing sleeve runout (assembled) .005" max.

Pinion Setting:—Standard setting (distance from nearest face of differential bearing boss in carrier to face of pinion) shown in table below (correct for pinions marked '0.') Figure etched on face of each pinion should be added (plus mark) or subtracted (minus mark) to secure setting. Use recommended pinion setting gauge (HMJ-162), set gauge for zero on master gauge using correct locating button for each model, install gauge in differential carrier (differential assembly removed), remove adjusting hole cover on side of pinion housing, loosen clamp bolt, turn adjusting sleeve until correct pinion setting secured, tighten clamp bolt, replace adjusting hole cover. See that lock engages slot.

Car Model.	Pinion Setting.
50 (1932-35)	1.95725"
60 (1932-35)	2.0731"
80 (1932-33), 90 (1932-35)	2.21225"
90 (1936)	3.875"

Ring Gear:—Drill out old rivets. Reface ring gear seat if runout exceeds .002". New ring gear runout must not exceed .006" installed (measure on back face, use differential hubs as centers).

Differential Gears:—Bronze thrust washers installed in back of side gears and pinions. Backlash between gears .008" maximum.

Differential Bearing Adjustment:—Back off bearing cap nuts on right hand differential bearing 1½ turns, tap cap lightly with hammer to loosen, free lock, back off bearing adjusting nut slowly and note point where outer bearing race stops turning with nut. If race does not turn with nut (caused by bearing wear or race turning on hub due to 'locking'), determine the 'just free' position by turning nut in until outer race just starts to turn with nut. For correct adjustment, turn adjusting nut in one notch minimum or two notches maximum from the just free position, tighten bearing cap nuts and replace adjusting nut lock.

NOTE—Mark position of adjusting nut before dismantling or removing differential assembly and install in same positions so that ring gear backlash will not be changed.

Ring Gear Backlash Adjustment. Check backlash by rocking ring gear back and forth with pinion held stationary. To adjust backlash, back off one differential bearing adjusting nut and turn up opposite nut equal amount (to avoid disturbing bearing adjustment).

BUICK SPIRAL BEVEL TYPE

Used On:

MODEL 40 (1934-35-36)

MODEL 60 (1936)

MODEL 80 (1936-37)

MODEL 90 (1937)

TYPE:—Spiral bevel gear, semi-floating type with torque tube drive. Pinion integral with shaft and is splined and pinned to propeller shaft within torque tube. Pinion shaft mounted on double row ball bearing (front), roller bearing (rear—except 40 '34-35 which has single row ball bearing). Bearings mounted directly in housing with spacer between them and held in place by setscrew and locknut on side of housing which engages tapered hole in spacer. Differential assembly carried on ball bearings with adjusting nuts under bearing caps on carrier.

SERVICING:—Gear Adjustment. Check pinion setting (see instructions below) or paint gears to check mesh. Backlash should be .006-.010" for new gears or slightly more for worn gears. To adjust, back off one differential bearing adjusting nut, tighten opposite nut equal amount (see differential bearing adjustment below).

Axle Replacement. Axles retained by 'C' washer (40), nut and cotter pin (others) at inner end in differential case. To remove axle, take out locking pin, withdraw differential pinion shaft, remove spacer block, pull axle in and remove 'C' washer or take off nut, then push axle out. Shafts formed with integral flange at outer end to which brake drums and wheels attached.

NOTE—Spacers should be selected to give axle shaft endplay of .000" minimum, .008" maximum. Model 40 spacers ground on two sides to provide minimum and maximum production limit sizes. Spacers for 60, 80, 90 are furnished std., and .020" oversize.

Propeller Shaft Front Bearing (90 1937)—Consists of a bronze bushing in a removable cast-iron sleeve seated against a shoulder in the forward end of the torque tube and held by a setscrew. Bushing assembly may be removed from rear end of torque tube after setscrew taken out. NOTE—Plug provided in torque tube at this bearing for lubrication. Use transmission oil.

OVERHAUL:—Pinion and shaft must be removed from propeller shaft by cutting off head of pin and disengaging splines to remove bearings. Use new pin when reassembling.

Pinion Bearing Assembly:—Bearings should be press fit on pinion shaft. Tighten pinion bearing nut securely and stake in place. When installing assembly in housing tap outer race of rear roller bearing forward against collar to prevent possibility of race rubbing on pinion. See that adjusting shims installed ahead of front bearing and tighten pinion adjusting setscrews securely.

Pinion Setting:—Standard setting shown in table below (Dimension 'A' distance from rear face of pinion to nearest face of differential bearing boss in carrier, 'B' distance to ring gear center line), add (plus figure) or subtract (minus figure) the amount in thousands stamped on rear face of pinion. Use approved pinion setting gauge (with master test fixture to check gauge '0' point). Set gauge for each model, install gauge in differential carrier (differential assembly removed) so that locating rings seat in side bearing holes, add or remove shims located ahead of front pinion bearing in housing until pinion location correct, tighten adjusting setscrews and locknuts securely. Adjusting shims furnished .012", .015", .018", .060" and 3/16" thick.

Car Model.	'A' Pinion Setting	'B'
40(1934-35-36)	1.894"	3.4688"
60, 80 (1936)	1.947"	3.7187"
80, 90 (1937)	1.947"	3.7187"

Differential Bearing Adjustment:—Same as for other Buick models. See preceding article for complete instructions. Setting should be 1 notch minimum, 1½ notches maximum, tight or turned in from the just free position.

BUICK HYPOID TYPE

Used On:

MODELS 40, 60 (1937-38-39)

MODELS 80, 90 (1938-39)

TYPE:—Hypoid gear, semi-floating type with torque tube drive. Pinion integral with shaft and is splined and pinned to propeller shaft within torque tube. Pinion shaft mounted on double row ball bearing (which takes thrust in both directions) at front, roller bearing at rear. Bearings mounted directly in housing and front bearing locked in place by collar which is held in housing by tapered setscrews. Locking collar serves as spacer between bearings on Models 80, 90 (On Models 40, 60 rear bearing outer race seats against shoulder in housing). Differential side bearings are Hyatt self-aligning (barrel) roller type with adjusting nut under bearing cap on carrier at each bearing.

Model 40, 60 ('39). Torque tube built in two sections, rear section extending only to universal joint ball which is mounted on frame at rear of X member. Torque tube struts are not adjustable (bolt holes at forward end must be drilled in new torque tubes when installed). Pinion shaft front bearing has been increased in size and has one shielded side which must face forward. No pinion bearing washer (between bearing and seat in torque tube) is used as new type heavier pinion setting shims used which make this washer unnecessary. New type roller bearing is used at forward end of propeller shaft. Rear axle gears are not interchangeable with 1938 parts but rear wheel bearings, oil seals, axle shafts, and bearings (except double row pinion bearing) are interchangeable.

NOTE—Special removal and installation instructions required to maintain alignment of engine and rear axle on these models. See Buick Shop Notes in 'M' section for complete instructions on re-alignment.

BUICK HYPOID TYPE CONT.

Model 80, 90 ('39). Torque tube changed slightly (cast in differential carrier housing instead of being riveted) and strut bolts must be drilled in new torque tubes when installed. All axle parts, except for torque tube and axle housing interchangeable with 1938 parts.

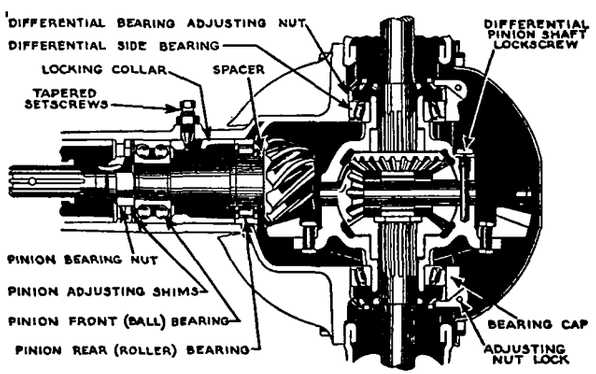
SERVICING:—Gear Adjustment. Check pinion setting (see instructions below) or paint gears to check mesh. Backlash should be .006-.010" for new gears (slightly more for worn gears). Total lash measured at outside diameter of tire (one wheel jacked up) should not exceed ¾". To adjust backlash, back off one differential side bearing adjusting nut, tighten opposite nut equal amount (see Differential Bearing Adjustment below).

Axle Replacement:—Axles retained by 'C' washer at inner end (all models). To remove axle shaft, take out locking pin, remove differential pinion shaft and spacer block, push axle in and remove 'C' washer at inner end within differential side gear, pull shaft out (wheel bearing inner race is press fit on shaft and will be removed with it, outer race is light press fit in axle housing and can be removed with J-528-B puller).

Axle Shaft Endplay. Controlled by spacer block between axle ends in differential case and should be .000" minimum; .008" maximum. Four block sizes used in production, replacement spacer block ground on four sides to furnish minimum and maximum production sizes. (one size each for 40-60 and 80-90). **Important**—New bronze side gear thrust washers should be installed back of differential side gears before new axle shaft spacer block installed to correct endplay (not possible to secure correct endplay of .008" maximum with spacer block only if thrust washers worn).

NOTE—On '38-39 cars, right hand axle shafts are ¾" (40,60), 15/16" (80, 90) longer than left hand shafts and shaft not interchangeable. Shafts also not interchangeable with those used on 1937 models.

Propeller Shaft Front Bearing (40, 60 1939). The sleeve on the shaft (bearing race) is light press fit on shaft and will not be disturbed by shaft removal (will come out with shaft leaving bearing in torque tube. To dismantle bearing for servicing, remove propeller shaft, take out front oil seal, front bearing spacer, bearing roller assembly, bearing outer race, rear bearing spacer, and rear oil seal in order. When reassembling, use new oil seals, and remove bearing inner race sleeve from propeller shaft before installing shaft (oil seal will be damaged if shaft installed with sleeve in place).



Propeller Shaft Front Bearing (80, 90):—Consists of bronze bushing in cast-iron body seated against shoulder at forward end of torque tube and held in place by setscrew. Shaft clearance in bushing should be .012-.016".

NOTE—Plug provided in torque tube at this bearing for lubrication. Use 10-W engine oil only.

OVERHAUL:—Disassembly. Mark differential bearing adjusting nuts and bearing caps before disassembling. To remove pinion and shaft assembly, loosen locknuts and take out taper setscrews on side of housing. To remove pinion from propeller shaft, file off head of pin, drive pin out, use tool J-862-A to pull pinion from propeller shaft (this tool used also to install pinion). Pry up staked portion of pinion bearing nut, remove nut, dismantle bearing assembly.

Pinion Bearing Assembly:—Bearings should be press fit on pinion shaft (use tubing of correct diameter to engage inner race when pressing bearings on shaft). No inner race used for rear pinion bearing (outer race and rollers furnished as assembly) and spacer must be installed between rollers and pinion to prevent creeping. Tighten pinion bearing nut securely and stake into notch on shaft. Assemble pinion to propeller shaft riveting pin to prevent it loosening in service (see propeller shaft straightening below). When installing assembly in housing, tap outer race of rear bearing in against shoulder in housing (40, 60), bearing collar (80, 90), to prevent race rubbing on pinion. Make certain that adjusting shims installed ahead of front bearing and tighten setscrews and locknuts securely.

Pinion Rear Bearing (40, 60)—With some optional gear ratios, pinion is larger in diameter than rear bearing and special forked tool must be inserted between pinion and bearing so that pinion bearing can be driven in place (use bronze driving block to drive on face of pinion), remove tool after bearing seated in carrier bore.

Propeller Shaft Run-out. With propeller shaft supported on 'Vee' blocks at point just behind splines at forward end and rear pinion bearing outer race at rear, run-out on tubular shaft 1½" back of forward end should be less than .010", run-out at center of tubular shaft should be less than .015", run-out at front pinion bearing outer race should be less than .002". With these limits, run-out at universal joint end (before joint connected) should be less than 1/16" (greater run-out will cause universal joint bushing wear and possible oil leak from transmission).

Ring Gear Installation:—Ring gear and pinion furnished only in matched sets. To remove old gear, drill out rivets with ⅜" drill on differential case flange side (cutting rivets with chisel will distort case). Case run-out must be less than .002" with gear removed. Bolt ring gear in place with 5/16" bolts in alternate holes, then install opposite rivets between bolts, remove bolts and finish riveting. Run-out at back of gear must not exceed .006".

Pinion Setting:—Pinions marked on rear face by etched figure and plus or minus sign for necessary correction of standard setting (micrometer reading for standard settings given below). Plus sign indicates that pinion should be moved away from axle shaft center-line, minus sign toward axle center-line, the amount (in thousandths) of the figure following this plus or minus sign. Use J-681-A Pinion Setting Gauge, check micrometer '0' on test fixture, set micrometer to standard figure (as given in able below for each model), turn micrometer pointer in (for plus figure) or out (for minus figure) the amount stamped on face of pinion, install gauge in axle housing (with differential carrier removed) seating gauge rings on differential bearing posts, add or remove shims between pinion front bearing and shoulder in housing until micrometer pointer contacts face of adapter installed on pinion (adapter must be used on all hypoid gears). Shims furnished .011", .012", .015", .018", .060" and 3/16" thick.

1939 Pinion Setting Note—Production pinions are not ground on face and have definite tooth for pinion setting gauge measurements. When using gauge, measure to blank tooth (between tooth which has factory inspection mark of letter and number, and tooth with + or — mark) and again at opposite side of pinion (place adapter on pinion with blank tooth up and then with blank tooth down) and average these two readings to determine shim correction. NOTE—All service pinions have ground face. Above procedure is for original production pinions only.

Pinion Setting Shims ('39 40, 60)—New heavier type shims used between pinion front double-row ball bearing and torque tube seat to adjust pinion for correct mesh (these shims eliminate thrust washer used on previous models). Shims furnished in .001" steps from .010" to .020" thick inclusive (use two shims for greater thicknesses).

Standard Pinion Setting

Car Model	Micrometer Setting
50 (1932-33-34-35)	.649
60 (1932-33-34-35)	.336
80 (1932-33), 90 (1932-33-34-35)	.000
40 (1934-35-36)	.711
60, 80 (1936)	.461
90 (1936)	.305
80, 90 (1937)	.461
40, 60 (1937-38-39)	.379
80, 90 (1938-39)	.203

NOTE—This J-681-A gauge can be used for pinion setting on previous models and standard micrometer readings given for these models above. Use adapter for all models with hypoid gears.

Differential Bearing Adjustment:—Remove adjusting nut locks, mark adjusting nuts, loosen right bearing capscrews 1½ turns, tap cap lightly to free nut, back off right hand nut slowly and note point where bearing race stops turning with nut, mark this new position, return nut to original position and repeat check. Race should stop turning at same point and number of notches nut has been turned is 'notches tight' of old setting. Correct setting is 1-1½ ('37), 2-2½ ('38) notches tight. If bearing did not turn when nut backed off, turn up adjusting nut until bearing starts to turn and note number of notches that bearing was free. If this free setting not caused by bearing wear (lapped free or race turning on hub of case), equalize adjustment by turning each adjusting nut up 1 notch from point where race started to turn. Tighten both bearing capscrews and replace bearing locks.

Ring Gear Backlash Adjustment. When adjusting ring gear backlash, make certain that differential side bearing adjustment not disturbed (back off one nut and tighten opposite nut equally). Check bearing adjustment. If adjusting nuts marked before dismantling, setting nuts up to original marks should give correct ring gear position.

BUICK REAR SUSPENSION

Used On:

MODELS 40, 60, 80, 90 (1938-39)

TYPE:—New type using coil springs with conventional rear axle. Springs retained at top and bottom by steel plates and insulated from frame by rubberized fabric insulator at top. Radius Bar linked to frame and to axle housing on right side controls side movement. Shock absorbers are direct acting type (1938), double acting type (1939).

SERVICING:—No adjustment required except that spring heights ('Trim' dimension) must be correct to insure satisfactory shock absorber action and special directions necessary to remove and replace springs.

Spring Removal:—Disconnect lower ends of shock absorbers at axle bracket, raise rear of car to distend springs, remove bolts in upper and lower spring cups (upper bolt has right hand thread, lower bolt threaded up through spring bracket has left hand thread).

Spring Installation:—Make certain that insulator is in place between top of spring and frame, turn spring cups on bolts so that they are snug in end coils, see that rubber insulator in place on upper bolt, tighten bolts securely.

Trim Dimension (1938):—At curb weight, with full tank of gasoline, distance between spring seat on frame side rail and spring seat on rear axle bracket should be 14" maximum (if this 'trim' dimension greater than 14" shock absorber will be damaged on rebound). Replace spring if incorrect. If spring bottoms excessively under load, install special substitute springs (see Table #1—Special Springs) in matched pairs and check to see that these springs do not exceed 14" trim dimension. **1939 Models**—Check distance between lower face of frame side rail at center-line of rubber bumper and top of axle housing. Distance should be 6¾-7¾ for all models. Replace spring if this trim dimension incorrect.

SPRING SPECIFICATIONS:—Spring part number stamped on flat of end coil and springs paint-marked on first coil for identifications as follows:

1938 Standard Springs

Model	Part No.	Color	Length
40C, 41, 44, 47, 48	1304057	Yellow	18¾"
46, 46C, 46S, 66C, 66S	1304583	Blue	19¼"
60C, 61, 67, 68	1304584	Red	19"
80C, 81, 81F, 87	1304585	Orange	18¾"
90, 90L	1304586	Green	18¾"
91	1305032	White	18½"

1939 Standard Springs

Model	Part No.	Color Mark	Length
39-41, 41C, 48	1310363	Brown	20⅛"
39-46, 46C, 46S	1310361	Blue	20⅛"
39-61, 61C	1310362	Red	20⅛"
39-66C	1310363	Brown	20⅛"
39-66S	1310361	Blue	20⅛"
39-80C, 81, 81C, F, 87	1309893	Orange	20¼"
39-90, 90L	1308803	Green	20¼"
39-91	1309892	White	19⅞"

Heavy Duty (Overload) Springs:—Where springs bottom excessively or where heavy loads are customarily carried, heavier rear springs may be installed on all models as follows:

1938 Heavy Duty Springs

Table #1—For cars where trim dimension less than 14" and when spring bottoms excessively with load.
Table #2—For use with trailers or heavy loads in rear compartment (will maintain correct trim with 500 lb. overload on axle).

Model No.	Table #1 Part No.	Table #2 Part No.
40, 60 Coupes	1304057	1305364
40 (others)	1304584	1305364
60 (others)	1304585	1305364
80	1304586(*)	1305365
90	1305365	1305366

(*)—1305364 may also be used.

1939 Heavy Duty Springs

	Front Spring	Rear Springs 200 lbs. Overload	300 lbs.
40 Sedan	1311185*	1306461	1309893
40 Coupe	1311185	1310363	1304584
60 Sedan	1311186**	1304584	1309892
60 Coupe	1311186	1311621	1304584

*—With Spare at rear. No. 1311186 for Fender wells.
**—With Spare at rear. On Fender Well cars, install two steel shims No. 1310413 between spring and insulator at upper end of springs.

NOTE—See Independent Suspension article for special front springs used with heavier rear springs.

CADILLAC—LA SALLE (FIRST TYPE)

CADILLAC V8, ALL SERIES (1932 to 35)
CADILLAC V12, ALL SERIES (1932 to 35)
CADILLAC V16, ALL SERIES (1932 to 37)
LA SALLE V8, ALL SERIES (1932-33)

TYPE:—Spiral bevel, ¾ floating type with torque tube drive (1932-33), Hotchkiss drive (1934 on). Design same except for minor differences due to change in drive. Pinion integral with shaft (splined and pinned to propeller shaft on 1932-33 models, rear universal flange held on shaft by pinion bearing nut on later models). Pinion shaft mounted on double row ball bearing (front), single row ball bearing (rear). Front bearing mounted in adjusting sleeve with shims between sleeve and housing. Differential assembly mounted on roller bearings with adjusting nut at each side under bearing cap.

SERVICING:—On V16 models, complete differential carrier assembly should be returned to factory for service.

Gear Adjustment:—Paint gears to check mesh. Backlash should be .004" minimum, .012" maximum. Adjusted by backing off one differential bearing adjusting nut and tightening opposite nut equal amount. See differential bearing adjustment below.

OVERHAUL:—Pinion Bearing Assembly. On 1932-33 models, disconnect torque tube by taking out capscrews at rear flange on housing (these screws also hold pinion bearing sleeve), disconnect propeller shaft from pinion shaft by taking out pin and disengaging splines. On later models without torque tube, these screws hold bearing sleeve only. To dismantle assembly, take off pinion bearing nut on forward end of shaft. See that spacer installed between bearings and tighten pinion nut securely when reassembling (lock nut to prevent loosening). NOTE—New front double row ball bearing should be used when new gears installed.

Pinion Setting:—Pinion position controlled by shims between front bearing sleeve flange and carrier. When installing new gears, install .075-.090" shim thickness at this point (shims furnished .010", .015", .035" thick), then add or remove shims to secure correct gear mesh.

Ring Gear:—Mounted on differential housing by capscrews. Wire screws to prevent loosening. Ring gear runout installed must not exceed .001-.004" (measure on back face of gear).

Differential Gears:—Bronze thrust washers installed behind pinion and side gears. Pinion clearance on shaft .010" max., backlash between pinion and side gears .020" maximum.

Differential Bearing Adjustment:—Loosen bearing caps slightly, free locking plates, turn adjusting nuts in until pull required to rotate ring gear is 8-10 lbs. measured at rim of gear (hook spring scale on rim of gear, pressure to start gear should be approximately 15 lbs. but 8-10 lbs. should rotate gear after starting).

Ring Gear Backlash Adjustment. Adjust by backing off one differential side bearing adjusting nut and tightening up opposite nut equal amount.

CADILLAC—LA SALLE SPIRAL BEVEL & HYPOID TYPE

CADILAC V8, ALL SERIES (1936 to 39)
CADILLAC V12, ALL SERIES (1936-37)
CADILLAC V16, SERIES 90 (1938-39)
LA SALLE, SERIES 50 (1935 to 39)

NOTE—Manufacturer recommends that Differential Carrier assembly not be dismantled.

TYPE:—Spiral bevel (1935-36-37 models except Cadillac 37-60, LaSalle 37-50), Hypoid gear type (all 1938-39 models and 37-50, 60) with Hotchkiss drive. differential housing is barrel type with provision made to remove and install pinions and side gears through right hand end (case closed by end cap screwed in housing and retained by locking screw or taper locking pin installed from outside of case. Differential assembly mounted on taper roller bearings (bearing cups seated in ends of differential housing) with threaded sleeve type adjusting nut at outer end of each bearing. Adjusting sleeves are locked by clamp bolt in each bearing post. Several types of pinion mountings used as follows:

Spiral Bevel Type Pinion Mounting—Pinion mounted on double row ball bearing (front), roller bearing without inner race (rear). Assembly retained in housing by spacer collar bearing against front bearing outer race and retained by taper locking screws in housing. Rear roller bearing outer race is seated against rear face of spacer collar.

1937 Hypoid Pinion Mounting—Same as for Spiral Bevel Pinion (above) except that rear roller bearing race seated against shoulder in housing and spacer collar shortened so that it does not extend beyond locking screws.

1938 Hypoid Pinion Mounting—Pinion mounted on taper roller bearings seated directly against shoulders in housing with spacer on shaft between bearing cups (see illustration). Bearing adjustment by shims between spacer and front bearing cup.

1939 Hypoid Pinion Mounting—Same as 1938 type (above) except that compressible type steel spacer used and bearing adjusting shims omitted. Bearings are pre-loaded by turning up rear universal joint yoke nut which compresses or buckles the spacer. CAUTION—Loosening or tightening this universal joint yoke nut will change pinion bearing setting.

SERVICING:—Differential carrier assembly should be serviced by replacement. Manufacturer recommends that axles not be dismantled.
CAUTION—Do not loosen rear universal yoke nut which will disturb pinion bearing pre-loading setting.

CHEVROLET SPIRAL BEVEL PASSENGER CAR & TRUCK TYPE

Used On:
STANDARD, CC ('33), DC ('34), EC ('35), FC ('36)
MASTER, MODELS CA ('33), DA ('34), EA, ED ('35), FA, FD ('36).
HALF-TON, ¾ TON, ¾ TON SPECIAL, 1 TON TRUCK MODELS (1933 TO 1939)

NOTE:—Axle used on each model may be identified by letter prefixed to axle number stamped on carrier as follows:

Truck Model	Axle Ratio	Prefix Letter
GC, HC, HD, JC, JD Std.	4.11-1	B (or none)
GC, HC, JC Optl.	3.82-1	F or FB
HE, JE Optl.	4.11-1	T or TB

TYPE:—Spiral bevel, semi-floating type with torque tube drive. Pinion integral with shaft which is splined and pinned in bushing in rear end of tubular propeller shaft. Pinion shaft mounted on double row ball bearing at front (which takes thrust in both directions), roller bearing at rear (for radial load only, no inner race with this bearing). Differential assembly mounted on ball bearings with adjusting nut under bearing caps on outer ends.

SERVICING:—Gear Adjustment. Paint gears to check mesh. Backlash should be .004-.006" (1933-38), .006-.010" ('39). Adjust by backing off one differential bearing adjusting nut and tighten opposite nut equally. See Pinion Setting and Differential Bearing Adjustment below.

Axle Replacement. Wheel mounting flange integral with axle shaft. Wheel bearings pressed in axle housing. To remove shafts, take off differential case cover, take out differential pinion shaft screw, pull out pinion shaft, remove spacer block, pry axle in and remove retaining 'C' washer (recessed in side gear), pull axle shaft out. When replacing axle see that 'C' washer seated in gear. Check endplay.
NOTE—On 1933-35 models, brake drum held on axle flange by wheel mounting bolts and cannot be removed separately (drive out bolts to remove drum with axle out of car). When installing drum, use new bolts, coat gasket between drum and oil deflector with shellac or paint on both sides to insure oil-tight joint, line up extra hole in brake drum and gasket with oil pocket in deflector and notch in axle shaft flange, install bolts and peen shoulder into countersink in axle flange so as to rivet these parts together. On 1936 and later models, drum mounted on outer face of axle flange and held by wheel bolts (with wheel installed), two screws only (wheel removed). Drum can be removed separately without disturbing axle by taking out these screws. See that hole in drum and axle flange are lined up. Deflector and wheel bolt installation same as for earlier model above.

Axle Shaft Endplay. Controlled by spacer block and should be Free Fit to .014" max. Spacers furnished in three sizes (one block for two larger sizes, obtained by turning block which is ground on all four sides) as follows: Std. Models (1933-36) 1.0105", 1.0195", 1.0285". Master (1933-36) & All Trucks—1.1485", 1.1575", 1.1675".

Propeller Shaft Front Bearing. Consists of a bushing and leather oil seal seated against a shoulder in the housing at forward end of torque tube and an additional bushing (All Master and Truck models, Standard Model 1936 only) which engages the stub shaft of the universal joint. Bushings are doweled in place. Replace bushings when clearance exceeds .010". To remove bushings (front bushing must be removed to take out rear bushings), drill out dowel pins, drive bushing out with chisel through slot in housing, remove packing washer and retainer. Drive new bushing in until packing washer retainer seats against shoulder in housing, drill hole in bushing for new dowel pin, drive dowel in and prick-punch dowel head to prevent it loosening in service.

Front Propeller Shaft Assembly (HD, HE only). Same type as used on 1½ ton truck model except that bushing at forward end of housing engages front universal stub shaft (instead of propeller shaft. See 1½ ton truck axle article (following).

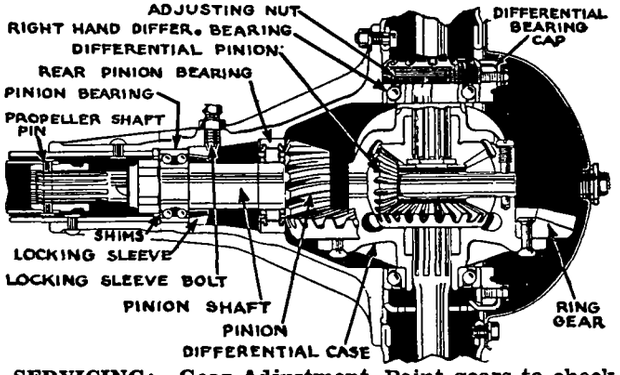
OVERHAUL:—Pinion Bearing Assembly. To dismantle assembly after propeller shaft removed from torque tube housing, loosen pinion bearing locknut, cut off head of rivet at rear end of propeller shaft, drive pinion shaft out of propeller shaft splines. Remove bearing locknut and press bearings off shaft. Front double row bearing should have no perceptible endplay (new bearings may have .001" tightness or drag). Rear ball bearing endplay .004-.006". Press bearings on shaft, asemble locking ring in front of rear bearing (roller bearing type only), install locking sleeve (ball bearing type) with tapered side toward pinion, use new locknut. Tighten locknut after pinion shaft riveted to propeller shaft and lock nut by peening metal into shaft keyway with a chisel. Maximum allowable runout at double row bearing .002".

Pinion Setting:—Pinion position controlled by shims in housing in front of front double row bearing. Standard shim assembly consists of one .188" spacer, one .015" and one .018" shim. With correct setting ring gear and pinion teeth will be flush at toe end of teeth. Vary the shim thickness as required to correct pinion position between .030" and .036" (two .015" or two .018" shims). Drive assembly into housing to seat bearings against shims, turn up three locking screws evenly to engage collar or locking sleeve and tighten securely, tighten locknuts.

Differential Bearing Assembly:—Install differential side bearings with the thick side of the inner race (marked 'thrust here') toward the differential case.

Differential Bearing Adjustment:—Differential ball bearings (Difrax type) have .018" max. sideplay (new). To adjust bearings, with differential bearing cap screws sufficiently tight to flatten lockwashers, turn adjusting nut in until snug, then turn nut in additional 1-1½ notches (1933-36), 1-2 notches ('37 & later) for correct bearing pre-load or tension install locks and tighten bearing cap screws securely.

Ring Gear Backlash Adjustment. When installing differential assembly, turn left hand adjsuting nut in until all backlash taken up between ring and pinion with ring gear turned so that high spot is at pinion (max. allowable runout .007"), then back off adjusting nut one notch. Adjust differential bearings by turning in right hand adjusting nut as directed above. This should give correct backlash .004-.006" (1933-38), .006-.010" (1939).



Ring Gear Replacement:—Ring gear riveted on differential case flange. To remove gear, cut off rivet heads on back of flange, drive rivets out with punch. When riveting new ring gear, install opposite rivets alternately using four bolts to hold gear on case. Run-out at back face of ring gear must not exceed .007" when installed.

CHEVROLET HYPOID TYPE (PASSENGER CARS)

Used On:
MASTER DELUXE, GA ('37), HA ('38), JA ('39)
MASTER PASS. CAR & SEDAN DELIVERY, GB ('37), HB ('38), JB ('39).

NOTE:—Master Deluxe axles (4.22-1 ratio) marked by Prefix 'B' (or no prefix) on axle number stamped on differential carrier. Master axles (3.73-1 ratio) marked by prefix 'C' or 'CB' on number.

TYPE:—Hypoid gear, semi-floating type with torque tube drive. Pinion integral with shaft which is splined and pinned in bushing in rear end of tubular propeller shaft. Pinion shaft mounted on double row ball bearing (front) which takes thrust in both directions, roller bearing (rear) which takes radial load only. Rear bearing does not have inner race and is assembled directly on shaft. Differential assembly mounted on 'barrel' type roller bearings with adjusting nut under bearing cap at outer end of each bearing.

SERVICING:—Gear Adjustment. Paint gears to check mesh. Backlash should be .004-.008". Adjusted by backing off one differential bearing adjusting nut and tightening opposite nut equally. See Differential Bearing Adjustment and Pinion Setting below.

Axle Shaft Removal. Remove wheels, take out two machine screws mounting brake drum on axle shaft flange and remove drum. Remove axle housing rear cover, take out pinion shaft screw, withdraw pinion shaft, lift out axle shaft spacer block. Push shafts in toward center of axle, remove 'C' washer at inner end within differential side gears, withdraw axle shaft. When replacing shaft, check endplay.
NOTE—Axle shafts are of unequal length. Install longer shaft on right hand side.

Axle Shaft Endplay. Controlled by spacer block at inner end of shaft and should be Free to .014". Spacers furnished in three sizes (one block for two larger sizes, obtained by turning block which is ground on all sides): 1.0105", 1.0195", 1.0295".
1939 Spacer Blocks—Furnished in four sizes as follows: 1.0105", 1.0195" & 1.0295" (one block, ground on all sides), 1.0345" (new size).

New Axle Shaft Installation. Wheel hub bolts are press fit in axle flange and must be installed in new shafts (these bolts hold oil deflector assembly on flange). Coat new gasket with heavy shellac or paint, install gasket and oil deflector on flange lining up oil holes (extra center hole of three closest together should be lined up with notch in flange, oil pocket in deflector should also line up with this notch), insert special wheel bolts and force heads

CHEVROLET HYPOID CONT.

down to deflector, peen shoulder on bolts into countersink around bolt holes in flange (this is very important). Check shaft endplay.

Propeller Shaft Front Bearing. Consists of a bushing and leather oil seal seated against shoulder in housing at forward end of torque tube, and an additional bushing at the extreme end of the torque tube which engages the stub shaft of the universal joint. Both bushings are doweled in place. Replace bushings when clearance exceeds .010". To remove bushings (front bushing must be removed to take out rear bushing), drill out dowel pins, drive bushings out from rear end of torque tube. Install oil seal with open end of leather toward front, insert rear bushing, use J-968 bushing driver to seat bushing and oil seal firmly. Drill new dowel hole in bushing (being careful not to break through wall), coat dowel with Permatex to prevent oil leaks, peen dowel in place. Install new front bushing in same manner, using arbor to prevent damage to bushing while drilling dowel hole and installing dowel (bushing has very thin wall).

OVERHAUL:—Pinion Bearing Assembly. To remove assembly from torque tube, loosen locknuts and take out retaining screws on side of housing, withdraw assembly from torque tube. To dismantle assembly, drill out head of rivet pin in propeller shaft, loosen pinion bearing locknut, disassemble pinion from propeller shaft. Use J-996 pinion bearing remover to press double row ball bearing from pinion shaft, remove locking sleeve or bearing retaining collar, remove lock ring from pinion shaft, take off roller bearing. Front double row ball bearing must have no perceptible endplay (new bearings may be .001" tight or have some drag). Assemble in reverse order making certain that lock ring installed on shaft ahead of roller bearing (to prevent rollers creeping) and that locking sleeve installed with beveled edge toward pinion. Tighten bearing locknut securely and stake nut into slot in shaft. Use new rivet pin when assembling pinion and propeller shaft and rivet both ends of pin securely. Make certain that pinion setting shims installed in housing (see Pinion Setting below), insert propeller shaft assembly and drive it down to seat bearings (use drift in hole in end of pinion, do not drive on pinion teeth). Make certain that locking sleeve down against bearing, install the three tapered lockscrews, tighten screws evenly and securely, tighten locknuts.

Pinion Setting:—Pinion position controlled by shims installed in housing ahead of front bearing. Standard assembly .033" shim thickness (one .015" shim, one .018" shim) and should be used for new gears. Shims furnished .015", .018" thick and shim pack can be varied from .030" to .036".

Differential Bearing Assembly:—Use special puller to remove bearings from differential case hubs (notches provided in case for puller so that pressure applied to inner races only). Use J-994 bearing replacer to install bearings. When installing differential assembly in carrier (third member), make certain that marks on bearing caps and carrier line up.

Differential Bearing Adjustment:—With carrier or third member assembly out of axle housing, tighten differential bearing cap screws until lockwashers are just flattened, turn right hand adjusting nut up until it is just snug, then turn nut additional 1-2 notches to locking position, tighten bearing cap screws securely and install adjusting nut locks.

Ring Gear Backlash Adjustment. To set up differential assembly for correct backlash when installing assembly in carrier, turn left hand adjusting nut in slowly until all balcklash between ring gear and pinion taken up (revolve ring gear while making this adjustment), then back adjusting nut off one notch. Adjust differential bearings by turning right hand adjusting nut as directed above. This setting should give correct backlash of .004-.008". If backlash not correct, back off one adjusting nut, turn up opposite nut equal amount.

Ring Gear Replacement:—Run-out of differential case flange must not exceed .001" with ring gear removed. When installing ring gear, use guide pins in alternate bolt holes to position gear while bolts are being installed, use new lockwashers under bolt heads, tighten all bolts evenly and securely and lock with wire. Ring Gear run-out .004" maximum.

CHEVROLET FULL-FLOATING TRUCK TYPE

Used On:

1½ TON TRUCK, MODELS O ('33), P ('34), Q ('35), R ('36), S ('37), T ('38), VA TO D ('39)

CAB-OVER-ENGINE TRUCKS, VE TO H (1939)

TYPE:—Spiral bevel, semi-floating (1933-34-35), full floating (1936 on) with torque tube drive. Pinion integral with shaft and straddle mounted on double row ball bearing (front), single row ball bearing (rear). Differential assembly mounted on ball bearings (1933-35), barrel type roller bearings (1936 on) with adjusting nut under bearing cap on each side. Thrust button located behind ring gear at pinion. Differential assembly mounted on ball bearings with adjusting nut under bearing cap at outer end of each bearing.

SERVICING:—Gear Adjustment. Pinion not adjustable. Backlash should be .006-.010" (see Differential Bearing Adjustment below).

Axle Shaft & Wheel Bearing (Semi-floating (type). Double row ball bearing pressed on axle shaft against shoulder. No adjustment required. To remove axle, take out capscrews in bearing retainer on outer end of axle housing, use puller to remove shaft and bearing.

Axle Shaft & Wheel Bearing (Full-Floating Type). Barrel type taper roller bearings used. To remove axle shaft, take out 8 capscrews in axle shaft flange at outer end, install two screws in tapped hole in flange (between regular screw holes) and turn these screws up evenly to loosen shaft. To adjust wheel bearings, remove axle shaft, remove locknut and star lock washer, turn inner adadjusting nut up tight and then back off to nearest tank of lock washer, install lock washer and locknut, bend lock washer tangs into notches on both nuts. When installing axle shaft, make certain that vellumoid gasket on inner face of flange is in good condition, use new soft steel locks under axle capscrews (axle lubricated by oil from differential case, gasket prevents leaks at hub, locks prevent leaks around mounting screws).

Wheel Bearing Adjustment—Wheel should be removed (permits more accurate bearing adjustment). Use special wrench J-870 to turn adjusting nut and tighten nut moderately tight while turning the hub (no spring in races and nut will come to definite stop under normal tension). After installing lock and locknut make certain that hub turns freely.

Wheel Bearing Assembly. No spacer used, inner bearing outer race seated against shoulder in hub, inner race seated against shoulder in axle housing, outer bearing outer race seated against snap ring in hub, inner race positioned by adjusting nut. Install outer bearing first, pressing inner race and roller assembly and outer race (thin edge down) into hub with special replacer J-872-1 until outer race just clears snap ring groove, then install snap ring in groove in hub and use special driver J-872-3 through capscrew holes in end of hub to drive outer race back in positive contact with snap ring. Install inner bearing outer race (thick edge down) in hub using driver J-872-4, then install inner race and roller assembly. Press oil seal in place in arbor press using replacer J-872-2, lock seal in place by prick-punching at three points on rim.

NOTE—Oil slinger in axle housing must be installed with special replacer J-973 (which pilots on housing) to insure correct alignment with slinger in hub.

Rear Propeller Shaft Front Bearing. Consists of a bronze bushing, packing washer and washer retainer in forward end of torque tube and retained by dowel pin in housing. Replace when clearance between shaft and bushing exceeds .010". To remove, drill out dowel, drive bushing out with chisel inserted through slot in housing. Install new bushing and packing assembly, then drill bushing in line with dowel hole, install new dowel and lock by prick-punching edge of housing.

Front Propeller Shaft Assembly. Consists of short front shaft and intermediate universal joint assembly. To dismantle assembly, remove rear universal joint by taking out capscrew in rear end of front shaft, take out snap ring holding ball bearing in front shaft housing, withdraw shaft and bearing assembly, press bearing from shaft. Bushing in forward end of shaft housing removed and installed in same manner as rear propeller shaft front bushing (above).

OVERHAUL:—Pinion Bearing Assembly. Pinion shaft and propeller shaft splined and pinned in connecting sleeve. To dismantle, remove rivet in propeller shaft, use special tool and push sleeve off propeller shaft, then remove rivet in pinion shaft and press off sleeve. Use new rivets when reassembling. Bearings are press fit on pinion shaft. Rear single row ball bearing endplay .004-.006" new. Retained on pinion shaft by locking ring. Front double row ball bearing should have no endplay (.001" drag permissible when new). Tighten pinion shaft nut securely and stake in place by peening metal into shaft keyway.

Propeller Shaft Run-out. After assembling pinion and propeller shaft assembly, mount on 'Vee' blocks at ground surface on shaft (at rear of splines) at forward end, and at double row ball bearing at rear end. Maximum run-out for assembly is as follows: .003" at front single row bearing, .010" at finished part of propeller shaft in front of rear splines, .015" at center of propeller shaft (unfinished portion), .005" at extreme front end of propeller shaft. Straighten assembly if run-out exceeds these figures.

Pinion Setting:—Pinion non-adjustable. Bearing should be seated against shoulder in housing and is retained by torque tube flange.

Differential Bearing & Backlash Adjustment:—Adjusted in same manner as on passenger car models (see preceding article). Left hand adjusting nut should be backed off 2 notches from tight position to secure correct backlash of .006-.010". Right hand

CHEVROLET FULL-FLOATING TYPE CONT.

nut should be turned in 1½-2 notches from the snug position for correct bearing pre-load.

Differential Bearing Assembly. Bearings are press fit on differential case hubs. Use special puller to remove bearings applying pressure to inner race only (bearings will be damaged if pressure applied to outer race when removing or installing bearings).

Ring Gear Servicing:—Ring gear furnished riveted to differential case (not serviced separately). When installing ring gear, make certain that marks on differential case and cover line up. Tighten the bolts in cover evenly and lock with wire. Check ring gear run-out with differential bearings installed on case. Run-out measured on back of ring gear must not exceed .007".

Ring Gear Thrust Pad Adjustment. Replace thrust pad if bronze tip is worn. To adjust, loosen locknut on thrust pad screw (on left hand side of axle housing), turn screw in until thrust pad contacts back of ring gear, then back screw off 1/12 turn and tighten locknut. With correct adjustment clearance between thrust pad and ring gear should be .005-.010".

CHEVROLET TWO-SPEED (DOUBLE REDUCTION) TRUCK TYPE

Optional Equipment On:
CHEVROLET, ALL TRUCK MODELS (1939)

TYPE:—Double reduction type with conventional ring and pinion gear and second gear reduction consisting of a helical gear on the right gear shaft meshing with a larger gear on the differential case (ring gear mounted on short separate shaft in front of differential case and axle shafts). Two speed feature consists of a duplicate set of the double reduction gears with a shifting sleeve between the gears on the ring gear shaft so that either high or low speed set of gears can be engaged at the will of the operator (gears are constant-mesh type and free to revolve on shaft, one gear at a time is locked to the shaft by the shifting sleeve). Three spring-loaded poppet balls are located within the shifter sleeve to maintain its position and an additional lock pawl is located under the shift lever on the axle housing. This lever is linked to auxiliary shift lever in cab by a combination rod and cable linkage.

SERVICING:—**Gear Adjustment**—Paint gears to check mesh. Pinion position controlled by shims. Backlash should be .006-.012". Controlled by shims at bearing caps on ends of double reduction (ring gear) shaft. See Pinion Setting and Double Reduction Shaft Bearing Adjustment below.

Axle Shaft & Wheel Bearings—All servicing operations same as for regular Full-floating truck axle (see preceding article) except that studs and conical locking sleeves used to retain axle shaft flange on wheel hub. To remove shafts, take off nuts on studs, install two 7/16x14" capscrews in extra holes in axle flange and turn screws up evenly to loosen axle, being careful not to lose locking sleeves.

OVERHAUL:—**Disassembly**—Take out capscrews retaining torque tube on pinion cage, remove torque tube. Mark differential bearing caps and adjusting nuts with punch to insure reassembly in exact same positions, remove tie wire, adjusting nut locks, bearing cap bolts, remove differential assembly from carrier. Take out pinion cage and propeller shaft assembly retaining nuts, remove assembly (two tapped holes provided in cage flange for removing tight cages) using extreme care not to lose shims under cage (these shims control pinion mesh). Remove shifter lever retaining nut and lockwasher, remove lever, being careful not to lose woodruff key and pawl, remove shaft bushing (raise bushing with screwdriver inserted through notch in carrier). Take off nuts and lockwashers on double reduction shaft bearing caps, remove bearing caps using extreme care not to lose shims under caps which control bearing adjustment and ring gear backlash (if necessary, use short bar between back of ring gear and carrier to remove left bearing cap which is piloted in carrier). Remove double reduction shaft assembly by sliding it toward left and pulling ring gear to rear so that assembly can be threaded past differential bearing supports. Remove shifter yoke, tap right hand bearing outer race out of carrier with soft drift punch.

Propeller Shaft & Pinion Assembly:—To disassemble, cut off coupling rivet heads with chisel, drive out rivets, use special press to separate pinion from coupling. Raise pinion bearing locknut edge, remove locknut and thrust washer, press pinion out of bearings toward rear. To remove bearing outer races, use Front Wheel Bearing Outer Race Driver. NOTE—Pinion cage serviced with front and rear bearing outer races pressed in place. To reassemble, lubricate bearing races, install pinion and rear bearing in cage, press front bearing race assembly on shaft until slight drag felt when cage is turned. Install thrust washer, bearing nut, lockplate, and locknut. Adjust bearings by turning bearing nut until cage can be turned with slight drag, tighten locknut and bend lock plate tangs over both nuts. Install propeller shaft and coupling, install new rivets in coupling. Use new gasket and same shims removed with cage and install cage on carrier, being careful to line up oil holes in gasket and shims with hole in case (top right side).

Double Reduction Shaft Assembly:—To disassemble, remove locking rings on bearing nuts, remove nut on end opposite ring gear first, remove bearing, low speed reduction gear, shifter sleeve, detent balls and springs (ball will fly out when sleeve removed, use care not to lose these parts). Clamp shaft in vise (engage clutch gear machined on shaft in copper vise jaws), remove bearing nut on ring gear end of shaft. Install shifter sleeve on shaft so that it bears against high speed reduction gear, install assembly in arbor press (supported on shifter sleeve), press bearing and ring gear off shaft, lift off high speed reduction gear. To reassemble, coat inner bearing surface of reduction gears with light grease, install parts in same order as when taken off (use outer race on bearing rollers when pressing bearings on shaft). Ring gear and bearing should be pressed tightly on shaft and bearing nut tightened securely (see that nut is in locking position so that locking ring can be installed). Install clutch sleeve with tapered face toward ring gear and three tapered teeth in line with detent balls and springs (see Note), make certain that detent balls and springs in place in shaft holes. Press right hand bearing on shaft until clearance between bearing inner race and low speed reduction gear is .012-.015", tighten bearing nut and install locking ring. When installing assembly in carrier, make certain that shifter fork engages shift sleeve, tap right hand bearing outer race in flush with case, use new gasket and install shims removed from under bearing cap when disassembled, being careful to line up cut-outs in gasket and shims with lubrication opening in housing, install bearing caps and tighten securely (inner race is permanently assembled in left hand bearing cap—bearing cap serviced with race installed). Install shifter shaft bushing, cork oil seal, shifter lock spring and pawl, key, shift lever, lockwasher, and nut. Check bearing adjustment (see adjustment instructions below).

Differential & Bearing Assembly:—To disassemble, remove lock wire, take out bolts in case, remove cover, high speed reduction gear, differential spider, pinions, and side gears (low speed reduction gear riveted to case and serviced as an assembly—do not remove this gear). To reassemble, lubricate thrust washers, side gear hubs and pinions, install in case. Install high speed reduction gear on pilot on case with flat side of gear toward case, match 'X' marks on cover and case, install four bolts first and tighten evenly and securely, then install balance of bolts and securely lock with wire. Lubricate differential side bearings, install races, install assembly in carrier, turn adjusting nuts up to marks made before disassembly, tighten bearing cap bolts snug, check bearing adjustment as directed below.

ADJUSTMENT:—**Pinion Mesh**—Check mesh by painting gears. If tooth bearing below pitch line (low contact), pinion is set too deep and should be moved out away from ring gear. If tooth bearing above pitch line (high contact), pinion should be moved in toward ring gear. To adjust, add shims between pinion cage and carrier (to move pinion out), remove shims (to move pinion in). When adjustment completed, tighten all pinion cage mounting bolts securely.

Double Reduction Shaft Bearing & Ring Gear Backlash Adjustment:—With double reduction shaft bearing caps in place and securely tightened, shaft should turn by hand with slight drag. Adjust by adding or removing shims under bearing caps (shims furnished .003" and .005" thick). Then check ring gear backlash.

Ring Gear Backlash Adjustment—Check with dial indicator contacting heel of ring gear tooth. If backlash not .006-.012", adjust by transferring shims from one bearing cap to the other as follows: Move shim from left side to right side to increase backlash, move from right to left to decrease backlash. CAUTION—Total shim thickness must not be changed (these shims control reduction shaft bearing adjustment). Then check shift sleeve adjustment.

Shift Sleeve Adjustment—Check clearance between shift sleeve and each reduction gear pinion with shift lever moved to engage that gear. Should be .015-.025". Adjust by turning eccentric shifter lever stop pins.

Differential Bearing Adjustment:—With bearing cap bolts tightened just snug and adjusting nuts turned up to align marks on nuts and case made before disassembly, check alignment of double reduction pinions. Align gears by backing off one adjusting nut and tightening opposite nut. Then adjust bearings by turning adjusting nut up tight and backing off 1 notch. Tighten bearing cap bolts securely, install adjusting nut locks and lock all bolts with wire.

Control Linkage Adjustment:—Disconnect front adjustable pull rod (at front end) and rear adjustable rod. Unscrew front connector from cable (at front frame bracket) and turn lock on cable so that it is 11/16" from end, replace connector and tighten locknut. Move connector so that front end is 2"

CHEVROLET (TWO-SPEED) CONT.

from front face of bracket. Place hand lever vertical or slightly forward so that clearance between lever and seat cushion is not less than 1", adjust front pull rod length so that clevis pin can just be inserted, tighten locknut at connector. Move shift lever on axle housing to forward or Low Ratio position, see that detent ball engaged in notch, adjust rear pull rod so that clevis pin can just be installed. Shift to High Ratio position and see that detent ball engages notch.

IMPORTANT LUBRICATION NOTE:—When axle dismantled for service and reassembled, remove pipe plug in pinion cage and fill space between pinion bearings with 1 pint of regular lubricant for initial lubrication (no further attention required at this point in service).

Regular Lubricant—Use SAE. No. 90 gear lubricant. Capacity 13½ pints.

CHRYSLER (FIRST TYPE)

Used On:

CHRYSLER ROYAL 8, MODEL CT (1933)
CHRYSLER IMPERIAL 8, CH ('32), CQ ('33)
CHRYSLER CUST. IMPERIAL, CL ('32), CL* ('33)
DE SOTO, MODEL SC (1932)
DODGE SIX, MODEL DL (1932)
DODGE EIGHT, MODELS DK ('32), DO ('33)

TYPE:—Spiral bevel, semi-floating type. Pinion integral with shaft and mounted on taper roller bearings (spacer between front and rear bearings) carried in cage. On Chrysler Models CT, CQ & Dodge Models DK, DO, cage forms cup for both bearings (no separate cups used). Differential assembly mounted on roller bearings with adjusting nut under bearing cap at each side.

NOTE—Pinion shaft assembly may be removed for pinion bearing adjustment (pinion mesh adjusted without removal, See Pinion Setting below) without disturbing differential.

SERVICING:—Gear Adjustment. Paint gears to check mesh. Backlash should be .005-.010" adjusted by backing off one differential bearing adjusting nut and tightening opposite nut equally. See Pinion Setting and Differential Bearing Adjustment below.

Axle Replacement. See that endplay is .0025-.005" for each shaft. Adjusted by adding or removing shims between cup of inner wheel bearing and shoulder in axle housing.

OVERHAUL:—Pinion Bearing Adjustment. Check pinion shaft endplay (before disassembling unit). Should be .0015-.0025" when pushing shaft by hand. Adjust by adding or removing shims between front bearing cone and front face of spacer.

Pinion Setting:—Pinion position controlled by split shims between flange of pinion bearing cage and front face of differential carrier. Adjust pinion by adding or removing shims equally above and below. This adjustment can be made by removing four capscrews and two stud nuts holding cage to carrier.

Differential Bearing Adjustment. Loosen bearing caps slightly, free adjusting nut locks, turn adjusting nuts in until slight drag in bearing, then back off adjusting nuts one notch.

Ring Gear Backlash Adjustment. Back off one adjusting nut, tighten opposite nut equal amount. Check bearing adjustment (above).

CHRYSLER SPIRAL BEVEL TYPE

Used On:

CHRYSLER MODELS

SIX, MODELS CO ('33), CA, CB ('34), C6 ('35).
AIRFLOW 8, MODELS CU ('34), C1 ('35), C9 ('36), C17 ('37)
IMPERIAL 8, MODELS CV ('34), C2 ('35), C10 ('36),
CUSTOM IMPERIAL, MODELS C3 ('35), C11 ('36),

DE SOTO MODELS

SIX, MODEL SC (1933)
AIRFLOW, MODEL SE (1934)
AIRSTREAM, SF (1935), S1 DELUXE (1936)

DODGE MODELS

SIX, DP ('33), DR, DS ('34), DU ('35), D2 ('36)

PLYMOUTH MODELS

SIX, MODELS PC, PD ('33), PE, PF, PG ('34), PJ ('35), P1, P2 ('36).

NOTE—On Dodge Model D2 ('36) some cars equipped with Hypoid gears, others with spiral bevel gears (see following article for Hypoid data).

TYPE:—Spiral bevel, semi-floating type with Hotchkiss drive. The pinion gear is integral with the pinion shaft and mounted on taper roller bearings which seat directly in carrier housing (positioned by spacer on shaft). Differential carrier mounted on roller bearings in housing.

SERVICING:—Gear Adjustment. Paint gears to check mesh. Backlash should be .005-.010" (1933-34-35 models), .006-.008" (1936 models), .006-.010" (1937 models). Adjust by backing off one differential bearing adjusting nut and tightening opposite nut equally. See Pinion Setting and Differential Bearing Adjustment below.

Axle Replacement (Cars with double wheel bearings). See that endplay is .0025-.005" for each shaft. Adjusted by adding or removing shims between cup of inner wheel bearing and shoulder in axle housing.

Axle Replacement (Cars with single wheel bearings). Total endplay between shafts and spacer in differential which transmits thrust from one shaft to the other should be .003-.008". Take up clearance by removing or adding shims equally between rear wheel brake support and each end of axle housing at the flange. Shims furnished .010", .0125" and .030" thick.

OVERHAUL:—Pinion Bearing Adjustment (1933 Models). Check pinion shaft endplay (before disassembling). Should be .0015-.0025" when shaft pushed backward and forward with 1400 lbs. pressure. Adjust by adding or removing shims between front bearing cone and front face of spacer.

(1934-37 Models). Check endplay with dial indicator, if no endplay, disassemble to remove front pinion bearing, add shims at front face of spacer to give free endplay. Reassemble and recheck endplay. Then remove shims to take up all endplay plus an additional .004" (1933-36), or .002" (1937) to give proper 'draw' or 'tension'. Pinion shaft bearings should be .004" (1933-36), .0015-.0025" (1937) tight.

Pinion Setting:—Pinion position controlled by shims between pinion gear and pinion shaft rear bearing. Adjustable from rear only.

Differential Bearing Adjustment (1933 Models):—Adjusted in same manner as early models (see preceding article).

(1934-35-36 Models). Bearings should be 'preloaded' to give .016" 'spread' on bearing supports. To adjust, set up a dial indicator on each side of drive gear with finger resting against one side of each bearing cap. Loosen bearing cap nuts slightly, free adjusting nut locks, then turn each adjusting nut in until total reading of both indicators is .016". Tighten bearing cap nuts, replace adjusting nut locks.

(1937 Models). Tighten bearings to seat cups in place. Then back off adjusting nuts to relieve strain. Tighten nuts slightly to give slight drag when pulling ring gear by hand.

NOTE—Gear mesh should be checked whenever differential bearings adjusted. Also mark bearing cap and adjuster before disassembling to facilitate readjustment of bearings.

Ring Gear Backlash Adjustment. Check with dial indicator. Back off one adjusting nut, tighten opposite nut equal amount. Check bearing adjustment (above).

CHRYSLER HYPOID TYPE

Used On:

CHRYSLER MODELS

ROYAL, MODEL C7 ('36), C16 ('37), C18 ('38)
ROYAL & WINDSOR, MODELS C22 (1939)

SIX, MODELS D2 ('36), D5 ('37), D8 ('38)
LUXURY LINER, STD. & SPEC. D11 (1939)

PLYMOUTH MODELS

SIX, MODELS P3, P4 ('37), P5, P6 ('38)
STD. MODEL P7, DELUXE P8 (1939)

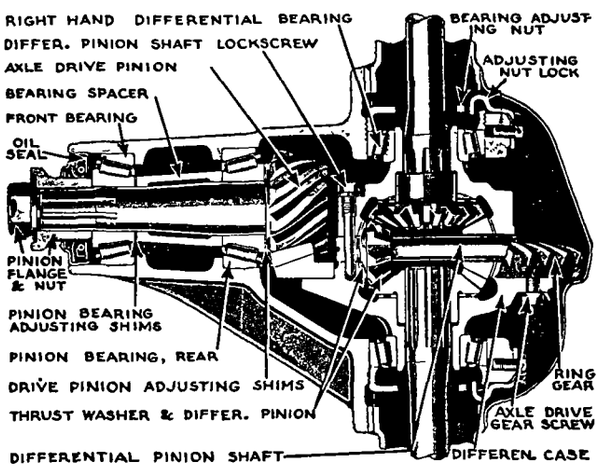
TYPE:—Hypoid gear, semi-floating type with Hotchkiss drive. Pinion integral with shaft and mounted on taper roller bearings seated directly in differential carrier housing. Bearings positioned by spacer on shaft and adjustment controlled by shims assembled between spacer and front bearing. Differential assembly mounted on taper roller bearings with adjusting nut at outer end of each bearing.

SERVICING:—Gear Adjustment. Paint gears to check mesh. Backlash should be .006-.010". Adjusted by backing off one differential bearing adjusting nut and tightening opposite nut equally. See Pinion Setting and Differential bearing adjustment below.

Axle Shaft Replacement. Remove wheel, axle shaft nut, hub and brake drum assembly (use special hub puller C-319), disconnect brake line at wheel cylinder, take out stud nuts and remove oil seal and backing plate, remove and save wheel bearing adjusting shims, use puller C-158 and remove axle shaft and bearing assembly. Use puller C-293 to remove bearing from shaft.

NOTE—If new oil seals installed, soak in thin oil for 30 minutes, roll seal with smooth bar before installing (use special drift C-201 or C-202 to install seals).

OVERHAUL:—Pinion Bearing Adjustment. With pinion assembled in differential carrier, check pinion shaft endplay with dial indicator. If no endplay, take off pinion shaft nut, pull oil seal (see below), remove front bearing, add shims to give positive endplay reading, reassemble and check endplay (universal yoke flange must be in place and nut on shaft tight). Remove shims equal to observed endplay plus .004" (1936), .002" (1937 & later models) shim



CHRYSLER HYPOID TYPE CONT.

thickness which will give required 'draw' or bearing pre-load. Bearings should be .004" (1936), .0015-.0025" (1937 & later models) tight.

Pinion Shaft Oil Seal. Can be removed and installed without removing differential bearing assembly or pinion. To remove, take off nut on end of pinion shaft, remove rear universal yoke flange, use puller C-358 to remove oil seal. Use special drift C-359 to seat oil seal. Seal leather must be soft and pliable (soak in thin oil for 30 minutes.

Pinion Setting:—Pinion position controlled by spacer washers installed on shaft between pinion and rear bearing. Pinion must be removed from carrier housing and bearings removed from shaft to change washer to correct pinion mesh.

Differential Bearing Adjustment:—Bearings should be just tight enough to cause slight drag when ring gear revolved by hand (assembly must not spin). Mark adjusting nuts and bearing caps before dismantling differential assembly to allow replacement in correct position. When installing assembly,

tighten adjusting nuts with sufficient force to seat bearing cups solidly against shoulder in bore, back off nuts, then tighten just enough to cause slight drag (see note for 1936 models), tighten bearing cap nuts securely and install adjusting nut locks. NOTE—On 1936 models, use dial indicator set up at each differential bearing post and tighten adjusting nuts until total spread of both posts is .016" (sum of both indicator readings). This will provide correct bearing pre-load.

Differential Side Gear Assembly—Differential pinion gear shaft retained by pin or lockscrew. Clearance between differential side gears and pinions should be .004-.012" (controlled by thrust washer in back of each side gear). When assembling differential gears make certain that thrust block installed on shaft at center with thrust washer between block and each differential pinion (this thrust block takes thrust of axle shafts).

Ring Gear Replacement:—Ring gear is press fit on differential case and is held in place by bolts or by capscrews (C19, all 7 Pass. models except C20).

Ring Gear Backlash Adjustment. Check with dial indicator. To adjust, back off one differential bearing adjusting nut, tighten opposite nut equally. Check differential bearing adjustment.

DUESENBERG (OWN MAKE)

Used On:

MODEL J, SJ (1932-37).

NOTE:—Rear axle should not require adjustment during the life of the car and manufacturer recommends that no attempt be made to dismantle assembly. Entire axle assembly should be removed from car if service work is required.

TYPE:—Hypoid gear, semi-floating type with torque tube drive. Pinion shaft integral with pinion and mounted on double row ball bearing (front), single row ball bearing (rear). Front bearing mounted in sleeve with pinion adjusting shims between sleeve flange and carrier flange. Pinion shaft is hollow and splined rear end of propeller shaft engages internal splines in forward end. Differential assembly mounted on single row ball bearing (left side), double row ball bearing (right side) with sleeve adjustment for ring gear backlash.

SERVICING:—Gear Adjustment. Ring gear backlash controlled by adjusting nut at right hand differential bearing. See also Pinion Setting below.

Axle Replacement. Complete axle shaft, brake drum, and wheel bearing assemblies may be removed by taking out 8 wheel bearing retainer bolts in axle housing flange on inner face of backing plates. Axles mounted on single row ball bearings which require no adjustment.

OVERHAUL:—Pinion Bearing Assembly. Bearings assembled on pinion shaft with spacer between them and held by pinion nut, lockwasher and locknut at forward end.

Pinion Setting:—Correct distance from rear face of pinion to center-line of ring gear marked on each pinion. Adjusted by adding or removing shims located between front bearing sleeve flange and carrier flange. When reassembling pinion, install same shim thickness at this point as previously to maintain pinion setting.

Differential Bearing Adjustment:—Ball bearings used. No adjustment required.

FORD (PASSENGER CAR)
LINCOLN ZEPHYR & MERCURY

FORD MODELS

V8 '60', ALL PASS. CAR & COMM'L. (1937-38-39)
V8 '85', ALL PASS. CAR & COMM'L. (1932 to 1939)

LINCOLN ZEPHYR

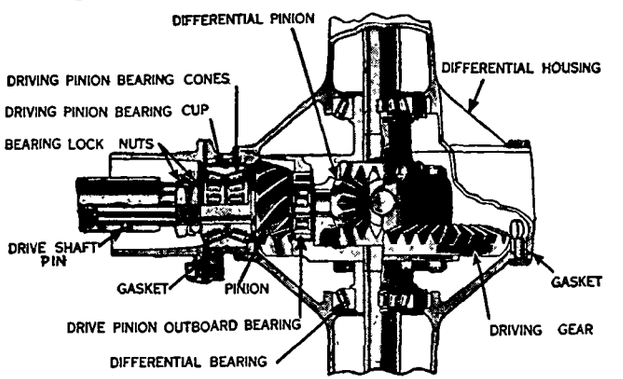
MODELS H (1936), HB (1937)

MERCURY MODELS

V8 '95', MODEL 99A (1939)

LINCOLN-ZEPHYR NOTE:—Axle on 1936-37 models similar in design to Ford type and serviced in same manner.

1938-39 Models—Hypoid type. See separate article on Lincoln-Zephyr Hypoid Rear Axle for complete data.



TYPE:—Spiral bevel, ¾ floating with torque tube drive. Pinion mounted on double roller bearing (straddle mounted with additional roller bearing behind pinion after November, 1932). Pinion shaft integral with propeller shaft (first type stub mounted pinion), splined and pinned to tubular propeller shaft (straddle mounted pinion, pinion integral with shaft on this type). Differential assembly mounted on roller bearings directly in axle housing (right and left hand housings bolted directly to pinion housing).

SERVICING:—Gear Adjustment. Backlash should be .010" Max. Controlled by gaskets between axle housings and pinion housing (see differential bearing adjustment).

Axle Replacement. Axle shafts must be removed from inner end after axle dismantled and differential case bolts removed (side gears integral with shafts). When installing axles see that free travel or play at wheels keyway does not exceed .010" or endplay exceed .015". If play excessive, check differential gears for wear (pinion clearance .005" maximum).

Propeller Shaft Forward Bearing:—In forward end of torque tube behind speedometer drive gear. Two types used (use B-4645-A roller assembly with split sleeve, 68-4645 with small rollers with solid sleeve). Use special puller SV-245 to remove solid sleeve from torque tube. Install new grease retainer (use tool A-310) with sharp edge of leather toward universal joint (old grease retainer will be damaged by sleeve removal).

Propeller Shaft Center Bearing:—In torque tube at center. On types with solid propeller shaft, front bearing sleeve must be removed before center bearing can be removed with SV-186 tool (see above).

OVERHAUL:—Disassembly. Remove speedometer driven gear assembly. Remove snap ring on forward end of propeller shaft, withdraw speedometer drive gear and thrust washer. Take out flange mounting screws at rear of torque tube, withdraw propeller shaft from tube toward rear. Drive out rivet in coupling, disconnect propeller shaft from pinion. Use AATA-1 driver to remove pinion assembly from housing, BV-92 puller to remove bearings.

Pinion Bearing Assembly:—Assemble bearings on pinion shaft (see Note below), tighten bearing locknuts so that bearing cup turns on cones with heavy drag. Heat housing (use approved heater or immerse housing neck in boiling water or hot oil for 1-2 minutes), install outboard bearing (use BV-94 driver), then with housing still hot install pinion assembly making certain that bearing cup is against shoulder in housing. Check pinion bearing adjustment only after installed in housing.
NOTE—Only bearings marked 'P' on end of cone should be used next to pinion

Pinion Bearing Adjustment:—Use approved gauge (ABV-129) to check bearing adjustm't. Setting must be 15-20 in. lbs. (V8 stub pinion), 12-17 in. lbs. (V8 with straddle mounted pinion, Lincoln Zephyr). To adjust, tighten pinion bearing nut until correct gauge reading secured (check only after pinion assembly installed in axle housing), then tighten locknut securely and turn lockwasher ears over on nuts.

Differential Bearing Adjustment:—Assemble axle with one 18-4035-A gasket (.008-.010" thick) between right and left hand axle housing and pinion housing. Check bearing adjustment by rotating both axle shafts simultaneously (rotating one shaft will not turn differential assembly). Differential assembly should turn with a heavy drag. If clearance too great, replace gasket between right hand axle housing & pinion housing with B-4035-BR gasket (.004-.005" thick). Then check gear for backlash.

Ring Gear Backlash. Use dial indicator mounted to show pinion gear shaft movement with ring gear stationary. Backlash should be .003" minimum, .010" maximum. Adjust by increasing or decreasing thickness of gasket between left hand axle housing and pinion housing. Total gasket thickness must not be changed in order not to disturb bearing adjustment (increase or decrease right hand gasket thickness equally).

FORD (TRUCK TYPE)

Used On:

ALL '60', '85', '95' TRUCKS (1932 TO 1939)

TYPE:—Spiral bevel, 3/4 floating (1932-33), full floating (1934 on) with torque tube drive. Pinion integral with shaft and straddle mounted on taper roller bearings (front), plain roller bearing (rear). Front bearings mounted in sleeve in pinion housing (sleeve flange clamped between flanges on torque tube and pinion housing which is integral with right section of axle housing). Pinion shaft splined in rear end of tubular propeller shaft. Differential assembly mounted on taper roller bearings seated directly in recesses in axle halves.

SERVICING:—Gear Adjustment. Backlash should be .008-.020" (1932-36), .004-.016" (1937 on).

Axle Shafts & Wheel Bearings (3/4 Floating Type). Axle shaft and differential side gear are integral. Axle must be dismantled and shafts withdrawn at inner end. No wheel bearing adjustment required. See that axle shaft nut at wheel kept tight (tighten with load off wheels).

Axle Shaft (Full Floating Type):—Can be removed without disturbing wheel or bearing adjustment. To remove, take off hub cap, remove nuts on 8 studs, turn in the two bolts located between studs to break axle shaft flange free from hub, then back off these bolts, strike axle flange sharp blow to loosen centering cones on three studs, pull axle shaft out, being careful not to lose the split centering cones on three studs. To install axle shaft, back off loosening bolts, install cones on three studs, tighten nuts on these studs first to center axle shaft, then tighten all stud nuts evenly and securely. Tighten loosening bolts just enough to prevent their loosening

Wheel Bearing Adjustment:—With axle shaft out, remove outer locknut, nut retainer, and grease retainer. Turn inner nut up tight, then back off 1/8 turn, install nut retainer and grease retainer, tighten outer locknut securely, replace axle shaft.

Propeller Shaft Front Bearing:—In forward end of torque tube behind speedometer drive gear. Consists of two plain roller bearings side by side on shaft within split sleeve in torque tube. Use tool BB-309 to remove or install bearing sleeve, BB-140 to install new grease retainer in tube behind bearing sleeve.

OVERHAUL:—Disassembly. Propeller shaft removed from torque tube in same manner as passenger car model (see preceding article). Pinion bearing sleeve or cup clamped between torque tube flange and axle housing flange, use AAT13 tool to remove and install assembly after torque tube removed. Use BB-143 tool to remove bearing cups, BB-144 to install. Use tool BB-142 to remove and install pinion bearing roller and cone.

Pinion Bearing Assembly & Adjustment:—Tighten pinion nut (on pinion shaft in front of forward bearing) until force required to turn shaft is 12-16 in. lbs. Use ABV-129 gauge to check setting (gauge reads in. lbs. directly which is force in lbs. times distance out from center of shaft at which force is applied in inches). Tighten locknut securely and see that lockwasher ears turned over against both nuts

Pinion Setting:—Not adjustable. Replace worn parts.

Differential Bearing Adjustment:—Not adjustable.

FORD TWO-SPEED TRUCK TYPE

Optional Equipment On:

ALL TRUCK MODELS (1939)

NOTE:—This axle provides a ratio of 5.83-1 for speed with reduced engine R.P.M. (planetary gears locked out) and a ratio of 8.11-1 for power (with planetary gears operating—these gears provide a supplementary reduction of 1.39-1). Do not confuse this type with the Ford Overdrive Axle used on passenger car models which operates differently.

TYPE:—Spiral bevel, full-floating type with torque tube drive. Pinion integral with shaft and is straddle mounted on two taper roller bearings (front), plain roller bearing (rear). Pinion shaft is splined and pinned to propeller shaft within torque tube housing. Differential assembly mounted on taper roller bearings with bearing adjusting nut under bearing cap at outer end of each bearing.

Two-Speed (Planetary) Gears. Two speed design consists of a set of four planetary pinions mounted on hardened bronze pins in the differential case and meshing with an internal gear cut on the inner rim of the ring gear. A sliding gear clutch on the left side of the differential assembly (operated by a shift lever extending through the axle housing) controls the planetary system.

Lubrication System. Special lubricating system consists of a drum on the ring gear which picks up lubricant and a scraper tube which is held against the drum by light spring pressure so as to collect this lubricant. Scraper tube is divided by partition so that lubricant directed to front pinion bearings through one channel and to right differential bearing through second channel in housing.

SERVICING:—Gear Adjustment. Paint gears to check mesh. Backlash should be .006-.020". Adjusted by backing off one differential bearing adjusting nut and tightening opposite nut equally (to avoid disturbing differential bearing adjustment). See Pinion Setting and Differential Bearing Adjustment below.

Axle Shafts & Wheel Bearings. Same design as used on regular full-floating Ford Truck Axle. See separate Ford Truck Axle article for adjustment directions.

Two-Speed (Planetary Gear) Adjustment. No adjustment is required. Planetary gears are Spur type.

OVERHAUL:—Pinion Bearing Assembly & Adjustment. Pinion bearing design and assembly similar to type used on other Ford models. Pinion bearing adjustment controlled by pinion bearing nut on forward end of pinion shaft. To adjust, tighten nut until bearings have no perceptible endplay but make certain that pinion rotates freely. Lock Adjustment by tightening locknut and making certain that lockwasher ears are turned over nuts.

Pinion Setting. Pinion position controlled by shims installed between bearing cage flange and carrier.

Differential Bearing Adjustment. After correct gear mesh and backlash secured (see below), tighten right hand differential bearing adjusting nut until bearings are tight, then back off adjusting nut one notch which should allow bearings to roll freely. Install adjusting nut locks and make certain that bearing cap nuts are securely tightened.

Ring Gear Backlash Adjustment. Back off right hand differential bearing adjusting nut and turn up left hand nut until backlash between gears is .006-.020" (measured at gear teeth). Paint gears to check mesh, adjust ring gear position for corect lengthwise contact, adjust pinion position for correct contact on tooth (contact depth on face of tooth). After correct gear mesh and backlash secured, adjust differential bearings (above).

HUDSON (OWN MAKE)

Used On:

HUDSON MODELS

'112' MODELS 89 (1938), 90 (1939)
SIX, ALL MODELS (1933 TO 1939)
EIGHT, ALL MODELS (1932 TO 1939)

TERRAPLANE MODELS

SIX & EIGHT, ALL MODELS (1932 TO 1939)

TYPE:—Spiral bevel, semi-floating type. Axle housing rear cover welded in place requiring removal of differential carrier assembly for any work on axle. Pinion integral with shaft and mounted on taper roller bearings with bearing cups seated directly in housing. Differential assembly mounted on roller bearings with adjusting nut under bearing cap at each side.

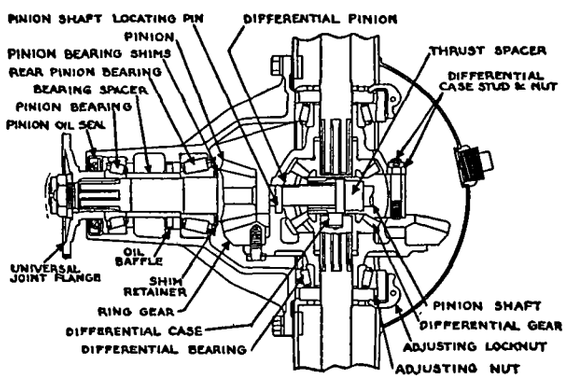
1939 Type:—Design changed from 1938 type as follows: **Differential Carrier**—heavier construction with integral pinion shaft oil baffle; **Differential Case**—Heavier construction with additional reinforcing webs, ring gear mounting now eight 7/16" bolts (bolts 1/16" larger and two extra bolts used), differential hubs have greater diameter with larger side bearings; **Gears**—Ring gear same as previous model except for greater number of mounting bolts, pinion shaft increased in diameter with new larger pinion bearings; **Ring Gear Bolts**—Shakeproof lockwashers used instead of lockplates, bolts 1/16" larger.

Interchangeability of Parts—Following parts not interchangeable on previous models: Differential carrier, pinion gear and bearings, ring gear, differential case halves and bearings.

NOTE—Differential carrier and gear assembly may be installed on previous models as a unit. Optional ratio gear sets (for previous models) cannot be installed on 1939 cars.

SERVICING:—Gear Adjustment. Paint gears to check mesh. Pinion position controlled by shims between pinion and rear bearing cone. Backlash should be .0005-.003". Adjusted by backing off one differential bearing adjusting nut and tightening opposite nut equally. See Pinion setting and differential bearing adjustment below.

HUDSON TYPE CONT.



Axle Shaft Replacement. Remove rear wheels, axle shaft nut and washer, use wheel puller to remove hub and brake drum assembly (do not use knock-out type puller). Take off 4 nuts on wheel bearing adjusting cap, remove cap and bearing adjusting shims, use puller J-352 to remove shaft and bearing assembly. Use Bearing Remover J-358 to remove bearing cone and rollers from shaft.

Axle Shaft Thrust Button Renewal. Thrust button consists of hardened steel plug in inner end of axle shaft. To remove button, grind end flush with shaft, center punch button and drill through center with 11/32" drill, tap hole with 3/8-16 tap, screw in 3/8-16 capscrew, place head of screw in vise and tap end of shaft with soft hammer to remove button. Drive new button into place in shaft.

Axle Replacement. When replacing axle or adjusting wheel bearings remove shims equally at both wheels for endplay of .004-.010" (before '39), .002-.004" ('39) & uniform clearance between thrust buttons and thrust spacer on differential pinion shaft (unequal clearance on one side will cause spacer to contact shaft and transmit thrust to differential).

OVERHAUL:—Pinion Bearing Adjustment. Install pinion bearing adjustment shims between bearing spacer and front bearing cone, tighten pinion shaft nut securely with rear universal joint flange in place, check bearing adjustment. It should be just possible to turn pinion shaft with one hand. Add thin shim if bearings too tight. Pinion bearing endplay should be .000-.001".

Pinion Setting:—When reassembling pinion install same shim thickness between pinion and rear bearing cone to retain correct pinion position. Adjust pinion by adding or removing shims at this point.

Differential Bearing Adjustment:—To set up bearings when installing differential carrier, tighten differential bearing cap capscrews finger tight, turn left hand adjusting nut in until all play eliminated between pinion and ring gear, then tighten right hand adjusting nut securely. Set up dial indicator to check gear backlash, back off left hand adjusting nut one half notch and tighten right hand nut equal amount until gear backlash is .0005-.003" Tighten bearing capscrews securely on left hand adjusting nut, turn right hand adjusting nut in one additional notch to secure correct bearing pre-load of .009" bearing tension. Tighten right hand bearing capscrews securely and install locks on both nuts.

Ring Gear Replacement:—Ring gear mounted on differential case by capscrews (screws locked in place by locking plate under heads). When installing ring gear, always use new screw locks, tighten screws evenly and securely, bend ears on locks over screws.

NOTE—Manufacturer recommends that shakeproof lockwashers be used under screw heads when installing gear instead of the soft steel lock plates.

LINCOLN (OWN MAKE)

Used On:

V12 MODEL (1932 TO 1939)

TYPE:—Spiral bevel, full floating type with torque tube drive. Pinion integral with shaft which is splined and pinned in sleeve at rear end of propeller shaft (propeller shaft should be disconnected by taking out pin and disengaging splines when pinion bearing assembly is to be dismantled). Pinion straddle mounted on two taper roller bearings (front), single roller bearing (at rear of pinion). Differential assembly mounted on taper roller bearings with adjusting nut under bearing cap at each side. Thrust block located behind ring gear at pinion is mounted on bracket bolted to carrier housing.

Propeller Shaft Front Bearing. Consists of a roller bearing assembled within the forward end of the torque tube (speedometer gear housing). Bearing is lubricated from universal joint and should not require servicing.

SERVICING:—Gear Adjustment. Paint gears to check mesh. Backlash should be .010". Adjusted by backing off one differential bearing adjusting nut and tightening opposite nut equally. See differential bearing adjustment below.

Axle Replacement. To remove shafts, remove locking ring at brake drum hub, pull shafts out (does not disturb wheels or wheel bearing adjustment). Shafts interchangeable.

Wheel Bearing Adjustment. Adjust bearings whenever removed for lubrication (5000 mile intervals). To remove, remove axle shafts, take off lock nut, lock washer, bearing nut on end of axle housing. When replacing bearings, turn up bearing nut so that bearing play is hardly perceptible, install lockwasher and lock nut.

OVERHAUL:—Pinion Bearing Assembly. Rear bearing held in place in housing by rivet adjacent to bearing hole (washers at each end of rivet engage bearing outer race). Pinion bearings seated in bearing sleeve against shoulder. Bearings adjusted by taking up pinion bearing nut at forward end of bearing assembly. Tighten lock nut securely and turn up lockwasher ears against nut after adjusting.

Pinion Setting:—Not adjustable. Replace worn parts.

Differential Bearing Adjustment:—To adjust, remove adjusting nut locks, loosen bearing cap nuts slightly, turn adjusting nuts. Replace locks and tighten bearing caps securely.

Ring Bear Backlash Adjustment:—When adjusting backlash, back off one differential bearing adjusting nut and tighten opposite nut exactly same amount to avoid disturbing bearing adjustment. Backlash should be .010".

LINCOLN ZEPHYR TYPE

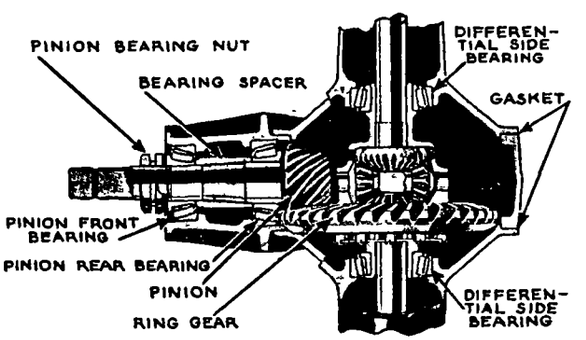
Used On:

MODEL 86H (1938), 96H (1939)

TYPE:—Hypoid gear, 3/4 floating, with torque tube drive. Similar to design used on 1937 model (see preceding article) except for pinion mounting as follows:

Pinion Assembly:—Pinion integral with shaft and mounted on taper roller bearings. Bearing cups seated directly against shoulders in housing. Bearing cones positioned on shaft by spacer.

Replacement Exchange Axle Assemblies—Assemblies consisting of differential housing (axle housing center section) with pinion gear installed (and set up for correct bearing adjustment and pinion gear mesh), and mated ring gear are furnished for both 86H (1938) and 96H (1939) as Part No. 86-H-4020.



SERVICING:—Serviced in same manner as Ford Axle except for following points:

Ring Gear Backlash—Should be .002-.004". Ring gears marked with etched figure indicating correct clearance for each ring and pinion gear set.

Pinion Bearing Adjustment—Correctly set at factory and should not be disturbed in service. Bearing pre-load should be 18-20 in. lbs. (measured with ABV-129 gauge).

OVERHAUL:—Manufacturer recommends that Axle Assembly (Differential housing with Pinion installed) not be dismantled and should be serviced by Axle Assembly Exchange (Assembly furnished with Pinion installed, bearings adjusted, and set for marked backlash with mated Ring Gear). Overhaul data below applies to 1938 model.

Pinion Bearing Assembly—With propeller shaft disconnected, remove locknut and pinion bearing nut on forward end of pinion shaft, press pinion out toward rear. Use special pullers to remove bearing cups from housing.

Pinion Bearing Assembly & Adjustment:—Reverse dismantling directions above. Pinion bearing adjustment controlled by spacer on shaft between bearing cones (see also Pinion Bearing shims under Pinion mesh below). Spacers furnished in following thicknesses: 2.2700-2.2705", 2.2720-2.2725", 2.2740-2.2745", 2.2760-2.2765", 2.2780-2.2785", 2.2800-2.2805", 2.2820-2.2825", 2.2840-2.2845", 2.2860-2.2865", 2.2880-2.2885". With pinion assembled and pinion nut tight, pinion shaft should turn with 18-20 in. lbs. force (use ABV-129 gauge).

LINCOLN ZEPHYR TYPE CONT.

Pinion Setting:—Pinion position controlled by shims installed between rear pinion bearing cup and shoulder in housing. These shims furnished .009", .010", .011", .012", .013", .014", .015" thick. First type shims (86H-4663-A to G) were flat washers 3.18" outside diameter. These shims superseded by new type (86H-4663-T to Z) cup-shaped shims installed between rear bearing and shoulder of pinion shaft. Whenever rear bearing cup removed, remove old shims and install new type.

Differential Bearing & Ring Gear Backlash Adjustment—Gaskets for installation between differential housing and right and left axle housings furnished in three thicknesses as follows: .008-.010" (86H-4035-A), .004-.006" (86H-4035-B), .013-.018" (86H-4035-C). Normal gasket thickness (for correct backlash and differential bearing adjustment) is .005-.008" at each side of differential housing. Vary thickness at left hand housing to adjust backlash (keep total thickness for both sides same to avoid disturbing differential bearing adjustment), vary thickness at right hand side to adjust differential bearings (without changing backlash).

NASH 1933-35 TYPE

Used On:

NASH MODELS.

SIX, 1120 (1933), 1220 (1934), 3520 (1935)
STANDARD 8 1130, SPECIAL 8 1170 (1933)
ADVANCED EIGHT, 1280 (1934), 3580 (1935)

LAFAYETTE MODELS.

SIX, MODELS 110 (1934), 3510 (1935)

TYPE:—Spiral bevel, semi-floating type. Pinion integral with shaft and mounted on taper roller bearings seated directly in housing. Differential assembly mounted on taper roller bearings with adjusting nut under bearing caps at each side (on some models, adjusting nut located at right hand side only for bearing adjustment, shims on left hand side for backlash adjustment).

SERVICING:—Axle serviced as a unit by manufacturer. **Gear Adjustment.** Paint gears to check mesh. Backlash adjusted by backing off one adjusting nut equally, or by adding or removing shims located between left hand differential bearing cone and differential case. See Pinion Setting and Differential Bearing Adjustment below.

Axle Replacement. Check axle shaft endplay. Should be .003-.006". Adjust by adding or removing shims between backing plate and axle housing flange (at one wheel, spacer installed in differential housing transmits thrust from one shaft to the other).

OVERHAUL:—Pinion Bearing Adjustment. When assembling pinion, see that pinion adjusting shims installed between pinion and rear bearing cone, and pinion bearing shims installed between spacer and front bearing cone (on some models bearing adjusting shims located between rear bearing cup and shoulder in housing).

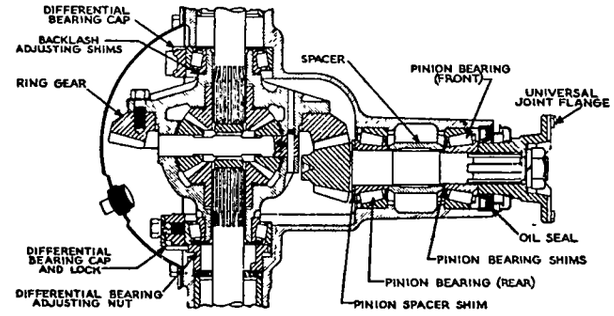
Pinion Setting:—Position adjusted by adding or removing shims located between rear bearing cone and pinion. Pinion position not changed by bearing adjustment on Nash models.

Differential Bearing Adjustment:—Adjust by loosening bearing cap screws slightly, removing lock and turning up bearing adjusting nut.

Ring Gear Backlash Adjustment. On models with right and left hand differential bearing adjusting nuts, back off one screw and tighten opposite screw equally to avoid disturbing bearing adjustment. On models with right hand bearing adjusting nut only, it will be necessary to remove differential assembly and add or remove shims between left hand bearing cup and differential housing to secure correct backlash and then adjust differential bearings.

NASH 1936-39 TYPE

Used On:



NASH MODELS

AMBASS. 6, 3620('36), 3720('37), 3820('38), 3920('39)
AMBASS. 8, 3680('36), 3780('37), 3880('38), 3980('39)
'400' MODEL, 3540, 3640 ('35-36), 3640A ('36)

NASH-LAFAYETTE MODELS

3610 ('36), 3710 ('37), 3810 ('38), 3910 ('39)

HYPOID AXLE NOTE:—Manufacturer recommends that Hypoid axles (used on some models) not be disassembled or serviced in the field. Service data below applies to Spiral Bevel axles only.

NOTE:—Two types used—"Small Type" (Six and Nash-Lafayette). "Large Type" (Nash 8). Axles similar except that Small Type does not have separate differential carrier (differential assembly mounted on bearings seated directly in housing). Large Type has separate carrier which can be removed from housing for servicing. Servicing operations are same for both exles except as noted below.

TYPE:—Spiral bevel, semi-floating type with Hotchkiss drive. Pinion integral with shaft and mounted on taper roller bearings seated directly in housing with spacer on shaft between bearing cones. Differential assembly mounted on taper roller bearings with adjusting sleeve at right hand bearing only (Small Type), both bearings (Large Type). NOTE—Small Type axle has shims for backlash adjustment located at left hand differential bearing.

SERVICING:—Gear Adjustment—Paint gears to check mesh. Backlash should be .005-.007". Backlash adjusted by adding or removing shims located behind left hand differential bearing (Small Type), backing off one differential bearing adjusting sleeve and turning up opposite sleeve equally (Large Type). See Pinion Setting and Differential Bearing Adjustment below.

Axle Shaft Replacement—To remove shaft (with wheel and hub removed), take off nuts on bearing retainer on backing plate, remove oil seal, retainer, backing plate and bearing adjusting shims. Pull axle and bearing assembly. When replacing shims adjust endplay by adding or removing shims between backing plate and housing flange to secure desired endplay of .004-.006" total. This adjustment must be made equally at both wheels to insure thrust block being centered on differential pinion shaft.

OVERHAUL:—Disassembly—With axle shafts out, remove rear housing cover (Small Type only), loosen bearing cap bolts, mark adjusting sleeve position (to insure correct reassembly) and back sleeves off (sleeve at right hand end only on Small Type), remove bearing cap bolts and bearing caps, lift differential assembly out. To remove pinion, take off universal joint companion flange nut, pull flange, press pinion out of housing toward rear. Use pullers to remove bearings from housing.

Pinion Bearing Assembly:—Bearing adjustment controlled by shims located between spacer on shaft and forward bearing cone. When assembling pinion, install correct washer and shim pack (for correct pinion mesh—see Pinion Setting below) on pinion shaft against pinion, install rear bearing cone and bearing spacer. Install pinion shaft in housing, install sufficient shims on shaft in front of bearing spacer to insure positive endplay in shaft when assembled (for bearing adjustment), install front bearing cone, companion flange and nut, tighten nut securely, check bearing adjustment as directed below. NOTE—Do not install oil seal in front end of housing until after bearing adjustment completed, then install new seal.

Pinion Bearing Adjustment—Use dial indicator to check pinion shaft endplay with companion flange nut tight. Disassemble pinion shaft and remove shims from between front bearing cone and spacer equal to this endplay plus .003" additional to insure bearings being pre-loaded or set up .003" tight.

Pinion Setting:—Pinion mesh controlled by washer (or washer and shim pack) installed on shaft between pinion and rear bearing cone. Use Pinion Setting Gauge SE-534-A to determine washer thickness for pinions as follows: With pinion installed in housing or carrier, install gauge with end discs seated in differential bearing bores in housing, install rectangular checking block on rear face of pinion, turn gauge micrometer so that shaft just contacts ground surface of checking block (rock gauge slightly on end discs to secure extremely accurate reading). Subtract gauge reading from standard figure of .408" (Small Type), .190" (Large Type) which will give correct washer thickness for standard pinions (marked by =0 following the set number on the end of the pinion teeth). If pinion

NASH 1939 TYPE CONT.

marked + or —, subtract shims (if pinion marked +), add shims (if pinion marked —) equal in .000" to the figure on the pinion following this plus or minus mark. Install washer and shims equal to this final figure on shaft between pinion and rear bearing cone and re-install pinion in housing.

Pinion Adjusting Washer Note—Washers for pinion adjustments are .129", .130", .131" thick and are used in combination with one to three .003" shims to make up all necessary thicknesses from .117" to .140" (in .001" steps—thicknesses outside these limits not required). Part Nos. for these washers and shims are as follows: Washer—No. 28283 (Small Type), 22838 (Large Type), Shims—No. 18742 (Small Type), 15578 (Large Type). CAUTION—Adjusting washer must be installed with chamfered side toward pinions and Shims (if used) between washer and bearing cone.

Differential Gear & Bearing Assembly:—To dismantle differential gear assembly, drive out pin in differential pinion shaft, remove shaft, axle shaft thrust block, pinions, side gears and thrust washers. When reassembling, make certain that thrust washers are installed on back of each side gear and pinion and that thrust block is installed on pinion shaft (this block transmits thrust from one shaft to the other). On Small Type axles only, shims are installed on differential case hub on left side (between case and differential side bearing) to control ring gear backlash. NOTE—On Large Type Axles, when installing differential assembly in carrier, tighten left hand bearing adjusting sleeve until all backlash removed between ring and pinion gears, then back off adjusting sleeve six notches or one half turn until notch is in line with lock on cap, make all bearing adjustments by turning right hand adjusting sleeve. This procedure will insure correct ring gear backlash of .005-.007".

Differential Bearing Adjustment:—With right hand bearing adjusting sleeve lock removed, and bearing cap loosened slightly so that sleeve can be turned, tighten adjusting sleeve until all bearing endplay is just removed and notch in sleeve lines up with lock, then tighten adjusting sleeve two notches additional to provide correct bearing pre-load, tighten bearing cap and install adjusting sleeve lock.

Ring Gear Backlash Adjustment (Small Type)—Check backlash at several points around ring gear. If backlash not within limits of .005-.007", dismantle axle, remove left hand differential side bearing, add or remove shims on hub behind bearing cone (add shims to increase backlash, remove shims to decrease backlash—.005" shim thickness will change backlash .0025"), reassemble axle. Readjust differential bearings (bearing adjustment will be affected by any change in shim thickness).

Ring Gear Backlash Adjustment (Large Type)—Check backlash at several points around ring gear. If outside limits of .005-.007" adjust by loosening both bearing caps and backing off right hand adjusting sleeve (to decrease backlash), left hand adjusting sleeve (to increase backlash), then **tighten opposite sleeve exactly same number of notches** to avoid disturbing differential bearing adjustment. See Note under Differential Bearing assembly above for correct setting up of differential bearings when assembling axle to insure backlash being correct.

OLDSMOBILE—LA SALLE (OWN MAKE)

Used On:

OLDSMOBILE 6, MODELS F-32 ('32), F-33 ('33)
OLDSMOBILE 8, L-32 ('32), L-33 ('33), L-34 ('34)
LA SALLE 350, SERIES 50 (1934-35)

TYPE:—Spiral bevel, semi-floating type. Pinion integral with shaft which is mounted on double row ball bearing (front), single row ball bearing (rear) with spacer between bearings. Bearings seated directly in carrier with adjusting nut on each side of front bearing for pinion adjustment. Differential assembly mounted on ball bearings with adjusting nut under bearing cap in carrier.
NOTE—Pinion bearings changed on later LaSalle cars. Single roller bearing used at rear, spacer discontinued and double row ball bearing at front positioned by shoulder on shaft.

SERVICING:—Gear Adjustment. Paint gears to check mesh. Backlash for LaSalle models stamped on rear face of each pinion with prefix 'L' (figure following indicates desired backlash in thousandths). Adjusted by backing off one differential bearing adjusting nut and tightening opposite nut equally. See differential bearing adjustment below.

Axle Replacement. Wheel bearings are ball bearing type (no adjustment required). Bearings pressed on axle shafts against shoulder and retained by backing plate which engages outer race.

OVERHAUL:—Pinion Bearing Assembly. See that oil baffle installed on front pinion bearing under front adjusting nut, and that front bearing inner race seated against spacer (first type), or shoulder on pinion shaft (later type), tighten pinion nut at rear universal joint flange securely.

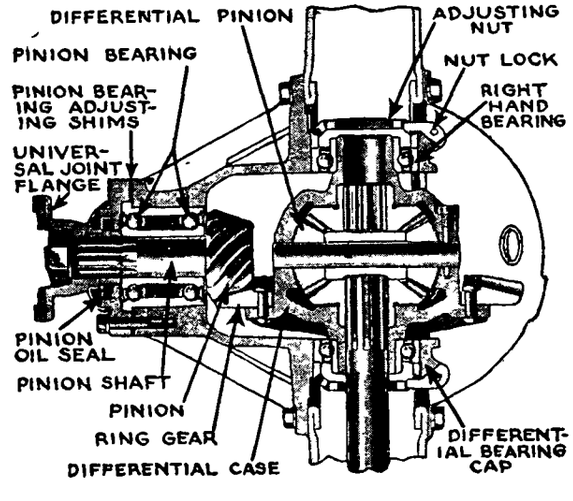
Pinion Setting: Controlled by adjusting nut at each side of front bearing. Tighten both nuts securely against bearing race before checking mesh. Adjust by backing off one nut and tighten other nut equally, moving each nut a few notches at a time. Back off rear nut (to move pinion in toward ring gear), front nut to move pinion out or away from ring gear. Install locking plates on both nuts after adjusting.

Differential Bearing Adjustment:—Loosen bearing caps, remove locks, turn up adjusting nut at outside of each bearing. With correct setting, pull at rim of ring gear required to turn gear should be 8-10 lbs. (15 lbs. to start gear, 8-10 lbs. to rotate gear) on LaSalle models.

Ring Gear Backlash Adjustment. When adjusting backlash, back off one adjusting nut and turn up opposite nut equal amount to avoid disturbing differential bearing adjustment.

OLDSMOBILE (OWN MAKE)

Used On:



SIX, MODELS F-34 ('34), F-35 ('35), F-36 ('36)
EIGHT, MODELS L-35 (1935), L-36 (1936)

TYPE:—Spiral bevel, semi-floating type. Pinion integral with shaft and mounted on special long double row ball bearing. Differential assembly mounted on Radax or Difrax ball bearings (designed to take thrust in one direction) with adjusting nuts under bearings caps in carrier.

SERVICING:—Gear Adjustment. Check pinion setting or paint gears to check mesh. Backlash should be .004-.008". Adjusted by backing off one differential bearing adjusting nut and tightening opposite nut equal amount (see differential bearing adjustment below.)

Axle Replacement. Wheel bearings are special shielded type lubricated at factory. Sideplay on new bearings .008-.010", replace bearings when sideplay exceeds .015". Bearings pressed on shaft against shoulder with 3000 lb. pressure and should be removed and installed in an arbor press. No bearing adjustment required.

OVERHAUL:—Pinion Bearing Assembly. Shielded type (packed with lubricant at factory and should not be washed out). Bearing should have no endplay (replace if endplay noted). Bearing inner race is a press fit on the pinion shaft (remove and install on an arbor press, apply pressure to inner race only).

Pinion Setting:—Use Pinion Setting Gauge, J-705, install gauge in carrier in place of differential assembly, adjust micrometer so that stem contacts rear face of pinion. Gauge reading should be .0625" (1935-36 models) for pinions marked '0'. Figure stamped on end of pinion should be added (minus figure), or subtracted (plus figure) from standard .0625" reading to secure setting for each pinion. Adjust pinion position by adding or removing shims installed between bearing retainer flange and front flange of carrier.
NOTE—On 1934 model, adjusting nut used instead of flanged bearing retainer. Nut locked by locking plate on carrier.

Differential Bearing Adjustment:—Back off bearing cap bolts one half turn, remove locks, turn adjusting nut in until bearing race just starts to turn, turn nut in two additional notches, replace lock, tighten bearing cap bolts.

Ring Gear Backlash Adjustment. To set up differential bearings for correct ring gear backlash when installing differential assembly, tighten bearing cap bolts securely and then back off one half turn, tighten left hand adjusting nut until all lash between ring gear and pinion taken up, then back off this nut exactly four notches to point where notch lines up with lock slot in cap. Then adjust differential bearings by turning up right hand adjusting nut as directed above. This setting should give correct backlash of .004-.008".

OLDSMOBILE 1937-39 TYPE

Used On:
SIX, F-37 ('37), F-38 ('38), '60' F-39 ('39)
SIX '70', MODEL G-39 (1939)
EIGHT, L-37 ('37), L-38 ('38), '80' L-39 ('39)

1939 NOTE:—Ring and pinion gear ratio stamped on outer surface of differential carrier of all axles as follows: 43-10 (4.3-1 Std. axle), 40-11 (3.636-1 Std. axle with Self-shifting Trans.), 41-9 (4.55-1 Optl. Mountain ratio).

TYPE:—Spiral bevel gear (1937-38 models). Hypoid gear (1939), semi-floating type with Hotchkiss drive. Pinion integral with shaft and mounted on double row ball bearing at front (this bearing takes thrust in both directions), roller bearing at rear (takes radial load only, no inner race used with this bearing). Bearings mounted directly in housing (front bearing locked in place by retainer sleeve held by tapered lockscrews in housing, rear bearing seats against shoulder in housing). Differential assembly mounted on Hyatt self-aligning (barrel) roller bearings with adjusting nut under bearing cap at outer end of each bearing.

SERVICING:—Gear Adjustment. Paint gears to check mesh. Backlash should be .004-.008". Adjusted by backing off one differential bearing adjusting nut and tightening opposite nut equally. See Pinion Setting and Differential Bearing Adjustment below.

Axle Replacement. Wheel mounting flange integral with axle shaft. To remove shafts, remove wheel (wheel nuts on left side of car have left hand threads), take out two bolts holding brake drum on axle shaft flanges, remove drums, take off nuts on 4 bolts holding backing plate on axle housing flange, remove static collector, pull axle shaft bearing retaining plate away from backing plate (be careful not to disturb backing plate which will damage brake lines), withdraw axle shaft and bearing assembly using puller J-942, replace one nut to hold backing plate in position.

Wheel Bearings & Oil Seal. Bearings are shielded type (lubricated at factory) and pressed on axle shaft against shoulder at wheel end of shaft. Remove bearings only when new bearings installed (see Bearing Collar Note below). To remove, use tool J-947-2 (to prevent bursting of race), and plate J-947-1 and press bearing off shaft in arbor press. Install new bearings in same manner using tool J-947-3 and plate J-947-1 to insure pressure being applied to inner race only. Before installing shaft, make certain that double feather edge of leather oil seal is in good condition or install new seal with tool J-944 (1937-38), J-1049 (1939) and coat outer rim of seal with Permatex or white lead to prevent oil leaks.

Bearing Collar Note—On 1937-38 models, collar installed on shaft behind bearing. Collar must be split with chisel before bearing removed. After new bearing installed, press new collar on shaft firmly against bearing with tapered end away from bearing. Oil seal contacts collar (1937-38), shaft (1939).

Wheel Bearing Note—New wheel bearings have .008-.010" sideplay and should not be replaced unless sideplay exceed .015" or bearings are noticeably rough.

OVERHAUL:—Disassembly. Mark both differential bearing adjusting nuts and caps to insure correct reassembly, remove bearings caps and adjusting nuts, lift differential assembly out of carrier. Remove rear universal companion flange nut, use tool J-962, remove flange from shaft, press pinion shaft back through front ball bearing inner race and remove, remove and save shims installed on shaft directly back of this bearing. Do not remove snap ring on pinion shaft directly in front of pinion gear (this gear prevents rear bearing rollers from creeping on shaft). Remove rear bearing rollers (rollers cannot be removed singly on new bearings), use tool J-983 to pull outer race out of housing, take out 3 lockscrews in housing, remove locking sleeve, tap front bearing out.

Pinion Bearing Assembly:—Push front ball bearing into housing and tap lightly on outer race to seat bearing against shoulder in housing, insert bearing retainer sleeve (tapered end toward rear) and lock sleeve firmly in place against ball bearing race by turning up the three cone-pointed lockscrews evenly and securely and tightening lockscrew locknuts. Use tool J-940 to drive rear roller bearing outer race in place in carrier, coat the 14 bearing rollers with heavy grease and install in place in bearing race. Install correct shim thickness for each pinion against shoulder on pinion shaft (see Pinion Setting directions below), make certain that roller lock ring in place on pinion shaft at pinion end, install pinion in carrier guiding shaft through washer at forward end of carrier. Install companion flange, tighten flange nut (hold flange in vise). NOTE—Front ball bearing has slight 'pre-load' when new and should be replaced if any endplay noted. Pinion shaft should not be worn more than .0007" (compare with unworn shaft ahead of bearing). If any radial play noted at pinion when assembled, gears will not run quietly (replace roller bearing if shaft not worn).

Pinion Setting:—Standard shim thickness for each carrier indicated by marking on flange as follows: D5—.049", D4—.048", D3—.047", D2—.046", D1—.045", C—.044", S1—.043", S2—.042", S3—.041", S4—.040", S5—.039". 'D' indicates bearing shoulder deeper than standard, 'C' on center or standard, 'S' shallower than standard. These figures correct for standard or unmarked pinions. When pinion marked by plus or minus figure on face, shims should be added (+ sign), subtracted (— sign) from this standard shim thickness equal (in thousandths) to the figure following this plus or minus sign. Pinions which are unmarked do not require any correction to be made to the shim thickness as indicated by the carrier marking. Shims furnished in four sizes and colored for identification as listed below (use combinations of shims for all required thicknesses).

Shim Thickness	Part No.	Color
.012"	499528	Plain
.014"	503063	Blue
.015"	499529	Copper
.018"	499530	Plain

Pinion Marking Note—Standard pinions (which require no shim correction) are marked by figure 'OC' 1937), and are unmarked for 1938-39.

Differential Gear & Bearing Assembly:—To remove side bearings, use tool HM-483B ('37-38), HM-986 ('39) installed so pressure applied to bearing cone only. Use J-941 driver to install bearings. To dismantle differential gears and pinions, take out pinion shaft lockscrew and shaft, revolve pinions until aligned with openings in case, withdraw pinions, remove side gears and thrust washers. Install in same manner (thrust washers may be installed with either face toward gears).

Differential Bearing Adjustment:—Adjusting nuts and bearing caps should be marked before disassembly to insure correct replacement. To adjust bearings, loosen each bearing cap bolt one-half turn, remove locks, back off right hand adjusting nut until bearing outer race stops turning with nut, turn nut up until race begins to turn, tighten 3 notches, then repeat adjustment and turn nut up 1½-2 notches from point where bearing race begins to turn with nut, tighten bearing cap bolts and replace locks.

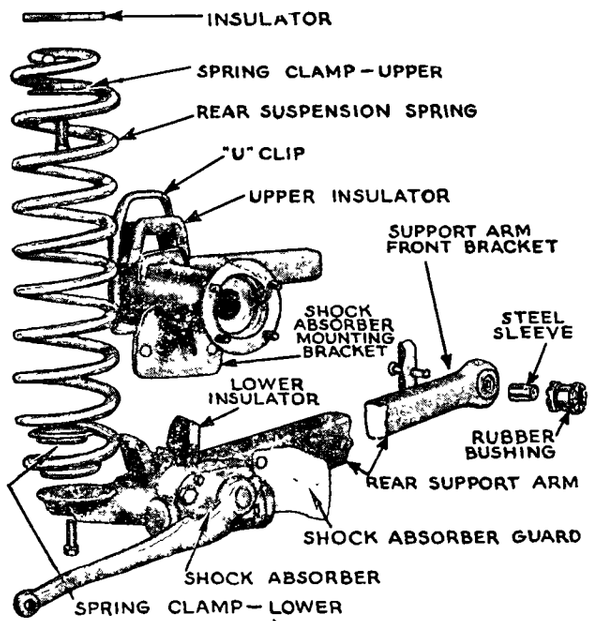
Ring Gear Backlash Setting—When installing differential assembly, back off right hand adjusting nut four turns, then turn left hand adjusting nut up until all backlash removed from between ring and pinion gears, finally back off left hand adjusting nut exactly four notches. Adjust differential bearings by turning right hand adjusting nut as directed above. This procedure should give correct backlash of .004-.008".

OLDSMOBILE REAR SUSPENSION

Used On:
SIX '60', MODEL F-39 (1939)
SIX '70', MODEL G-39 (1939)
EIGHT '80', MODEL L-39 (1939)

TYPE:—New type using coil springs with conventional rear axle. Springs are seated in bracket on frame at upper end, seat on rear end of support arm at lower end and support car only (all driving and braking torque taken by support arms which are mounted on rubber bushings on frame 'X' member at front end and bolted to axle housing near wheel at rear end). A track bar is linked between the frame cross-member and the axle housing to prevent side movement. Shock absorbers are mounted on rear ends of support bars under axle housing with shock absorber arms pointing toward the rear of the car and are linked to the frame.

SERVICING:—Spring Removal—Disconnect brake hose at rear axle, disconnect shock absorber link at shock absorber arm, raise car to remove weight from spring, remove lower spring clamp and bolt (bolt has left hand thread), remove upper spring clamp and bolt, remove spring and insulator pad. CAUTION—Brake hose must be disconnected from axle whenever shock absorber arms or springs are disconnected to prevent damage.



Spring Installation:—Spring must be installed with 'curled' end (small diameter end coil) at bottom with curled end toward left side of car and pointing straight ahead (if spring has both ends curled, install with either end up, if one end is straight, this straight end must be installed at top). Place spring in position, install insulator on top of spring and spring clamps in end coils (lower clamp has grommet nut, upper clamp does not have nut which is located in frame side rail). Assembly will be facilitated if upper clamp and insulator are taped to spring. Line up holes in clamp and frame, lower car slightly to hold spring while bolts installed. Make certain that clamps turned so as to grip end coils tightly (clamps are cam shaped), install clamp bolts and tighten securely.

Support Arms:—To remove support arms, proceed as directed above for spring removal (without disturbing spring upper clamp bolt at frame). Disconnect rear axle housing 'U' bolt, free support arm from frame by loosening support arm brackets and removing support arm bolt. To install new rubber bushing in forward end of support arm, apply weak solution of soapy water to bushing, start bushing in arm, pound arm on wood block until bushing

OLDSMOBILE REAR SUSPENSION CONT.

seated. Install steel bushing in same manner and make certain that it is centered in the rubber bushing. To install new insulators at rear axle, see that metal bearing edges of insulators are clean and free of rubber, apply soapy water to rubber to insure good seat. When replacing support arm, tighten U bolts to tension of 75 ft. lbs. (plus or minus 5 lbs.) with J-1264 torque wrench.

Track Bar:—Mounted on rubber bushings at both ends. To remove bar, take off nut on frame end bolt, pry bar forward to loosen serrated bolt from frame, then disconnect axle end of bar in same manner. When installing bar, attach at frame end first, lower car slightly on springs, if necessary, to align axle end bolt holes.

REAR SPRINGS:—Spring part number is stamped on outside of one end coil (top or bottom—will not be visible with spring installed) and are paint-marked for identification as follows:

Car Model	Color Mark
F-39 Bus. & Club Coupe	Blue
F-39 Tour. Coupe & Sedan	Red
G-39 Bus. & Club Coupe, Convertible	Green
G-39 Tour. Coupe & Sedan	Yellow
L-39 Bus. & Club Coupe, Convertible	Green
L-39 Tour. Coupe & Sedan	Yellow

PACKARD 1939 TYPE REAR SUSPENSION

Used On:

PACKARD SIX, MODEL 1700 (1939)
PACKARD '120' EIGHT, 1701, 1A, 2 (1939)
PACKARD SUPER EIGHT, 1703, 3A, 5 (1939)

TYPE:—Consists of a special Lateral Stabilizer (with double acting shock absorber control), Anti-sway Bar, and opposed mounting of shock absorbers as follows:

Lateral Stabilizer:—Connected between shock absorber (mounted on right side of frame cross-member above axle housing) and bracket on axle housing at left spring seat. This lateral stabilizer shock absorber is the 'Fifth' shock absorber.

Shock Absorber Mounting:—Regular rear shock absorbers are mounted on underside of axle housing at spring seats with shock absorber arm pointing forward (right side), toward rear (left side). Both shock absorber arms are linked to frame.

Anti-Sway Bar:—Right end of bar is bolted to right hand shock absorber arm, left end of arm is pivoted in bracket bolted to underside of left hand spring seat and linked to frame (forward of axle) by link similar to those used on shock absorbers.

SERVICING:—Shock Absorber Refilling—Remove filler plug, fill housing to level of bottom of filler plug hole with Houde 800 second fluid. Move arm up and down through two full strokes to eliminate all air from chamber, recheck fluid level.

Shock Absorber Adjustment:—Check adjustment by mounting shock absorber in vise with arm pointing up, attach 50 lb. weight to bolt hole in end of arm, check time required for arm to make complete stroke (from extreme upper to extreme lower position with weight attached). Time should be 18 seconds minimum, 24 seconds maximum at room temperature. If outside these limits, remove plug on end of shaft (at arm), turn adjusting needle valve in or out as required and recheck performance. Standard setting of valve is ¼ turn out from inner seated position. Tighten packing nut to correct leakage at valve.

Spring Leaf Inserts:—Spring leaves are separated by special rubber and lead alloy disks installed in cups at ends of leaves (various combinations of inserts used on various spring types). Springs should not be lubricated. If springs squeak, remove all metallic inserts, clean both sides of inserts with a wire brush and pack retainer cups with #3 cup grease when re-installing.

TROUBLE-SHOOTING:—If rear seat unsteady or rattles occur under car on rough roads, check lateral stabilizer shock absorber for free travel (arm should have no free travel and should require considerable force to move it). If refilling or adjustment does not correct shock absorber performance, replace unit. Check anti-sway bar and see that mounting bolts are tight at shock absorber arm.

PACKARD SIX & EIGHT (OWN MAKE)

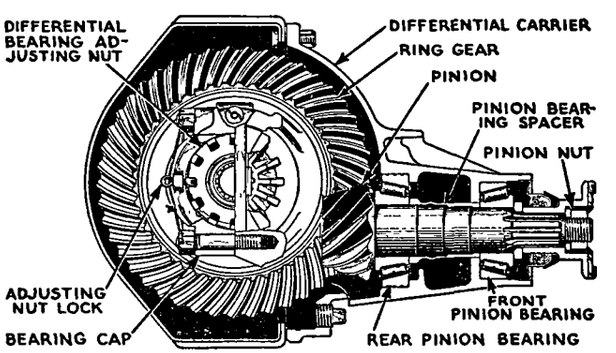
Used On:

SIX, 115C ('37), 1600 ('38), 1700 ('39)
'120' EIGHT, 120 ('35), 120B ('36), 120C ('37) 1601,1A,2 ('38), 1701,1A,2 ('39)
SUPER EIGHT, 1603,3A,5 (1939)

TYPE:—Angle-set (except 1938), Hypoid gear, semi-floating type same as Packard Senior line except for pinion mounting. Pinion mounted on taper roller bearings seated directly against shoulders in carrier housing (at inner side of each bearing) and adjusted by flexible bearing sleeve on shaft. Differential assembly mounted on taper roller bearings with adjusting nut at outer end of each bearing under bearing cap.

NOTE—On 1935-36 models, pinion mounted on two single row ball bearings (each bearing taking thrust in one direction).

Ring Gear Support Roller (Super Eight only)—Consists of a roller-bearing-mounted roller mounted on an eccentric stud in the forward face of the differential carrier housing so as to act as a support for the back face of the ring gear. Roller is adjustable (see Servicing data below).



SERVICING:—Gear Adjustment. Paint gears to check mesh. Backlash should be .003-.005". Adjusted by backing off one differential bearing adjusting nut and taking up opposite nut equal amount. See differential bearing adjustment.

Axle Shaft Replacement. To remove axle shaft, remove wheel, take off axle shaft nut and washer, remove hub and brake drum assembly (use puller), disconnect brake line, take out nuts in backing plate, remove backing plate, pull axle and bearing assembly.

Wheel Bearing Adjustment. Endplay up to .050" can be taken up by removing shims between backing plate and axle housing flange on one side. If endplay greater than .050", remove shims at both wheels equally. Endplay should be .004-.007".

OVERHAUL:—Pinion Bearing Assembly. Bearing mounted directly in recesses in pinion housing. On 1935-36 models, bearings adjusted by spacers assembled in housing in back of rear bearing outer race. This spacer also controls pinion position.

Pinion Bearings (1937-39). Adjusted by turning up rear universal flange nut to buckle bearing spacer and apply pre-load to bearings. To adjust, tighten nut until spacer is felt to buckle and pressure required to turn pinion shaft is 25-30 in. lbs. (5-6 lbs. pressure at outer end of 5" wrench, rear wheels must be off floor or carrier out of housing when this test made). Check bearing adjustment whenever this nut is loosened.

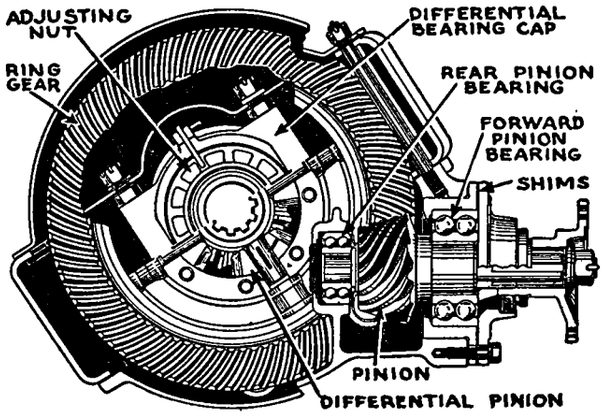
Pinion Setting:—On 1935-36 models, pinion position controlled by spacer behind rear bearing outer race (same spacer as controls bearing pre-load). On 1937 and later models, pinion position not adjustable.

Differential Bearing & Backlash Adjustment:—Adjusted in same manner as other Packard models (see following article on Packard Senior Line). Bearings should be pre-loaded to secure spread of bearing support pedestals of .010-.012" (Six & Eight), .015" (Super Eight). NOTE—On Super Eight model, make certain that there is sufficient clearance between ring gear and support roller when making this adjustment.

Ring Gear Support Roller Adjustment (Super Eight only)—After adjusting ring gear backlash and differential bearing pre-load, adjust ring gear support roller by loosening lockscrew on roller stud sector plate and turning roller stud so that clearance between roller and back face of ring gear is .005". Make certain that sector plate and lockscrew are tight after making adjustment.

PACKARD 'SENIOR LINE'

Used On:



EIGHT, 901, 2 ('32), 1001, 2 ('33), 1100, 1, 2 ('34), 1200, 1, 2 ('35), 1400, 1, 2 ('36)

SUPER 8, 903, 4 ('32), 1003, 4 ('33), 1103, 4, 5 ('34), 1203, 4, 5 ('35), 1403, 4, 5 ('36), 1500, 1, 2 ('37) 1603, 4, 5 ('38)

TWELVE, 905, 6 ('32), 1005, 6 ('33), 1107, 8 ('34), 1207, 8 ('35), 1407, 8 ('36), 1506, 7, 8 ('37) 1607, 8 ('38), 1707, 8 ('39)

IMPORTANT NOTE—Whenever rear universal joint flange is removed, fill pinion bearing oil reservoir with 1¼ ounces SAE. #50 oil after assembling spacer but before installing universal joint flange.

TYPE:—Angle-set, Hypoid gear, semi-floating type. Pinion straddle mounted on double row ball bearing front and rear. Front bearing mounted in sleeve with adjusting shims located between sleeve flange and carrier. Differential carrier mounted on roller bearings with adjusting nut under bearing caps on carrier.

SERVICING:—Gear Adjustment. Paint gears to check mesh. Backlash should be .003-.005". Adjust by taking up one differential bearing adjusting nut and backing off opposite nut equal amount. See differential bearing adjustment.

Axle Shaft Removal. To remove axle shaft, remove wheel, take off axle shaft nut and washer, remove hub and brake drum assembly (use puller), disconnect brake line, take out nuts in backing plate, remove backing plate, use puller to remove axle and bearing assembly.

Wheel Bearing Adjustment. Wheel bearings are double taper roller type and each wheel is adjusted independently. After axle shaft removed (see above) add or remove shims located between inner bearing cup and axle housing to secure desired endplay of .003" plus or minus .001". Coat inner face of bearing cap with good grade of gasket paste before installing.

OVERHAUL:—Pinion Bearing Assembly. Front double row bearing held on pinion shaft by spacer and rear universal joint companion flange with pinion shaft nut at forward end.

Pinion Setting:—Pinion position controlled by shims installed between pinion carrier flange and face of differential carrier casting. Shims furnished .005", .008", .015" thick. Paint gears to check gear mesh.

Differential Bearing Adjustment (1932-36):—Loosen bearing cap nuts ¾ turn, remove locks, turn right hand bearing adjusting nut up until some drag noticed when ring gear rotated by hand, tighten cap nuts and install locks.

Bearing Adjustment (1937-38-39). Bearings should be pre-loaded for .015" spread of support pedestals or differential bearing posts. To adjust, loosen bearing cap nuts ¾ turn, remove locks, back off right hand bearing adjustment nut until differential assembly is loose in bearings (make certain that left hand adjusting nut position allows backlash between ring and pinion gears). Use outside calipers to measure distance between outer faces of differential bearing posts with .015" feeler under one caliper leg, lock caliper. Tighten right hand bearing adjusting nut until posts are spread so that caliper will just slide over bearing cap lock bosses without feeler. Tighten bearing cap nuts, check backlash. Install adjusting nut locks after adjustment completed.

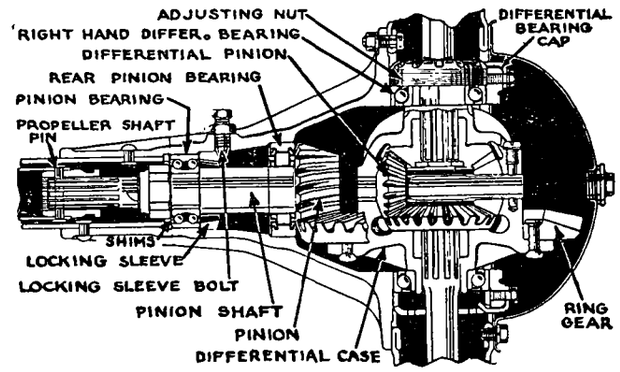
Ring Gear Backlash Adjustment. Back off one adjusting nut, tighten opposite nut equal amount. Check differential bearing adjustment as directed above.

PONTIAC 1935-36 TYPE

Used On:

SIX, MODELS 701-A, B ('35), 36-26 A, B ('36)

EIGHT, MODELS 601 ('33), 603 ('34), 605 ('35), 36-28 ('36)



TYPE:—Spiral bevel, semi-floating type with torque tube drive. Pinion integral with shaft which is pinned and splined to propeller shaft within torque tube. Pinion shaft mounted on double row ball bearings (front), single row ball bearing (1933-34-early 35) roller bearing (late 35-all 1936) at rear. Front pinion bearing takes thrust in both directions, rear carries radial load only. Differential assembly carried on ball bearings with adjusting nuts under bearing caps on carrier.

SERVICING:—Gear Adjustment. Paint gears to check mesh. Backlash should be .005-.010" for new gears or slightly more for worn gears. To adjust, back off one differential bearing adjusting nut, tighten opposite nut equal amount. See Pinion Setting and Differential Bearing Adjustment below.

Axle Replacement. Axles retained by 'C' washer at inner end in differential case. To remove axle, take out locking screw, withdraw differential pinion shaft, remove spacer block, pull axle in and remove 'C' washer, then push axle out. Shaft formed with wheel mounting flange integral.

Axle Shaft Endplay. Controlled by spacer block and should be Free Fit to .014" max. Spacer blocks furnished standard and .015" oversize.

OVERHAUL:—Pinion Bearing Assembly. With propeller shaft removed from torque tube, pinion shaft can be removed by cutting off head of pin and disengaging splines. Bearings are press fit on shaft and front double row ball bearing should have no perceptible endplay. When installing assembly in housing see that adjusting shims installed ahead of front bearing, tap pinion into seat against shims, with pinion screws drawn up evenly against pinion locking ring make final adjustment with full arm pull on 6-8" wrench for each screw.

Pinion Setting:—Adjusted by adding or removing shims located ahead of front pinion bearing in housing until location is correct. See Pinion Bearing Assembly (above) for directions.

Differential Bearing Adjustment:—Correct adjustment for both bearings is one to two notches tight of adjusting nut from point where outer race of bearing stops turning when nut backed off, if race does not turn when nut backed off, turn adjusting nut for each bearing up equally to point where race begins to turn, then one additional notch tight will give correct adjustment.

Ring Gear Backlash Adjustment. Back off one adjusting nut, tighten opposite nut equal amount. Check differential bearing adjustment as directed above.

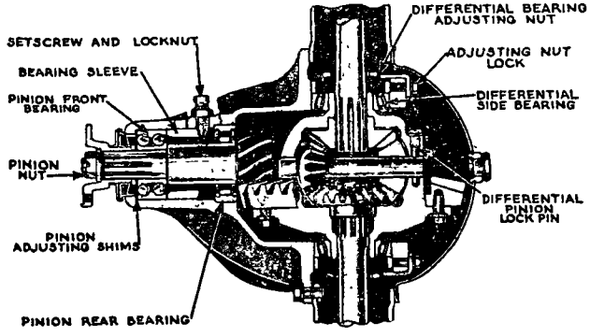
PONTIAC 1937-39 TYPE

Used On:

QUALITY SIX, MODEL 39-25 (1939)
SIX, 37-26CA ('37), 38-26DA ('38), 39-26 ('39)
EIGHT, 37-28CA ('37), 38-28DA ('38), 39-28 ('39)

TYPE:—Spiral bevel gear (1937-38 car models), Hypoid gear (1939), semi-floating type with Hotchkiss drive. Pinion integral with shaft and mounted on double row ball bearing (front), roller bearing (rear). Front bearing designed to take thrust in both directions, rear bearing radial load only. Differential assembly mounted on barrel type roller bearing at each side with adjusting nut under bearing cap at outer end of each bearing.

SERVICING:—Gear Adjustment. Paint gears to check mesh. Make certain that pinion flange nut, ring gear mounting screws, and pinion thrust bearing wedging screws are tight and that differential bearing adjustment is correct before checking gears. Backlash .003-.010". Adjust by backing off one differential bearing adjusting nut and tighten opposite nut equally. See Pinion Setting and Differential Bearing Adjustment below.



Axle Shaft Replacement. Wheel mounting flange integral with axle shaft. Bearings are special shielded type (lubricated at factory) pressed on axle shaft and held by retainer collar pressed on shaft. To remove shaft, remove wheel and brake drum, remove nuts from four bolts holding backing plate on housing, withdraw axle shaft (use puller J-942) taking care not to drag shaft on oil seal or to dislodge backing plate which will damage brake line. New bearings must be installed whenever removed from shaft. To remove bearings, use chisel to split retainer, press bearing off using special tool J-947 on outer race (pressure exerted on outer race which may burst if tool not used). Use same tool to install new bearing (pressure on inner race only) and retainer, pressing bearing on shaft against shoulder. Install shaft with left hand wheel studs on left hand side of car, shaft with right hand studs on right side of car. To renew oil seal, use tool J-943 to remove seal assembly, lubricate new seal with oil and coat outside rim of retainer with Permatex, use tool J-944 (1937-38), J-1049 (1939) to install seal assembly.

NOTE—If edge of brake drum flange is not flush with surface of shield on backing plate when installed, use sufficient gaskets, Part No. 499776 or 499930, installed between drum and axle flange for correct alignment.

OVERHAUL:—Axle Disassembly. Mark differential bearing caps and adjusting nuts (to insure correct replacement), remove bearing caps and adjusting nuts, lift out ring gear and differential assembly. Remove universal joint flange nut, use puller J-962 and remove flange. Press pinion out of carrier taking care not to damage pinion shaft threads or oil washer. No further disassembly required if pinion setting only being adjusted (see Pinion setting below). Loosen locknuts and remove three wedging screws on outside of housing, press bearings and locking sleeve out of housing using tool J-964.

Pinion Bearing Assembly:—Double row ball bearing should have no endplay (replace if endplay is perceptible). Roller bearing may have moderate amount of radial clearance on pinion shaft (no inner race). Bearings are drive fit in carrier housing. To install, drive ball bearing in against shoulder in housing (use tool J-939), install locking sleeve against bearing, back off locknuts and install locking sleeve wedge screws (oil screws before installing, tighten each screw one-half turn at a time, finish with full arm swing on 6-8" wrench), tighten locknuts, drive rear roller bearing in against shoulder in case (use tool J-940). Install rear bearing spacer on pinion shaft, select correct shim thickness for each carrier and pinion (See Pinion Setting below), install shims on pinion shaft, press pinion in carrier through bearings being careful that no pressure exerted on pinion teeth and that bearing rollers are not wedged against shaft. Install universal joint flange (at right angles to cotter pin hole), tighten pinion nut securely.

Pinion Setting:—Standard shim thickness for each carrier (indicated by mark on carrier flange) is as follows: D5—.049", D4—.048", D3—.047", D2—.046", D1—.045", 0—.044", S1—.043", S2—.042", S3—.041", S4—.040", S5—.039" ('D' indicates carrier bore deeper, 'S' shallower, than standard '0' dimension). To this standard shim thickness (which is correct for all unmarked or standard pinions), add additional shims (when pinion marked +), subtract shims (when pinion marked —) equal to amount of figure following this plus or minus mark on pinion (figure indicates shim thickness in thousandths). This total shim thickness will position pinion for correct mesh with ring gear. Shims furnished in four sizes and

colored for identification as listed below (use combinations of these shims for all required thicknesses).

Shim Thickness	Part No.	Color
.012"	499528	Plain
.014"	503063	Copper
.015"	499529	Blue
.018"	499530	Plain

NOTE—Unmarked pinions are standard and indicate no correction need be made to indicated carrier flange shim thickness.

Differential Gear & Bearing Assembly:—To disassemble, take out locking screw (in case at end of pinion shaft), withdraw shaft, take out differential gears, thrust washers and pinions. Shaft must be removed before 'mountain-ratio' ring gear can be removed. Differential bearing inner race is .0012" press fit on hub (if less than this amount, replace case or copper-plate hub). To remove bearing, use puller J-986 (exert pressure on inner race only), install in same manner using tool J-941. Replace bearings if rough or pitted.

Differential Bearing Adjustment:—Remove adjusting nut locks, back off bearing cap nuts just enough to relieve strain so that nuts can be turned, mark nut and cap to establish original position, back off right hand nut slowly until bearing race just stops turning with nut (amount nut turned indicates 'notches tight' of nut. Turn adjusting screw in until race just starts to turn with nut, then tighten nut additional 1½ (minimum), 2½ (maximum) notches for correct bearing pre-load. Tighten bearing cap nuts securely and replace locks.

Ring Gear Backlash Adjustment—When adjusting differential bearings (above), if ring gear has slight backlash (.005"), equalize differential bearing adjustment by tightening each adjusting nut one notch (do not make entire adjustment at right hand nut). Backlash can be adjusted without disturbing differential bearing adjustment by backing off one adjusting nut and tightening opposite nut exactly same number of notches. Recheck bearing adjustment after adjusting backlash.

Ring Gear Replacement:—Replace ring and pinion gears as matched sets. Ring gear mounted on differential case by special heat treated alloy steel capscrews (do not use ordinary screws). Use new heavy type lockwasher on each screw each time screws are removed.

REO (OWN MAKE)

Used On:

MODELS S, S2, S3, S4, S7 (1932-35)

NOTE:—Spicer (Salisbury) axle used on other Reo models. See Spicer article for complete data.

TYPE:—Spiral bevel, semi-floating type. Pinion straddle mounted on double row ball bearing (front), single row ball bearing (rear). Bearings mounted directly in housing. Differential assembly mounted on taper roller bearings with adjusting nut under bearing cap at each side.

SERVICING:—Gear Adjustment. Pinion not adjustable. Backlash should be .010-.015". Adjusted by backing off one differential bearing adjusting nut and taking up opposite nut equally. See differential bearing adjustment.

Axle Replacement. When installing new axle, place approximately .042" shim thickness between wheel bearing cap and axle housing flange. Check endplay. If greater than .005" remove shim.

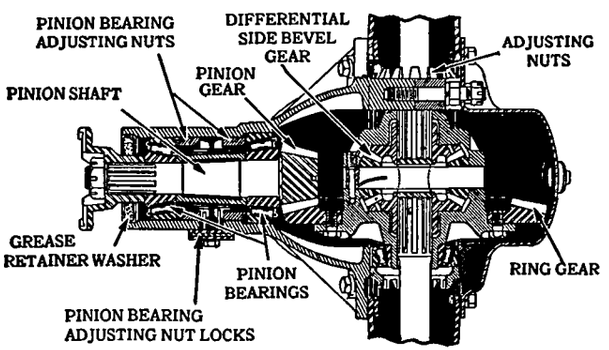
OVERHAUL:—Pinion Bearing Assembly. Rear ball bearing peened in place in axle housing. To remove bearing, cut peen marks with sharp chisel. See that new bearing peened in place to prevent shifting. When removing front bearing, save shims installed between outer race and shoulder in housing at rear of bearing, and re-install these shims when replacing bearing (these shims compensate for variation in machining housing and are not an adjustment).

Pinion Setting:—Non-adjustable type. When installing new pinion, see that shims furnished with each pinion are installed between front bearing inner race and pinion at rear of bearing. These shims will insure correct pinion position.

Differential Bearing Adjustment:—Remove adjusting nut locks, loosen differential bearing cap screws, turn up adjusting nuts to remove all endplay. Differential assembly should revolve freely after adjustment completed. Tighten bearing caps and replace locks.

Ring Gear Backlash Adjustment. Back off left hand adjusting nut (to increase backlash), right hand nut (to decrease backlash), tighten opposite nut same amount to avoid disturbing bearing adjustment. Set backlash at .010" or to secure quietest running position (backlash limits .010-.015").

STUDEBAKER (OWN MAKE)



Used On:
SIX, MODEL 56 (1933)
COMMANDER, MODEL 73 (1933), 1B (1935)
PRESIDENT, MODEL 82 (1933), 1C (1935)

NOTE:—Spicer (Salisbury) Axles used on other models. See Spicer article for complete data.

TYPE:—Spiral bevel, semi-floating type. Pinion integral with shaft and mounted on roller bearings which are seated directly in carrier housing and positioned by pinion adjusting nuts (double nuts in housing between bearings). Differential carrier mounted on taper roller bearings with adjusting nut at each side under bearing cap.

SERVICING:—Gear Adjustment. Paint gears to check mesh or use pinion setting gauge to check pinion (see Pinion Setting). Backlash should be .006-.008" ('33), .002-.004" ('35). Adjusted by backing off one differential bearing adjusting nut and tightening other nut (see Differential Bearing Adjustment).

Axle Replacement. See that endplay is .001-.005" (total clearance between shafts and thrust block which transmits thrust from one shaft to the other). Adjust by adding or removing shims between backing plate and axle housing flange. Shims furnished .003", .005", .010",. 030" thick.

OVERHAUL:—Pinion Bearing Adjustment. Remove pinion bearing adjusting nut locks (one side of housing), tighten both adjusting nuts as much as possible while turning pinion shaft. Tap carrier housing lightly to seat bearing cups and rollers. Then back off one nut one notch so that pinion turns with slight drag, install adjusting nut locks.

Pinion Setting:—Pinion position adjusted by backing off one pinion bearing adjusting nut and tightening the other nut an equal amount (necessary to maintain pinion bearing adjustment, see above). Backing off front adjusting nut will move pinion toward ring gear; rear nut, away from ring gear.

Pinion Setting Gauge:—If Gauge Fixture No. HMJ-589 used for 1935 models, set micrometer for special zero setting by turning clockwise .010" to '15' (correct for pinions marked '0'). Install in axle housing in place of differential carrier, adjust pinion until gauge contacts ground surface on end of pinion (pinions marked '0') subtract (plus figure), or add (minus figure), the figure etched on end of each pinion. These figures indicate in thousandths the amount the pinion should be moved forward (plus) or to rear (minus) from the standard or zero setting.

Differential Bearing Adjustment:—Loosen bearing cap studs enough so that bearing adjusting nuts can be turned with 6" or 8" wrench. Tighten right hand adjusting nut until the bearing cup and rollers just start to rotate with the nut, tighten nut one additional notch, tighten bearing cap studs and install locks (lockscrews enter through case with screw heads on outside). Repeat adjustment on left hand adjusting nut.

Ring Gear Backlash Adjustment:—When adjusting ring gear backlash, back off one adjusting nut and tighten opposite nut exactly the same amount to avoid disturbing bearing adjustment. Check bearing adjustment (above).

WILLYS (OWN MAKE)

Used On:
WILLYS, 77 (1933-36), 37 ('37), 38 ('38), 48 ('39)
WILLYS-OVERLAND, MODEL 39 (1939)

TRUCK NOTE:—Spicer (Salisbury) Axles used on 1938-39 truck models. See Spicer article for complete data.

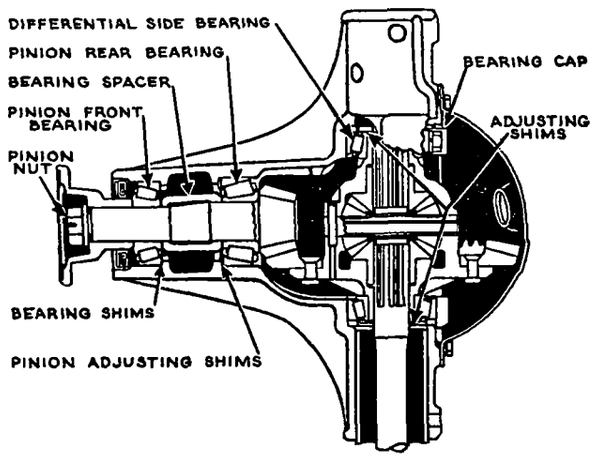
TYPE:—Model 77. Spiral bevel, semi-floating type. Pinion shaft integral with pinion and straddle mounted on two taper roller bearings (front), single roller bearing (rear). Differential assembly mounted on taper roller bearing at each side with adjusting shims in housing under bearing caps.

1937-39 Type—Spiral bevel, semi-floating type with Hotchkiss drive. Pinion mounted on taper roller bearings seated directly in housing with pinion bearing adjusting shims between front bearing cone and spacer, pinion adjusting shims in housing in front of rear bearing cup. See special directions below for pinion bearing adjustment and pinion setting on this model.

NOTE—Differential assembly is Spicer Model 22.

SERVICING:—Gear Adjustment. Paint gears to check mesh. Backlash should be .004-.008". Adjusted by shifting shims from one differential bearing to the other (same number of shims should be used to avoid disturbing differential bearing adjustment). See Pinion Setting and Differential Bearing Adjustment below.

Axle Shaft Removal. Remove rear wheels, take off axle shaft nut and washer, pull hub and brake drum assembly (use puller), remove nuts on backing plate, remove oil deflector, oil seal, backing plate and brake assembly, pull axle shaft and bearing assembly. Use puller to remove bearing from shaft.



Axle Replacement. When replacing shafts, check endplay and adjust by adding or removing shims between bearing retainer and axle housing flange at each wheel. Wheel bearings designed to take thrust in one direction (transmitted through spacer to opposite shaft in other direction).

OVERHAUL:—Disassembly. Remove differential housing cover, remove differential bearing caps, remove shims on right hand side of differential assembly first, then left hand shims (keep shims separate and install same shim pack at each point when reassembling axle). Take off nut and remove rear universal joint companion flange, use brass drift and drive pinion out of housing toward rear (rear bearing cone, rollers and bearing spacer will come out with shaft). Drive front bearing cup, rollers, and oil seal out toward front as an assembly (notches provided for drift in opposite sides of housing). Drive rear bearing cup out toward rear in same manner.

Pinion Bearing Adjustment (1933-36 Models):—Shims installed on pinion shaft between front bearing cones. When assembling pinion assembly, install same shim thickness as removed from old assembly for initial trial. Pinion should have no endplay but should turn freely with nut tight.

Bearing Adjustment (1937-39). Shims installed between front bearing cone and bearing spacer. Install shims removed from old assembly when reassembling pinion. Tighten nut securely and check adjustment. Pinion should have no endplay but should turn with 1 lb. pressure on 15" leverage (1937), 2 lbs. pressure on 10" leverage (1938-39). Adjust by adding or removing shims furnished .004", .010", .030" thick. Bearing adjustment changed by pinion setting adjustment and should be rechecked when adjusted.

NOTE—If dial indicator used to check pinion bearing adjustment, measure endplay, then remove shims equal to endplay plus additional .002" shim thickness to secure correct .002" tension or bearing pre-load.

Pinion Setting (1933-36):—Shims located between pinion bearing shell or cup and shoulder in housing behind bearing. Add shims to move pinion away from ring gear, remove shims to move pinion toward ring gear.

1937-39 Type. Shims located between pinion rear bearing cup and shoulder in housing ahead of bearing. Install same number of shims as removed from old assembly when assembling pinion, check mesh. Add shims to move pinion in toward ring gear, remove shims to move pinion away from ring gear. Shims furnished 004", .010", .030" thick. Recheck pinion bearing adjustment.

Pinion Setting Gauge—Available from factory for setting new pinions to insure correct mesh with ring gear (Part No. W-101—part of Kit No. W99). When re-installing pinions, make certain that all shims originally installed in housing behind rear pinion bearing cup are replaced to insure correct pinion mesh.

Differential Bearing Adjustment:—Shims located between bearing cups and housing on either side. Furnished .180", .184", .188", .192", .196" thick. Select shims for correct bearing adjustment. When removing differential assembly, take off bearing caps, remove shims on right hand side first, install same shim thickness when reassemblying.

Ring Gear Backlash Adjustment. Transfer shims from behind left hand differential bearing to right hand bearing to increase backlash, or from right to left to decrease backlash. Total shim thickness must not be changed to avoid disturbing differential bearing adjustment.

SPICER SPIRAL BEVEL & HYPOID TYPES

SPIRAL BEVEL TYPES

Model 10

BANTAM, MODEL 63 & SUPER FOUR 65 (1940)

Model 11

CROSLEY, MODEL A (1939-40)

Model 21-1

WILLYS, MODEL 440P PANEL TRUCK (1940)

HYPOID GEAR TYPES

Model 23

STUDEBAKER CHAMPION, MODEL 2G (1940)

Model 41-2

GRAHAM, SPECIAL 108, SUPERCHARGER 107 ('40)
GRAHAM, HOLLYWOOD SUPERCHARGER 109 (1940)
STUDEBAKER COMMANDER, MODEL 10A (1940)
STUDEBAKER PRESIDENT, MODEL 6C (1940)

Model 41-3

HUPMOBILE SKYLARK, MODEL R (1939-40)

These Axles same design as used on corresponding 1938 car models.

CROSLEY NOTE:—Crosley Axle is new design with Torque Tube drive. Serviced in same manner as other Spicer models after torque tube has been removed.

SERVICING & OVERHAUL:—These models serviced in same manner as on previous car models. ***See Spicer (Salisbury) 'Spiral Bevel' and 'Hypoid Gear' Rear Axle articles in Mechanical Equipment Section of manual for complete data and adjust axles to following specifications:***

Axle Shaft Endplay—Total endplay for both shafts should be .005" (Bantam), .001-.005" (Studebaker), .002-.007" (others). When adjusting, shims should be removed equally at both wheels to keep thrust block at inner ends of axle shafts centered on differential pinion shaft (excessive shim removal at one wheel will cause block to bind on shaft).

Ring & Pinion Gear Backlash—Should be .006-.008" (Bantam), .004-.008" (Crosley, Graham, Willys), .004-.007" (Hupmobile), .003-.005" (Studebaker Champion), .005-.007" (Studebaker Comm. & Pres.). Adjusted by shifting differential bearing shims from one side to the other (total must be kept the same to avoid disturbing differential bearing adjustment).

Pinion Setting—Zero cone setting (for pinions marked '0') for each axle model shown in table below. This figure should be used with pinion setting gauge (See Model 10, 11, 23 Note below) and must be corrected for pinions marked + or — as directed in manual article.

Axle Model	Zero Cone Setting
10	.218"
21-1	.407"
23, 41-2, 41-3	.719"

Model 10 Note—Special smaller pinion gauge must be used for this model (endplate diameter of 2.714-2.716"). Pointer extends 2.000" beyond differential bearing bore center-line with micrometer set at zero.

Model 11 Note—This is special small axle and regular pinion setting gauge cannot be used.

Model 23 Note—Regular Pinion Setting Gauge cannot be used for this model. Special pinion setting gauge available (Studebaker Tool No. J-589-D —use with J-589-10-2 step plate and special retaining cross-bar which are part of complete gauge set). This J-589-D is used on Champion model only, regular Studebaker Pinion Setting Gauge No. J-589-C should be used on Commander & President models.

Pinion Bearings—Should be set up for slight drag when revolving pinion by hand with differential assembly out of axle (all models).

Differential Bearings—Should be set up for fairly heavy drag with pinion out of axle. To secure this setting, install shims sufficient to remove all bearing endplay, then install additional shim thickness of .003-.006" (except Studebaker), .008" (Studebaker Champion), .008-.010" (Studebaker Com. & Pres.).

Ring Gear Backlash Adjustment—When adjusting backlash, shift shims from one side of differential case to the other. Total shim thickness must not be changed as this would disturb differential bearing adjustment.

BUICK HYPOID TYPE

Used On:

SERIES 40-40, 50, 60, 70, 80, 90.

These Axles same design as used on 1939 models except as noted below.

SERIES 50, 70 NOTE:—These are new models (no corresponding 1939 models) but axles are same design as used on Series 40, 60.

TYPE:—Design changed from type used on 1939 models as follows:

Series 40, 60. Torque tube is separate part with flanged end which is bolted to flange on differential carrier. Torque tube should not be removed from carrier and bolts should not be loosened when servicing axle (except for installation of special gasket to correct oil leaks), as these parts furnished as an assembly only, not available separately. Universal joint ball housing and torque tube connection same design as used on 80, 90 except that no propeller shaft front bearing used (frame mounted universal and two-section torque tube as used on 1939 Models 40, 60 has been discontinued). Right hand axle shaft ¾" longer than left shaft and not interchangeable (same as for 1938-39 models).

Series 50, 70. Axle same design as 40, 60 (above).

Series 80, 90. Same design as used on previous 80, 90 models. Right hand axle shaft is 15/16" longer than left hand shaft and not interchangeable.

Axle Identification (All Models). Gear ratios of production car axles marked by paint marks on both axle shaft flanged ends as follows:

Car Model	Axle Ratio	Color Mark
40 Std.	4.4-1	White
40 Optl.	3.9-1	Red
50 Std.	4.4-1	.....
60, 70 Std.	3.9-1	Red
60 Optl.	3.6-1	Blue

SERVICING & OVERHAUL:—All service operations same as for corresponding previous models. ***See "Buick Hypoid Type" Rear Axle article in Mechanical Equipment Section of manual for complete data and note following points:***

Axle Shaft Endplay—If installation of new spacer block does not reduce shaft endplay to desired .008" maximum, install new bronze thrust washers in back of differential side gears.
